

THE SECRETARY OF THE INTERIOR
WASHINGTON

ORDER NO. 3348

Subject: Concerning the Federal Coal Moratorium

Sec. 1 Purpose. The Federal coal leasing program is of critical importance to the economy of the United States, supplying approximately 40 percent of the coal produced in the Nation. On January 15, 2016, Secretary's Order 3338, "Discretionary Programmatic Environmental Impact Statement to Modernize the Federal Coal Program," was signed and placed a moratorium on the coal leasing program with limited exceptions. Given the critical importance of the Federal coal leasing program to energy security, job creation, and proper conservation stewardship, this Order directs efforts to enhance and improve the Federal coal leasing program.

Sec. 2 Authorities. This Order is issued under the authority of Section 2 of Reorganization Plan No. 3 of 1950 (64 Stat. 1262), as amended. Other statutory authorities for this Order include but are not limited to the following statutes:

- a. Mineral Leasing Act, 30 U.S.C. §1181 *et seq.*
- b. Mineral Leasing Act for Acquired Lands, 30 U.S.C. § 351 *et seq.*
- c. Federal Land Policy and Management Act, 43 U.S.C. 1701-1785.
- d. Surface Mining Control and Reclamation Act, 30 U.S.C. §§ 1201–1328.

Sec. 3 Background. Secretary's Order 3338 directs the Bureau of Land Management (BLM) to analyze and "consider potential leasing and management reforms to the current Federal coal program." Secretary's Order 3338 ordered the preparation of a discretionary Programmatic Environmental Impact Statement (PEIS) to analyze potential reforms and ordered a "pause on leasing, with limited exceptions" pending completion of the discretionary Federal Coal Program PEIS. The PEIS is estimated to cost many millions of dollars and would be completed no sooner than 2019, even with robust funding.

Sec. 4 Revocation of Secretary's Order 3338. Based upon the Department's review of Secretary's Order 3338, the scoping report for the discretionary Federal Coal Program PEIS issued in January 2017, and other information provided by BLM, I find that the public interest is not served by halting the Federal coal program for an extended time, nor is a PEIS required to consider potential improvements to the program. Accordingly, consistent with the principles of responsible public stewardship entrusted to this office, I revoke Secretary's Order 3338, "Discretionary Programmatic Environmental Impact Statement to Modernize the Federal Coal Program."

Sec. 5 **Implementation.** With the revocation of Secretary's Order 3338, BLM is directed to process coal lease applications and modifications expeditiously in accordance with regulations and guidance existing before the issuance of Secretary's Order 3338. All activities associated with the preparation of the Federal Coal Program PEIS shall cease. The Deputy Secretary, Assistant Secretaries, and heads of bureaus and offices are hereby directed to make changes in their policy and guidance documents that are consistent with the revocation of Secretary's Order 3338.

Sec. 6 **Effect of the Order.** This Order is intended to improve the internal management of the Department. This Order and any resulting reports or recommendations are not intended to, and do not, create any right or benefit, substantive or procedural, enforceable at law or equity by a party against the United States, its departments, agencies, instrumentalities or entities, its officers or employees, or any other person. To the extent there is any inconsistency between the provisions of this Order and any Federal laws or regulations, the laws or regulations will control.

Sec. 7 **Expiration Date.** This Order is effective immediately. It will remain in effect until it is amended, superseded, or revoked.

Secretary of the Interior

Date: MAR 29 2017

**INFORMATION/BRIEFING MEMORANDUM
FOR THE ASSISTANT SECRETARY – LAND AND MINERALS MANAGEMENT**

DATE: February 9, 2017
FROM: Kristin Bail, Acting Director, Bureau of Land Management (BLM)
SUBJECT: Input to Leadership on Five Promising Areas for Coal Leasing and Development, Production Trends, Leasing Information and Regulation/Administrative Challenges and Opportunities

The purpose of this memorandum is to provide an overview of the status of coal mining in the U.S. and the state of the coal mining industry. Specifically, the memorandum addresses the following questions: 1) What are the five areas in the U.S. where coal leasing and development is most promising? 2) How much coal mining is occurring in the U.S. and where is it occurring? 3) What are we doing in the way of regulatory activity and how is that impacting coal mining? 4) What coal companies are still in business? 5) How can we spur coal mining in the US?

BACKGROUND

The BLM's coal program was audited by both the Office of the Inspector General (OIG) and the Government Accountability Office (GAO) with reports published in 2013. A total of 21 recommendations were made by the audits covering topics of transparency, royalty rate reductions, inspection & enforcement and coal leasing & exports. All recommendations were corrected and both audits have been closed.

In 2016 at the direction of the then Secretary of the Interior through Secretarial Order (S.O.) 3338, the BLM began a Programmatic Environmental Impact Statement (PEIS) of the Federal coal program. The S.O. directed the BLM to address the topics of; 1) how, when and where to lease; 2) fair return; 3) climate impacts of coal production and combustion; 4) socio-economics; 5) exports; and 6) energy needs of the nation. Along with development of the PEIS, S.O. 3338 directed the BLM to stop issuing new Federal coal leases during this process, with limited exclusions and exceptions.

As of the end of Fiscal Year 2016 (FY16), the BLM managed over 306 coal leases in 11 states.

DISCUSSION

What are the five areas in the U.S. where coal leasing and development is most promising?

The BLM was asked to identify five areas within the United States where coal leasing and development are most promising, including, but not limited to, areas where leasing and operations are ongoing and reserves are located. The five areas that were identified to be the most promising for coal leasing and development, in order from greatest to least promise, include the Powder River Basin, Unita-Piceance Basin, Green River Basin, San Juan Basin, and areas of Oklahoma and North Dakota. Attachment 1 provides a detailed summary of each of these areas and Attachment 2 depicts Coal Fields within the lower 48 states.

How much coal mining is occurring in the U.S. and where is it occurring?

In Calendar Year 2015¹, the U.S. produced approximately 895 million tons of coal. Of that total, approximately 383 million tons were produced from Federal leases. Attachment 3 shows total and Federal production by state for 2015. Over 42 percent of all coal produced in the U.S. comes from Federal leases. The Powder River Basin (PRB) of Wyoming and Montana produces the greatest amount of coal, most of which is Federal. Other significant areas of Federal coal production include the Uinta-Piceance Basin, Green River Basin, and the San Juan Basin (Attachment 2). Outside of the PRB, most U.S. production comes from the Illinois Basin and the Central and Northern Appalachian Basins of Alabama, Illinois, Kentucky, Pennsylvania and West Virginia. The majority of these states' production is from private coal, though there is some limited Federal leasing and production in Alabama and Kentucky.

Total U.S. and Federal production has been in steep decline in recent years. Total U.S. production is down approximately 25 percent and Federal production is down approximately 37 percent from peak production in 2008 of 1,186 and 480 million tons, respectively.

What are we doing in the way of regulatory activity and how is that impacting coal mining?

Federal coal is leased in one of two ways. The first is the lease-by-application (LBA) process whereby an applicant applies to lease a specific tract of Federal coal, the lease for which ultimately is offered in a competitive lease sale. The second is the non-competitive lease modification application (LMA) process whereby an existing leaseholder may request that a tract of Federal coal be added to its lease if it meets certain regulatory requirements showing, among other things, that the tract would not be of competitive interest and would otherwise be permanently bypassed.

At the end of FY16, the BLM administered 306 coal leases. As of February 1, 2017, the BLM is processing 28 LBAs and 16 LMAs in six state offices (Attachment 4). As shown, seven of these leasing actions have been placed on hold by the applicant due to economics (four in Wyoming, two in Colorado and one in Montana).

Presently, the only regulatory actions being pursued by the BLM with respect to coal leasing are related to the S.O. 3338 and the PEIS. While no rule makings have been initiated from the PEIS at this time, the administrative pause on coal leasing directed by the Secretary while the PEIS is being prepared has effectively halted a number of leasing actions and the acceptance of new leasing applications (with very limited exceptions).

In addition to the PEIS and leasing pause, the results of recent audits by the OIG and the GAO required the BLM to coordinate with the Office of Valuation Services (OVS), in preparing the pre-lease sale estimate of the fair market value (FMV). The FMV is used to establish the minimum acceptable bid for which a lease may be sold, either competitively or through non-competitive lease modifications. The new process in place with OVS has added approximately six to eight months to the most recent sales.

¹ Data on coal production for the United States is collected by the Energy Information Administration and is reported in calendar years. Federal coal production is collected by the Office of Natural Resources Revenue and is reported in fiscal years.

Federal coal leasing in the PRB has the additional regulatory requirement of consulting with and deferring to the Regional Coal Team (RCT) with respect to whether an LBA should be processed in a public forum. The RCT is an independently-functioning advisory board of the BLM and is comprised of the BLM Wyoming (Chairman) and Montana State Directors, the BLM Wyoming Deputy State Director for Minerals and Lands, and the Governors of Wyoming and Montana. This additional regulatory requirement typically adds several months or more to the processing time for leasing.

What coal companies are still in business?

Currently, there are 34 companies with either existing Federal leases or applications pending with the BLM (Attachment 5). The top three coal mining companies, Peabody Energy (Peabody), Arch Coal (Arch), and Alpha Natural Resources (Alpha), all filed for Chapter 11 bankruptcy protection in 2015 or 2016. Arch and Alpha have both emerged from Chapter 11. Peabody is still in bankruptcy proceedings. Peabody, Arch and Alpha companies represent nearly half of all U.S. coal production.

How can we spur coal mining in the U.S.?

Federal coal leasing is demand-driven, and invigoration of Federal coal leasing depends to a large extent on the national coal markets for electrical generation, a factor beyond the control of the BLM. Some factors that are within the control of the Department of the Interior and identified as potential pathways to encourage leasing include:

1. Remove regulatory and administrative burdens and uncertainty through:

- a. Lifting the pause on coal leasing mandated by S.O. 3338

Lifting the pause would provide assurance that coal will be made available to lease in a timely manner after site-specific environmental analyses (environmental impact statements or environmental assessments) are completed.

- b. Re-evaluate the relationship and roles of the BLM and the OVS in the preparation of the pre-lease sale estimates of the FMV. This would include ways to streamline the process and ensure there are adequate resources to meet the intended objective.

- c. Streamline Mine Plan Decision Document (MPDD) Approval Process

After the BLM leases the coal, the lessee still needs to get approval to mine the coal from the Office of Surface Mining, Reclamation and Enforcement (OSMRE). Historically, the OSMRE (or the states with primacy) wait until after a lease is issued before moving forward with its review. This generally takes two years, in addition to the time it takes to issue a lease.

- d. Revisit the need for the PRB RCT

Consistent with input received during the scoping for the PEIS, it may be timely to revisit the need for the PRB RCT. Since notification to the Governors when leasing actions are undertaken is already a regulatory requirement, and both Governors are generally in favor of coal leasing,

the RCT meetings are generally redundant. Furthermore, the National Environmental Policy Act (NEPA) requires robust public involvement at various stages of the leasing process, so having a public meeting before work on processing an application has even begun does not provide the public much in terms of additional information.

2. Reduce the amount of time it takes from application to lease sale

While some of the above recommendations intended to decrease industry uncertainty will also reduce the amount of time needed to process a lease application, additional reductions could also be gained through:

- a. Streamlining the internal approval process to reduce delays associated with publication of the many required public notices in the Federal Register

There are five points in the leasing process (when an EIS is prepared) that generate a Federal Register Notice (FRN). Combined, the review time for these notices is approaching two years. Expediting and prioritizing these reviews, removing redundant layers of review, and establishing mandatory review time limitations could significantly reduce the time it takes from application to lease sale, providing industry more certainty in its long-term planning.

Similar review times occur for other coal-related actions, such as requests for concurrence on approvals of royalty rate reductions. Expediting reviews of these often critical decisions, that may determine the economics of the production of certain tracts of Federal coal, would likewise help remove some of the uncertainty felt by industry.

- b. Prioritizing and expediting site-specific NEPA analyses for lease and lease modification applications

Generally, the BLM does not have dedicated technical field staff that work only on processing coal leasing NEPA analyses. Most of the technical staff that is involved in the coal leasing NEPA process (e.g., wildlife specialists, natural resource specialists, archaeologists, etc.) is concurrently tasked with other important work, such as supporting grazing permit renewal, granting of rights-of-way, and resource management planning. Adding capacity at the field level to enable staff to be dedicated to coal leasing NEPA analyses could potentially cut a year or more off the time it takes to complete an EIS.

- c. Fund and perform national modeling of coal markets and regional air quality modeling to provide a baseline for site-specific NEPA analyses.

One of the significant factors that adds time to the NEPA process is the modeling that needs to be completed for socioeconomics and air quality assessments. Because coal leasing is performed under cost recovery, the BLM has not recently performed any regional models that could be used to support these NEPA documents. Having these models available to incorporate or tier to in site-specific NEPA analyses would likely be a significant time savings in the leasing process.

- d. Update policy and procedural handbooks.

While the BLM revised two key manuals and handbooks in the last several years (covering coal evaluation and inspection, enforcement, and production verification), the program is still working from some policies developed in the late 1980s. It can be difficult for new personnel or, in some cases, seasoned staff to know how they should proceed in any one particular aspect of the program.

NEXT STEPS

The intent of this memorandum is to provide information and next steps have not been identified at this time.

Attachments:

1. Five Promising Areas for Coal Leasing and Development
2. United States Total and Federal Coal Production by State in 2015
3. Coal Fields of the Lower 48 States
4. Summary of Pending Leasing Applications
5. Companies with Existing Federal Leases or Pending Federal Applications

Attachment 1: Five Promising Areas for Coal Leasing and Development

1. Powder River Basin (PRB) (Northeast Wyoming and Southeast Montana)

- 85% of Federal coal comes from reserves in this area.
- Most mine development in this area has occurred since 1975.
- Coal is sub-bituminous used primarily for electric power production.
- Supports 10 mines in Wyoming and 3 mines in Montana.
- Currently all low cost surface mining.
- Low production costs and considerable transportation infrastructure support continued production in this area and supply reaching electrical power plants across the United States.

2. Unita-Piceance Basin (East-Central Utah and Western Colorado)

- Long history of coal production.
- High quality bituminous coal that commands high prices and can sustain high production and transportation cost.
- Primarily used for electric power production but some may be chemically suitable for use in steelmaking.
- Almost all production from high cost underground mining.
- Locally important source of energy due to limited transportation infrastructure (i.e., typically not transported to the extent PRB coal is).

3. Green River Basin (Southwest Wyoming and Northwest Colorado)

- Long history of coal production.
- High quality bituminous coal, which demands higher prices and can sustain higher production and transportation cost.
- Almost all production from high cost underground mining.
- Locally important source of electric power production due to limited transportation infrastructure.

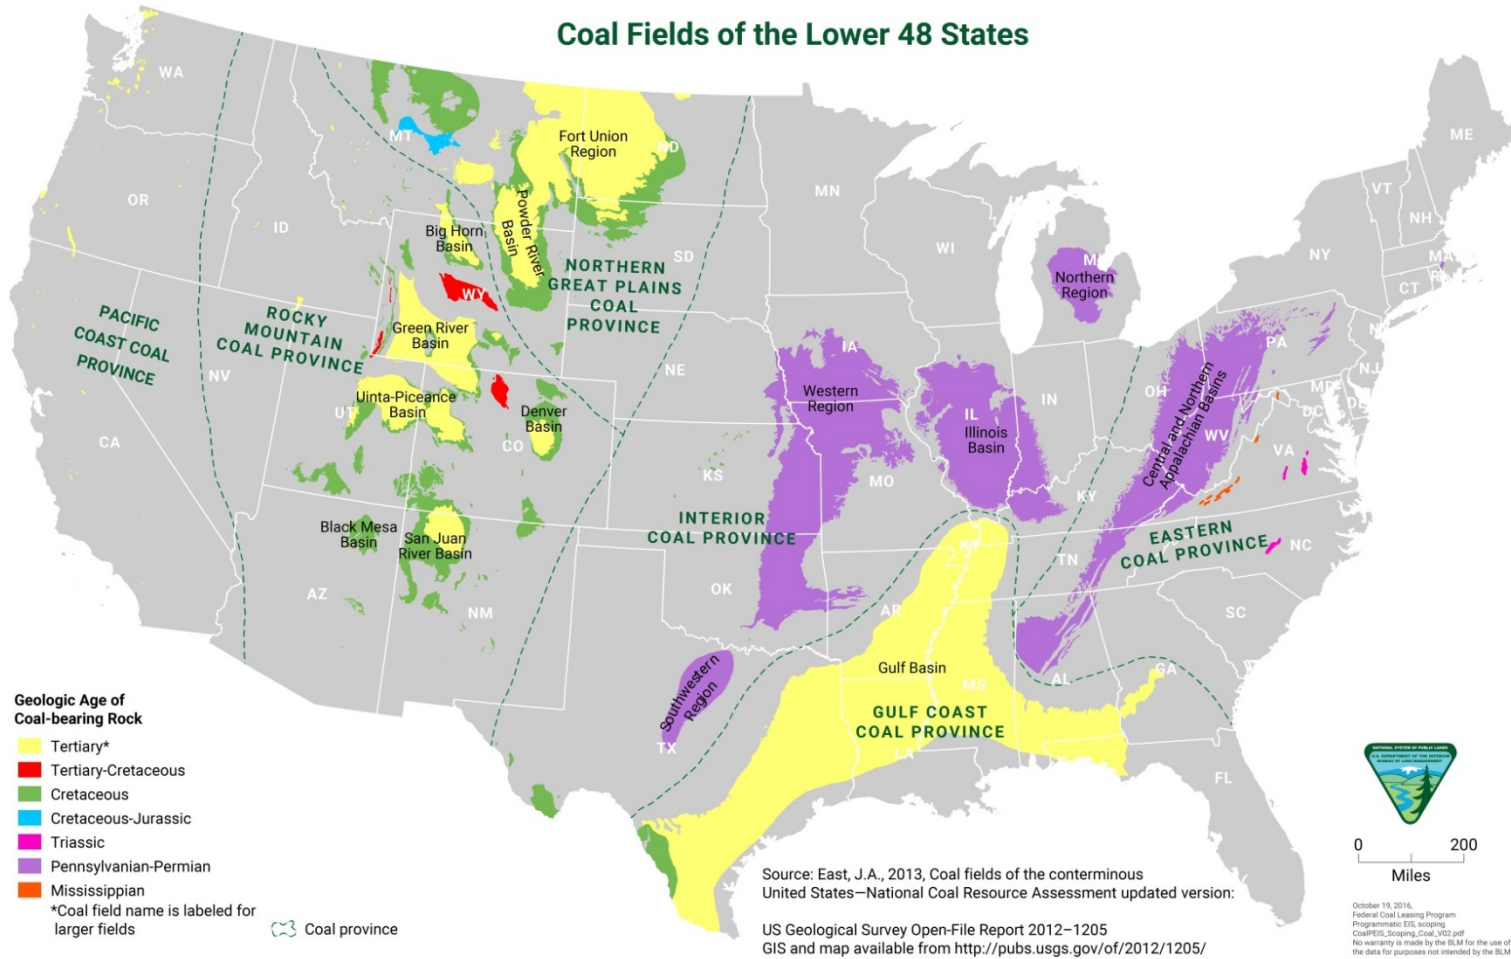

4. San Juan Basin (Northwest New Mexico and Southwest Colorado)

- Coal production primarily used for local electric power production.
- Mixture of surface and underground mining.
- Power plants in the area are under pressure to reduce or close.
- Poor infrastructure to move coal to other markets.

5. Other areas

- Other areas with lesser leasing potential include Oklahoma, North Dakota, and sporadic hold areas of Federal coal deposits and mines in the eastern United States.
- Typically development of Federal resources in these areas is dependent on development of adjoining non-Federal resources.

Attachment 2: Coal Fields of the Lower 48 States

Attachment 3: United States Total and Federal Coal Production by State in 2015 (Tons)

	Total	Federal	Fed % of Total
Alabama	13,191,000	36,210	0.27%

RECOMMENDATION MEMORANDUM
for the ASSISTANT SECRETARY – LAND AND MINERALS MANAGEMENT

DATE: March 28, 2017

FROM: Michael D. Nedd, Acting Director - Bureau of Land Management 

SUBJECT: Recommendation to Revoke Secretarial Order 3338, Ending the Programmatic Environmental Impact Statement and Lifting the Coal Leasing Moratorium

For the reasons outlined in this memorandum, the Bureau of Land Management (BLM) recommends that the Secretary revoke Secretarial Order 3338 (S.O. 3338), thereby discontinuing the Programmatic Environmental Impact Statement (PEIS) review of the Federal coal program and lifting the coal leasing moratorium.

I. Background

In January 2016, Secretary Sally Jewell issued S.O. 3338, directing the BLM to conduct a review of the Federal coal program through the preparation of a discretionary PEIS. The Order stated that while the precise issues to be addressed in the PEIS would be determined through the public scoping process, the PEIS was expected to address: how, when and where to lease; fair return; climate impacts of coal production and combustion; socio-economics; exports; and, the energy needs of the nation. See S.O. 3338, Discretionary Programmatic Environmental Impact Statement to Modernize the Federal Coal Program, Sec. 4 (Jan. 15, 2016) [hereinafter "S.O. 3338"]. In addition, based on Secretary Jewell's discretionary authority to lease coal¹ and her interest in ensuring that future leasing decisions would benefit from the recommendations that result from the PEIS, she directed the BLM to stop issuing new Federal coal leases during the review, with limited exclusions and exceptions.

Through the public scoping process, the BLM received input from approximately 500 speakers at six public scoping meetings and 214,866 written comments, resulting in a total of 1,118 unique submissions. See BUREAU OF LAND MGMT., FEDERAL COAL PROGRAM PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT - SCOPING REPORT, vol. 1, 4-3 (Jan. 11, 2017)[hereinafter "Scoping Report"]. In addition, external groups held three separate workshops on topics related to the PEIS (The Institute for Policy Integrity at the New York University School of Law, *Fair*

¹ Mineral Leasing Act (MLA), 30 U.S.C. § 201(a)(1).

Market Value [FMV] and Alternatives Analysis; Denver University Sturm School of Law, The Wilderness Society and Western Organization of Resource Councils, *Federal Coal Workshop: Leasing and Planning in the Public's Interest*; and Columbia Law School Sabin Center for Climate Change Law, *U.S. Coal in the 21st Century: Markets, Bankruptcy, Finance and Law*). The external groups submitted articles and studies presented during these workshops to the BLM as comments during the scoping process.

The BLM reviewed the input received through this scoping process and prepared a Scoping Report, which was released on January 11, 2017. The Scoping Report advised that modification of the Federal coal program was warranted, and the PEIS should focus on four main areas: Fair Return; Climate Change; Resources Management and Protection; and Program Administration.² See Scoping Report ES-4 - ES-5, 6-1.

A careful review of the Scoping Report shows that a PEIS is not needed to analyze and recommend any potential reforms in the four identified main areas. These topics have been or continue to be addressed through BLM's program review outside of the PEIS process, and completion of the PEIS is not necessary to implement any reforms that the BLM may determine to be appropriate. Each of the four main areas of focus identified in the Scoping Report is addressed below. Without the need for a PEIS process to identify, consider, and carry out any necessary reforms of BLM's coal leasing program and for various other reasons described below, the BLM has determined that a coal leasing moratorium is unnecessary and should be lifted.

II. The Discretionary PEIS is Unnecessary and Should be Discontinued

As stated above, the PEIS is unnecessary and should be discontinued for the following reasons: (1) an environmental impact analysis, which is normally conducted to comply with requirements of the National Environmental Policy Act (NEPA), is neither the best vehicle nor the appropriate vehicle to analyze the need for and potentially recommend reforms to BLM's coal leasing authorities and program, including the four areas of focus outlined in the Scoping Report; (2) all four of the identified areas of focus have been or are continuing to be addressed through BLM's review processes outside of the PEIS process; and, (3) the PEIS process cannot be completed within the allotted timeframe, which began in January 2016 and was to be completed by January 2019.

² The Scoping Report states that there are "three general areas" that need additional analysis and modernization, but then proceeds to discuss four areas throughout the Report. When it refers to three areas it treats climate change and resource protection and management as one area. See Scoping Report ES-4, 6-2. This memorandum will discuss the four areas separately.

A. The Discretionary PEIS is Not Needed to Review the Four Main Areas Identified by the Scoping Report Because These Topics Have Been or Continue to be Addressed through BLM Review Outside of the PEIS, and the PEIS is not Necessary to Implement Any Needed Reforms.

For each of the four main areas identified by the Scoping Report, this memorandum shows why the PEIS is unnecessary by detailing the BLM reviews that have taken place or are continuing to take place outside of the PEIS, the reforms the BLM has already put in place to address concerns raised by the U.S. Department of the Interior Office of Inspector General (OIG), the U.S. Government Accountability Office (GAO), Congress, stakeholders, or the public, and the ways that BLM can review and potentially recommend reforms to the Program outside the PEIS in the near future, if determined to be necessary.

1. “Fair Return”

A central objective identified through the PEIS scoping process is to analyze and recommend reforms to the level of return that the Federal coal program provides to the American public. *See* Scoping Report 6-7. Return is the monetary revenue generated by the leasing (bonus bids) and production (royalties) of federal coal, as well as the rentals generated from the use of the federal surface. Since 2007, Federal coal leasing and production has generated approximately \$10.68 billion in revenue from bonus bids, royalties and rental payments. These payments are split approximately equally with the Federal Treasury and the states in which the coal was mined. Although the term “fair return” has no true definition in statute or regulation, and, based on the comments received during the scoping period, has different meanings to different people, the Scoping Report describes “fair return” to include the following components: bonus bids set by FMV determinations, royalty rates, rental rates, and performance bonding amounts.³ *See* Scoping Report ES-6, 4-22 - 4-23, 6-7 - 6-13. Some of the comments received during the scoping process suggested that accounting for certain economic “externalities” associated with the combustion of coal through, for example, the incorporation of a so-called “carbon adder” to the royalty rate charged for federal coal production would better provide the public with “fair return.” A PEIS is not needed to address these issues. As discussed below, the BLM has already addressed a number of these issues in response to OIG and GAO recommendations, and to the extent necessary or desired, remaining issues surrounding “fair return” can be assessed through separate, more targeted processes.

³ Although the Scoping Report identified performance bonding as a component of “fair return,” performance bonding is not part of the fair market value determination of a coal tract. The purpose of performance bonds are to assure that operators fulfill their obligations, and are not an additional source of revenue for the United States.

One of the processes outside the PEIS process that has led to effective reforms of BLM's coal leasing program is the review conducted by the OIG and GAO and their recommendations to BLM. In 2013, the OIG and GAO audited the BLM coal program. The report analyzed each of the Scoping Report's "fair return" components, except for performance bonding. The OIG and GAO published audit reports with a total of 21 recommendations. Eight of the recommendations focused on BLM's determination of FMV for coal tracts applied for under the leasing regulations, and four recommendations focused on BLM coordination with the Department of the Interior Office of Valuation Services (OVS) to review the FMV determinations. See U.S. Dep't of the Interior, Office of Inspector Gen., *Evaluation Report - Coal Management Program*, Report No. CR-EV-BLM-0001-2012 (June 2013); U.S. Gov't Accountability Office, *Coal Leasing: BLM Could Enhance Appraisal Process, More Explicitly Consider Coal Exports, and Provide More Public Information*, Rep. No. 14-140 (Dec. 2013). The BLM addressed all of the audit recommendations, including the FMV recommendations, through development of new protocols and issuance of policy guidance, a manual (BLM Manual MS-3073), and a handbook (BLM Handbook H-3073-1). See Memorandum from Douglas Glenn, Director, Office of Financial Management, to Jeff Carlson, Director, Energy Audit Unit on Verification Review - Recommendations for the Report titled "Coal Management Program, U.S. Department of the Interior (January 22, 2016) (acknowledging that all 13 OIG recommendations have been resolved and implemented); U.S. Government Accountability Office, *Coal Leasing: BLM Could Enhance Appraisal Process, More Explicitly Consider Coal Exports, and Provide more Public Information*⁴ (containing a list on the GAO website of all of the GAO recommendations that are considered to be closed and implemented).

