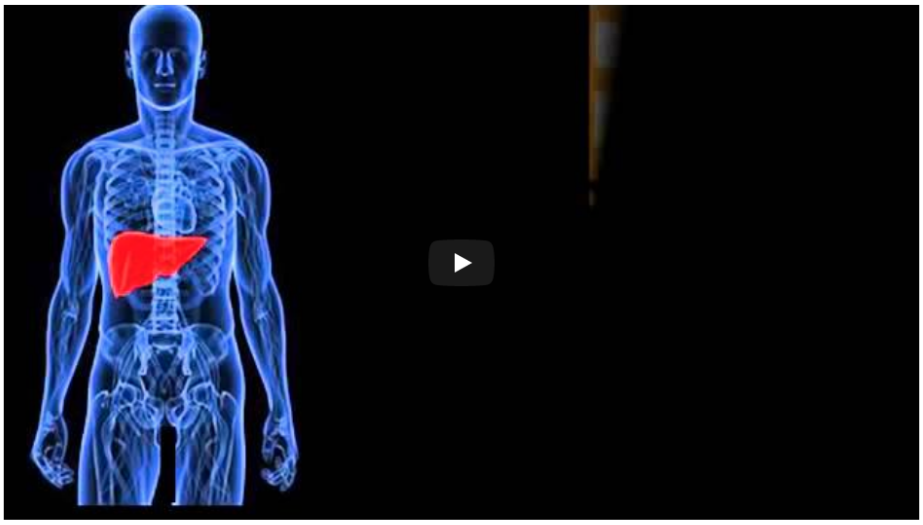
Artificial Pancreas Treatment

Nothing short of amazing.

Artificial Pancreas Treatment can help eliminate diabetes complications once and for all.

Treating your diabetes can be a significant challenge in itself without the added pain and aggravation of associated complications. Now patients with Type 1 and Type 2 diabetes may be able to stop and often reverse these complications, leaving them free to enjoy the quality of life they once had.



Mitochondria

The Heart of Artificial Pancreas Treatment

Mitochondrion are little organelles that provide energy to each cell by converting foodstuffs into adenosine triphosphate – commonly known as ATP. The mitochondria of people with diabetes do not receive the signals and enzymes from the liver necessary to properly burn carbohydrates.

The good news is that once mitochondrion are provided the necessary signals and enzymes, they quickly begin to heal themselves. This is the beauty of the Artificial Pancreas Treatment, it merely mimics what a normal pancreas does by way of stimulating the liver! This is also why there has never been any injury or adverse reaction.

Facts

1 Diabetes is a complicated and debilitating disease affecting carbohydrate metabolism, leading to devastating complications.

2 APT has been given to patients more than 200,000 times without any negative reactions, requiring no side effects warnings.

3 The device used to infuse APT has been cleared by the FDA without fails, recalls, claims or negative outcomes.

4 APT successfully stops and reverses the complications of both Type 1 and Type 2 diabetes, due to their similar metabolism effects.

5 After treatment with APT, patients regain the proper levels of ATP, giving their cells energy and protecting them from the damage of complications.
