- A very important peptide (especially during the current situation) is the Thymosin Alpha Peptide; it mimics the role that the thymus had before puberty to strengthen our immune system and in particular supports the NK cells (natural killer cells), so important in defending the body against viruses. It can be administered as a very small injection underneath the skin to stimulate the immune system and should help protect against COVID-19. Dr. Read and all her staff are using this peptide, as are many of her patients. It can easily be self-administered in your own home, daily.

- Peptide 5 amino IMQ is an extremely exciting product for weight loss and