The changes that the BLM implemented in response to the OIG and GAO recommendations already address the Scoping Report's "fair return" components, and ensure, among other things, that (1) the BLM is receiving at least the estimated FMV for all accepted coal bids,⁵ (2) fair market valuation reports reflect trends in the market and account for the current state of export activity, (3) FMV fully accounts for export potential, and (4) the public is given access to non-sensitive, non-proprietary coal lease sale FMV-related documents.⁶

⁴ See http://www.gao.gov/products/GAO-14-140#summary_recommend (last visited March 1, 2017).

⁵ See BLM Handbook H-3073-1. To ensure that accepted bids comply with the Mineral Leasing Act by meeting or exceeding the BLM's estimate of FMV, the BLM updated the BLM Handbook to require that the Sale Panel, which generally includes the Deputy State Director for Mineral Resources, a minerals appraiser or economist, geologist, and mining engineer, develop a post-sale report that documents all of the factors that were considered by the Sale Panel in its decision to recommend that the bid be accepted or rejected. Also, as part of its analysis, the Sale Panel may review the procedures used in developing the pre-sale analysis and may request reconsideration of the pre-sale analysis, if the property value appears unreasonably derived, unsound, or inadequately explained. *Id.*

⁶ On September 26, 2014, the BLM issued IM 2014-159 entitled, "Publicly Accessible Bureau of Land Management

In reviewing the bonus bids, royalty rates, and rental rates, the GAO and OIG noted only one deficiency, and it was with the bonus bid process. Both reports recommended changes to the minimum acceptable bid determination process through the valuation/appraisal. As a result, BLM revised the necessary BLM Handbook to implement the recommended changes. Neither the GAO nor OIG concluded that the royalty rates, rental rates, or other aspects of the bonus bid were deficient. For instance, neither the GAO nor OIG recommended that the royalty rates or rental rates were too low.

However, to the extent further analysis is determined to be desirable to ensure that fair return is accomplished, these components can be addressed through BLM's discretionary authority to perform program reviews and therefore do not require a PEIS process. To accomplish such a task, a team of BLM experts could work with OVS to analyze royalty rates, rental rates, and bonus bids and make recommendations for any reforms that may be helpful in ensuring that these three revenue streams provide the public a "fair return" for the leasing and production of federal coal. Such an approach would provide analysis based on actual production and could give the BLM the means to put forth potential recommendations per region, whereas the PEIS would analyze national production estimates and be better suited to provide national recommendations. Furthermore, the Department is currently considering reinstating the Royalty Policy Committee (RPC).⁷ The RPC would provide advice to the Secretary on the fair market value of, and on the collection of revenues derived from, the development of energy and mineral resources on Federal and Indian lands.

In addition, in the Scoping Report, BLM proposed to analyze and potentially recommend reforms that would increase royalty rates, rental rates, or bid bonuses to account for carbon-based externalities.⁸ As with the other aspects of "fair return," this suggestion would not require a PEIS to inform BLM's decision making. Moreover, after further consideration of the information gathered and analyzed for the Scoping Report, the BLM believes that the leasing

Websites for Coal Leasing Information," requiring the BLM State Offices to post on their public websites certain public documents related to past and pending coal leasing actions (e.g., NEPA documents, sale information, etc.).

⁷ The RPC was established by charter in 1995 under the Federal Advisory Committee Act. The Committee advised the Secretary of the Interior through the Director of the then-Minerals Management Service about the management of Federal and Indian mineral leases and revenues under the laws governing the Department of the Interior. The RPC was tasked with reviewing and providing comment on revenue management and other mineral and energy-related policies, and providing a forum to convey views representative of mineral lessees, operators, revenue payors, revenue recipients, governmental agencies, and public interest groups. The RPC was terminated on April 2, 2014.

⁸ The phrase "carbon-based externalities" was coined by economists/social scientists in recent years to describe the upstream and/or downstream impacts of the coal life cycle. See, e.g. Paul R. Epstein et al., *Full accounting of the life cycle of coal*, 1219 Ann. N.Y. Acad. Sci. 73-98 (2011).

stage is not the appropriate place to analyze such externalities. The BLM's consideration of carbon-based externalities associated with coal production would need to rely primarily on estimates for carbon dioxide (CO₂) emitted from combustion. There are many uncertainties surrounding such estimates because the emissions vary based on location, source, and combustion technology, and any capture and sequestration of CO₂. For the most accurate accounting for externalities associated with coal combustion, CO₂ emissions should be measured at the source of downstream combustion. Also, these types of externality costs are not ordinarily encompassed within the concept of "return." Rather, as previously stated, "return" is the monetary revenue generated by the leasing and production of federal coal, as well as the rentals generated from the use of the federal surface. Carbon-based externalities are not generated from leasing or production, and there is no statutory indication that Congress intended to consider them when directing the Secretary to ensure a fair return. See 30 U.S.C. §§ 201(a)(1), 207(a).

2. Climate Change

Another central objective identified through the PEIS scoping process is to analyze the effect of the Federal coal program on and alignments with the U.S. climate goals. See Scoping Report 6-13. Currently, the environmental analysis conducted to comply with NEPA for individual leasing actions appropriately analyzes impacts on climate change as required by existing guidance and judicial decisions. In the environmental analysis for each Lease-by-Application (LBA) and lease modification application (LMA), BLM's current practice is to analyze the impacts of the leasing decision on climate change, including the cumulative impacts of the leasing decision associated with Greenhouse Gas (GHG) emissions related to coal mining, transport, and subsequent combustion. Many of the recent NEPA documents have been challenged in federal court. With the exception of the recent West Elk II decision,⁹ federal courts have upheld the NEPA analysis for each of BLM's coal leasing decisions.¹⁰ The BLM will continue to look at climate impacts in its NEPA analysis on a project basis as required by law and policy. The PEIS analysis on climate change would be largely duplicative and unnecessary,

⁹ The West Elk II case is easily distinguishable from the other cases that called into question the adequacy of the agency's NEPA analysis. In West Elk II, the agency used the social cost of carbon protocol in the draft EIS to quantify the project's contribution to costs and benefits associated with global climate change, but then omitted any mention of this tool in the final EIS and omitted a discussion of the costs of the project, while retaining a quantified projection of the benefits associated with the project. See *High Country Conserv'n Advocates v. U.S. Forest Serv.*, 2014 WL 2922751, *9 (D. Colo. June 27, 2014). The court held that the agency's behavior was arbitrary and capricious because it quantified the benefits but claimed that it was impossible to quantify the costs, "when such an analysis was in fact possible" and was included in the draft EIS. *Id.* at *10.

¹⁰ E.g. *Northern Plains Res. Council Inc. v. Bureau of Land Mgmt.*, 2016 U.S. Dist. LEXIS 43947 (D. Mon. 2016); *WildEarth Guardians v. U.S. Forest Serv.*, 2015 U.S. Dist. LEXIS 109690 (D. Wyo. 2015); *WildEarth Guardians v. Salazar*, 2012 U.S. DisL LEXIS 105331 (D.D.C., 2012); *WildEarth Guardians v. Salazar*, 859 F. Supp. 2d 83 (D.D.C 2012).

and would not provide significant additional useful information to the decision maker or the public.

The Scoping Report also discusses potential reforms to mitigate GHG emissions, such as CO₂ and methane. But a PEIS is not needed to consider whether reforms are needed to address these matters.¹¹ For example, with respect to methane, the Scoping Report states that the BLM will consider methods for improving capture of methane from coal production activities. After the Scoping Report was released, the BLM addressed this recommendation by issuing guidance that establishes national procedures to encourage waste mine methane (WMM) capture by the coal lessee in cases where the oil and gas estate is not currently under lease and it would be feasible to do so. The guidance also describes several voluntary best management practices that BLM offices may use to encourage operators to help improve capture of WMM. If necessary, this guidance could be amended based on later program reviews.

Lastly, the Scoping Report states that BLM will consider adopting requirements for the use of compensatory mitigation to offset GHG emissions and climate change impacts associated with Federal coal production and combustion. To be clear, the BLM has not concluded that such mitigation is appropriate or lawful. And in any event a nationwide-scoped PEIS is not needed to make mitigation decisions, which can be made on a lease-by-lease or regional basis.

3. Resource Protection and Management

Although not labeled as central, another objective identified through the PEIS scoping process was to consider options aimed at improving resource protection and management, beyond climate considerations. *See* Scoping Report 6-20 - 6-24. Specifically, the Scoping Report states that this focus area includes developing best management practices for resource protection and improving planning to avoid land use conflicts through the modification and application of unsuitability criteria or through the development of strategic coal leasing plans. This focus area also includes working with the Office of Surface Mining Reclamation and Enforcement (OSMRE) to strengthen requirements for companies bidding on leases, such as prohibiting leasing to self-bonded companies and verifying that applicant companies have been fulfilling reclamation obligations in connection with their other operations. *See* Scoping Report ES-6. However, based on the information gathered and analyzed for the Scoping Report, the BLM believes that such resource protection and management topics are not appropriate to analyze in a

¹¹ As stated earlier, the BLM does not believe the leasing stage is the appropriate place to analyze and attempt to mitigate carbon-based externalities. Any potential impacts and appropriate mitigation can be accurately determined only at a later stage when the coal is actually combusted.

national PEIS, but instead have been and should continue to be addressed through program reviews outside of the PEIS.

The Scoping Report states that, because of concerns expressed by commenters, it will analyze the BLM's process for applying the unsuitability criteria to ensure that the criteria are applied consistently at the land use plan level. During land use planning, the BLM reviews federal lands and assesses whether there are areas unsuitable for all coal mining or for certain stipulated methods of coal mining. Such unsuitability review is reported in detail in the Resource Management Plan NEPA analysis, which generally consists of a report that addresses the 20 criteria of coal unsuitability as defined in 43 CFR 3461.5 and applies these criteria to the known recoverable coal resources areas for the applicable coal fields. Additionally, the BLM regulations at 43 CFR 3461.3-1 allow for application of the unsuitability criteria at both the land use planning and lease specific stages. The BLM's current practice is to take a second look at the area under consideration once a lease application is submitted to determine if any of the unsuitability criteria are triggered based on site-specific information. As this is already ongoing practice, ensuring that this review is completed consistently at both stages can be accomplished without further analysis in a PEIS.

If BLM determines that further analysis is needed on its application of the unsuitability criteria at the land use plan level, the analysis would appropriately be conducted through reviews that have the ability to focus on specific BLM office practices.

The public scoping process has provided the BLM with significant analysis on each of the listed resource protection and management topics. If further analysis is determined to be necessary before BLM can make any needed reforms, this analysis should be addressed through program reviews outside of a PEIS process. To accomplish such a task, a team of BLM and OSMRE experts can work together to analyze each identified area and make recommendations for any reforms that are necessary to avoid, minimize, or mitigate impacts on resources of concern. The BLM and OSMRE could also engage other Federal agencies, and partners in State, local, or tribal governments in the region.

In addition, the resource protection and management topics identified for analysis all pertain to voluntary best management practices, and if reform is determined to be appropriate, it may be implemented through guidance documents outside of the rulemaking process.

4. Program Administration

The last central objective identified through the PEIS scoping process was to analyze and recommend reforms intended to improve the lease process itself. *See* Scoping Report 6-24 - 6-26. Specifically, the Scoping Report stated that the PEIS would analyze and recommend reforms to enable the BLM to work with other agencies to evaluate means for eliminating redundant processes, improve transparency, standardize lease application forms, and develop an electronic platform for application submissions. *See* Scoping Report ES-6, 6-24- 6-26. Based on an assessment of the information gathered and analyzed for the Scoping Report, the BLM believes that such Program Administration areas do not need to be analyzed in a national PEIS. Many of the Program Administration areas have been or continue to be addressed through program review outside of the PEIS, and outstanding areas of concern should be analyzed and developed as part of regional mitigation strategies.

In response to concerns raised by the Department, other Federal agencies, stakeholders, and the public, the BLM is currently analyzing and reforming the Federal coal program outside of the PEIS to ensure that there is increased transparency and improved lease processing efficiency. The previously mentioned 2013 OIG and GAO audits also analyzed components of the leasing process. Of the 21 recommendations included in the OIG and GAO published audit report, 13 of them focused on coal leasing and exports in general, with five on inspection and enforcement, two on transparency to the public, and one on royalty rate reductions. The BLM addressed all of the audit recommendations, including the lease process recommendations, through development of new protocols and issuance of policy guidance, a manual (BLM Manual MS-3073), and a handbook (BLM Handbook H-3073-1).

The Scoping Report states that analysis and potential reforms to improve transparency associated with the Federal coal program may be necessary; however, BLM has now addressed those transparency and public accessibility concerns. Previously, in response to a GAO recommendation to improve transparency associated with the Federal coal program, on September 30, 2014, the BLM issued guidance requiring BLM to maintain on their websites accurate information on past coal lease sales, a national summary of coal lease sales, and information on pending lease sales. In January 2017 BLM enhanced this guidance, directing the BLM Washington and State offices to post on their websites links to up-to-date information regarding existing leases and pending coal lease applications, lease modification applications, exploration licenses and royalty rate reductions. Accordingly, the BLM has put guidance in place to improve transparency associated with the Federal coal leasing process, and if future modification of the guidance is necessary, it can and should happen outside the PEIS process.

In response to public and Congressional concern regarding the process for disposal by exchange

for split estate tracts, the BLM conducted a review of the process outside of the PEIS and issued guidance that provides the BLM authorized officer guidance on selecting a Federal coal tract for disposal through fee coal exchange as provided in 43 CFR Subpart 3436. This includes guidance on the information and consent that is necessary from a surface owner to determine if a split estate tract should be selected for exchange in those instances where a proponent is found to be qualified for a fee coal exchange per 43 CFR 3436.2-1 and has identified a split estate tract they would like to receive in exchange for their private coal interest. If future modification of the guidance is necessary, it can and should happen outside the PEIS process.

The rest of the Program Administration areas identified in the Scoping Report would more appropriately be analyzed and potentially reformed outside of the PEIS, and the Department has already taken steps to make this happen. The PEIS scoping process has provided the BLM with an informal review of the entire program and identified areas within the leasing process that may need improvements. A team of BLM and OSMRE experts has been convened to analyze the current Federal coal leasing program and determine if, and where, improvements are necessary to ensure that the leasing process is efficient and rid of redundancies. Any and all improvements that are determined to be necessary can and will be implemented outside of the PEIS process, as such, the PEIS is not necessary for implementation of these potential reforms.

B. The PEIS is Behind Schedule and Cannot be Completed within the Allotted Timeframe.

The Scoping Report lays out the following milestones for the PEIS:

Milestone	Proposed Date
Scoping Report	January 2017
Draft PEIS	January 2018
Public Comment Period	January – March 2018
Final PEIS	January 2019
Record of Decision	March 2019

This aggressive schedule was developed based on Secretary Jewell’s recommendation that the PEIS be completed in three years. However, it is highly unlikely that the PEIS could have been

completed in the allotted timeframe because the process is already roughly one year behind schedule, and, to this point, only the scoping meetings and preparation of the Scoping Report have been funded. The BLM has developed a statement of work for the Department of Energy (DoE) and the National Renewable Energy Laboratory to develop coal market modeling to support the PEIS and supplement future leasing actions. Potential funding for this effort was initially identified by DoE (\$1.5 million), but has not been secured. It is unclear if the DoE funding will be made available in the near future.

The BLM's estimate for the cost of the entire PEIS is approximately \$12 million. About \$4.5 million was requested in the Fiscal Year (FY) 2017 President's Budget for the PEIS; however, Congress did not allocate funding for the PEIS in the FY 2017 budget. In addition, BLM's entire annual coal budget is \$10 million, which is insufficient to fund both its Coal Management program and completion of the PEIS in the next two years.

Because of lack of funding, BLM cannot proceed with the PEIS.

II. The Coal Leasing Moratorium is Unnecessary and Should be Lifted.

The coal leasing moratorium directed by Secretary Jewell has effectively stopped, with limited exceptions, the BLM from making leasing decisions on pending applications and from accepting new applications. However, the leasing moratorium is unnecessary and should be lifted for several reasons: (A) if the PEIS is discontinued, which the BLM believes is necessary as explained above, the moratorium is unnecessary; (B) the economic hardships it is placing on currently producing and future coal operations are considerable, as described more fully below ; (C) other Departmental resource programs have successfully had programmatic reviews without instituting a leasing moratorium; and (D) the GAO and OIG audit reports did not recommend a leasing moratorium while the BLM implemented recommended changes to the Program.

In addition, lifting the coal leasing moratorium would provide assurance that coal will be made available to lease in a timely manner after site-specific environmental analyses (EISs or Environmental Assessments) are completed.

A. The Leasing Moratorium is Unnecessary if the PEIS is Discontinued.

Section 5 of S.O. 3338 states that a pause on leasing, with limited exceptions, will allow future leasing decisions to benefit from the recommendations that result from the PEIS while minimizing any economic hardship during the review. If the PEIS is discontinued, the reason for

creating the moratorium will be gone. Nor is a moratorium needed to make prospective changes to the coal program should additional reforms be deemed useful.

Furthermore, S.O. 3338 presumes a minimal economic hardship, predicated on the extensive recoverable reserves of Federal coal currently under lease. S.O. 3338 notes that the Federal coal reserves currently under lease are estimated to be sufficient to continue production from Federal leases at current levels for 20 years. *See* S.O. 3338, Section 2(a), 5. However, during the scoping period and preparation of the Scoping Report, this 20-year reserve figure was questioned by BLM engineers and the public as being an overly simplistic estimate that does not take into consideration the circumstances of individual mines or leases. The figure represents the sum of the estimated recoverable reserves from all federal leases across the U.S. divided by the annual federal coal production from 2015. *See* Scoping Report 5-14- 5-15. In 2015, federal coal production was at a record low, and the top three mining companies were on the verge of declaring Chapter 11 bankruptcy, and ultimately did the following year. Thus, the gross nature of the data used to determine this average does not accurately project the needs of the coal industry, which has a large number of mines with dwindling reserves. This reality is reflected in the fact that since the moratorium was instituted, a total of seven mines¹² have requested that the BLM continue processing their applications under the S.O. 3338 Sec. 6(a) emergency leasing exclusion. Four of these requests have been verified to meet the criteria for emergency leasing at 43 CFR 3425.1-4 and have continued to be processed as excluded from the moratorium. Three are still under review. In general these mines have requested the emergency exclusion because they are reaching the end of their mineable reserves, the leasing process takes years, and if they reach the end of their mineable reserves with no certainty of future leasing, the mines may face closure.

If S.O. 3338 stays in place, thereby allowing the PEIS and the moratorium to continue, BLM expects that it will receive additional requests for exclusion from the moratorium under the emergency leasing provision. This is especially true as industry becomes aware that the PEIS is behind schedule and cannot be completed within the originally allotted three year timeframe.

B. The Economic Hardships the Moratorium is Placing on Currently Producing and Future Coal Operations are Considerable.

Although Secretary Jewell believed that the public and the coal program would benefit from

¹² The following operators have requested exclusion from the leasing moratorium under the emergency leasing exclusion: BNI Coal, Ltd. (North Dakota), GCC Energy (Colorado), Alton Coal Development (Utah), Falkirk Mining Company (North Dakota), Black Butte Coal Company (Wyoming), Peabody Energy (Wyoming), and Georgea Colliers Inc. (Oklahoma).

imposing the leasing moratorium to ensure that future leasing decisions benefit from the recommendations that result from the PEIS, that benefit is outweighed by the economic hardship placed on the industry.

When the moratorium on leasing began in January 2016, there were 44 lease and lease modification applications pending with the BLM. Of those, only 14 have been exempt or excluded from the moratorium under S.O. 3338, Section 6. The remaining 30 applications are subject to the moratorium. Pursuant to S.O. 3338, Section 5(a)(ii), the NEPA analysis on some of the applications have continued, but no leasing decisions can be made until the moratorium is lifted. The lease-by-applications and lease modification applications subject to the moratorium contain over 1.8 billion tons¹³ of Federal coal that would potentially be produced from 28 mines across the states of Alabama, Arkansas, Colorado, Kentucky, Montana, North Dakota, Oklahoma, Utah and Wyoming, including some of the largest mines in the Western states. While employment data for each individual mine is not immediately available, combined these coal mines employed 25,348 direct staff at the end of 2015. See Energy Information Administration, *Table 6. Coal Production and Numbers of Mines by State and Coal Rank, 2015*, <http://www.eia.gov/coal/annual/pdf/table6.pdf> (last visited March 1, 2017).

When S.O. 3338 was issued, the BLM believed that most of the existing applications that did not fit within a specific exclusion to the moratorium would ultimately not be affected by the leasing moratorium because the NEPA analysis would continue under S.O. 3338, Section 5(a)(ii), and it was unlikely that the BLM would finalize the various NEPA documents before the PEIS January 2019 completion date. However, that is no longer true. Because the PEIS is already roughly one year behind schedule, a greater number of leases are likely to be affected. In addition, during the leasing moratorium the processing of new applications that do not fit within an exclusion have been deferred. The number of new applications affected by this deferment would continue to rise if the PEIS process was to continue and the timeline for the PEIS lengthened.

The applicants are feeling the economic hardship of the leasing moratorium. For example, due to BLM's cost recovery provisions for coal, the applicants are paying for NEPA analysis that may become outdated before any PEIS is completed and that analysis would then likely need to be supplemented after the PEIS is completed, if the PEIS process were to continue. For the applicants that fall under the moratorium, competitive sales and, ultimately, production of the coal are being delayed by the PEIS process. Such applicants may even need to modify mining

¹³ This is a conservative estimate of the tonnages associated with these applications. Four of the applications at the time of the moratorium had unknown quantities of coal and it would require further analysis and/or exploration to estimate the reserves.

plans to ensure that operations continue to meet required levels of production.

C. Other Departmental Resources have Successfully Had Programmatic Reviews Without Instituting Leasing Moratoriums.

The BLM continually assesses its various resource programs to look for ways to improve them and does so without instituting any leasing moratoriums. For example, the BLM recently completed a review of its oil and gas program, and the BLM did not institute a leasing moratorium during the review. In response to OIG and GAO audits and published reports with recommendations, as well as a review by the Secretary's Subcommittee on Royalty Management, the BLM completed five rulemaking efforts related to the federal oil and gas program. During the BLM's reviews and rulemakings, the BLM continued to issue oil and gas leases.

D. The OIG and GAO Audit Reports Did Not Recommend a Moratorium on Leasing While BLM Implemented their Recommended Changes to the Coal Program.

As previously stated, the 2013 GAO and OIG audits of the Federal coal program resulted in 21 total recommendations covering the following four categories: Coal Leasing & Exports, Inspection & Enforcement, Royalty Rate Reductions, and Transparency. While many of these recommendations requested that the BLM make major modifications to the administration of the BLM coal program, none of the recommendations called for a moratorium on the issuance of new coal leases while BLM implemented the requested changes. The BLM was able to address all 21 recommendations and the audits were closed out while the coal program continued to issue new leases and undergo review. See U.S. Dep't of the Interior, Office of Inspector Gen., *Evaluation Report - Coal Management Program*, Report No. CR-EV-BLM-0001-2012 (June 2013); U.S. Gov't Accountability Office, *Coal Leasing: BLM Could Enhance Appraisal Process, More Explicitly Consider Coal Exports, and Provide More Public Information*, Rep. No. 14-140 (Dec. 2013).

III. Conclusion

For the aforementioned reasons, the BLM recommends that the Secretary revoke S.O. 3338, thereby discontinuing the PEIS and lifting the coal leasing moratorium.

Status of Currently Pending Lease and Lease Modification Applications as of February 28, 2017

Table 1. Projects Potentially Covered by One of the Pause Exceptions

State	Mine	Application Type (Serial No.)	Acres	Tons (Millions)	Status
AL	Narley Mine No. 3	LBA (ALES55199)	160	0.67 M	Lease by application (LBA) decision record (DR) signed Feb. 2015. An unsuccessful lease sale was held Apr. 14, 2016. A lease sale reoffer Federal Register Notice is being prepared.
CO	Foidel Creek	LMA (COC54608)	310	0.34 M	DR signed Dec. 2015. Lease Modification Application (LMA) was issued effective April 1, 2016. In response to an IBLA case remand, a new DR was issued December 21, 2016.
CO	Colowyo	LMA (COC123475)	28	0	LMA less than 160 acres. DR signed June 30, 2016. Lease modification was issued effective October 1, 2016.
CO	West Elk	LMAs (COC1362 & COC67232)	800 & 921	10.1 M	LMA's DR signed 2014. OMB determined USFS Colorado Roadless Rule (CRR) is a significant rulemaking and will require more time to process. The CRR NOA final SEIS was published in the FR November 17, 2016. The FS ROD and CRR Final Rule were published in the FR on December 19, 2016. The reinstatement of the CRR becomes effective mid-February 2017.
OH	Buckingham Coal	LBA (OHES57390)	432	1.420 M	Environmental assessment (EA) finalized Sept. 2013. U.S. Forest Service DR was signed September 12, 2013. LBA sale proposed mid-2017.
ND	Falkirk Mine	LBA (NDM107039)	320	3.4 M	Potential bypass situation.* In February 2016, the applicant provided written notice requesting BLM to continue processing the LBA. In July 2016, MT SO determined that the LBA met the S.O. 3338 Section 6a., emergency leasing criteria, to allow the processing of the LBA to a leasing decision. WO concurred on November 11, 2016. The EA is being prepared.
ND	Center Mine	LBA (NDM102083)	160	2.43 M	Potential bypass situation.* On February 23, 2016, BNI notified BLM that their LBA was submitted under the Emergency Leasing provisions of 43 CFR 3425.1-4. BLM determined that the LBA met Emergency Leasing Sec. 6(a) criteria of S.O. 3338. WO concurrence provided 7-12-16. The NEPA document is being prepared.
MT	Rosebud	LMA (MTM080697)	160	5.9 M	LMA less than 160 acres. The LMA's EA thirty-day public scoping period started on October 31, 2016 and ended on November 29, 2016. EA analysis underway.
UT	Sufco Mine	LBA (UTU84102)	6,175	56.6 M	Greens Hollow Final Supplemental Environmental Impact Statement (SEIS) issued Feb. 2015. U.S. Forest Service ROD signed Oct. 2015. A successful LBA sale was held

State	Mine	Application Type (Serial No.)	Acres	Tons (Millions)	Status
					January 4, 2017.
WY	Bridger	LMA (WYW154595)	120	0.74 M	DR signed Dec. 29, 2015. On August 26, 2016, the Interior Board of Land Appeals (IBLA) issued an Order to set aside and remand this DR because of its signing by an improper authority. BLM is currently taking steps to evaluate and implement IBLA's order.
WY	Antelope	LMA (WYW177903)	856	15.8 M	DR signed Aug. 15, 2014. On February 7, 2017, the IBLA set aside and remanded this DR because the improper authority signed. BLM is currently taking steps to evaluate and implement IBLA's decision.
WY	Black Thunder	LBA (WYW164812)	4,530	467.6 M	Wright Area Coal Lease FEIS issued Jul. 2010. U.S. F.S. ROD signed in 2011, BLM ROD signed February 1, 2012. Applicant has requested delay of sale 3 times citing market conditions. Anticipated sale date in late 2018.
WY	Buckskin	LBA (WYW172684)	1253	167 M	Kiewit Mining Properties Hay Creek II LBA FEIS issued Jul. 2011. BLM ROD signed May 1, 2013. BLM held an unsuccessful LBA sale September 18, 2013. Applicant requested a reoffer and then in 2015 requested that BLM delay offering this lease due to poor market conditions. Sale date is yet to be determined.
WY	Cordero Rojo	LBA (WYW180711)	2306	271 M	South Gillette FEIS issued Aug. 2009. BLM ROD signed Aug. 30, 2012. On December 19, 2014, Cordero advised BLM that they were not prepared to participate in a sale for this lease. Sale date is yet to be determined.

Acres have been rounded to the nearest acre. Tonnages provided are either those received in an application, will be or have been published in the NEPA analysis, or the tonnages published in the decision document. To be determined (TBD) are cases where no reserve information is available.

**Application may qualify under emergency application provisions.*

Table 2. Projects Potentially Subject to the Temporary Pause

Note: Projects in Table 2 may proceed with NEPA and other related analyses at the applicant's request during the programmatic review; however, the BLM will not make final decisions on new leases until the comprehensive review is completed unless the applicant has demonstrated that one of the S.O. 3338 exemptions or exclusions apply.

State	Mine	Application Type (Serial No.)	Acres	Tons (Millions)	Mine Type Underground Surface and Status
AL	Cassidy	LBA (ALES55797)	5,988	22.753 M	Underground Applicant requested that BLM continue work on LBA.
AL	Yellow Creek	LBA (ALES56519)	5,658	27.326 M	Underground EA on hold
AR	Bates	LBA (ARES57757)	2,430	0.0268 M	Underground Applicant requested that BLM continue work on LBA.
CO	King II Mine	LMA (COC62920)	955	6.3 M	Underground CSO determined that the LMA meets the S.O. 3338 Emergency Leasing Section

State	Mine	Application Type (Serial No.)	Acres	Tons (Millions)	Mine Type Underground Surface and Status
					6(a) exemption. WO concurrence provided on 7-12-16. An EA is expected to be available mid-2017.
CO	Bookcliffs	LBA (COC70538)	14,098	78 M	Underground The Notice of Intent to complete and EIS was published on 1/17/14. The EIS is currently on hold at applicant's request.
CO	New Elk Coal Co	LBA (COC71978)	1,440	9 M	Underground The LBA's EA is on hold awaiting additional data from the applicant.
KY	Alma Deep	LBA (KYES55296)	554	5.336 M	Underground EA has been reviewed and returned by the US Army Corps of Engineers with comments. BLM has not received confirmation by the applicant to continue processing during the Pause.
MT	Decker	LMA (MTM101099)	310	17.5 M	Surface In 2015, the applicant requested BLM to delay processing the LMA for a 3-5 years.
MT	Decker	LBA (MTM108494)	2,375	203.4 M	Surface In 2016, the applicant requested BLM to delay processing the LBA for a 3-5 years. The applicant intends to initiate baseline data collection on the coal tract in 2017.
MT	Spring Creek	LBA (MTM105485)	1,603	198.2 M	Surface On January 21, 2016, the applicant provided BLM a written request to continue processing the NEPA analysis on the LBA in accordance with S.O. 3338 Section 5 a. (ii). Public scoping meetings were held on January 25, 2017.
MT	Spring Creek	LMA (MTM094378)	150	6.9 M	Surface On January 21, 2016, the applicant provided the MSO a written request to continue processing the NEPA analysis on their application in accordance with S.O. 3338 Section 5 a. (ii). On May 9, 2016 the applicant modified their LMA, reducing tract size to 150 acres. BLM confirmed that the lease modification application is not subject to S.O. 3338 because the modified lease tract is less than 160 acres and the LMA can continue through to a leasing decision. On November 28, 2016 WO concurred. The LMA is being processed in an EIS in conjunction with the Spring Creek LBA (MTM-105485). Public scoping meetings were held on January 25, 2017.
ND	Center Mine	LBA (NDM105513)	1,040	22.7M	Surface On July 12, 2016, BLM determined LBA met Emergency Leasing Sec. 6(a) criteria of S.O. 3338 and MSO SD notification letter was issued to the applicant on July 28, 2016. WO concurrence provided 7-12-16 to proceed.
OK	Heavener	LBA (OKNM130536)	5,915	TBD	Surface & Underground On May 19, 2016, applicant submitted request for Exemption to SO 3338 Package is under review by Coal Specialist NMSO.
OK	Liberty No. 8	LBA (OKNM124610)	1,620	3.2 M	Surface On June 27, 2016 applicant submitted request for Exemption to SO 3338 to the NMSO.
OK	McCurtain	LBA (OKNM127509)	1,271	3.6 M	Underground Applicant submitted request for Exemption to SO 3338 on July 11, 2016. Package is under review by NMSO.

OK	Pollyanna	LBA (OKNM134392)	790	4.45 M	Underground On October 9, 2015, the applicant request processing of LMA (OKNM-91190) first.
OK	Pollyanna #8	LMA (OKNM-91190)	520	3.37 M	Underground NM SO is reviewing the lessee's qualifications for meeting S.O. 3338 Emergency Leasing Sec. 6(a) exemption.
OK	Milton	LMA (OKBLM17902)	290	1.80 M	Surface: Lessee has not indicated whether they would like BLM to continue processing during the Pause.
OK	Rock Island	LMA (OKNM91571)	960	TBD	Surface Oklahoma RMP initiated 07/26/2013. Lessee has not indicated whether they would like BLM to continue processing during the Pause.
OK	Shady Point/Cavanal	LMA (OKNM91590)	380	TBD	Surface Oklahoma RMP initiated 07/26/2013. Lessee has not indicated whether they would like BLM to continue processing during the Pause.
OK	Heavener	LMA (OKNM91569)	900	TBD	Surface Oklahoma RMP initiated 07/26/2013. On May 19, 2016, applicant submitted request for Exemption to SO 3338. Package is under review by NMSO.
UT	Alton Coal Development	LBA (UTU81895)	2,682	30.8 M to 44.9 M	Surface: The FEIS NOA FRN will be completed for submittal to the WO after the comments are evaluated and addressed. Alton has submitted an alteration to the LBA (UTU-081895) to provide two tracts within the original application area. Tract 1 is proposed to meet the Emergency Lease Application requirements under 43 CFR § 3425.1-4 which if approved would move forward pending the NEPA analysis and Tract 2 ROD would wait until the S.O. 3338 Pause has ended. UT SO is reviewing the applicant's qualifications for meeting S.O. 3338 Emergency Leasing Sec. 6(a) exemption for Tract 1.
UT	Utah American Energy	LBA (UTU080043)	4,191	32.2 M	Underground NEPA analysis is underway upon the applicants request.
WY	Rawhide	LMA (WYW83395)	291	26.6 M	Surface. On May 12, 2016, lessee asked BLM to continue processing their LMA because they believe it met exclusion 6(a) of SO 3338 (emergency leasing criteria). The BLM Wyoming State Office (WY SO) reviewed the applicant's justification and agreed their application meets exclusion 6(a). On August 10, 2016, the WSO requested WO concurrence. Processing of this application is on hold pending WO review and concurrence.
WY	Black Butte	LMA (WYW6266)	450	9.2 M	Surface On April 19, 2016, lessee notified the BLM that they believed LMA WYW-6266 qualified for exclusion under Section 6(a). The BLM SO agreed that the application met the requirements of exclusion 6(a) and requested WO concurrence. On December 2, 2016, the WO provided their concurrence and directed BLM WY to continue processing this application. The

State	Mine	Application Type (Serial No.)	Acres	Tons (Millions)	Mine Type Underground Surface and Status
					EA\FONSI\DR is expected to be released mid-2017.
WY	Belle Ayr	LBA (WYW180238)	1,874	253 M	Surface The applicant was dissolved as part of bankruptcy proceedings. On February 3, 2017, the BLM requested the new company, Contura Wyoming Land Company, LLC, whether they were interested in pursuing the LBA.
WY	Antelope	LBA (WYW184599)	3,508	441 M	Surface BLM preparing a Federal Register Notice of Intent to Prepare an EIS.
WY	Haystack	LBA (WYW159423)	300	14.3 M	Surface LBA NEPA processing was suspended until 2010 due to preparation of Kemmerer RMP. In 2013, applicant requested BLM to wait until sage grouse plan amendments were completed (2015) prior to continuing processing LBA.
WY	Black Thunder	LBA (WYW172388)	2,371	440.4 M	Surface Sale date will be established after the North Hilight tract (WYW-164812) sells.

Acres have been rounded to the nearest acre. Tonnages provided are either those received in an application, will be or have been published in the NEPA analysis, or the tonnages published in the decision document. TBD are cases where no reserve information is available.

My name is Richard Reavey. I work for Cloud Peak Energy, a coal producer here in Wyoming and Montana. First, I object to these hearings, the moratorium on federal coal leasing, and the sham of the programmatic environmental impact study on federal coal leasing. The majority of comments from the so-called listening sessions on coal leasing last summer made it clear that the program works, that there's no justification for increasing royalty and leasing rates. Neither the Government Accountability Office nor the Inspector General or Department of the Interior reports on federal coal leasing make any recommendations that merit a leasing moratorium or the witch hunt of a programmatic EIS, despite misleading claims to the contrary by the Secretary. This is a politically motivated sham pandering to the political allies of the Secretary and the administration at the cost of jobs, communities, and people in this room today. I want to make it extremely clear that this effort by the Secretary to justify leasing and royalty rate increases through this witch hunt EIS is illegal. The Mineral Leasing Act, which is a very good data source for you, should you care to read it, is the law under which the federal coal leasing program operates. It directs and requires the Secretary to develop guidelines and regulations for the program that -- and I quote -- "ensure the maximum economic recovery of coal." The coal leasing moratorium violates that requirement. Furthermore, with federal coal selling at historic lows, miners being forced out of their jobs, coal producers in bankruptcy, and PRB coal delivering 40 percent of the selling price in taxes, fees, and royalties, there is no economic justification for an increase in royalty or leasing rates. Instead Secretary Jewell has repeatedly stated that royalty and leasing rates should reflect the administration's climate objectives. If so, she should seek amendment of the Mineral Leasing Act in Congress because Congress has the authority to impose new taxes, not the Secretary. There's no economic justification for royalty and leasing rate increases. So any attempt to impose new increases on the basis of the administration's climate objectives is a social cost, a carbon tax, a climate tax, or whatever else she would like to call it, is illegal. Attempting to keep it in the ground by imposing taxes and fees that discourage the maximum economic recovery of coal is illegal. Finally, I want to make it clear that the Secretary's efforts to destroy mining in the West, to destroy communities across the West, and to destroy the livelihoods of people in this room is a despicable act of political pandering. I

request that the Secretary remove the moratorium immediately
and cease the sham of this EIS.

THE SECRETARY OF THE INTERIOR
WASHINGTON

ORDER NO. 3338

Subject: Discretionary Programmatic Environmental Impact Statement to Modernize the Federal Coal Program

Sec. 1 Purpose. The Department of the Interior (Department) is entrusted with overseeing Federal land and resources for the benefit of current and future generations. This responsibility includes advancing the safe and responsible development of our energy resources, while also promoting the conservation of our Federal lands and the protection of their scientific, historic, and environmental values for generations to come. The production of federally managed coal presently accounts for approximately 41 percent of the coal produced in the Nation. However, the existing regulatory and programmatic scheme for leasing that coal has been in place, with only relatively minor adjustments, since 1979. It was established at a time when market conditions, environmental concerns, and energy infrastructure were considerably different from today. To help determine whether and how the current system for developing Federal coal should be modernized, this Secretarial Order directs the Bureau of Land Management (BLM) to prepare a discretionary Programmatic Environmental Impact Statement (PEIS) that analyzes potential leasing and management reforms to the current Federal coal program. The PEIS will provide a vehicle for the Department to undertake a comprehensive review of the program and consider whether and how the program may be improved and modernized to foster the orderly development of BLM administered coal on Federal lands in a manner that gives proper consideration to the impact of that development on important stewardship values, while also ensuring a fair return to the American public. This Order does not apply to the coal program on Indian lands as that program is distinct from the BLM's program and is subject to the unique trust relationship between the United States and federally recognized Indian tribes and government-to-government consultation requirements, nor does it apply to any action of the Office of Surface Mining Reclamation and Enforcement (OSMRE) or the Office of Natural Resources Revenue (ONRR).

Sec. 2 Background.

a. Summary of the Federal Coal Program.

The BLM has responsibility for coal leasing on approximately 570 million acres where the coal mineral estate is owned by the Federal Government. The owner of the surface estate of these lands varies and may be the BLM, other Federal agencies, state and local governments, or private landowners. Under authorities, such as the Mineral Leasing Act (MLA), the Mineral Leasing Act for Acquired Lands, and the Federal Land Policy and Management Act, the BLM regulates the leasing and development of this coal. Other Department bureaus, in particular OSMRE and ONRR, also have responsibilities in administering coal mining operations. The OSMRE and those states that have regulatory primacy under the Surface Mining Control and Reclamation Act

(SMCRA) have regulatory responsibilities over surface coal mining and reclamation operations. The ONRR collects, disburses, and verifies revenues from the lease, including bonus bids, royalties, and rental payments, and distributes those funds evenly between the Federal Treasury and the states where the coal resources are located.

The BLM issued coal leasing regulations in 1979 that contemplated two separate competitive coal leasing processes: regional leasing, where the BLM selects tracts within a region for competitive sale, and leasing by application, where the public nominates a particular tract of coal for competitive sale. The regional leasing system has not been used since the 1980s, and currently all BLM coal leasing is done by application. Leasing by application begins with BLM review of an application to ensure completeness, that it conforms to existing land use plans, and that it contains sufficient geologic data to determine the fair market value of the coal. The Agency then prepares an environmental analysis in compliance with the National Environmental Policy Act (NEPA). At the same time, the BLM will also consult with tribal governments and appropriate Federal and state agencies, and will determine whether the surface owner consents to leasing in situations where the surface is not administered by the BLM.

Preparations for the actual lease sale begin with the BLM formulating, after obtaining public comment, an estimate of the fair market value of the coal. This number is kept confidential and is used to evaluate the bids received during the sale. Sealed bids are accepted prior to the date of the sale and are publicly announced during the sale. The winning bid is the highest bid that meets or exceeds the coal tract's presale estimated fair market value, assuming that the bidder meets all eligibility requirements and has paid the appropriate fees and payments.

The BLM receives revenue from coal leasing in three ways: (1) a bonus that is paid at the time BLM issues a lease; (2) rental fees; and (3) production royalties. The royalty rates are set by regulation at a fixed 8 percent for underground mines and not less than 12.5 percent for surface mines. All receipts from a lease are shared equally with the state in which the lease is located.

Over the last few years, approximately 41 percent of the Nation's annual coal production has come from Federal land. Federal coal produced from the Powder River Basin in Montana and Wyoming accounts for over 85 percent of that Federal coal production. Federal coal was used to generate about 14 percent of the Nation's electricity in 2015. Coal is also used for other critical processes, including making steel (metallurgical coal).

As of Fiscal Year 2014, the BLM administered 310 Federal coal leases, encompassing 475,692 acres in 10 states, with an estimated 7.75 billion tons of recoverable Federal coal reserves. Over the last decade, the BLM has held 39 coal lease sales and managed leases that produced approximately 4.4 billion tons of coal and \$10.3 billion in revenue. The recoverable reserves of Federal coal currently under lease are estimated to be sufficient to continue production from federal leases at current levels for 20 years, which does not take into account projections from the Energy Information Administration (EIA) showing that demand for coal is declining.

b. Open Conversation about Modernizing the Coal Program.

On March 17, 2015, I called for "an honest and open conversation about modernizing the Federal coal program." The last time the Federal coal program underwent comprehensive review was in

the mid-1980s, and market conditions, infrastructure development, and national priorities have changed considerably since that time. My call also responded to continued concerns from numerous stakeholders about the Federal coal program, including concerns raised by the Government Accountability Office (GAO), the Department's Office of Inspector General (OIG), Members of Congress, and interested stakeholders. The concerns raised by the GAO and OIG centered on whether taxpayers are receiving fair market value from the sale of coal. Other commenters raised concerns that the current Federal leasing structure lacks transparency and competition and is therefore not ensuring that the American taxpayer receives a fair return from Federal coal resources. These groups also questioned whether the leasing program results in over-supply of a commodity that has significant environmental and health impacts, including impacts on global climate change.

In response to my call for a conversation to address these concerns, the BLM held 5 listening sessions on the Federal coal program in the summer of 2015. Sessions were held in Washington, D.C.; Billings, Montana; Gillette, Wyoming; Denver, Colorado; and Farmington, New Mexico. The Department heard from 289 individuals during the sessions and received over 92,000 written comments before the comment period closed on September 17, 2015. The oral and written comments revealed several recurring themes:

- Concern about global climate change and the impact of coal production and use.
- Concern about the loss of jobs and local revenues if coal production is reduced.
- Support for increased transparency and public participation in leasing and royalty decisions and concern about whether the structure of the leasing program does not provide for adequate competition or a fair return to the taxpayer for the use of federal resources.
- Support for increasing the coal royalty rate, because: (1) the royalty rate should account for the environmental costs of coal production; (2) the royalty rate should match the rate for offshore Federal leases; and (3) taxpayers are not receiving a fair return.
- Support for maintaining or lowering royalty rates, because: (1) the coal industry already pays more than its fair share because existing Federal rates are too high given current market conditions; (2) raising rates will lower production and revenues; and (3) raising rates will cost jobs and harm communities.
- Support for streamlining the current leasing process, so that the Federal coal program is administered in a way that better promotes economic stability and jobs, especially in coal communities which are already suffering from depressed economic conditions.

Of these concerns, three aspects of the current coal program received the most attention. First, numerous stakeholders are concerned that American taxpayers are not receiving a fair return on public coal resources. Second, many stakeholders are concerned that the Federal coal program conflicts with the Administration's climate policy and our national climate goals, making it more difficult for us to achieve those goals. Third, there are numerous and varying concerns about the structure of the Federal coal program in light of current market conditions, including how implementation of the Federal leasing program affects current and future coal markets, coal-dependent communities and companies, and the reclamation of mined lands. These three main concerns are addressed in more detail below.

i. Concerns about Fair Return. In 2013, both GAO and OIG issued reports expressing concerns about the Federal coal program, particularly with respect to the leasing process and fair market value. In response, in 2014 the BLM developed new protocols and issued policy guidance, as well as a manual and handbook, to implement these changes. Nevertheless, stakeholders have expressed concerns that the BLM's response, while helpful, was insufficient to rectify fundamental weaknesses in the program with respect to fair return.

These concerns arise, at least in part, because there is currently very little competition for Federal coal leases. About 90 percent of lease sales receive bids from only one bidder, typically the operator of a mine adjacent to the new lease, given the investment required to open a new mine. While the BLM conducts a peer-reviewed analysis to determine the "fair market value" of the coal and will not sell a lease unless the bid meets or exceeds that value, commenters have questioned whether an accurate fair market value can be identified in the absence of a truly competitive marketplace.

Commenters also raised concerns about the royalty rates set in Federal leases, which are set by regulation at a fixed 8 percent for underground mines and not less than 12.5 percent for surface mines. Many stakeholders believe that these rates do not adequately compensate the public for the removal of the coal and the externalities associated with its use. Still others have suggested that the impact of Federal coal sales, which currently represent approximately 41 percent of total domestic production, artificially lowers market prices, further reducing the amount of royalties received.

Stakeholders also criticize the Federal coal program for obtaining even lower returns through certain types of leasing actions, such as lease modifications, and through royalty rate reductions, which may result in royalty rates as low as 2 percent. In addition, stakeholders have noted that the \$100 acre minimum bid requirement, which is rarely applicable due to fair market value requirements, but occasionally relevant, is outdated.

ii. Concerns about Climate Change. The second broad category of concerns about the Federal coal program relates to its impacts on climate change. The United States has pledged to the United Nations Framework Convention on Climate Change (UNFCCC) to reduce its greenhouse gas (GHG) emissions by 26-28 percent below 2005 levels by 2025. The Obama Administration has made, and is continuing to make, unprecedented efforts to reduce GHG emissions in line with this target through numerous measures. Numerous scientific studies indicate that reducing GHG emissions from coal use worldwide is critical to addressing climate change.

At the same time, as noted above, the Federal coal program is a significant component of overall United States' coal production. Federal coal represents approximately 41 percent of the coal produced in the United States, and when combusted, it contributes roughly 10 percent of the total U.S. GHG emissions.

Many stakeholders highlighted the tension between producing very large quantities of Federal coal while pursuing policies to reduce U.S. GHG emissions substantially, including from coal combustion. Critics also noted that the current leasing system does not provide a way to systematically consider the climate impacts and costs to taxpayers of Federal coal development.

iii. Concerns about Market Conditions. Stakeholders raised various concerns about the implications of current and future coal market conditions. As reported by EIA, between 2008 and 2013, United States' coal production fell by 16 percent, as declining natural gas prices and other factors made coal less competitive as a fuel for generating electricity. In 2015, United States' coal production was roughly 900 million short tons (MMst), 10 percent lower than 2014—the lowest level since 1986. Worldwide, demand for coal appears to be softening as well, with EIA projecting a 21 percent decline in total U.S. coal exports in 2015 from the previous year. As a result, a number of mines in the U.S. have idled production, several major coal companies have entered Chapter 11 bankruptcy, many coal miners have been laid off, and coal-dependent communities have suffered. The EIA and other projections of future coal production show anticipated continuing declines.

Stakeholders have urged the BLM to change the Federal coal program to take these significant market changes into account, although the recommended changes vary. Some suggest that the program should attempt to improve the economic viability of the coal industry and help coal-dependent communities by reducing royalties and streamlining the leasing and permitting processes. Others raise concerns that the program has contributed to low coal prices by incentivizing over-production through non-competitive sales that oversupply the market.

Some have focused on how current market conditions threaten reclamation of lands disturbed by coal mining and may leave state and Federal governments with billions of dollars of unfunded reclamation liabilities. Specifically, many coal companies “self-bond” to meet reclamation bonding requirements, and some stakeholders have asserted that these companies may no longer have the funds to support reclamation activities, and/or they may attempt to shed reclamation obligations in bankruptcy.

Stakeholders also expressed various views regarding exports of Federal coal. Some see export markets as a possible way to maintain or expand Federal coal production, while others view the production of coal for export as a less valuable activity than coal production for domestic use. Still others expressed concern that the export of U.S. coal will contribute to GHG emissions worldwide, which undermines our climate objectives. A number of stakeholders expressed concern that exports, or the potential for exports, were not adequately considered as part of leasing decisions or fair market value determinations.

c. Previous Comprehensive Reviews.

The Department has previously conducted two separate comprehensive reviews of the Federal coal program. In the late 1960s, there were serious concerns about speculation in the coal leasing program. A BLM study discovered a sharp increase in the total Federal acreage under lease and a consistent decline in coal production. In response, the Department undertook the development of a planning system to determine the size, timing, and location of future coal leases, and the preparation of an environmental impact statement (EIS) for the entire Federal coal leasing program. The short-term actions included a complete moratorium on the issuance of new coal prospecting permits, and a moratorium with limited exceptions on the issuance of new Federal coal leases. New leases were issued only to maintain existing mines or to supply reserves for production in the near future, where “near future” meant that development and production were to commence within 3 and 5 years, respectively. The moratorium was scaled

back over time, but was not completely lifted until 1981, after a PEIS had been completed, a new leasing system had been adopted through regulation, and litigation was resolved.

In 1982, concerns about the Federal coal program arose again, this time related to allegations that the Government did not receive fair market value from a large lease sale in the Powder River Basin under the new procedures adopted as part of the programmatic review in the 1970s. Among other reports on the issue, in May 1983, GAO issued a report concluding that the Department had received roughly \$100 million less than it should have for the leases sold, although the Department disputed this conclusion. In response, in July 1983, Congress directed the Secretary to appoint members to a commission, known as the Linowes Commission, to investigate fair market value policies for Federal coal leasing. Congress also, in the 1984 Appropriations Act, directed the Office of Technology Assessment (OTA) to study whether the Department's coal leasing program was compatible with the nationally mandated environmental protection goals.

As part of the 1984 Appropriations Bill, Congress imposed a moratorium on the sale or lease of coal on public lands, subject to certain exceptions, starting in 1983 and ending 90 days after publication of the Linowes Commission's report. The Linowes Commission published the *Report of the Commission on Fair Market Value Policy for Federal Coal Leasing* in February 1984. The OTA report, *Environmental Protection in the Federal Coal Leasing Program*, was released in May 1984. The principal thrust of these reports was that the Department should: (1) temper its pace of coal leasing; (2) improve and better document its procedures for receiving fair market value; and (3) take care to balance competing resource uses in making lease decisions.

Interior Secretary William P. Clark extended the suspension of coal leasing (with exceptions for emergency leasing and processing preference right lease applications, among other things), while the Department completed its comprehensive review of the program. This review included proposed modifications to be made by the Department in response to the Linowes Commission and OTA reports. Secretary Clark announced on August 30, 1984, that the Department would prepare an EIS supplement to the 1979 Final Environmental Statement for the Federal Coal Management Program. The Department issued the Record of Decision for the PEIS supplement in January 1986, in the form of a Secretarial Issue Document. That document recommended continuation of the leasing program with modifications. In conjunction with those modifications, Interior Secretary Donald Hodel lifted the leasing moratorium in 1987.

Sec. 3 Authorities. This Order is issued under statutory authority that includes, but is not limited to, the Mineral Leasing Act, 30 U.S.C. §§ 181 *et seq.*; the Mineral Leasing Act for Acquired Lands, 30 U.S.C. §§ 351 *et seq.*; the National Environmental Policy Act, 42 U.S.C. §§ 4321 *et seq.*; the Surface Mining Control and Reclamation Act, 30 U.S.C. §§ 1201 *et seq.*; and the Federal Land Policy and Management Act, 43 U.S.C. §§ 1701 *et seq.*

Sec. 4 Discretionary Programmatic Environmental Impact Statement. Given the broad range of issues raised over the course of the past year (and beyond) and the lack of any recent analysis of the Federal coal program as a whole, a more comprehensive, programmatic review is in order, building on the BLM's public listening sessions. Accordingly, to meaningfully address the breadth and complexity of the issues raised by commenters regarding the Federal coal

program, I hereby direct the BLM to conduct a broad, programmatic review of the Federal coal program it administers through the preparation of a PEIS under NEPA.

The Department is authorized to undertake this effort in its stewardship role as a proprietor and sovereign regulator which is charged by Congress with managing and overseeing mineral development on the public lands, not only for the purpose of ensuring safe and responsible development of mineral resources, but also to ensure conservation of the public lands, the protection of their scientific, historic, and environmental values, and compliance with applicable environmental laws. Additionally, the Department has the statutory duty to ensure a fair return to the taxpayer and broad discretionary authority to decide where, when, and under what terms and conditions, mineral development should occur, including with regard to the issuance of Federal coal leases.

Although I am not proposing any regulatory action at this time, the purpose of the PEIS is to identify, evaluate, and potentially recommend reforms to the Federal coal program. This review will enable the Department to consider how to modernize the program to allow for the continued development of Federal coal resources while addressing the substantive issues raised by the public, other stakeholders, and the Department's own review of the comments it has received.

While the precise issues to be assessed in the PEIS will be determined through the public scoping process, the PEIS should at a minimum address the following topics:

a. How, When and Where to Lease. The regional leasing program authorized in the 1979 regulations has not worked as envisioned and, instead, BLM has conducted leasing only in response to industry applications. Given concerns about the lack of competition in the lease-by-application system, as well as consideration of environmental goals, the PEIS should examine whether the current regulatory framework should be changed to provide a better mechanism or mechanisms to decide which coal resources should be made available and how the leasing process should work.

As part of this evaluation, the PEIS should explicitly examine the issue of when to lease. Some leasing programs for other Federal resources operate with an established schedule for leasing or consideration of leasing (*e.g.*, BLM holds onshore oil and gas lease sales on a quarterly basis if parcels are available; offshore oil and gas leasing occurs using a schedule established in a five-year plan). The PEIS should examine whether scheduled sales should be used for Federal coal.

The PEIS should also examine where to lease. In other contexts, the Department has identified areas to promote certain kinds of resource development. For example, the BLM's Solar PEIS (Western Solar Plan) amended land use plans across six southwestern states and established preferred locations for solar development. The PEIS should examine whether a similar approach would be useful for coal to minimize potential user conflicts and streamline leasing decisions.

b. Fair Return. The PEIS should address whether the bonus bids, rents, and royalties received under the Federal coal program are successfully securing a fair return to the American public for Federal coal, and, if not, what adjustments could be made to provide such compensation. As part of this analysis, the PEIS should examine whether the decision to lease large amounts of relatively low cost coal artificially drives down pricing in the U.S. market and, if so, how the taxpayer may best be compensated for the reduced royalties due to artificially low

prices. The PEIS should also examine whether the BLM estimates of fair market value for purposes of establishing minimum bids successfully substitute for competition in the bidding process, and if not, how to better estimate fair market value.

c. Climate Impacts. With respect to the climate impacts of the Federal coal program, the PEIS should examine how best to assess the climate impacts of continued Federal coal production and combustion and how to address those impacts in the management of the program to meet both the Nation's energy needs and its climate goals, as well as how best to protect the public lands from climate change impacts.

d. Socio-Economic Considerations. Beyond the issue of fair market value, the PEIS should assess whether the current Federal coal leasing program adequately accounts for externalities related to Federal coal production, including environmental and social impacts. It should more broadly examine how the administration, availability, and pricing of Federal coal affect regional and national economies (including job impacts), and energy markets in general, including the pricing and viability of other coal resources (both domestic and foreign) and other energy sources. The impact of possible program alternatives on the projected fuel mix and cost of electricity in the United States should also be examined.

e. Exports. The PEIS should address whether leasing decisions should consider whether the coal to be produced from a given tract would be for domestic use or export. In consultation with other applicable executive branch offices, the PEIS should examine how to estimate export potential, particularly given potential differences between the estimates of industry and independent economic experts about the prospects for exports in a given circumstance.

f. Energy Needs. Finally, the PEIS should examine the degree to which Federal coal supports, or should support, fulfilling the energy needs of the United States. The evaluation should include an assessment of how the administration, availability, and pricing of Federal coal impacts electricity generation in the United States, particularly in light of other regulatory influences, and what other sources of energy supply (including efficiency) are projected to be available.

Sec. 5 Pause on the Issuance of New Federal Coal Leases for Thermal (Steam) Coal. Lease sales and lease modifications result in lease terms of 20 years and for so long thereafter as coal is produced in commercial quantities. Continuing to conduct lease sales or approve lease modifications during this programmatic review risks locking in for decades the future development of large quantities of coal under current rates and terms that the PEIS may ultimately determine to be less than optimal. This risk is why, during the previous two programmatic reviews, the Department halted most lease sales with limited exceptions for small sales, emergencies and other situations involving potential economic hardship. Considering these factors and given the extensive recoverable reserves of Federal coal currently under lease, I have decided that a similar policy is warranted here. A pause on leasing, with limited exceptions, will allow future leasing decisions to benefit from the recommendations that result from the PEIS while minimizing any economic hardship during that review.

a. Pursuant to my discretionary authority under the Mineral Leasing Act (e.g., 30 U.S.C § 201) and other statutes, and based on the reasons discussed herein, I conclude that further evaluation, additional receipt of public input, and comprehensive consideration of the Federal coal program is warranted, and accordingly, I hereby direct BLM to apply the following limitations on the issuance of Federal coal leases until the completion of the PEIS:

(i) No new applications for thermal (steam) coal leases or lease modifications will be processed, subject to the enumerated exclusions in Section 6 of this Order; and

(ii) For pending applications, no lease sales will be held, leases issued, or modifications approved for thermal (steam) coal, subject to the enumerated exclusions in Section 6 of this Order. At an applicant's request, preparatory work on pending applications may continue (including the preparation of NEPA analyses), but no final decision on whether to hold a lease sale will be made unless one of the exceptions listed in Section 6 of this Order applies.

b. This pause in holding lease sales, issuing coal leases, and approving lease modifications will apply to applications for both surface and underground thermal coal, but it does not apply to metallurgical coal. Metallurgical coal is produced at far fewer mines and in much smaller quantities than thermal coal, and recoverable metallurgical coal reserves may not be sufficient to support current production levels for that resource during the pause. In addition, metallurgical coal is required for key applications, such as steelmaking, for which substitutes are not readily available. Given that the Federal mineral estate includes comparatively very small quantities of metallurgical coal, we expect potential impacts from any leasing activities for metallurgical coal during the review period to be very limited.

c. This pause does not constitute a decision on the merits of any application, but is merely a deferral of the decision to allow the PEIS to be considered in making future final decisions. The pause applies only to the Federal mineral estate administered by the BLM and does not apply to coal leases on tribal or allotted lands, which are regulated by the Bureau of Indian Affairs under a different regulatory structure. The pause applies only to lease sales and modifications. It does not apply to other BLM actions related to the Federal coal program, including the processing and issuance of coal exploration licenses, the issuance of renewal leases when required by the terms of existing leases, and the development and implementation of resource management plans. Similarly, the pause does not apply to any actions undertaken by ONRR, OSMRE, or any other agency, office, or bureau with duties related to the development, production or reclamation of Federal or non-Federal coal resources.

Sec. 6 Exclusions. Nothing in this Order will be deemed to prohibit or restrict:

- a. emergency leasing as defined in 43 C.F.R. § 3425.1-4;
- b. lease modifications, as defined in 43 C.F.R. § 3432.1, that do not exceed 160 acres or the number of acres in the original lease, whichever is less;
- c. lease exchanges as defined in 43 C.F.R. §§ 3435.1, 3436.1, and 3436.2;
- d. the rights of preference right lease applicants based on prospecting permits issued prior to August 4, 1976; and

- e. the sale and issuance of new thermal coal leases by application, 43 C.F.R. Subpart 3425, or the issuance of thermal coal lease modifications, 43 CFR Subpart 3432, under pending applications for which the environmental analysis under NEPA has been completed and a Record of Decision or Decision Record has been issued by the BLM or the applicable Federal surface management agency as of the date of this Order. This exception extends to previously issued Records of Decision or Decision Records that have been (or may be) vacated by judicial decision and are undergoing re-evaluation in accordance with the judicial decision. Before holding any lease sale or issuing any lease under this exception, the BLM must confirm and ensure that the applicable NEPA document for a project is adequate and includes, at a minimum, an analysis of the direct and indirect greenhouse gas emissions resulting from the proposed leasing action.

Sec. 7 Implementation.

- a. The Director of the BLM is responsible for implementation of this Order. This responsibility may be delegated as appropriate.
- b. The Director will expeditiously initiate the NEPA scoping process by inviting Federal, State, and local agencies, Indian tribes, and the public to help identify the environmental issues and reasonable alternatives to be examined in the PEIS. Upon completion of the scoping process, the Director will provide a scoping report to me along with a proposed schedule for the completion of the PEIS.

Sec. 8 Effect of the Order. This Order is intended to provide for a comprehensive review of the Federal coal program and allow for the Department to improve the program going forward. This Order and any resulting report or recommendation are not intended to, and do not, create any right or benefit, substantive or procedural, enforceable at law or equity by a party against the United States, its departments, agencies, instrumentalities or entities, its officers or employees, or any other person. To the extent there is any inconsistency between the provisions of this Order and any Federal laws or regulations, the laws or regulations will control.

Sec. 9. Effective Date. This Order is effective immediately and will remain in effect until its provisions are amended, superseded, or revoked, whichever occurs first.

Secretary of the Interior

**COMPLAINT FOR
DECLARATORY AND
INJUNCTIVE RELIEF**

evaluating the program's significant environmental, health, and economic impacts—including impacts from climate disruption caused by the burning of fossil fuels such as coal, and socioeconomic and environmental impacts to local communities. In doing so, Defendants violated the National Environmental Policy Act (“NEPA”), 42 U.S.C. §§ 4321-4370h.

2. BLM's most recent full programmatic environmental review for the federal coal program was completed in 1979—38 years ago—at a time when the threat of climate change had not yet been fully realized or understood. Since 1979, there have been fundamental shifts in our understanding of the impacts of the federal coal program, in addition to a plummeting need for federal coal to fuel our nation's electric sector. Most importantly, an overwhelming body of evidence has developed demonstrating that continued reliance on fossil fuel-generated power will lead to a climate catastrophe, spurring 180 nations, including the United States, to commit in 2016 to greenhouse gas reductions to keep global temperature increases to no more than 1.5-2°C above pre-industrial levels. Reducing reliance on coal-based energy is essential to achieving this objective. Yet BLM has never completed a review of whether it can continue its coal leasing program and fulfill national climate commitments, as well as its statutory land-management obligations.

3. In addition to the pressing need to address climate change, additional changed circumstances since 1979 not only warrant, but require, supplemental programmatic review of the federal coal leasing program. As discussed below, while the federal coal leasing program generates significant environmental and social harm, it has failed to live up to aspirations to generate a fair economic return to American taxpayers. Market changes have decreased demand for coal to fuel the domestic energy sector at the same time that technological advances have increased the availability of clean energy sources that obviate the need for federal coal. In short, the policy and cost-benefit considerations underlying the federal coal leasing program—and its severe environmental impacts—have fundamentally shifted over the past 30-plus years.

4. In January 2016, the then-Secretary under the Obama administration took the first steps toward complying with the government's obligations under NEPA by commencing a process to prepare a programmatic environmental impact statement ("PEIS") of the federal coal program and putting in place a moratorium on most new leasing activity until that review was complete. See Secretarial Order No. 3338, Discretionary Programmatic Environmental Impact Statement to Modernize the Federal Coal Program (Jan. 15, 2016) ("Secretarial Order 3338"). Secretarial Order 3338 acknowledges that it is time for BLM to reevaluate the

environmental impacts of the federal coal program, as well as the fundamental need for new federal coal leasing at this time.

5. Before such NEPA compliance could be realized, however, on March 29, 2017, the Secretary under the new Trump administration issued Secretarial Order 3348 reversing the prior administration's decision, thus fulfilling President Trump's political campaign promises to repeal the moratorium and increase our country's reliance on coal. In doing so, the Secretary and BLM have opened the door to a host of harmful environmental, health, and economic impacts from new leases that have never been fully evaluated under NEPA.

6. Defendants' lifting of the nationwide coal leasing moratorium is a major federal action that will result in significant environmental impacts. Defendants, however, failed to complete the PEIS, or even to prepare the less-detailed "environmental assessment," prior to making their decision to lift the moratorium, in violation of NEPA.

7. To prevent significant, unstudied impacts from occurring, Plaintiffs Citizens for Clean Energy, ecoCheyenne, Montana Environmental Information Center, Center for Biological Diversity, Defenders of Wildlife, Sierra Club, WildEarth Guardians, and the Northern Cheyenne Tribe request that this Court find that the Defendants violated NEPA by issuing Secretarial Order 3348 without

first completing the requisite environmental analysis, vacate that order, and enjoin further federal coal leasing pending compliance with NEPA.

JURISDICTION AND VENUE

8. This action arises under NEPA, 42 U.S.C. §§ 4321-4370h, and the Administrative Procedure Act (“APA”), 5 U.S.C. §§ 701-706.

9. This Court has jurisdiction over Plaintiffs’ claims pursuant to 28 U.S.C. § 1331 (federal question), and may issue a declaratory judgment and further relief pursuant to 28 U.S.C. §§ 2201-02. Plaintiffs bring this action pursuant to the APA, 5 U.S.C. § 706, which waives Defendants’ sovereign immunity, see id. § 702.

10. Venue is proper in this District pursuant to 28 U.S.C. § 1391(e)(1) because plaintiffs Citizens for Clean Energy, Montana Environmental Information Center, ecoCheyenne, and the Northern Cheyenne Tribe reside in the District of Montana and land affected by the challenged action is within the District of Montana. Venue is proper in this division because lead plaintiff Citizens for Clean Energy resides in Great Falls and federally owned coal subject to the federal coal leasing program lies in this division.

PARTIES

11. Plaintiff Citizens for Clean Energy, Inc. (“CCE”) is an all volunteer group of Montana citizens from many backgrounds and political persuasions.

CCE's objective is to convince decision makers that adequate, clean, efficient, and cost effective energy for our community, state and world can be obtained without destroying our health, lifestyle, environment and heritage. CCE members are united by a very deep concern about the harm fossil fuels cause to our world. With all the wonderful resources available in this country, CCE asserts that there are many good solutions for clean power to serve our needs. CCE believes the days of fossil fuel fired generators are now numbered.

12. Plaintiff ecoCheyenne is a grassroots group of Northern Cheyenne tribal citizens formed to protect their environment from, among other things, the damaging impacts of coal mining. For example, faced with the largest proposed coal mine in the nation (the Otter Creek mine) and associated coal railroad along the pristine Tongue River and Otter Creek Valley—interrelated projects adjacent to the Northern Cheyenne Indian Reservation and in the midst of sites with irreplaceable historical, cultural, and spiritual significance—ecoCheyenne conducted a major educational push among Northern Cheyenne tribal members about the significant potential harms from both projects. ecoCheyenne also has partnered with members of the Lummi Nation of western Washington State to raise awareness about the impact of coal mining and burning, from the coal mines to the coal ports, on tribal communities throughout the Northwest.

13. Plaintiff Montana Environmental Information Center (“MEIC”) is a Montana-based nonprofit organization founded in 1973 with approximately 5,000 members and supporters throughout the United States and the State of Montana. MEIC is dedicated to the preservation and enhancement of the natural resources and natural environment of Montana and to the gathering and disseminating of information concerning the protection and preservation of the human environment through education of its members and the general public concerning their rights and obligations under local, state, and federal environmental protection laws and regulations. MEIC is also dedicated to assuring that federal officials comply with and fully uphold the laws of the United States that are designed to protect the environment from pollution. MEIC and its members have intensive, long-standing recreational, aesthetic, scientific, professional, and spiritual interests in the responsible production and use of energy, the reduction of greenhouse gas pollution as a means to ameliorate our climate crisis, and the land, air, water, and communities impacted by fossil fuel development.

14. Plaintiff Center for Biological Diversity (“the Center”) is a non-profit corporation headquartered in Tucson, Arizona, with offices in Washington, DC, a number of states, and La Paz, Mexico. The Center believes that the health and vigor of human societies and the integrity and wildness of the natural environment are closely linked. Combining conservation biology with litigation, policy

advocacy, and strategic vision, the Center is working to secure a future for animals and plants hovering on the brink of extinction, for the wilderness they need to survive, and by extension, for the welfare of generations to come. The Center is actively involved in endangered species and habitat protection issues nationwide and in Mexico, and has more than 52,300 members throughout the United States and the world, including 275 members who reside in Montana. The Center has members in Montana and throughout the United States who are harmed by greenhouse gas emissions, mercury and other emissions from combustion of federal coal, and loss of wildlife habitat and recreation opportunity from federal coal leasing. The Center and its members have participated in the coal Programmatic Environmental Impact Statement process, and submitted detailed scoping comments on the proposed federal coal leasing Programmatic Environmental Impact Statement, along with more than 20,000 letters from its members and supporters.

15. Plaintiff Defenders of Wildlife (“Defenders”) is a non-profit, membership organization headquartered in Washington, D.C. with field offices throughout the country, including an office in Missoula, Montana. Founded in 1947, Defenders is a science-based conservation organization with more than 393,000 members nationwide, including approximately 1,700 members in Montana. Many of Defenders’ members reside and/or recreate within areas

impacted by the coal leasing moratorium. Defenders is dedicated to the protection of all native wild animals and plants in their natural communities and the preservation of the habitats on which they depend. Defenders advocates new approaches to wildlife conservation that will help keep species from becoming endangered, and it employs education, litigation, research, legislation, and advocacy to defend wildlife and their habitat, including on federal lands. Defenders brings this action on its own institutional behalf and on behalf of its members.

16. Plaintiff Sierra Club is America's largest and most influential grassroots environmental organization, with more than 2.7 million members and supporters nationwide, including more than 2,500 who live in Montana. Sierra Club is dedicated to exploring, enjoying, and protecting the wild places of the Earth; to practicing and promoting the responsible use of the Earth's resources and ecosystems; to educating and enlisting humanity to protect and restore the quality of the natural and human environment; and to using all lawful means to carry out these objectives. Sierra Club has been engaged in both litigation and non-litigation advocacy aimed at reform of the federal coal leasing program for many years. Sierra Club staff and volunteer supporters attended each of BLM's listening sessions regarding the federal coal program in July and August 2015 that were held in Billings, Montana; Denver, Colorado; Gillette, Wyoming; Farmington, New

Mexico; and Washington, D.C. Sierra Club members and supporters also attended each of the six scoping meetings held by BLM on the federal coal leasing programmatic environmental review process that took place in the summer of 2016 in Casper, Wyoming; Salt Lake City, Utah; Knoxville, Tennessee; Seattle, Washington; Grand Junction, Colorado; and Pittsburgh, Pennsylvania. Sierra Club continued to engage throughout this PEIS process by submitting detailed scoping comments to BLM along with more than 100,000 letters from its members and supporters.

17. Plaintiff WildEarth Guardians is a non-profit conservation organization with major offices in Denver, Colorado; Santa Fe, New Mexico; and Missoula, Montana. Guardians' mission is to protect and restore the wildlife, wild places, wild rivers, and health of the American West. Guardians has over 200,000 members and supporters, many of whom live, work, and/or recreate on and adjacent to public lands in the West affected by coal mining and combustion. Through its Climate and Energy Program, Guardians utilizes advocacy, media, and litigation to protect its members and members of the public from the harm coal mining and coal combustion cause to air, land, wildlife, and public health.

18. Plaintiff Northern Cheyenne Tribe ("the Tribe") has been a federally recognized Indian tribe since the Friendship Treaty of 1825. See 81 Fed. Reg. 5,019, 5,022 (Jan. 29, 2016). The Tribe's ancestral territory includes the Powder

River Basin of Montana and Wyoming. The Tribe now occupies the Northern Cheyenne Reservation (“the Reservation”), which is composed of approximately 444,000 acres of land in Big Horn County and Rosebud County, Montana. More than 99 percent of lands within the Reservation are held by the United States in trust for the Tribe or the Tribe’s members. The Tribe also possesses off-Reservation trust lands, including parcels along the Tongue River Reservoir in close proximity to the Decker and Spring Creek coal mines in Montana. The Tribe has approximately 11,000 members, most of whom live on or in close proximity to the Reservation.

19. Protecting the Tribe’s land and water is paramount to the survival and identity of the Northern Cheyenne. Since contact with the U.S. Government and white settlers, the Tribe has sacrificed life and financial gain to maintain its lands and culturally and spiritually significant sites for future generations; protect culturally important plants and wildlife; preserve pristine air and water quality on the Reservation; and improve the difficult economic conditions endured by the Tribe’s members and other residents of the Reservation. For example, over the last four decades, the Tribe took legal action to regain control of the mineral rights underlying the Reservation in perpetuity; successfully challenged coal-related development that would have surrounded the Reservation, including in the Tongue River Valley; was the first tribe to designate its Reservation as a Class 1 air quality

region; adopted Tribal water quality standards, which were approved by the U.S. Environmental Protection Agency; and facilitated designation of three National Historic Landmarks outside the Reservation: (1) Rosebud Battlefield-Where the Girl Saved Her Brother on Rosebud Creek; (2) Wolf Mountains Battlefield-Where Big Crow walked Back and Forth on the Tongue River; and (3) Deer Medicine Rocks on Rosebud Creek.

20. Plaintiffs' members use, live, work, hunt, recreate, and engage in cultural and spiritual practices in areas adversely affected by coal mine operations that are likely to be expanded by leases currently subject to the moratorium. Their interests extend to the land, air, rivers and streams, wildlife, and cultural and spiritual resources that are harmed by coal mining. In particular, Plaintiffs' members own and use lands overlying and adjacent to potential coal leases, hunt for and seek to view wildlife that would be displaced by new coal mining, breathe air and drink water that is threatened by pollution from new coal mining, collect culturally significant plants on lands that may be affected by potential coal leases, and engage in ceremonial practices that would be adversely affected by new coal mining.

21. The aesthetic, conservation, recreational, wildlife preservation, and cultural and spiritual interests of plaintiffs and their members, staff, and volunteers are adversely and irreparably injured by the Defendants' failure to follow the

procedures required by NEPA. These are actual, concrete injuries that are traceable to the Defendants' conduct and would be redressed by the requested relief. Plaintiffs have no adequate remedy at law.

22. Defendant U.S. Secretary of the Interior has supervisory responsibility over the Department of the Interior and the BLM. The Secretary is sued in his official capacity.

23. Defendant U.S. Department of the Interior is the federal department that oversees the U.S. Bureau of Land Management.

24. Defendant U.S. Bureau of Land Management is a federal agency within the Department of the Interior. BLM is responsible for implementing the federal coal program, including administering federal coal leasing.

BACKGROUND

I. LEGAL BACKGROUND

A. NEPA

25. NEPA "is our basic national charter for protection of the environment." 40 C.F.R. § 1500.1(a). NEPA has two fundamental purposes: (1) to guarantee that agencies take a "hard look" at the consequences of their actions before the actions occur by ensuring that "the agency, in reaching its decision, will have available, and will carefully consider, detailed information concerning significant environmental impacts," Robertson v. Methow Valley Citizens Council, 490 U.S. 332, 349-50 (1989); and (2) to ensure that "the relevant

information will be made available to the larger audience that may also play a role in both the decisionmaking process and the implementation of that decision,” *id.* at 349. “NEPA emphasizes the importance of coherent and comprehensive up-front environmental analysis to ensure informed decision making to the end that ‘the agency will not act on incomplete information, only to regret its decision after it is too late to correct.’” Blue Mountains Biodiversity Project v. Blackwood, 161 F.3d 1208, 1216 (9th Cir. 1998) (internal citation omitted).

26. Pursuant to NEPA, “all agencies of the Federal Government shall ... include in every recommendation or report on ... major Federal actions significantly affecting the quality of the human environment, a detailed statement ... on (i) the environmental impact of the proposed action, (ii) any adverse environmental effects which cannot be avoided should the proposal be implemented, (iii) alternatives to the proposed action” (including a “No Action” alternative), and other environmental implications of the action. 42 U.S.C. § 4332(2)(C). This environmental impact statement (“EIS”) helps to ensure “that environmental concerns [will] be integrated into the very process of agency decision-making.” Andrus v. Sierra Club, 442 U.S. 347, 350 (1979).

[B]y requiring agencies to take a “hard look” at how the choices before them affect the environment, and then to place their data and conclusions before the public, NEPA relies upon democratic processes to ensure ... that “the most intelligent optimally beneficial decision will ultimately be made.”

Or. Nat. Desert Ass'n v. BLM, 625 F.3d 1092, 1099-1100 (9th Cir. 2008) (quoting Calvert Cliffs' Coordinating Comm., Inc. v. U.S. Atomic Energy Comm'n, 449 F.2d 1109, 1114 (D.C. Cir. 1971)) (internal citation omitted).

27. In an EIS, federal agencies must analyze the direct, indirect, and cumulative impacts of their actions. See 42 U.S.C. § 4332(2)(C); 40 C.F.R. §§ 1508.7, 1508.8. Indirect impacts “are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable.” 40 C.F.R. § 1508.8(b). NEPA affirmatively requires “[r]easonable forecasting,” and requires agencies to provide information that is “essential to a reasoned choice among alternatives,” where the cost of obtaining the information is not exorbitant. 40 C.F.R. § 1502.22(a); Scientists' Inst. for Pub. Info., Inc. v. Atomic Energy Comm'n, 481 F.2d 1079, 1092 (D.C. Cir. 1973).

28. NEPA recognizes the need for programmatic environmental review when the connected actions under a federal program “will have a compounded effect on a region.” Nat'l Wildlife Fed'n v. Appalachian Reg'l Comm'n, 677 F.2d 883, 888 (D.C. Cir. 1981); see also Kleppe v. Sierra Club, 427 U.S. 390, 400 (1976) (recognizing need for PEIS for federal coal leasing program); City of Tenakee Springs v. Block, 778 F.2d 1402, 1407 (9th Cir. 1985) (“Where there are large-scale plans for regional development, NEPA requires both a programmatic and a site-specific EIS. 40 C.F.R. § 1508.28, 1502.20[.]”).

The thesis underlying programmatic EISs is that a systematic program is likely to generate disparate yet related impacts. This relationship is expressed in terms of ‘cumulation’ of impacts or ‘synergy’ among impacts that are caused by or associated with various aspects of one big Federal action. ... In evaluating a comprehensive program design an agency administrator benefits from a programmatic EIS which indubitably promotes better decisionmaking.

Nat’l Wildlife Fed’n, 677 F.2d 888 (internal quotation marks, and alteration omitted).

29. NEPA also requires an agency to supplement a past EIS when there are “significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts.” 40 C.F.R. § 1502.9(c)(1)(ii). Under NEPA, when “there remains ‘major Federal actio[n]’ to occur, and if the new information is sufficient to show that the remaining action will ‘affec[t] the quality of the human environment’ in a significant manner or to a significant extent not already considered, a supplemental EIS must be prepared.” Marsh v. Or. Nat. Res. Council, 490 U.S. 360, 374 (1989) (quoting 42 U.S.C. § 4332(2)(C)).

B. Federal Coal Leasing Statutes

30. Under the Mineral Leasing Act of 1920, 30 U.S.C. § 181 et seq. (as amended by the Federal Coal Leasing Amendments Act of 1975 (“FCLAA”), Pub. L. No. 94-377, 90 Stat. 1083 (Aug. 4, 1976)), BLM has broad authority to lease (or

not to lease) public lands for coal mining operations after conducting a competitive bidding process. See 30 U.S.C. § 201(a)(1). Key substantive limitations on that authority include the requirement under the Federal Lands Policy and Management Act (“FLPMA”) to manage public lands for multiple uses, 43 U.S.C.

§§ 1701(a)(7), which is defined as “the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people,” id. § 1702(c).

31. In addition, the Mineral Leasing Act of 1920 as amended, requires BLM to only lease coal only in a manner that balances “long-term benefits to the public against short-term benefits.” 30 U.S.C. § 201(a)(3) (requiring that lands subject to leasing be included in a land use plan); 43 U.S.C. § 1712(c)(7) (land use plans must “weigh long-term benefits to the public against short-term benefits” of proposed land uses). Finally, under both FLPMA and the Mineral Leasing Act of 1920 as amended, BLM must “receive fair market value of the use of the public lands and their resources.” 43 U.S.C. § 1701(a)(9); see also 30 U.S.C. § 201(a)(1).

II. FACTUAL BACKGROUND

A. Federal Coal Program and Its Impacts

32. The United States has the largest demonstrated coal reserve in the world. The United States has an estimated 477 billion tons of coal, with 255 billion tons identified as recoverable.

33. BLM is responsible for coal leasing on approximately 570 million acres where the coal mineral estate is owned by the Federal Government. The surface estate of these lands is variously controlled by BLM, the United States Forest Service, private land owners, state land owners, or other Federal agencies. As of 2015, BLM managed 306 active federal coal leases in 11 states, authorizing coal mining on 482,691 acres under both public and private ownership. Bureau of Land Mgmt., Total Federal Coal Leases in Effect, Total Acres Under Lease, and Lease Sales by Fiscal Year Since 1990, available at http://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy/coal_lease_table.html (last visited Mar. 29, 2017). The vast majority of federal coal production—over 85%—is in the Powder River Basin of Montana and Wyoming, primarily on federal public lands. The recoverable reserves of federal coal currently under lease are estimated to be sufficient to continue production from federal leases at current levels for 20 years.

34. BLM's most recent full programmatic environmental review for the program was in 1979—38 years ago—at a time when the federal government's policy was to increase reliance on coal and the threat of climate change had not yet been fully realized or understood. See Bureau of Land Mgmt., Final Environmental Statement: Federal Coal Management Program (Apr. 1979) (“1979 PEIS”). The 1979 PEIS contains limited and insufficient analysis of impacts to

tribal governments and members, and contains no specific analysis of impacts to the Northern Cheyenne Tribe and its members. BLM committed to update its 1979 PEIS “when conditions change sufficiently to require new analyses of [national and interregional] impacts.” Id. at 3-9.

35. Preceding that analysis in 1973, in response to concerns about speculation in the coal leasing program, the Department of the Interior enacted Secretarial Order 2952, which imposed a “complete moratorium on the issuance of new coal prospecting permits, and a moratorium with limited exceptions on the issuance of new Federal coal leases.” See Secretarial Order 3338, at 5. The moratorium was lifted in 1981, following completion of the 1979 PEIS and after a “new leasing system had been adopted through regulation.” Id. at 6.

36. Congress again imposed a moratorium on federal coal leasing in 1983, in response to concerns that lease sales in the Powder River Basin were not garnering fair market value. Id. The Interior Secretary extended the moratorium while the Department of Interior reviewed the leasing program and enacted modifications. Id. Following those modifications, the moratorium was lifted in 1987. Id.

37. In the nearly four decades since the government last undertook environmental review of the federal coal program as a whole, there have been fundamental shifts in our understanding of the impacts of the program, in addition

to a plummeting need for federal coal to fuel our nation's electricity sector. Most significantly, BLM concedes that federal coal, when burned, accounts for nearly 14 percent of annual U.S. carbon dioxide emissions and 11 percent of total U.S. greenhouse gas emissions. An overwhelming body of evidence has developed demonstrating that continued reliance on fossil fuel-generated power will lead to a climate catastrophe. The damaging results include more extreme weather events and increasing levels of harmful pollution that cause increased illness and mortality. Further, large areas of the U.S. and the world face reduced water supplies, increased water pollution, severe wildfires, and flooding from rising sea levels among other devastating impacts.

38. Recognition of these looming impacts in 2015 spurred 180 nations, including the United States, to commit to greenhouse gas reductions aimed at keeping global temperature increases to no more than 1.5-2°C above pre-industrial levels pursuant to the Paris Agreement on climate change. See Conference of Parties No. 21, UNFCCC, Decision 1/CP.21, U.N. Doc. FCCC/CP/2015/10/Add.1 (Jan. 29, 2016), available at <http://unfccc.int/resource/docs/2015/cop21/eng/10a01.pdf> (last visited Mar. 29, 2017). The United States has translated this commitment to an economy-wide target to reduce U.S. net greenhouse gas emissions 26 to 28 percent below 2005 levels by 2025, and a goal of putting the nation on a path to 80 percent reductions

by 2050. United States, Intended Nationally Determined Contribution, Submission to the UNFCCC Secretariat (2015), available at <http://www4.unfccc.int/Submissions/INDC/Published%20Documents/United%20States%20of%20America/1/U.S.%20Cover%20Note%20INDC%20and%20Accompanying%20Information.pdf> (last visited Mar. 29, 2017). The U.S. government has never completed a review of whether it can continue its coal leasing program and fulfill its climate commitments, as well as its land-stewardship obligations that are placed in jeopardy by a changing climate.

39. In addition to the pressing need to address climate change, the Department of the Interior and BLM have not examined on a programmatic level new information and policies regarding the destructive impacts of federal coal leasing on public land, water, wildlife, and culturally and spiritually significant resources. In a November 3, 2015 Memorandum, President Obama established a policy for the Department of the Interior and other federal agencies that mining and other development projects on America's public lands should result in a net benefit—or at a minimum no net loss—for the nation's public lands, public waters, and wildlife resources. See Presidential Memorandum: Mitigating Impacts on Natural Resources from Development and Encouraging Related Private Investment (Nov. 3, 2015), published at 80 Fed. Reg. 68,743 (Nov. 6, 2015). The Department of the Interior and BLM have never examined whether resumption of the federal

coal leasing program will meet the “no net loss” policy established by the Mitigation Memorandum.

40. Moreover, new and mounting evidence demonstrates the significant environmental, health, and economic impacts of coal production, transport, and combustion. The activities directly and indirectly associated with coal leasing include, among other things, coal transport by rail, truck and sea, construction and operation of infrastructure and equipment related to storing, shipping and processing coal, coal combustion domestically and overseas, and disposal of coal ash. Each of these activities negatively impacts air and water quality in downstream communities, harming their health, threatening their safety and causing significant nuisance. Potential impacts include adverse effects to air quality on the Reservation, which is designated as a Class 1 air quality region under the federal Clean Air Act, and adverse effects on water quality in downstream segments of the Tongue River on the Reservation that are subject to the Tribe’s water quality standards (approved by the U.S. Environmental Protection Agency in 2013).

41. There is also a growing understanding of the environmental justice implications of the federal coal program. As BLM’s Scoping Report recognized, minority and low-income communities bear a disproportionate risk of suffering adverse effects of climate disruption, as well as other undesirable environmental,

health, and economic externalities of mining, transporting, and burning coal. In addition, over the last 38 years, researchers have developed an understanding of the impacts of energy booms and their unequal distribution of costs and benefits amongst local residents. For example, the record in this case includes an expert economic analysis of the local economic impacts of coal mining describing, among other things, that coal-dependent communities generally exhibit poorer economic performance than communities not reliant on coal mining. See Power Consulting, Inc., *The Economic Consequences of the Federal Coal Leasing Program: Improving the Quality of the Economic Analysis*, at 8-13 (July 27, 2016).

42. While the federal coal leasing program generates significant environmental and social harm, it has failed to live up to aspirations to generate a fair return to American taxpayers. Notably, in 2013, the U.S. Government Accountability Office and the Department of the Interior's Office of the Inspector General both released reports criticizing the non-competitive federal coal leasing process and other structural flaws that have resulted in below-market returns on federal coal in a manner not contemplated when the program was adopted, let alone any subsequent evaluations.

43. At the same time, market changes have decreased demand for coal to fuel the domestic energy sector and technological advances have increased the availability of clean energy sources that obviate the need for federal coal.

44. Because of these changed circumstances, NEPA mandates that BLM re-evaluate the environmental impacts of the federal coal leasing program and available alternatives for meeting our nation's energy needs.

B. Secretarial Order 3338 and Scoping Report

45. The federal government determined to address these critical deficiencies in its analysis of the federal coal program with Secretarial Order 3338. In announcing a moratorium on significant new leasing and the commencement of a PEIS process in January 2016, the Secretary of the Interior took the first steps toward complying with obligations under the Mineral Leasing Act of 1920, as amended, FLPMA, and NEPA. The Secretarial Order cited the Interior Department's obligation "to ensure conservation of the public lands, the protection of their scientific, historic, and environmental values, and compliance with applicable environmental laws" as well as its "statutory duty to ensure a fair return to the taxpayer." Secretarial Order 3338, at 7.

46. Recognizing evidence of the federal coal program's likely inconsistency with these statutory obligations, the Secretary determined it was appropriate to suspend the federal coal program while BLM undertook a comprehensive review in a PEIS. *Id.* at 8. As the Secretary explained:

Lease sales and lease modifications result in lease terms of 20 years and for so long thereafter as coal is produced in commercial quantities. Continuing to conduct lease sales or approve lease modifications during this

programmatic review risks locking in for decades the future development of large quantities of coal under current rates and terms that the PEIS may ultimately determine to be less than optimal. This risk is why, during the previous two programmatic reviews, the Department halted most lease sales with limited exceptions for small sales, emergencies and other situations involving potential economic hardship. Considering these factors and given the extensive recoverable reserves of Federal coal currently under lease, I have decided that a similar policy is warranted here.

Id. at 8. The moratorium on most new federal coal leasing has remained in place over the past year.

47. Secretarial Order 3338 states that the PEIS should address, at a minimum: (a) how, when, and where to lease coal; (b) fair return to the American public for federal coal; (c) the climate change impacts of the federal coal program, and how best to protect the public lands from climate change impacts; (d) the externalities related to federal coal production, including environmental and social impacts; (e) whether lease decisions should consider whether the coal would be for export; and (f) the degree to which federal coal fulfills the energy needs of the United States. Id. at 7-8.

48. In March 2016, the Secretary issued a Notice of Intent to Prepare a Programmatic Environmental Impact Statement to Review the Federal Coal Program and to Conduct Public Scoping Meetings. 81 Fed. Reg. 17,720 (Mar. 30, 2016). The Secretary's outreach included inviting 212 impacted tribal nations,

including the Northern Cheyenne Tribe, to engage in government to government consultation. See U.S. Dep't of Interior, Federal Coal Program, Programmatic Environmental Impact Statement – Scoping Report, at ES-3–5 to 3–6 (Jan, 2017). During the spring and summer of 2016, BLM accepted more than 200,000 public comments and held public meetings in various cities regarding its programmatic review of the federal coal program. Members of Plaintiff organizations and the Northern Cheyenne Tribe commented in support of continuing a moratorium on coal leasing.

49. On January 11, 2017, BLM completed the first stage of its NEPA review and released a scoping report detailing the agency's conclusions based on its initial review of the public comments and expert analysis. See U.S. Dep't of Interior, Federal Coal Program, Programmatic Environmental Impact Statement – Scoping Report, at ES-3–4 (Jan, 2017). The scoping report concluded “that modernization of the Federal coal program is warranted.” Id. at ES-4. “The three general areas requiring modernization are: fair return to Americans for the sale of their public coal resources; impact of the program on the challenge of climate change and on other environmental issues; and efficient administration of the program in light of current market conditions including impacts on communities.” Id. at 6-2.

50. The scoping report identified a number of alternatives that would be studied in the PEIS to inform BLM’s decision about appropriate modifications to the coal program. The alternatives included options for increasing royalty rates paid by coal producers and avoiding or mitigating the program’s climate-change impacts. Id. at 6-28–32. Additionally, the Scoping Report identified an alternative that would end federal coal leasing, an alternative that would limit the amount of federal coal leased at a given time based on a carbon budget, and a “no-action” alternative that would leave the pre-moratorium leasing program in place. Id. at 6-31–32.

51. “Under the no action alternative, the Federal coal program would continue to be administered in the manner in which it is administered currently. ... The no action alternative would not address concerns raised by numerous parties about the Federal coal program, including concerns raised by the GAO, the [Office of the Inspector General], members of Congress, interested stakeholders, and the public.” Id. at 32.

52. BLM identified pending lease applications that were suspended pending completion of the PEIS. Those projects “may proceed with NEPA and other related analyses at the applicant’s request during the programmatic review; however, the BLM will not make final decisions on new leases until the comprehensive review is completed.” BLM, Status of Currently Pending Lease

and Lease Modification Applications (Feb. 5, 2016), available at
[https://www.blm.gov/style/medialib/blm/wo/Communications_Directorate/public
affairs/news_release_attachments.Par.16330.File.dat/Status%20of%20Pending%20
Leases.pdf](https://www.blm.gov/style/medialib/blm/wo/Communications_Directorate/public_affairs/news_release_attachments.Par.16330.File.dat/Status%20of%20Pending%20Leases.pdf) (last visited Mar. 29, 2017).

53. Those projects encompass a minimum of 1.86 billion tons of coal in nine states, id., roughly equivalent to a 4-5 year supply of federal coal from all federal mines. The pending lease applications subject to the moratorium include four leases encompassing 426 million tons of coal adjacent to the Decker and Spring Creek mines in Montana. Id.

C. Trump Administration’s Secretarial Order 3348

54. On the campaign trail, then-candidate Trump pledged to eliminate the moratorium on federal coal leasing and increase our nation’s reliance on fossil fuels. See <https://www.whitehouse.gov/the-press-office/2017/02/16/president-trump-putting-coal-country-back-work> (last visited Mar. 29, 2017). Now, President Trump has fulfilled that political promise.

55. On March 28, 2017, President Trump issued an executive order directing the Secretary of the Interior to “take all steps necessary and appropriate to amend or withdraw Secretary’s Order 3338 dated January 15, 2016 (Discretionary Programmatic Environmental Impact Statement (PEIS) to Modernize the Federal Coal Program), and to lift any and all moratoria on Federal land coal leasing

activities related to Order 3338. The Secretary shall commence Federal coal leasing activities consistent with all applicable laws and regulations.”

56. The following day, March 29, 2017, Interior Secretary Ryan Zinke issued Secretarial Order 3348, which revokes Secretarial Order 3338, thus lifting the moratorium on federal coal leasing and terminating the PEIS process. The Order directs BLM “to process coal lease applications and modifications expeditiously in accordance with regulations and guidance existing before the issuance of Secretary’s Order 3338.” Secretarial Order 3348 also orders the immediate cessation of all activities associated with the Programmatic Environmental Impact Statement process.

57. In response to reports that the Trump Administration planned to eliminate the moratorium on federal coal leasing, the Northern Cheyenne Tribe transmitted a letter to Secretary Zinke on March 2, 2017, raising concern that the federal coal leasing program could have significant environmental and socioeconomic impacts on the Tribe and its members and requesting government-to-government consultation regarding the federal coal leasing program prior to any decision to lift or otherwise modify the moratorium. Despite the trust relationship between the Department of the Interior and the Tribe, and fiduciary obligations Secretary Zinke has to the Tribe, the Tribe did not receive a response from Secretary Zinke or the Department of the Interior prior to the issuance of

Secretarial Order 3348 and the requested government-to-government consultation on the federal coal leasing program has not occurred.

58. In effect, Defendants' decision to repeal the moratorium was a premature selection of the "no-action" alternative, without the requisite analysis to inform that selection. The decision threatens to accomplish what Secretarial Order 3338 sought to avoid by "locking in for decades the future development of large quantities of coal under current rates and terms that the PEIS may [have] ultimately determine[d] to be less than optimal." Secretarial Order 3338, at 8.

59. Because Secretarial Order 3348 opens the door to federal coal leasing and its harmful environmental impacts that have not been evaluated in a PEIS or a supplemental PEIS, the Order violates NEPA.

FIRST CLAIM FOR RELIEF

(Violation of NEPA, 42 U.S.C. § 4332(2)(C) and APA, 5 U.S.C. § 706(2)(A)—
Failure to Prepare PEIS)

60. Plaintiffs hereby reallege and reincorporate Paragraphs 1 through 59.

61. Absent the decision to repeal the federal coal leasing moratorium, coal-lease applicants would have no ability to move forward with leasing and mining. The decision thus opened the door to the significant environmental impacts that accompany leasing and mining.

62. Accordingly, the decision to repeal the federal coal leasing moratorium is a "major Federal action[]" significantly affecting the quality of the

human environment” that requires preparation of an EIS. 42 U.S.C. § 4332(2)(C); see also 40 C.F.R. § 1508.18(a) (major federal actions “include new and continuing activities” and “new or revised agency rules, regulations, plans, policies, or procedures”). Further, a PEIS is required because the repeal gives rise to a comprehensive program with widespread, cumulative environmental effects. Kleppe, 427 U.S. at 400.

63. The significant environmental impacts of the decision to end the federal coal leasing moratorium include, but are not limited to, greenhouse gas emissions and the resulting impacts on climate change, air and water quality, land, fish and wildlife, and human health. The challenged decision is also related to other actions with cumulatively significant environmental impacts, and may adversely affect threatened and endangered species, requiring an EIS. 40 C.F.R. § 1508.27(b).

64. In ending the federal coal leasing moratorium without first completing a PEIS to evaluate the federal coal program’s significant, unstudied environmental impacts, Defendants violated NEPA, 42 U.S.C § 4332(2)(C), and the APA’s requirement for rational, rather than arbitrary, decisionmaking, 5 U.S.C. § 706(2)(A). Secretarial Order 3348 should therefore be held unlawful and set aside. Id.

65. By abruptly reversing Secretarial Order 3338 without adequate rationale, Defendants took agency action that violated the APA's requirement for rational, rather than arbitrary, decisionmaking. 5 U.S.C. § 706(2)(A). Secretarial Order 3348 should therefore be held unlawful and set aside.

66. By ending the federal coal leasing moratorium in violation of NEPA and the APA, Defendants violated their sacred trust responsibility to the Northern Cheyenne Tribe. Secretarial Order 3348 should therefore be held unlawful and set aside.

SECOND CLAIM FOR RELIEF

(Violation of NEPA, 42 U.S.C. § 4332(2)(C), 40 C.F.R. § 1502.9(c)(1)(ii), and
APA, 5 U.S.C. § 706(2)(A)—
Failure to Prepare Supplemental PEIS)

67. Plaintiffs hereby reallege and reincorporate Paragraphs 1 through 66.

68. In the alternative to preparing a PEIS on the decision to repeal the federal coal leasing moratorium, Defendants were required under NEPA to complete a supplement to the 1979 PEIS to evaluate “significant new circumstances or information relevant to environmental concerns and bearing on the [proposal to modify or resume the federal coal program] or its impacts.” 40 C.F.R. § 1502.9(c)(1)(ii).

69. Defendants' decision to repeal the federal coal leasing moratorium without first completing the PEIS that was intended to evaluate modifications to

the federal coal program was a significant decision regarding the implementation of the federal coal program.

70. Because Defendants issued Secretarial Order 3348 without first completing a supplemental PEIS—or even meaningfully evaluating whether such supplemental environmental review was required—Defendants violated NEPA, 42 U.S.C § 4332(2)(C); 40 C.F.R. § 1502.9(c)(1)(ii), and the APA’s requirement for rational, rather than arbitrary, decisionmaking, 5 U.S.C. § 706(2)(A). Secretarial Order 3348 should therefore be held unlawful and set aside. Id.

71. By issuing Secretarial Order 3348 in violation of NEPA and the APA, Defendants violated their sacred trust responsibility to the Northern Cheyenne Tribe. Secretarial Order 3348 should therefore be held unlawful and set aside.

RELIEF REQUESTED

THEREFORE, Plaintiffs respectfully request that this Court:

1. Declare that Defendants violated NEPA by failing to complete a PEIS prior to ending the federal coal leasing moratorium;
2. In the alternative, declare that Defendants violated NEPA by failing to complete a supplemental PEIS prior to ending the federal coal leasing moratorium;
3. Declare that Defendants violated the APA by arbitrarily and capriciously reversing Secretarial Order 3338;

4. Declare that Defendants violated their sacred trust duty to the Northern Cheyenne Tribe;
5. Set aside and vacate Defendants' decision to end the coal leasing moratorium;
6. Enjoin further federal coal leasing pending completion of the requisite NEPA analysis;
7. Award to Plaintiffs their reasonable fees, costs, and expenses, including attorneys fees, associated with this litigation; and
8. Grant Plaintiffs such further and additional relief as the Court may deem just and proper.

Respectfully submitted this 29th day of March, 2017.

EXECUTIVE SUMMARY

BACKGROUND

In addition to its responsibilities for managing 247 million acres of land and other resources, the Bureau of Land Management (BLM) is responsible for managing coal leasing on approximately 570 million acres where the coal mineral estate is owned by the Federal Government. The BLM manages these resources on behalf of their owners, the American people. This responsibility includes advancing the safe and responsible development of energy resources while promoting the conservation and protection of scientific, historic, and environmental values of our lands for generations to come.

The BLM currently administers 306 coal leases encompassing over 475,000 acres in 10 states, with an estimated 7.4 billion tons of recoverable coal. Over the last decade, BLM-administered leases have produced over 4 billion tons of coal, resulting in the collection of over \$10 billion in Federal revenue that is shared with the state from which the mineral was mined. The recoverable coal currently under lease is estimated to be enough to continue production at current levels for approximately 20 years.

In 2015, 42 percent of all coal produced in the United States came from publicly owned land, primarily in the Powder River Basin in Wyoming. Between 80 and 90 percent of the coal produced in the United States is used for electricity generation. In recent years there has been a consistent decline in coal-fired electricity generation and, consequently, a decline in coal production. Coal-fired electricity made up 50 percent of US generation in 2005 and by 2015 had declined to 33 percent. Coal production fell from 1.13 billion to less than 0.9 billion tons during this same time period.^{1,2} In 2015, US coal production

¹ US EIA. 2016. 2016 Annual Coal Report. November 3, 2016. Available at <http://www.eia.gov/coal/annual/>

² US EIA. 2012. Coal Rank and Minding Method, 1949-2011. September, 2012. Available at <https://www.eia.gov/coal/data.php#production>

experienced one of the steepest declines in history, and it is projected to decline by an additional 15 percent in 2016.³ Several major coal companies have instituted bankruptcy proceedings. Some of these companies have since emerged or are in the process of emerging from bankruptcy.

The last time the Federal coal program received a comprehensive review was in the mid-1980s, and most of the existing regulations were promulgated in the late 1970s and have been only slightly modified since that time. The direct, indirect, and cumulative impacts of the Federal coal program have not been fully analyzed under the National Environmental Policy Act (NEPA) in over thirty years. This has led to calls from a variety of sources for review of many facets of the program, including return to the American taxpayer, climate change considerations, resource protection mandates, and process efficiency.

The Secretary of the Interior is authorized to lease coal as she finds “appropriate and in the public interest” (30 United States Code [USC], Subsection 201[a][1]). Consideration of the implications of Federal coal leasing for climate change, as an extensively documented threat to the health and welfare of the American people, falls squarely within the factors to be considered in determining the public interest. Moreover, this consideration is critical in the development of land use plans where the Secretary must “weigh long-term benefits to the public against short-term benefits” (43 USC, Subsection 1712[c][7]). Such consideration is an important part of the Secretary’s responsibility under the Federal Land Policy and Management Act (FLPMA) to manage “the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people” (43 USC, Subsections 1701[a][7]; 1702[c]).

When resource extraction from public lands is determined to be appropriate, it is also incumbent upon the Department of the Interior to ensure that the public receives the appropriate compensation for the use of its resources. “No bid [on a coal lease tract] shall be accepted which is less than the fair market value, as determined by the Secretary, of the coal subject to the lease. Prior to his determination of the fair market value of the coal subject to the lease, the Secretary shall give opportunity for and consideration to public comments on the fair market value” (30 USC, Subsection 201[a][1]). This requirement to receive fair market value (FMV) places a floor on the monetary return the public must receive once the Secretary determines that it is appropriate and in the public interest to lease a coal tract. In other words, in determining where, when, and how to lease a coal tract, the Secretary must ensure that the sale of this public resource fairly compensates the public by receiving the highest price a willing seller would realize when leasing to a willing buyer—as would any party seek in selling resources in a commodity market.

ISSUE IDENTIFICATION

In the spring of 2015, Secretary of the Interior Sally Jewell called for “an honest and open conversation about modernizing the Federal coal program.” The Department of the Interior subsequently held listening sessions around the country that summer. Hundreds of individuals attended the hearings in person. The Department heard from 289 individuals during the sessions and received over 94,000 written comments. Through these sessions, the areas of concern to a wide variety of interests became clearer.

As a result, in early 2016 Secretary Jewell issued Secretarial Order 3338 directing the BLM to prepare a Programmatic Environmental Impact Statement (PEIS) under the NEPA to identify and analyze potential leasing and management reforms for the Federal coal program. The PEIS provides the BLM with an efficient and effective tool to consider a wide range of reasonable reform alternatives, evaluate the impacts of those alternatives with a focus on cumulative effects, and provide meaningful opportunities for public engagement to inform future agency decision-making.

This scoping report is the first step in the process of reviewing these complex and interrelated issues. It will be followed by a Draft PEIS that will further analyze and refine the reform options presented here and identify a menu of draft alternatives. Following public comment on that Draft PEIS, a Final PEIS will be produced with a recommended roadmap for reforming the Federal coal program. The final report is expected to be completed in early 2019.

In the spring of 2016, the BLM published a Notice of Intent to prepare a programmatic environmental impact statement to review the Federal coal program and to conduct public scoping meetings. That notice initiated the formal public scoping process for the PEIS, calling for public information and comment. In particular, the Notice of Intent posed questions to the public on the following issues identified as areas of concern in the Secretarial Order:

- How, when, and where to lease
- Fair return
- Climate impacts
- Socioeconomic considerations
- Exports
- Energy needs

The Department of the Interior held six public meetings during the summer of 2016 in all regions of the country, including key areas of Federal coal production. These meetings were attended by about 2,000 people and were also either live-streamed or made available in audio. In addition to oral comments provided at the meetings, about 214,402 written comments (654

unique) were received during the comment period, as well as expert reports and analyses.

Invitations have been extended to 72 potential “Cooperating Agencies” as defined by the NEPA that would function as partners with the BLM in preparing the PEIS. The BLM also has reached out to all federally recognized tribes to determine their interest in formal consultation on the PEIS. An initial meeting with Cooperating Agencies was held on December 13, 2016, and consultation with interested tribes was initiated in the same month.

NATURE OF SCOPING REPORT

This report is the result of the BLM’s review and consideration of the materials and analyses received through the listening sessions, public scoping process, or otherwise available. Based on this review, it appears that modernization of the Federal coal program is warranted. While energy markets, communities, environmental conditions, and national priorities have changed dramatically, the program has remained fairly static in its administration over the last thirty years.

This modernization should focus on ensuring a fair return to Americans for the sale of their public coal resources; addressing the coal program’s impact on the challenge of climate change; and improving the structure and efficiency of the coal program in light of current market conditions, including impacts on communities.

In each of these areas additional analysis is necessary prior to the recommendation of specific policy choices, in order to provide a complete understanding of the likely impacts of various policies on energy markets, electricity prices, employment, and other critically important issues. These issues will be the focus areas of analysis for the PEIS going forward. However, it is possible at this stage in the process to identify the most promising policies for consideration. This report sets out these currently available policy ideas for addressing these important issues, and the additional data and technical work needed to decide specifically how to move forward. In addition, there are some simpler good government improvements that can be made without significant additional analysis which the scoping report outlines as well.

This report provides context for considering reform opportunities, and it presents preliminary reform options and an analytical framework that will form the basis for the PEIS. This report sets out reform options organized by policy objectives that align with the Secretarial Order, and it expands upon the reform options based on input received. This report also identifies reform options received during the scoping process that are not recommended for further analysis and sets out the reasons for those recommendations. The reform options that will be carried forward for further consideration by the BLM include:

Fair Return

- Increase royalty rate
- Implement FMV determination process changes (i.e., transparency and consistency)
- Limit the use and increase the transparency of royalty rate reductions
- Increase rental rate
- Raise minimum bonus bid
- Implement inter-tract or modified inter-tract bidding processes to increase competition among bidders
- Evaluate current performance bonding amounts; increase bonding levels as necessary
- Convene a royalty policy commission

Reduce/Account for Greenhouse Gas Emissions

- Account for carbon-based externalities through royalty rate increase or royalty adder
- Require compensatory mitigation for greenhouse gas emissions
- Lease per a carbon budget
- Create incentives for methane capture
- No new leasing, except for limited lease modifications

Improve Resource Protection and Management

- Improve application of unsuitability criteria; modify criteria as necessary
- Develop strategic leasing plans that address landscape scale issues, multiple use, and mitigation planning
- Account for additional coal-related externalities, such as public health and environmental impacts
- Strengthen lease applicant qualification requirements
- Apply environmental protections to existing leases
- Develop regional mitigation strategies for existing and new coal development to address public health and environmental impacts
- Develop best management practices for resource protection

Increase Lease Process Efficiency

- Develop strategic leasing plans that allow for tiering of future lease decisions
- Create a pre-application process

- Create a standardized lease application form and develop an electronic application platform
- Establish a single team to develop FMV estimates
- Work with other agencies to evaluate means for eliminating overlapping requirements and redundant processes
- Improve transparency in the leasing process

The BLM believes that there are a number of these options that represent more modest reforms that could be combined with almost any combined option package or future alternative, or implemented as standalone actions. These options represent beneficial program modernization activities and good government practices.

For fair return, these include FMV determination process changes aimed at transparency and consistency, limiting the use of royalty rate reductions and improving the transparency associated with the use of royalty rate reductions, rental rate adjustments to reflect inflation, minimum bonus bid adjustments to reflect inflation, and evaluation of current performance bonding amounts. For greenhouse gas emissions, this includes creating incentives for methane capture.

For resource protection and management, this includes strengthening requirements for companies bidding on leases, all of which would require coordination with the Office of Surface Mining Reclamation and Enforcement (OSMRE). These requirements include prohibiting leasing to self-bonded companies, ensuring sufficient financial resources, ensuring companies have not been cited for major violations of environmental regulations in connection with other operations, and verifying companies have been fulfilling reclamation obligations in connection with other operations. It also includes developing best management practices for resource protection and improving planning to avoid land use conflicts, such as through the modification and improved application of unsuitability criteria or through the development of strategic coal leasing plans.

For lease process efficiency, these include standardizing lease application forms, developing an electronic platform for the submission of applications, working with other agencies to evaluate means for eliminating redundant processes, and improving transparency.

At the Secretary's direction in connection with Order 3338, the BLM is in the process of developing guidance to implement several of these improvements. Additional reforms may be implemented prior to completion of the Final PEIS if further analysis supports taking action on a more expedited timeframe.

To demonstrate how the various options could be combined to develop alternatives in the PEIS, the report sets out three possible option combination packages. Because each option presents its own range of analytic issues and

because that complexity may be compounded by interactions among the reform options if they are implemented in combination, additional analysis is needed before these or other combinations of options can be included as alternatives for consideration in the PEIS. The Draft PEIS also will analyze a “no action” and a “no leasing” alternative.

Possible Option Combination Package #1

1. Fair Return

Increase the royalty rate to reflect the fair return for coal produced on Federal land. The BLM would identify the most appropriate metric and corresponding royalty rate for Federal coal, reflecting on analysis already conducted by other groups such as the Council of Economic Advisers (CEA).

2. Climate Change/Resource Protection

Require compensatory mitigation for Federal coal leases. The BLM would require lessees to carry out or fund activities that proportionally offset climate-related impacts, including through investment in a fund managed by an entity that takes on the liability to proportionally offset those greenhouse gas emissions and climate-related impacts. Contribution to the fund would be tied to the units of coal produced. Funds could be used for activities including, but not limited to, carbon offsets, carbon sequestration, climate adaptation, and community resilience.

3. Leasing Process

- a. *Develop strategic leasing plans and utilize modified inter-tract bidding on a \$/ton or \$/British thermal unit (Btu) basis.* Strategic leasing plans would be developed based on regular reviews of projected domestic coal demand (e.g., over a 5-year window) and the role of Federal coal resources in meeting domestic energy needs. These plans would set lease sales on a regular schedule to accommodate a modified inter-tract bidding system. The BLM would determine a maximum tonnage of coal or maximum number of Btus to be leased consistent with projected demands. Under a modified inter-tract leasing process, all interested companies would bid among themselves for the right to produce a specified quantity of coal in the location of their choice, assuming it is suitable for mining and consistent with the approved land use plan and strategic leasing plan. To the extent that auctions become more competitive through the use of modified inter-tract bidding, resulting in increased bonus bids, the need for a higher royalty rate could be revisited on a periodic basis.

- b. *Develop regional mitigation strategies.* Regional mitigation strategies would be developed by the BLM to identify and facilitate compensatory mitigation opportunities at the regional scale, allowing for pre-planning for, and advanced investment in, mitigation opportunities.
4. Community Assistance
 - a. *Explore use of compensatory mitigation funds to invest in affected communities experiencing reduced coal production.* The BLM would seek to use compensatory mitigation funds to invest in economic diversification and workforce development efforts.
 - b. *Direct a portion of Federal coal revenues to community assistance.* The BLM would seek to secure Congressional authorization to direct a portion of increased Federal coal revenues toward investments in impacted communities that support economic diversification, job training, mine reclamation, and other community priorities.

Possible Option Combination Package #2

1. Fair Return

Increase the royalty rate to reflect the fair return for coal produced on Federal land. The BLM would identify the most appropriate metric and corresponding royalty rate for Federal coal, reflecting on analysis already conducted by other groups. Because a carbon-based royalty adder, as described under 2, could be instituted in combination with or independent of a potential royalty rate increase based on fair return principles, the BLM will analyze the effects of such changes both individually and cumulatively.

2. Climate Change/Resource Protection

Apply a royalty adder to account for carbon-based environmental and societal costs of coal production and use (\$/ton of coal). A royalty adder would tie climate costs directly to production/consumption. As a price mechanism, a royalty adder would provide price certainty to mining operators and downstream purchasers. A royalty adder would apply only to new and renewed leases and, therefore, would be necessarily phased in over time. The BLM would conduct analysis to identify the most appropriate royalty adder taking into account downstream regulations and substitution effects, and reflecting on analysis already completed by other groups. The BLM would also assess the net impact on revenues from such changes, including any potential reduction in bonus bids and production.

3. Leasing Process

Develop strategic leasing plans and utilize modified inter-tract bidding on a \$/ton or \$/Btu basis. Strategic leasing plans would be developed based on regular reviews of projected Federal coal demand (e.g., over a 5-year window) and could serve a variety of purposes that meet a number of policy objectives, including addressing resource management concerns at a landscape level and helping to streamline future leasing actions. These plans would set lease sales on a regular schedule to accommodate a modified inter-tract bidding system. The BLM would determine a maximum tonnage of coal or maximum number of Btus to be leased consistent with projected demands. Under a modified inter-tract leasing process, all interested companies would bid among themselves for the right to produce a specified quantity of coal in the location of their choice, assuming it is suitable for mining and consistent with the approved land use plan and strategic leasing plan. To the extent that auctions become more competitive through the use of modified inter-tract bidding, resulting in increased bonus bids, the need for a higher royalty rate could be revisited on a periodic basis.

4. Community Assistance

- a. *Direct a portion of Federal coal revenues to community assistance.* The BLM would seek to secure Congressional authorization to direct a portion of increased Federal coal revenues toward investments in impacted communities that support economic diversification, job training, mine reclamation, and other community priorities.
- b. *The states' portion of increased revenues would be available to invest in impacted communities experiencing reduced coal production.* The additional revenues generated by a royalty rate adder would be split with states consistent with current law and could be used by states to support economic diversification efforts in communities and related activities.

Possible Option Combination Package #3

I. Fair Return

Increase the royalty rate to reflect the fair return for coal produced on Federal land. The BLM would identify the most appropriate metric and corresponding royalty rate for Federal coal, reflecting on analysis already conducted by other groups.

2. Climate Change/Resource Protection

- a. *Periodically evaluate and ensure that coal production and associated life-cycle emissions are consistent with the need to reduce net domestic greenhouse gas emissions 80 percent below 2005 levels by 2050.* This

tracks to a straight-line reduction from the US 2025 Intended Nationally Determined Contribution (INDC),⁴ and it is also consistent with the long-term pathway set forth in the US Mid-Century Strategy for Deep Decarbonization.⁵ The BLM would limit the amount of Federal coal leased at a given time based on a carbon budget. The Federal coal leasing levels would be premised on a carbon budget that is commensurate with Federal coal's appropriate contribution to meeting economy-wide greenhouse gas emission reduction targets. In other words, the total amount of coal offered and made accessible under Federal leases would contain lifecycle carbon dioxide (CO₂) emission levels that are less than or equal to the anticipated emissions from Federal coal under an INDC strategy.⁶ The BLM would also need to evaluate the effectiveness of applying INDC-based limits to Federal coal leasing if and when no similar limitations are applied to substitute non-Federal energy sources to address concerns over emissions shifting to non-Federal coal sources. This potential shifting to non-Federal coal sources could reduce the environmental benefit of such limits (i.e., due to emissions leakage).

- b. *Develop strategic leasing plans.* Strategic leasing plans would incorporate the carbon budget and set lease sales on a regular schedule to accommodate a modified bidding system (see 3a below). These strategic plans could help meet a variety of policy objectives, including addressing resource management concerns at a landscape level and helping to streamline future leasing actions.

3. Leasing Process

Use modified inter-tract bidding on a \$/ton or \$/Btu basis. The BLM would determine a maximum tonnage of coal or carbon or maximum number of Btus to be leased consistent with the defined carbon budget. Under a modified inter-tract leasing process, all interested companies would bid among themselves for the right to produce a specified quantity of coal in the location of their choice, assuming it is suitable for mining and consistent with the approved land use plan and strategic leasing plan. To the extent that auctions become more competitive through the use of modified inter-tract

⁴ Actions described by the United States under the UNFCCC in December 2015 to achieve the long-term goals of the Paris Agreement: to hold the increase in global average temperature to well below 2°C, to pursue efforts to limit the increase to 1.5°C, and to achieve net zero emissions in the second half of this century.

⁵ The White House. 2016. US Mid-Century Strategy for Deep Decarbonization. November 2016. Available at https://www.whitehouse.gov/sites/default/files/docs/mid_century_strategy_report-final.pdf

⁶ One way to implement this approach would be for the BLM to use an economy-wide model to estimate least cost compliance strategies for meeting INDCs. The BLM could use the model output to derive anticipated Federal coal consumption levels over a 20-year period, and then use that level, in conjunction with reserves already under lease, as a limit on the amount of reserves that are leased.

bidding, resulting in increased bonus bids, the need for a higher royalty rate could be revisited on a periodic basis.

4. Community Assistance

Direct a portion of Federal coal revenues to investments in communities experiencing economic impacts from reduced coal production. The BLM would seek to secure Congressional authorization to direct a portion of increased Federal coal revenues toward investments in communities that support economic diversification, job training, mine reclamation, and other community priorities.

No Action Alternative

Under the no action alternative, the Federal coal program would continue to be administered in the manner in which it is administered currently. Leasing would be conducted through lease-by-applications (LBAs). The current means of determining FMV, royalty rate reductions, minimum bonus bids, and rental rates would remain unchanged. The no action alternative would not address concerns raised by numerous parties about the Federal coal program, including concerns raised by the Government Accountability Office (GAO), the Department of the Interior's Office of Inspector General (OIG), members of Congress, interested stakeholders, and the public.

No Leasing Alternative

Under a no leasing alternative, the BLM would issue no new leases for Federal coal, except for lease modifications within the defined acreage limitations (960 acres or less⁷). Existing coal already under lease would not be impacted. Administration of existing leases would remain unchanged, including existing royalty rates and rental rates. The BLM may also consider combining the no new leasing alternative with other reform options aimed at modernizing the administration of existing leases as part of separate reform packages or alternatives.

These options and option combination packages are based on the best judgment brought to bear based on the comments received and with the data at hand. The development of the PEIS will involve detailed analysis of these options and option combination packages. Of particular relevance will be analyzing effects on energy markets, the energy economy, communities, and the environment. As additional data becomes available during preparation of the PEIS, these options and option combination packages may be revised.

With this in mind, the key areas of analysis for the PEIS, many of which were identified as priorities by the Secretarial Order, include: return to the taxpayer, climate impacts/greenhouse gas emissions, socioeconomic considerations, energy needs (including coal production and exports, as well as substitution effects), energy prices,

⁷As defined in section 432 of the Energy Policy Act of 2005.

other environmental impacts (e.g., water quality and wildlife), and health impacts. The BLM will use the best available science to support its analyses in the PEIS and employ sophisticated power sector modeling to determine the potential outcomes of options and option combination packages. In conducting this analysis, the BLM will also rely on Cooperating Agency expertise and the thoughtful work completed and underway by stakeholders and the public.

This report is intended to provide an educated starting point for the work on the PEIS, and a path forward for continuing to involve and tap the expertise of the public who care about and know about these public lands and resources.

CHAPTER I

INTRODUCTION

The Bureau of Land Management (BLM) has undertaken scoping as part of its comprehensive review of the Federal coal program and has prepared this scoping report consistent with National Environmental Policy Act of 1969 (NEPA) requirements at Title 40 of the Code of Federal Regulations (CFR), Subpart 1501.7. Scoping is the process by which the BLM solicits internal and external input on the issues, impacts, and potential alternatives that will be addressed in an environmental impact statement (EIS), as well as the extent to which those issues and impacts should be analyzed in the NEPA document.

The objectives of this scoping report are to:

1. Provide an overview of the scoping process for the BLM's Coal Programmatic Environmental Impact Statement (PEIS)
2. Provide a summary of the comments received through the scoping process
3. Provide baseline information regarding the Federal coal program and establish the context in which the BLM will consider potential reform options
4. Present preliminary reform options for the Federal coal program that the BLM will carry forward for further analysis and that may form the basis for the alternatives in the PEIS.
5. Present a preliminary analytical framework for the PEIS

The scoping report is organized into the following chapters:

Chapter 2. Background—Provides background information on the BLM's development of the PEIS, including listening sessions held in 2015, Secretarial Order 3338, and the Notice of Intent.

Chapter 3. Public Involvement and Public Scoping Process—Describes the scoping process undertaken for the PEIS.

Chapter 4. Summary of Comments Received—Provides summaries of the comments received through the scoping process.

Chapter 5. Federal Coal Leasing Program—Describes the Federal coal program and provides baseline information intended to provide context for the BLM's consideration of potential program reform options. This chapter includes: authorities, other Federal agency roles and responsibilities, historical information, state of the coal industry information, coal leasing and production data, market projections for coal, greenhouse gas emissions, socioeconomic considerations, and an overview of the Federal coal leasing process.

Chapter 6. Programmatic Environmental Impact Statement—Provides the BLM's preliminary synthesis of information provided through the scoping process, which will provide the foundation for the Draft PEIS. This chapter includes: a purpose and need statement, preliminary reform options that meet identified policy objectives to be carried forward for further consideration by the BLM, a rationale for dismissing some options from further consideration, a framework for developing program reform alternatives, issues for analysis, an analytical approach, analytical considerations, and a schedule for completion of the PEIS.

CHAPTER 2

BACKGROUND

2.1 INTRODUCTION

The activities that the BLM conducted prior to the initiation of the official NEPA process are described in this chapter.

2.2 LISTENING SESSIONS

On March 17, 2015, Secretary Jewell called for “an honest and open conversation about modernizing the Federal coal program.” As previously described, the last time the Federal coal program underwent comprehensive review was in the mid-1980s, and market conditions, infrastructure development, scientific understanding, and national priorities have changed considerably since that time. The Secretary’s call was also motivated by concerns raised by numerous parties about the Federal coal program, including concerns raised by the Government Accountability Office (GAO)⁸, the Department’s Office of Inspector General (OIG)⁹, members of Congress, interested stakeholders, and the public. The concerns raised by the GAO and OIG centered on whether taxpayers are receiving fair market value (FMV) for leasing Federal coal on public lands. Other commenters raised concerns that the current Federal leasing structure lacks transparency and competition, while also raising questions regarding current market conditions for the coal industry generally and related implications for Federal resources. Stakeholders also questioned whether the leasing program results in over-supply of a commodity that has significant environmental and health impacts, including impacts on global climate change.

⁸ GAO. 2013. Coal Leasing: BLM Could Enhance Appraisal Process, More Explicitly Consider Coal Exports, and Provide More Public Information. GAO 14-140. December 2013. Available at <http://www.gao.gov/products/GAO-14-140>.

⁹ OIG. 2013. Coal Management Program, US Department of the Interior, Report No. CR-EV-BLM-0001-2012. June 2013. Available at <https://www.doioig.gov/sites/doioig.gov/files/CR-EV-BLM-0001-2012Public.pdf>

In response to the Secretary’s call for a conversation to address these concerns, the BLM held five listening sessions regarding the Federal coal program in the summer of 2015. These listening sessions offered the public the opportunity to comment on how the BLM can best carry out its responsibility to ensure that taxpayers receive a fair return for leasing the coal resources managed by the BLM on their behalf. The details of the public listening sessions are provided below in **Table 2-1**. In total, 1,068 individuals attended the listening sessions, and all of the listening sessions were live-streamed. The BLM heard oral comments from 289 individuals during the sessions.

**Table 2-1
Listening Sessions**

Location	Venue	Date	Number of Attendees
Washington, DC	South Main Interior Building 1951 Constitution Ave. NW	July 29, 2015	114
Billings, Montana	BLM Montana/Dakotas State Office 5001 Southgate Drive	August 11, 2015	365
Gillette, Wyoming	Campbell County Library 2101 South 4-J Road	August 13, 2015	308
Golden, Colorado	Marriott Denver West 1717 Denver West Boulevard	August 18, 2015	161
Farmington, New Mexico	Courtyard Marriott 560 Scott Avenue	August 20, 2015	120
Total			1,068

In coordination with the listening sessions, the BLM collected written input on reform of the Federal coal program. In total, 94,045 submissions were received before the comment period closed on September 17, 2015, as reflected in **Table 2-2**, below. The oral and written comments reflected several recurring themes. First, numerous stakeholders expressed concern that American taxpayers are not receiving a fair return for the leasing of public coal resources. Second, many stakeholders expressed concern that the Federal coal program conflicts with the Administration’s climate policy and the country’s national climate goals, making it more difficult to achieve those goals. Third, there were numerous and varying concerns raised about the structure of the Federal coal program in light of current market conditions, including how implementation of the Federal leasing program affects current and future coal markets, coal-dependent communities and companies, and the reclamation of mined lands.

**Table 2-2
Listening Session Submissions**

Type of Written Comment	Number of Submissions	Percent of Total
Form letters from all sources (12 groups)*	92,846	98.7
Written comments submitted at the listening session meetings	1,001	1.1
Other written comments	198	0.2
Total written comments	94,045	100

* Form letter campaigns were initiated by 12 different organizations

2.3 SECRETARIAL ORDER

In response to the broad range of issues raised over the course of the past few years and through the listening sessions, on January 15, 2016, the Secretary of the Interior issued Order No. 3338. The Order directs the BLM to carry out the following:

- 1) A formal, comprehensive review of the Federal coal program through a discretionary programmatic EIS under NEPA;
- 2) A pause on significant new coal leasing decisions on public lands while the programmatic review is underway, with limited, enumerated exemptions and exclusions;
- 3) A series of good government reforms to improve transparency and program administration, including the establishment of a public database to account for the carbon emissions from fossil fuels on public lands by the US Geological Survey (USGS).

The Order states:

“Given the broad range of issues raised over the course of the past year (and beyond) and the lack of any recent analysis of the Federal coal program as a whole, a more comprehensive, programmatic review is in order, building on the BLM’s public listening sessions[.]

...

[T]he purpose of the P[rogrammatic] EIS is to identify, evaluate, and potentially recommend reforms to the Federal coal program. This review will enable the Department to consider how to modernize the program to allow for the continued development of Federal coal resources while addressing the substantive issues raised by the public, other stakeholders, and the Department’s own review of the comments it has received.

...

The PEIS will provide a vehicle for the Department to undertake a comprehensive review of the program and consider whether and how the program may be improved and modernized to foster the orderly development of BLM administered coal on Federal lands in a manner that gives proper consideration to the impact of that development on important stewardship values, while also ensuring a fair return to the American public.”

The Order directs the Director of the BLM to expeditiously initiate the NEPA scoping process by inviting Federal, state, and local agencies; Indian tribes; and the public to help identify the environmental issues and reasonable alternatives to be examined in the PEIS. Upon completion of the scoping process, the Director of the BLM is required to provide a scoping report to the Secretary of the Interior along with a proposed schedule for the completion of the PEIS.

2.4 NOTICE OF INTENT

On March 30, 2016, in accordance with NEPA, the BLM published a Notice of Intent to prepare a programmatic environmental impact statement to review the Federal coal program and to conduct public scoping meetings¹⁰ in the *Federal Register* announcing its intent to prepare a PEIS to review the Federal coal program and beginning the formal scoping period. The Notice of Intent, included as **Appendix A**, announced the city and states of the planned public scoping meetings, stated that specific dates and locations would be announced at least 15 days in advance of each meeting, and listed various methods of commenting.

The Notice of Intent provided background on the Federal coal program, a preliminary set of issues that were expected to be addressed in the PEIS, and potential modifications to the Federal coal program suggested by stakeholders during the listening sessions that could be considered in the PEIS. While the full set of issues to be assessed in the PEIS would be defined through the public scoping process, the Notice of Intent included the following preliminary set of issues:

- How, when, and where to lease
- Fair return
- Climate impacts
- Other impacts
- Socioeconomic considerations

CHAPTER 3

PUBLIC INVOLVEMENT AND PUBLIC SCOPING

PROCESS

3.1 INTRODUCTION

Public involvement entails “the opportunity for participation by affected citizens in rulemaking, decision making, and planning with respect to the public lands, including public meetings or hearings...or advisory mechanisms, or other such procedures as may be necessary to provide public comment in a particular instance” (Federal Land Policy and Management Act (FLPMA), Section 103(d), 43 USC 1702(d)). Council on Environmental Quality (CEQ) regulations and BLM land use planning regulations both provide for specific points of public involvement in the NEPA processes to address local, regional, and national interests (40 CFR 1506.6; 43 CFR Subpart 1610). Guidance for implementing public involvement can be found in the BLM NEPA Handbook H-1790-1¹¹ Public involvement requirements of both NEPA and the FLPMA will be satisfied through this PEIS process.

Scoping is an early and open process for determining the issues to be addressed and identifying the significant issues related to a proposed action (40 CFR 1501.7). Information collected during scoping may also be used to develop the alternatives to be addressed in a NEPA document. The process has two components: internal scoping and external scoping.

The National Environmental Policy Act requires that there be an early and open process for determining the scope of the issues to be addressed by a study.

Internal scoping is the use of the BLM and Cooperating Agency staff to help determine what needs to be analyzed in a NEPA document conducted through

¹¹ BLM. 2008. Handbook H-1790-1—BLM National Environmental Policy Act. Washington, DC. January 2008.

an interdisciplinary process. External scoping is a public process designed to reach beyond the BLM. External scoping involves notification and opportunities for feedback from other agencies, organizations, tribes, local governments, and the public. Its aim is to identify the concerns of high importance to the public. Internal and external scoping help ensure the following:

- That issues are identified early and are properly studied
- That issues of no concern do not consume time and effort
- That the proposed action and alternatives are balanced, thorough, and implementable

The BLM follows the public involvement requirements documented in CEQ regulations implementing NEPA (40 CFR 1501.7 (scoping) and 1506.6 (public involvement)). The BLM also follows public involvement requirements described in the Department of the Interior regulations implementing NEPA (43 CFR, Part 46).

The BLM solicits comments from relevant agencies and the public, organizes and analyzes all comments received, and then distills them to identify issues that will be addressed during the NEPA process. These issues help define the scope of analysis for the EIS and are used to develop alternatives to the proposed action.

A Notice of Intent, an official legal notice published in the Federal Register, announces that a Federal agency is beginning the preparation of an EIS and often includes information about the public scoping process.

3.2 PUBLIC SCOPING

The formal public scoping period began on March 30, 2016, with the publication of a Notice of Intent in the *Federal Register* (see **Chapter 3**, Notice of Intent, included as **Appendix A**).

The Notice of Intent provided an overview of the project and advertised six public scoping meetings. The BLM advertised the scoping meeting locations and times on the project website and through local media, including press releases and newspaper advertisements. A sample newspaper advertisement is included in **Appendix B**, Scoping Materials.

3.3 SUMMARY OF SCOPING MEETINGS

The BLM hosted six public scoping meetings to provide the public with opportunities to learn about the project and the NEPA process and to offer comments. The Notice of Intent announced that the BLM would hold public scoping meetings at locations across the

1,943 individuals attended scoping meetings held in 6 locations throughout the US from May through June 2016.

country. The actual dates, meeting locations and times, and instructions for providing comments were announced via a press release (see **Appendix B**) and the project website: <https://www.blm.gov/programs/energy-and-minerals/coal/coal-peis>. The details of the public scoping meetings are provided in **Table 3-1**, below.

**Table 3-1
Public Scoping Meetings**

Location	Venue	Date	Live-streamed?	Number of Attendees
Casper, Wyoming	Casper Events Center One Events Drive	May 17, 2016	Yes	268
Salt Lake City, Utah	Salt Palace Convention Center 90 South West Temple	May 19, 2016	No (audio only)	550
Knoxville, Tennessee	Tennessee Theatre 604 South Gay Street	May 26, 2016	No (audio only)	115
Seattle, Washington	Sheraton Seattle Downtown 1400 6th Avenue	June 21, 2016	Yes	309
Grand Junction, Colorado	Avalon Theatre 645 Main Street	June 23, 2016	No (audio only)	354
Pittsburgh, Pennsylvania	Pittsburgh Convention Center 1000 Fort Duquesne Boulevard	June 28, 2016	Yes	47
Total				1,943

Note: Meetings were from 8 a.m. to 4 p.m., except for Casper, which was 8:30 a.m. to 4 p.m., and Pittsburgh, which was 11 a.m. to 7 p.m.

Each meeting began with a two-hour sign-in and speaker sign-up period. During this time, attendees had the opportunity to sign into the meeting and register their contact information for the mailing list. Attendees could also sign up for two-minute speaking slots by getting a speaker card (see **Appendix B**). Speaker cards were numbered sequentially so that attendees would speak in the order that they arrived.

Scoping Meetings included a PowerPoint Presentation with background information on the Federal coal program and an opportunity for public comment on a first-come, first-served basis.

After the registration period, the BLM's contractor, Environmental Management and Planning Solutions (EMPSi), provided welcoming remarks, including an explanation of the meeting format. This was followed by a PowerPoint

presentation given by the BLM (see **Appendix B**). The presentation included background information on the Federal coal program, explained the issues that the PEIS will consider, and provided specific topics for which the BLM is seeking public input. In addition, background information on the reform of the Federal coal program (including a Questions and Answers sheet and Secretarial Order 3338) was provided in handouts (see **Appendix B**).

At the conclusion of the presentation, EMPSi opened the meeting to public comments. Attendees who wished to speak were offered the opportunity according to the number on their speaker cards; these were given out sequentially, on a first-come, first-served basis, determined by sign-in order. Once all speakers with speaker cards had spoken, the BLM offered the opportunity for anyone else to speak. Meetings ended when there were no more attendees who wished to speak.

As noted in **Table 3-2**, below, the meetings in Casper, Seattle, and Pittsburgh were live-streamed. The meetings in Salt Lake City, Knoxville, and Grand Junction were available for listening via a phone conference line. Information on how to access these meetings was made available to the public on the project website.

Table 3-2
Remote Access of Public Scoping Meetings

Location	Live-stream Attendees
Casper, Wyoming	1,102
Seattle, Washington	420
Pittsburgh, Pennsylvania	147
Location	Audio Attendee (number of phone lines)
Salt Lake City, Utah	214
Grand Junction, Colorado	24
Knoxville, Tennessee	93

3.4 TRIBAL CONSULTATION

The United States has a unique legal relationship with American Indian tribal governments as set forth in the Constitution of the United States, treaties, Executive Orders (e.g., Executive Order 13175), federal statutes, federal policy, and tribal requirements, which establish the interaction that must take place between federal and tribal governments. An important basis for this relationship is the trust responsibility of the United States to protect tribal sovereignty, self-determination, tribal lands, tribal assets and resources, and treaty and other federally recognized and reserved rights. Additionally, tribal consultation is required by the National Historic Preservation Act (54 USC 300101, et seq.). Tribal consultation is undertaken by the BLM to identify the cultural values,

religious beliefs, traditional practices, and legal rights of Native American people, which could be affected by the BLM's actions on Federal lands.

Given the national focus of the PEIS and potential for decisions made through the PEIS to impact resources and values of Tribes across the United States, the BLM sent letters to all federally recognized tribes asking if they wanted to consult with the BLM on the PEIS. The BLM sent Tribal consultation invitation letters on October 3, 2016, to 212 tribal entities (see **Table 3-3**) and initiated tribal consultation with interested tribes in December 2016.

3.5 COOPERATING AGENCIES

The Cooperating Agency role derives from NEPA, which calls on Federal, state, and local governments to cooperate with the goal of achieving “productive harmony” between humans and their environment (42 USC, Sections 4321-4347). The CEQ regulations that implement NEPA authorize the lead Federal agency to invite State, local, and tribal governments, as well as other Federal agencies, to serve as Cooperating Agencies in the preparation of environmental impacts statements (40 CFR, Subparts 1501.5, 1501.6).

The Cooperating Agency relationship is distinctive, moving beyond consultation to engage officials and staff of other agencies and levels of government in working partnerships. The Cooperating Agencies share skills and resources to help shape the BLM environmental analyses to better reflect the policies, needs, and conditions of their jurisdictions and the citizens they represent. The benefits of enhanced collaboration among agencies in preparing NEPA analyses are as follows:

- Disclosing relevant information early in the analytical process
- Applying available technical expertise and staff support
- Avoiding duplication with other Federal, state, tribal, and local procedures
- Establishing a mechanism for addressing intergovernmental issues

State agencies, local governments, tribal governments, and other Federal agencies may serve as Cooperating Agencies. Cooperating Agency eligibility is defined as any Federal agency other than a lead agency that has jurisdiction by law or special expertise with respect to any environmental impact. A state or local agency with similar qualifications may be a Cooperating Agency. When the effects are on a reservation, an Indian tribe may by agreement with the lead agency become a Cooperating Agency (40 CFR, Subpart 1508.5).

“Jurisdiction by law” means agency authority to approve, veto, or finance all or part of the proposal (40 CFR, Subpart 1508.15). “Special expertise” means statutory responsibility, agency mission, or related program experience (40 CFR, Subpart 1508.26).

In accordance with 40 CFR, Subpart 1501.6, the BLM requested participation of Cooperating Agencies in the preparation of the PEIS. This included Federal agencies with jurisdiction by law or special expertise. In addition, the BLM invited state government representation from those states and counties where active coal leases exist. The BLM invited a total of 72 agencies that were eligible for Cooperating Agency status. The BLM requested a response by October 26, 2016. **Table 3-4** lists the Federal, state and local agencies that were invited as Cooperating Agencies.

Total invitations sent to county entities: 48

Total invitations sent: 72

In accordance with the Department of the Interior regulations implementing NEPA, the BLM must consider any request by an eligible government entity to participate as a Cooperating Agency (43 CFR, Subpart 46.225[c]). The request must be evaluated against Cooperating Agency eligibility criteria—jurisdiction by law or special expertise. Note that Campbell County, Wyoming, and the State of Wyoming requested to be Cooperating Agencies in their scoping comment letters; these groups were also included on the invitation list.

All designated Cooperating Agencies will sign memoranda of understanding with the BLM. The BLM held an initial meeting with Cooperating Agencies in December 2016.

3.6 FUTURE PUBLIC INVOLVEMENT ACTIVITIES

Future public involvement for this NEPA effort includes public review and comment on the Draft PEIS and public review of the Final PEIS. The BLM will continue to conduct public outreach via newsletters, news releases, the project website, and other media throughout the PEIS process.

CHAPTER 4

SUMMARY OF COMMENTS RECEIVED

4.1 COMMENT ANALYSIS PROCESS

All written submissions postmarked or received on or before September 15, 2016, are documented in this scoping summary report. Submissions received after this date are not incorporated in this report, but these and any other comments received throughout the PEIS process will be considered in the development of the PEIS and alternatives formulation, as appropriate.

Written comments were collected via the following methods:

- Project e-mail account at BLM_WO_Coal_Program_PEIS_Comments@blm.gov
- E-mail account at blm_wo_coal_comments@blm.gov
- US Postal Service
- Delivered in person at public scoping meetings or to the Washington, DC office of BLM

The most common format used for submissions was e-mail. A list of commenters is provided in **Appendix C**, List of Commenters.

The public could also provide verbal comments at the scoping meetings, which were documented by a court reporter. A transcript of all verbal comments was provided for each meeting, and these comments were also considered in the comment analysis process.

The BLM screened each written submission to determine if it was a form letter or a unique submission. Form letters are typically created by an organization and then circulated to individuals for submittal to the BLM. Unique submissions are those with distinct, unique text and not part of a form letter. The BLM worked

with representatives from organizations initiating form letter campaigns to ensure that all copies of form letters were received.

A copy of all unique submissions and a representative copy of each form letter were made available for public review on the project website on September 29, 2016.

All unique submissions were assigned a submission tracking identifier and commenter information, and submission text was entered into a comment analysis database. The text of each unique submission was then reviewed to determine if it contained substantive comments. Although all comments received through the scoping process have been considered by the BLM, substantive comments are defined in the BLM NEPA Handbook (Section 6.9.2.1) as comments that do one or more of the following:

- Raise issues that the BLM has not considered or reinforce issues that the BLM has already identified
- Present data or information that can be used when developing alternatives
- Present reasonable alternatives or reform options
- Present data or information that the BLM can use when it considers the impacts of the alternatives
- Raise concerns using reasoning; they may include concerns regarding public land resources, BLM-administered lands, or mineral estate in the project area

In accordance with the BLM NEPA Handbook (Section 6.9.2.1), comments that are not considered substantive include:

- Those in favor of or against an action without any reasoning, such as “I don’t like _____,” without providing any rationale
- Those without justification or supporting data, such as “allow more development”
- Those that provide background supporting information not directly related to the action

All substantive comments were categorized according to issue topic categories, as detailed below. Details for unique submissions are included below, in **Section 4.2**, Summary of Unique Submissions, followed by information on form letters and petitions received in **Section 4.3**, Form Letter Summary.

The BLM received 1,118 unique submissions via email, mail, and at public meetings.

Information from these comments, including key issues, data, and other information from the public, was queried to prepare this scoping summary report.

4.2 SUMMARY OF UNIQUE SUBMISSIONS

The BLM received 1,118 unique submissions out of 214,866 total submissions. **Table 4-1** and **Figure 4-1**, below, show the submission methods for the unique submissions. Of the 1,118 unique submissions, most were comments offered verbally at the public meetings (41.5 percent of total submissions), followed by comments submitted by e-mail (37.9 percent of total submissions). When multiple copies of a submission were received from different sources (e.g., submitted via e-mail and mail) only the original copy was included in the totals.

Table 4-1
Submissions by Methods of Submittal

Submission Method	Count	Percent of Total
E-mail	424	37.9
Mail	47	4.2
Paper copy submitted at a public meeting	183	16.4
Public meeting transcript	464	41.5
Total Submissions	1,118	100

Note: Includes unique submissions only

Figure 4-1. Submissions by Methods of Submittal Count

Figure 4-2 and **Table 4-2**, below, show the affiliation for each submission. Most submissions (68.5 percent) were provided by individuals, followed by organizations (nonprofit and citizen's groups; 18.0 percent). Letters received via mail or e-mail were considered to represent an organization, government, or other group when commenters signed them using official titles from these groups. (Note that speakers at the public scoping meeting often cited affiliation with organizations or other groups, and their comments were therefore classified as representing these groups. The BLM recognizes that these commenters may not be official representatives of these groups, so submissions from organizations may be over-represented.) **Appendix C**, List of Commenters, includes the organization affiliation, if provided, by commenters. The 1,118 unique submissions were submitted by 1,239 commenters.¹²

Table 4-3 and **Figure 4-3**, below, show the location of commenters by state for unique submissions; 309 commenters (25.5 percent) did not provide state location information. Most of these commenters submitted their comments by e-mail and, therefore, did not have location information associated with their entry. Of the commenters who did provide location information, most were from Washington (15.0 percent), followed by Colorado (12.6 percent). The largest numbers of commenters were from those locations where public meetings were held and very well attended, with the exception of the state of Montana.

Table 4-2
Submissions by Affiliation

Affiliation	Count	Percent of Total
Anonymous	1	0.1
Elected official	20	1.8
Federal government	8	0.7
Individual	766	68.5
Local government	34	3.0
Organization (nonprofit or citizens groups)	201	18.0
Private industry	57	5.1
State government	21	1.9
Trade group	7	0.6
Tribal government	3	0.3
Total Submissions	1,118	100

Note: Includes unique submissions only

¹² There are more commenters than submissions because some submissions had multiple commenters associated with them.

Figure 4-2. Submissions by Affiliation

Figure 4-3. Commenters by Geographic Area

**Table 4-3
Commenters by Geographic Area**

Location	Number of Commenters	Percentage of Total Commenters
Alabama	6	0.5

Washington	182	14.7
Washington, DC	16	1.3
West Virginia	1	0.1
Wisconsin	2	0.2
Wyoming	138	11.1
No state information provided	309	25.0
Total Commenters	1,239	100

Note: Includes unique submissions only. Some submissions had more than one commenter.

4.3 FORM LETTER SUMMARY

In addition to unique submissions, organizations submitted form letters. In total, the BLM received 213,748 form letter submissions from 19 form letter campaigns; details of the form letter submissions are shown in **Table 4-4**, below.

The BLM received over 213,000 copies of form letters in 19 form letter campaigns

A representative example of each form letter was entered into the comment analysis database and substantive comments were categorized as described for unique submissions. Letters that represented slight variations of the form letter without significant additional information were treated as form letters. When additional substantive comments were added to the form letter, these letters were entered into the comment-tracking database as a form letter with added text. The additional substantive comments were categorized according to issue topic categories, as described for unique submissions.

**Table 4-4
Form Letter Submissions**

Initiating Organization	Number of Submissions
American Coalition for Clean Coal Electricity	1,416
Care 2 Petitions	24,102

Unknown- maximize returns on Federal coal	27
Unknown- concerns with increased royalty rates	9
Unknown- reconsider the increase in royalty rates	19
Western Organization of Resource Councils	366
Western Values Project	713
WildEarth Guardians	490
Total submissions	213,748

Note: The initiating organizations were identified for all but 3 of the form letters. For letters where no organization was identified, a description of the main letter content is included above.

Petitions were also submitted to the BLM. A petition is a letter typically circulated by an organization and then signed by multiple individuals. In total, the BLM received 91,567 signatures from five petition campaigns; details of petition submissions are included in **Table 4-5**, below. For submissions where an initiating organization was identified, this organization is included. In two instances, no organization was identified; these entries are marked as “unknown.”

Table 4-5
Petition Submissions

Initiating Organization	Number of Signatures
Care2 Petition	2,369
The Climate Reality Project	41,987
The Sierra Club	43,559
Unknown	286
Unknown	3,366
Total submissions	91,567

4.4 SUMMARY OF COMMENTS

The BLM classified all substantive comments under an identified issue category (note some comments were categorized into more than one issue category) and also tagged comments if they contained references or data or a policy option for consideration. In total, 459 comments contained a reference or data and 130 contained a policy option.

In total, 459 comments contained a reference or data, 130 contained a policy option, and 3,199 related to an issue category.

The BLM identified 33 issue categories relevant to the reform of the Federal coal program. Issue categories were developed based on topics identified in the Notice of Intent and traditional BLM resource topics. The issue categories can be found in **Table 4-6**, below.

Table 4-6 and **Figure 4-4**, Comments by Issues Category, below, show the number and percentage of comments received by issue category. The BLM categorized 3,199 comments in total. The largest number of comments (14.6 percent) was assigned to the fair return/coal revenue category. Other significant categories included socioeconomics (14.0 percent), climate change (8.6 percent), and general comments on coal (8.7 percent). **Section 4.6**, Comment Summaries, provides a detailed analysis of the comments received for each issue category.

**Table 4-6
Comments by Issue Category**

Issue Category	Number of Comments	Percentage of Issue Comments
1. NEPA process		
1.1 Scoping meeting	23	0.7
1.2 Cooperating Agency relationship	11	0.3
1.3 Range of alternatives	59	1.8
1.4 Other general	151	4.7
2. Air quality	52	1.6
3. Climate change	276	8.6
4. Carbon/greenhouse gas emissions		
4.1 Social cost of carbon	125	3.9
4.2 Carbon capture	16	0.5
4.3 Life cycle emissions	27	0.8
4.4 National carbon reduction goals	109	3.4
5. Coal program topics		
5.1 General comment on coal	278	8.7
5.2 Coal land use planning decisions	33	1.0
5.3 Coal leasing pause	104	3.3
5.4 Specific coal lease application	17	0.5
5.5 Coal leasing process	205	6.4
5.6 Coal bonding	75	2.3
5.7 Fair return/coal revenues	466	14.6
5.8 Coal exports	72	2.3
5.9 Coal reclamation	107	3.3
5.10 Coal mitigation	35	1.1
5.11 Coal transportation/rights-of-way	17	0.5
5.12 Methane capture	11	0.3
5.13 Surface owner rights	12	0.4
6. Environmental justice	18	0.6
7. Public health and safety	124	3.9
8. Socioeconomics	449	14.0
9. Tribal interests and concerns	18	0.6
10. State's interests and concerns	15	0.5
11. Visual resources	2	0.1
12. Water resources	40	1.3
13. Biological resources	91	2.8
14. Other resource impacts	33	1.0
15. Renewable Energy	128	4.0
Total Comments	3,199	100

Note: Some comments were coded in more than one category.

Figure 4-4. Comments by Issues Category

4.5 ISSUES TO BE ADDRESSED PER THE NOTICE OF INTENT

As noted in **Section 2.4**, the Notice of Intent identified issues likely to be addressed in the PEIS. A cross-walk¹³ of issue codes and issue topics identified in the Notice of Intent is included in **Table 4-7**. Comments related to the procedural requirements of the NEPA process did not correspond directly with the Notice of Intent issue topics and are not included here. Some comment issues fell within more than one Notice of Intent issue topic.

¹³ Table showing the relationship between two other tables.

**Table 4-7
Issue Cross-Walk**

Notice of Intent Issue	Comment Issue Category
How, when, and where to lease	5.2. Coal Land Use Planning Decisions, 5.4. Specific Coal Lease Applications, 5.5. Coal Leasing Process, 5.6. Coal Bonding, 5.9. Coal Reclamation, 5.13. Surface Owner Rights
Fair return	4.1. Social Cost of Carbon, 5.5. Coal Leasing Process, 5.7. Fair Return/Coal Revenues
Climate impacts	3. Climate Change, 4.1. Social Cost of Carbon, 4.2. Carbon Capture, 4.3. Life Cycle Emissions, 4.4. National Carbon Reduction Goals, 5.12. Methane Capture
Other impacts	2. Air Quality, 5.11. Coal Transportation, 7. Public Health and Safety, 9. Tribal Interests and Native American Religious Concerns, 10. State's Interests and Concerns, 11. Visual Resources, 12. Water Resources, 13. Biological Resources, 15. Other Resource Impacts
Socioeconomic Considerations	4.1. Social Cost of Carbon, 6. Environmental Justice, 8. Socioeconomics
Exports	5.8 Coal Exports
Energy needs	5.1. General Comments on Coal, 5.3. Coal Leasing Pause, 15. Renewable Energy

4.6 COMMENT SUMMARIES

The following sections include a summary of the comments received organized by comment type and issue category. A complete listing of comments can be found in **Appendix D**, Comments by Issue Category.

4.6.1 Data and References

The BLM received approximately 449 comments that included data for consideration or citations to references for review. In addition, many commenters attached reference materials, white papers, or other data to their submissions for review. The BLM has considered this information in the development of this Scoping Report and will conduct an in-depth review of this information as part of the development of the PEIS, as relevant. To aid review of this material, the agency has compiled an annotated bibliography, providing an overview of the recommended literature and other documents (see **Appendix E**, Annotated Bibliography).

4.6.2 Policy Options

Approximately 130 comments suggested options for updating or revising Federal coal leasing and permitting policies. Many commenters suggested options for ensuring a fair return to taxpayers from Federal coal leasing. Examples of these options included updating the process and factors for the BLM's determinations of FMV, increasing or decreasing the royalty rate, updating the process and factors for setting bonus bid amounts, and changing the BLM's leasing process to increase competition. Additional comments suggested options for updating the Federal coal program to help achieve US

carbon emission reduction goals. Options suggested to meet this objective included quantifying greenhouse gas emissions and the social cost of carbon, limiting the amount of Federal coal leased according to a carbon budget, using Federal revenues to incentivize clean energy technologies, and requiring mitigation of climate impacts. Some commenters advocated for increasing coal exports, while others suggested that exporting Federal coal should not be allowed.

Other commenters suggested options for improving protection and management of public lands in the coal program, such as updating the coal unsuitability criteria, increasing mitigation requirements, strengthening bonding requirements, and increasing reclamation requirements. Some commenters submitted options for facilitating the economic transition of communities currently dependent on Federal coal development. These options included ideas for allocating Federal funding to support programs like community services, career re-training, and miner pensions. Some commenters suggested that the BLM end the coal leasing program altogether, while others suggested streamlining the leasing program to maximize leasing.

Table 6-1, Options Proposed for Analysis by Policy Objective, outlines the reform options that the BLM is proposing to carry forward for analysis in the PEIS and use as the basis for alternatives development. The options are organized by the policy objectives described in the Need for Federal Action in **Section 6.1.1**. Some options suggested by commenters are not proposed to be carried forward for analysis in the PEIS. **Chapter 5** explains the BLM's rationale for eliminating these options from further consideration.

4.6.3 Issue I NEPA Process

Scoping Process

Commenters expressed concern over the locations of the scoping meetings. They stated that meetings should be held in states and communities where coal mining occurs. Specifically, additional meetings were requested in Wyoming and Montana. Some commenters also felt that meetings should be held in areas likely to feel the impacts of climate change. In addition, some commenters stated that the “first-come, first-served” system used at meetings did not allow everyone an opportunity to speak.

Cooperating Agency Relationship

Commenters stressed the importance of including local governments and other Department of the Interior agencies as cooperators during the NEPA process. Specifically, Campbell County, Wyoming, and the State of Wyoming requested Cooperating Agency status.

Range of Alternatives

Commenters suggested many different alternatives and their elements to consider during the PEIS process. Some suggestions included no new Federal

coal leasing, reduction in royalty rates, greenhouse gas mitigation and reduction, new leasing framework, a no action alternative, a transition to renewable energy, and consideration of the social cost of carbon in royalty rates.

One commenter stated that the BLM should consider a true range of alternatives, rather than setting up alternatives at extreme ends of the spectrum. Another commenter stated that a no action alternative would be inconsistent with current climate change policy and that it should be rejected.

NEPA Process—Other General

Commenters expressed concern over the purpose and need for the BLM's reform of the Federal coal program. Some stated that rationale for program review is unfounded and current regulations are adequate, and the BLM has denied reasons for review in the past. Other commenters stated that the PEIS is appropriate and that the program is due for a reform.

Commenters noted the following specific concerns:

- Evaluation of the coal program at a landscape level is redundant, because federally mined coal already includes NEPA at multiple stages.
- In recently completed reviews, the Inspector General of the Department of the Interior and the GAO had only modest recommendations to improve the coal management program, and there were not enough to suggest a PEIS.
- The BLM does not have the authority to reform the Federal coal program, because other laws and agencies have set the regulations. Specifically, commenters argued that the Mineral Leasing Act requires that coal should be mined for maximum economic recovery, that the BLM does not have the authority to adjust mineral royalty rates, and that fees or taxes that apply to the sale of coal into export markets violate the Export Clause of the Mineral Leasing Act.

Commenters also noted a concern that interim actions undertaken by the DOI might prejudice the ultimate decision. Additional immediate measures for transparency were recommended. In addition, the commenters requested that the BLM pause consideration of any pending or new royalty rate reduction requests or approval of any coal lease or mining plan that would lead to underground mining activities requiring degasification systems, until completion of the PEIS.

Commenters had the following suggestions when conducting the NEPA analysis:

- Ensure sufficient cumulative impacts analysis, including a discussion of oil and gas development and state and private coal development. Review recommendations for approaching substitution impact.
- Limit the PEIS to a 3-year process to avoid delays, and ensure that the scoping report is released by the end of 2016.
- Consider recently finalized regulations and decisions and their impacts on coal mining (e.g., Clean Water Act Rule, Clean Power Plant (CPP), land use plan amendments for greater-sage grouse protection).
- Provide transparency throughout the NEPA process.
- Prepare comprehensive GIS and maps of coal resources and other key data, and make this information available for public review.
- Design a PEIS that could be tiered to and help facilitate a more streamlined leasing process and include specific guidelines on the NEPA process for obtaining a lease.
- Prepare a Reasonably Foreseeable Development Scenario.
- Quantify all coal impacts.
- Involve the Office of Surface Mining Reclamation and Enforcement (OSMRE) and other relevant state and Federal agencies in the NEPA process.

4.6.4 Issue 2 Air Quality

Commenters stated concern for the impacts that coal mining, burning, and transport can have on air quality, including an increase of pollutants and particulate matter in the air. This would result in poor air quality and unsafe conditions, such as soot, smog, and acid rain due to decreased air quality. Commenters also noted that the secondary impacts of poor air quality, including impacts on visibility, impacts on oceans and aquatic life, and impacts on public health. Some commenters also noted that the combustion of coal exports in other countries impacts North American air quality.

Some commenters suggested that the Clean Air Act (CAA) and other regulations have hurt the coal mining industry and require precisely blended coal to account for natural variations in different coal sources. One commenter stated that many mines do not meet the standards set by the Clean Air Act.

4.6.5 Issue 3 Climate Change

Commenters expressed concern about the contribution that coal mining and coal use have on climate change and stated that most coal must stay unmined if we are to avoid the worst effects of climate change. Commenters stated that burning coal extracted from public lands represents a significant contribution to greenhouse gas emissions and climate change.

Commenters also expressed concerns about specific direct, indirect, and cumulative impacts related to climate change, including the following:

- Water supply shortages
- More intense severe weather events
- More frequent and intense wildfire
- Impacts on human health
- Impacts on other uses of public lands
- Rising sea levels
- Shorter season for snow sports and reduced snowpack and ice formation
- Ocean acidification and impact on the fishing industry
- Heat waves
- Changing plant and wildlife habitat and ranges
- Invasive species outbreaks
- Extended ranges of disease carriers, like mosquitos and ticks

One commenter stated that climate damages from coal are 5 to 6 times greater than the value of coal, and that more coal has already been leased than is possible to burn without exceeding carbon budgets to meet climate objectives. One commenter suggested modeling climate impacts by alternative and their effect on royalty revenue, coal prices, energy markets, and energy substitution effects. Some commenters stated that climate change should not be considered during the PEIS process, due to the following reasons:

- Human-caused climate change has not been proven and cannot be accurately predicted.
- Climate change is already covered under NEPA and the existing leasing process.
- Coal's impact on climate change is offset by the protection that coal allows humans through affordable heating and cooling, sturdy buildings, and drought protection.

Commenters suggested that the PEIS should evaluate all fossil fuels and their relation to climate change taking into consideration both upstream and downstream greenhouse gas emissions, and that mitigation strategies for climate change should be employed. One commenter stressed the importance of an alternative that balances climate considerations with future energy demands. Commenters stated that the idea of a perfect substitution (replacement of Federal coal with coal from other sources) is not supported by recent findings and that the BLM should not use that assumption in climate change analysis.

4.6.6 Issue 4 Carbon/Greenhouse Gas Emissions

Issue 4.1 Social Cost of Carbon

Commenters stated that the social cost of carbon should be evaluated when reforming the Federal coal program, suggesting the following:

- The social costs of carbon should be built into coal royalties to reflect the true cost of climate change.
- Social costs should be used to quantify climate impacts of alternatives.
- Annual climate costs of the Federal coal program far outweigh benefits of fossil fuel production.
- A large increase in rates would result in a great benefit to climate and more revenue.
- The cost of coal would be much higher, if accounting for the social cost of carbon.
- Renewable energy is cheaper than coal, when considering the social cost of carbon.

Commenters also noted that there is a recent court decision supporting the use of the social cost of carbon. Commenters also provided specific direction for including the social cost of carbon, recommended models for social cost of carbon analysis, and alternative measures of quantifying carbon cost and other externalities.

Other commenters stated opposition to imposing a social cost of carbon for the following reasons:

- A carbon charge large enough to dramatically curtail Federal coal production could be in violation of the dual mandate to balance environmental goals with Federal revenue generation.
- The social cost of carbon estimates are unrealistically high and technically unsound.
- The BLM does not have the authority to impose a social cost of carbon.
- Imposing the social cost of carbon would have limited effectiveness due to substitution to non-Federal coals or other fossil fuels and due to lack of pass through to end user.
- The social cost of carbon has not undergone notice-and-comment rulemaking.
- Imposing a carbon fee would be double regulation/taxing.

- Imposing a social cost of carbon on producers would increase electricity prices.
- Implementing the social cost of carbon may not be successful, due to lack of competition. If Federal coal auctions are not competitive, firms may lower bids to offset the social cost of carbon.

Issue 4.2 Carbon Capture

Commenters stated the following regarding carbon capture related to the PEIS:

- Greenhouse gas emissions associated with coal use can be negated with flue-steam capture.
- Money applied to renewable energy subsidies should be invested in developing carbon capture.
- Storage and carbon capture technology is necessary in order to meet climate goals.

Commenters also noted concerns over the lack of Federal aid in developing carbon capture technology. They cited specific states and coal industries that have examples of efficient power plants and sequestration technology.

Issue 4.3 Life-Cycle Emissions

Commenters stated that the PEIS should analyze greenhouse gas emissions and associated impacts from all stages of coal mining and usage. Specifically, consequential life-cycle analysis methods were recommended over attributional life-cycle analysis methods. Other commenters stated that the BLM's review of the Federal coal program is not the appropriate time to analyze life-cycle emissions, since the BLM cannot determine how the coal will be used, and life-cycle analysis studies are inadequate.

Issue 4.4 National Carbon Reduction Goals

Commenters expressed concern regarding how the Federal coal program will align with the Administration's greenhouse gas reduction goals reflected in the Paris Agreement and the CPP. Specifically commenters focused on whether continued levels of US coal production was consistent with the Paris Climate Agreement and the commitment to stay under 2 degrees Celsius of warming, and questioned whether coal exports undermine the commitment to end reliance on coal by 2020.

Commenters also cited studies, suggesting that new Federal coal leasing at any significant level is inconsistent with climate goals. Commenters suggested creating a "carbon budget" to help meet emissions reduction goals and implementing a carbon adder for upstream emissions to help meet climate commitments. Commenters also stated that not combusting coal is critical to meeting climate goals and that the BLM should finalize the coal mine methane rule-making, because of the potent impact methane has on climate change.

4.6.7 Issue 5 Coal Issue Topics

Issue 5.1 General Comment on Coal

General comments on coal fell under two main categories: commenters who requested a complete cessation of new leases, a reduction in coal mining, or increased regulation of coal mining on Federal lands and those who favored limited modifications to the coal program, continued coal mining, or expansion of coal mining on Federal lands.

Commenters requesting a reduction in mining provided the following rationales and opinions:

- The Federal coal program has not been modified in many years and is due for a reform.
- There is reduced demand for coal due to market and policy conditions and mining on Federal lands needs to be phased out.
- The environmental impacts of coal outweigh the beneficial uses.
- Coal mining contributes to climate change and greenhouse gas emissions.
- A sufficient amount of coal is already leased.

Some commenters also noted the importance of analyzing the impacts from all stages of the coal life. One person noted that current leases should be rescinded. Another person stated that it is better to continue mining on current operations than to start new operations, because new mines and disturbance will have a greater impact.

Commenters who favored maintaining or expanding Federal coal mining provided the following rationales and opinions:

- Coal is a low cost energy source and is necessary to provide reliable and affordable electricity.
- Investments should be made in clean coal technology over alternative energy sources.
- Companies will turn to mining on private lands if Federal lands cannot be mined.
- Studies prepared for Federal coal mining provides valuable information about other natural resources.
- The coal industry is already over regulated.
- Coal demand is cyclical, so recent studies of coal demand may not be representative.
- The US has “cleaner” coal than other countries.

- The low cost energy derived from coal improves the quality of life and allows other industries to be competitive.

Issue 5.2 Coal Land Use Planning Decisions

Commenters stated that, when making coal land use planning decisions, the BLM should consider other land uses on public lands and lands with environmentally sensitive or special habitat value. Commenters requested that the BLM review and revise unsuitability criteria, implement unsuitability screening criteria at the land use planning level, and document the screening process. Specific areas suggested as unsuitable for leasing were those where the hydrological balance cannot be restored to pre-mining conditions and areas where coal development should be avoided due to high conflicts with wildlife, fisheries, water, air, and protected lands.

Issue 5.3 Coal Leasing Pause

Some commenters expressed support for the coal leasing pause, stating that it should be extended or made permanent and reasoned that a sufficient amount of coal has already been leased. Other commenters stated opposition to the coal leasing pause. They stated that it should be removed because it negatively impacts the economy, violates other laws, and is an attempt by the administration to stop coal mining. They said that pending leases already include a lengthy NEPA evaluation and should not be subject to the moratorium.

In addition, some commenters stated that the BLM has underestimated the time lag that would be produced by a moratorium. They requested that there be a guarantee that the moratorium would not go beyond the stated 3 years. Others stated that the assumption that a 20-year supply of coal is already under lease, as noted in Order 3338, is based on faulty information.

Issue 5.4 Specific Coal Lease Applications

Commenters stated concern over both the environmental impacts of leasing and the economic impacts of delays for specific coal lease applications, including at the following: Alton Mine, Bull Mountain Mine, Greens Hollow Coal tract (SUFCO Mine), and the Williams Draw tract (Lila Canyon Mine). Commenters also stated that analysis for one recently leased mine, the Narley Mine No. 3 mine, was inadequate. In addition, commenters provided input on particular coal mining regions. They stated that coal from the North Fork Valley produces less pollution and should be selectively mined and that the Powder River Basin should be recertified as a coal producing region.

Issue 5.5 Coal Leasing Process

Many commenters stated concerns for the current leasing process. Some stated that the leasing process takes too long and should be streamlined to remove redundancy and unnecessary barriers to development. Other commenters suggested specific changes to the leasing process in order to limit environmental impacts and to ensure a fair and transparent leasing process. Commenters suggested the following changes:

- Discontinue the lease-by-application (LBA) approach, because it does not encourage competitive bids.
- Provide more public notification of pending lease applications, minimum bids, and other leasing decisions.
- Examine leasing at the coal reserve level and reinstate coal producing regions in which regional planning takes into account market conditions and environmental impacts.
- Expand coordination with adjacent Federal landowners before leasing.
- Increase competition among coal companies for Federal coal leases.
- Lease only to companies that demonstrate they are resilient to expected market fluctuation.
- Make companies pay upfront at the time of lease for reclamation and evaluate unmet reclamation obligations before making additional leases.
- Incorporate elements from the Solar PEIS and Oil and Gas Master Leasing Plans into the coal leasing process, such as analyzing appropriate areas to lease on a regional scale.
- Cap coal tonnage or British thermal units and accept bids only until this cap is met.
- Focus lease offerings near existing tracts to limit additional disturbance.
- Wait for adequate market demand and set minimum bid prices.
- Consider lease prices reflecting the opportunity value involved in purchasing an option to mine a public resource in the future, when coal prices may recover from current lows.
- Apply maximum economic recovery standards and prepare a reasonably foreseeable development scenario.

Other commenters said that the current leasing system is sufficient and stated the following:

- The BLM should not exclude operators with greater than 10 years of reserves due to the length of the leasing process and other permitting.
- The BLM should retain the industry-nominated systems, as industry representatives are informed about future market needs.
- Note that conducting lease sales at set times in the past (such as quarterly) did not attract sufficient bids.

- Consider delaying collection of bonus bids until mining begins on the leases and allow a royalty credit for the capital costs to establish a mining operation to increase competition for bids.
- Leave the determination of where to lease to the field office at the local planning level.
- The BLM should acknowledge that bidding by adjacent mine operators is economically logical, due to reduced capital costs and that it does not represent a noncompetitive process.
- The BLM should acknowledge that it has the ability to adjust the lease nomination to ensure adequate competition.
- The BLM should acknowledge that the LBA process and leases with one bid are fair, because the government sets a minimum price.

Issue 5.6 Coal Bonding

Commenters expressed concern over the amount of outstanding self-bonded reclamation liability and the self-bonding process in relation to Federal coal leasing, stating that it does not protect taxpayers and allows many companies to avoid reclamation.

Other commenters stated that changes to the self-bonding and reclamation regulations are in conflict with Surface Mining Control and Reclamation Act (SMCRA), and another suggested that the BLM does not have the authority to interfere with the States' ability to regulate surface coal mining and reclamation operations or to apply its discretionary authority over the bonding of such operations. In addition, one commenter stated that the leasing moratorium will impact the bonding of reclamation liability by reducing companies' revenue.

Commenters recommended the following specific changes to coal bonding:

- Eliminate self-bonding.
- Suspend approval of self-bonding for companies filing for bankruptcy.
- Charge a set amount for cost-recovery, based on the type of mine and application at the time of leasing.
- Require coal companies to put down a large deposit at the time of leasing.
- Impose full-cost bonding.
- Hold companies liable for failure to meet reclamation requirements.
- Require companies to purchase insurance to cover reclamation costs.

- Do not permit new leases for companies until all of their mines have been reclaimed.
- Work with the OSMRE to strengthen self-bonding regulations.

Issue 5.7 Fair Return/Coal Revenues

Commenters expressed concern over the current royalty rates and return to taxpayers. Many commenters stated that royalty rates should be raised, because coal companies are not paying a fair return to taxpayers and exploiting loopholes to undervalue coal. Commenters noted that current rates have been in place for 30 years, and it is time for a review. Some commenters stated that Federal coal sales represent nearly 41 percent of the total domestic production, which artificially lowers market prices, further reducing the amount of royalties received. Commenters also supported specific changes to royalty rates, including the following:

- Increase transparency and public input when determining market values.
- Use royalty rates for coal that match rates for offshore oil and gas.
- Assess royalties on the net delivery price of coal.
- Impose a cap on transportation deductions.
- Develop a comprehensive, coal-specific, costs test analysis tool that would quantify and monetize the full range of damages caused by coal and the true avoided cost value of renewables when used to replace coal.
- Factor in life-cycle and external costs.
- Consider using the social cost of carbon.
- Ban companies from selling coal to subsidiaries to depress rates (captive transactions).

Other commenters stated that there is no rationale to support raising royalty rates and that royalty rates should be decreased. Their concern over raising royalty rates were for the following reasons:

- Many companies currently pay a significant share of revenues in the form in royalties, taxes, and fees.
- The coal market is declining, and companies are already facing economic pressure.
- There is no empirical evidence to support the notion that increasing Federal coal royalty rates will increase Federal coal revenues.
- Coal companies already pay fair rates that benefit many local communities in a struggling economy.

- Coal exports are not a valid basis for reevaluating valuation regulations or royalty rates.
- Higher rates will render many Federal coal operations uneconomic.
- Higher rates will shift emphasis to use of private coal and thereby reduce royalties collected.
- Higher royalty rates will decrease production and return.
- Higher royalty rates will increase the costs of electricity due to companies transferring increased costs to consumers.

Commenters stressed the importance of considering all components of return when evaluating fair return numbers. One commenter stated that wind and solar subsidies should be considered with determining coal rates, and another suggested conducting a full cost-benefit analysis.

Other comments recommended that the BLM reinstate the Royalty Policy Committee and that the Department of the Interior eliminate the current FMV criteria and replace it with a new partnership model between government agencies and private industry.

Issue 5.8 Coal Exports

Commenters stated support for Federal coal exports for the following reasons: the BLM would benefit from exporting coal and allowing for a greater return, exports are a lucrative market, exports would help other countries meet their energy needs, and countries would find other coal sources if they were not supplied with US coal. One commenter suggested that the government should assist coal producers in accessing international markets.

Other commenters stated opposition for coal exports for the following reasons:

- Burning coal for domestic use, as opposed to exporting it for foreign use, is cleaner and more efficient.
- Coal exports will discourage other countries from investing in renewable energy sources.
- Exporting federally subsidized coal artificially drives down the price of coal in the global market.
- The United States should not mine public lands to supply other countries with coal.
- It is only the BLM's objective to sell Federal coal to aid in meeting the nation's energy needs.
- Burning coal overseas will still impact domestic air quality and undermine climate policy.

Commenters suggested that impacts related to coal transportation must be evaluated when considering exports, additional fees should be imposed for Federal coal that is shipped out of the United States, and the United States should look at how other federally owned minerals are valued and apply that standard to coal.

Commenters also stated that the PEIS must fully analyze and assess the reasonably foreseeable impacts of coal exports that may occur as a result of future coal management.

One commenter stated that exports need to be considered in market demands, while others stated that exports are so low that even aggressive expansion would have no effect on Federal coal production.

Issue 5.9 Coal Reclamation

Commenters stated concern over the coal mine reclamation process, citing the following issues:

- Many mines on Federal lands have still not been reclaimed.
- Reclamation standards are elusive.
- Mining companies get by with no reclamation, due to self-bonding.
- It takes many years for mine reclamation to reach original flora and fauna conditions.
- Reclaimed lands are often susceptible to invasive or nonnative species.

Commenters also suggested the following:

- There should be no new leasing until existing mines are reclaimed and comply with environmental standards.
- A company's history with reclamation should be considered when determining new leases.
- Coal companies should be held responsible for reclamation responsibilities.
- Reclamation planning should begin at the time of the lease.
- Coal companies should be required to put up adequate funds for reclamation.
- Mine reclamation should be as contemporaneous as possible.
- Mine workers should be trained in restoring public lands.
- Reclamation standards should be revised.

Other commenters stated that claims that mining companies do not reclaim lands are unfounded and that reclaimed lands are often more productive and can support multiple uses, such as livestock grazing and wildlife habitat. One commenter stated that the BLM does not have the authority to monitor reclamation.

Issue 5.10 Coal Mitigation

Commenters stated support for identifying and analyzing mitigation strategies in the Draft PEIS, specifically suggesting that a new mitigation protocol be developed, compensatory mitigation be implemented, mitigation measures be applied to existing leases, greenhouse gas offset acquisition be required by lessees, and a mitigation fund from coal lease payments be established.

One commenter suggested that the existing climate is a finite resource, so mitigation measures to combat climate change are necessary under the Presidential Memorandum Mitigating Impacts from Natural Resource Development. Another commenter stated support for protecting essential habitat areas and waterways before relying on mitigation measures. One commenter questioned whether any mitigation can offset environmental impacts from coal mining and development.

Issue 5.11 Coal Transportation

Commenters expressed concern for the impacts that transportation of coal can have on air quality, water resources, biological resources, visual resources, public health, noise, quality of life, and traffic in local communities. Commenters specifically stated concern for coal dust from trains and long traffic jams at train crossings.

Commenters request that the PEIS provide a detailed analysis and assessment of how Federal coal is transported from mines to the source of consumption and provide the public with information and analysis on what the impacts of this transport are likely to be.

Issue 5.12 Methane Capture

Commenters stated that the PEIS should incorporate reduction strategies for mitigating methane emissions. One commenter stated that there should be a pause on production from mines that require a degasification system to vent methane, and others suggested that the BLM should move forward with the Mine Methane Waste Rule. A few commenters also noted that methane hydrates are a potential energy source.

Issue 5.13 Surface Owner Rights

Commenters stated that the PEIS should incorporate protections for surface owners, including addressing the uncertainty of future mining beneath private land and consideration of surface landowners in split-estate transactions.

4.6.8 Issue 6 Environmental Justice

Some commenters stated that low-income populations will be disproportionately affected by the loss of jobs and the increase in electricity prices as result of Federal coal reform. Others stated that low-income populations, the elderly, children, and communities of color would be disproportionately subjected to adverse environmental, health, and economic impacts from coal mining, downstream activities, and climate change effects.

4.6.9 Issue 7 Public Health and Safety

Commenters stated that coal miners suffer health impacts, including respiratory diseases, increased incidence of cancer, and traumatic injury resulting from unsafe mine conditions. In addition, commenters cited concern for the impacts on public health and safety for those who live or work near coal extraction sites, including exposures to toxic pollutants in air and water, such as selenium, benzene, mercury, and arsenic.

Commenters noted that additional, more widespread impacts on human health, including increased risk of respiratory disease, heart disease, and neurological disorders, occur from coal-fired power plant emissions and from health effects related to warming temperatures and climate change. Some commenters also noted that increased health risks are present for children, pregnant women, and senior citizens. Commenters suggested that coal companies should be held accountable for external costs and poor health effects related to mining and stated that all steps of the coal life cycle are harmful to human health.

4.6.10 Issue 8 Socioeconomics

Many commenters noted the positive economic impacts that coal mining has had on their communities, including employment, income, and tax and royalty revenue. Commenters also discussed the public projects and services funded by coal revenues.

Conversely, one commenter stated that coal communities are some of the poorest in the nation, and another suggested that Federal coal subsidies unfairly disadvantage coal producers and result in decreased economic contributions. Another commenter stated that federally leased coal mining is less labor intensive than private coal mining and creates fewer jobs.

Commenters stated that Federal coal reforms, such as increased royalty rates, could result in potential bankruptcies for coal companies and socioeconomic impacts, including the following:

- Direct loss of jobs and income in the coal mining industry
- Loss of secondary jobs supported by the industry and employee spending in coal mining communities

- Increased electricity prices, due to higher costs of less reliable alternative energy sources and the subsequent impact of less disposable income to spend elsewhere
- Loss of social benefits that come with providing affordable and reliable power to other industries at all hours (e.g., healthcare and the military)
- Jobs shifting to other countries when domestic coal is no longer competitive

Some commenters also noted that declining coal production would result in disproportionate economic impacts on rural communities.

Other commenters stated that climate change and environmental degradation resulting from coal mining affects certain industries, such as tourism and recreation. Others suggested that coal mining increases health care costs and associated decreases in workforce productivity and that traffic, noise, and pollution impact the quality of life for coal mining communities. Some commenters suggested that transitioning to renewable energy sources now would result in cheaper electricity rates and decreased costs from environmental and health impacts in the long term and would allow for economic diversification in coal mining communities.

Many commenters also recommended that assistance be available to help coal miners transition to other jobs and ensure a just transition of coal-dependent communities to a renewable energy future. One commenter warned that impacts on small businesses must be adequately analyzed to comply with the Regulatory Flexibility Act and the Small Business Regulatory Enforcement Fairness Act.

4.6.11 Issue 9 Tribal Interests and Native American Concerns

Commenters expressed concern for the impacts that coal mining has on tribal interests and suggested the following be considered during the PEIS process:

- Coal mining impacts on climate change and non-industrialized nations
- Requirements for consulting with tribes
- Environmental impacts on tribal lands
- Limits on coal transportation over tribal land
- Restrictions on mining, in view of religious or cultural sites
- Impacts on fishing rights and tribal traditions

Other commenters expressed concern for the impacts that changes in coal regulation would have on tribal funding from coal mining and stated that it

would further impede coal mining. One commenter stated that this would be an infringement on tribal sovereignty.

4.6.12 Issue 10 State's Interests and Concerns

Commenters had suggestions related to state involvement during Federal coal reform, including transferring public lands to the states, involving state officials in policy discussions, considering impacts on state resources and local governments, and revisiting Federal/state lease profit split agreements and setting "appropriate use" parameters. One commenter stated that it is important to consider the unique situations in individual states as part of the PEIS process (e.g., amount of coal mined, number of jobs, revenue, etc.).

4.6.13 Issue 11 Visual Resources

Commenters expressed concern for the impact that coal mining has on visual resources and stated distaste for the scarred landscape.

4.6.14 Issue 12 Water Resources

Commenters stated concern for water resource impacts, including the following:

- Contamination of surface and underground water sources and related concerns about contaminated domestic water supplies and impacts on wildlife
- Depletion of groundwater sources and impacts on other land uses
- Failure to properly reclaim the mined area, leading to failed water restoration and the associated water resource risks resulting from climate change, such as drought, flooding, and acidification

One commenter suggested that coal mining does not have an impact on water quality, due to National Pollution Discharge Elimination System permitting procedures in place.

4.6.15 Issue 13 Biological Resources

Commenters stated concern for biological resource impacts, including the following:

- Habitat fragmentation
- Impacts from river sedimentation
- Disturbance of vegetation and wildlife habitats and susceptibility of mined areas to invasive species
- Dangerous metals and compounds impacts on wildlife
- Construction and transportation impacts on wildlife

Many commenters also noted concerns with impacts on aquatic and avian wildlife caused by climate change, including habitat loss and ocean acidification. Conversely, some commenters stated that wildlife coexists with mining operations and often thrives on reclaimed mine lands.

One commenter stated that the BLM is required to initiate consultation with the Fish and Wildlife Service and the National Marine Fisheries Service at the PEIS level.

4.6.16 Issue 14 Other Resource Impacts

Commenters stated that the analysis should be at multiple scales and should consider impacts on additional resources and resource uses, such as night skies, geological risks like subsidence, other land uses, such as agriculture, and wilderness characteristics. Some commenters stated that reclaimed coal mines have a beneficial impact on grazing, and others noted impacts on adjacent lands, including National Parks, such as Bryce Canyon.

4.6.17 Issue 15 Renewable Energy

Commenters stated support for investing in renewable energy programs over coal mining operations, due to the decreased environmental impact and efforts to mitigate climate change. They suggested implementing programs to help coal miners transition to renewable energy jobs. Commenters also stated that there is enough coal currently under lease to last through a transition to renewable energy.

Other commenters expressed opposition to renewable energy, stating that solar and wind farms have visual impacts, kill wildlife, and still require mining, because they need rare earth minerals. Commenters also stated that solar and wind energy cannot be supported in the eastern the United States, due to lack of available space; also, it is not an economically feasible, reliable, or consistent energy source. In particular, commenters stated that government subsidies are required to make renewable energy competitive with fossil fuels and that these forms of energy result in reduced tax and royalty contributions. One commenter suggested embracing microgrids instead of large grid interconnections.

CHAPTER 5

FEDERAL COAL LEASING PROGRAM

The following chapter describes the Federal coal program and provides baseline information intended to provide context for the consideration of program reform opportunities. This chapter includes: authorities, other Federal agency roles and responsibilities, historical information, state of the coal industry information, coal leasing and production data, market projections for coal, greenhouse gas emissions, socioeconomic considerations, and an overview of the Federal coal leasing process. It is important to note that Secretarial Order 3338 specifically stated that the Order does not apply to the coal program on Indian lands, as that program is distinct from the BLM's program and is subject to the unique trust relationship between the United States and federally recognized Indian tribes and government-to-government consultation requirements, nor does it apply to any action of the Office of Surface Mining Reclamation and Enforcement or the Office of Natural Resources Revenue.

5.1 AUTHORITIES

The Mineral Leasing Act of 1920, as amended (30 USC 181 et seq.), authorizes and governs leasing of public lands for developing deposits of coal, oil, natural gas, and other minerals. The Mineral Leasing Act gives the BLM responsibility for managing coal leasing on approximately 570 million acres of mineral estate that is owned by the Federal government, where coal development is permissible. Depending on the location, the surface estate of these lands is managed by the BLM, United States Forest Service, private landowners, state landowners, or other Federal agencies. Regulations that govern the BLM's coal leasing program may be found in Parts 3000 and 3400 of Title 43 of the CFR. As described below, other Federal and state agencies are responsible for regulating the environmental effects of coal mining, issuing permits to operators, collecting fees from the development of Federal coal, mine reclamation, and ensuring the health and safety of mine operations.

The Federal Coal Leasing Amendments Act (FCLAA) of 1976, as amended, (P.L. 94-377; 90 Stat. 1083–1092) updated sections of the Mineral Leasing Act, focusing on issues related to FMV and speculation. The FCLAA repealed the noncompetitive preference right leasing system for coal and required all new leases to be sold in a competitive bidding process. The FCLAA banned the BLM from accepting any bid less than the estimated FMV of the lease. It tightened diligent development and continuous operation requirements, and made enforcement of these provisions nondiscretionary. The FCLAA also established the principle of Maximum Economic Recovery, and facilitated the consolidation of leases into logical mining units for maximum economic recovery. To help with recovery of less accessible coal, the law authorized the BLM to make carefully justified and controlled modifications to a company's royalty rate or lease terms.

The FLPMA (43 USC 1701 et seq.) establishes the broad framework under which BLM manages public lands today. FLPMA established a unified, comprehensive, and systematic approach to managing and preserving public lands in a way that protects "the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values." It established the principles of land use planning to guide the BLM in making its land management decisions. This framework required Federal land managers to balance conflicting demands on the land: productivity, environmental values, recreational opportunities, and economic return. FLPMA also required that the BLM ensure receipt of FMV in return for private extraction of public resources, and tasked the agency with considering likely future land uses, environmental concerns, and the protection of lands with wilderness characteristics when making long-term management decisions.

The SMCRA of 1977 (30 USC 1201 et seq.) is the primary Federal law that regulates the environmental effects of coal mining in the United States. SMCRA essentially created two programs: one for reclaiming pre-SMCRA abandoned mine lands and the other for regulating active coal mines. Title IV of SMCRA established the Abandoned Mine Reclamation Fund, supported by a fee on every ton of coal produced, to reclaim mine lands abandoned before the passage of SMCRA. Title V of SMCRA sets minimum performance standards for environmental protection and public health and safety that apply to surface coal mining and reclamation operations, surface effects of underground coal mining operations, and surface coal mining in special areas or in special circumstances (such as steep slope mining). A person who proposes to conduct surface coal mining and reclamation operations (which include surface effects of underground mining by definition) must apply for and receive a permit, which incorporate provisions of SMCRA and regulations (or the state equivalent), and must post performance bonds to cover the costs of reclamation.

In general, SMCRA establishes a program of cooperative federalism that allows a state or tribal regulatory authority (RA) to assume primary jurisdiction

(primacy) over the regulation of surface coal mining and reclamation operations within its borders once its regulatory program has been approved by the Secretary of the Interior. SMCRA requires that a state or tribal program demonstrate that the state's or tribe's rules and regulations are consistent with regulations issued by the Secretary pursuant to SMCRA. The OSMRE is responsible for ensuring that SMCRA is being enforced directly in Federal program states and tribes and through oversight of primacy states and tribes in order to ensure that each state and tribal RA is enforcing its counterparts to the Federal regulations.

The Energy Policy Act of 2005 (PL 109–58, 119 Stat. 594-1143) included five sections related to the Federal coal program, which involved increasing the cumulative acreage allowed for coal lease modifications, establishing a new mechanism to extend a logical mining unit beyond 40 years, providing new bonding provisions for payment of the remaining balance of a deferred bonus bid, changing the requirements for advance royalty payments, and changing the timing for development plan submission. Draft BLM regulations have been developed to implement those sections but have not yet been finalized (78 FR 49080-103, August 12, 2013). The BLM issued the following interim guidance documents to implement the Energy Policy Act of 2005:

- Advance royalty guidance (Energy Policy Act of 2005 Section 434) is provided in BLM-WO-IM-2006-127.¹⁴
- Deferred bonus bids guidance (Energy Policy Act of 2005 Section 436) is provided in BLM-WO-IM-2006-045.¹⁵
- Guidance regarding increased acreage for lease modification (Energy Policy Act of 2005 Section 432), which increased the limitation for lease modifications from 160 acres to 960 acres, is provided in BLM-WO-IM-2006-004.¹⁶

5.2 OTHER FEDERAL AGENCY ROLES AND RESPONSIBILITIES

The OSMRE within the Department of the Interior is responsible for carrying out the requirements of SMCRA in cooperation with states and tribes. OSMRE ensures that coal mines are operated in a manner that protects citizens and the

Washington, DC. Available at https://www.blm.gov/wo/st/en/info/regulations/Instruction_Memos_and_Bulletins/national_instruction/2006/im_2006-045__.print.html

¹⁶BLM. 2005. Instruction Memorandum No. 2006-004. Interim Guidance for Implementation of the Energy Policy Act of 2005 [P.L. 109-58] for Federal Coal Leasing. Washington, DC. September 30, 2016. https://www.blm.gov/wo/st/en/info/regulations/Instruction_Memos_and_Bulletins/national_instruction/2006/im_2006-004__.html

environment during mining and assures that the land is restored following mining. The OSMRE and the approved State RAs oversee the issuance of mine permits and reclamation bonding. SMCRA provides, however, that approval of mining plans under the Mineral Leasing Act cannot be delegated to the State RAs (30 USC 1273(c)). As a result, OSMRE is responsible for making a recommendation to the Secretary as to whether to approve, disapprove, or approve with conditions a mining plan or mining plan modification (30 CFR part 746). As part of this process, OSMRE notifies the BLM of any mine permit application on Federal lands and provides an opportunity for the BLM's input before it makes a recommendation to the Assistant Secretary of the Interior, Land and Minerals Management. SMCRA also requires OSMRE to work to mitigate the effects of past mining by pursuing reclamation of pre-SMCRA abandoned coal mines. However, despite remarkable achievements in reclamation of many abandoned coal mine sites that existed prior to the enactment of SMCRA, there remain more than \$4 billion worth of high priority health and safety coal-related abandoned sites in OSMRE's Abandoned Mine Land Inventory System (e-AMLIS) to be reclaimed.

The Office of Natural Resource Revenue (ONRR) within the Department of the Interior manages and ensures full payment of revenues owed for the development of the nation's energy and natural resources on the Outer Continental Shelf and onshore Federal and Indian lands. The ONRR collects, accounts for, and verifies natural resource and energy revenues due to states, American Indians, and the US Treasury, which includes product valuation. The ONRR coordinates with other Department of the Interior entities, including the BLM, Bureau of Indian Affairs, and Bureau of Ocean Energy Management (BOEM) to support the Department's management of oil, gas, coal, and other natural resources. The BLM works closely with the ONRR to ensure that the coal lessees are reporting coal production, sales, and inventory, which serve as the basis for revenue collection. The ONRR will notify the BLM if revenues are not being paid, and the BLM will enforce the terms and conditions of the lease, which may result in lease cancellation procedures.

The Mine Safety and Health Administration (MSHA) within the Department of Labor is delegated the responsibility of enforcing the Federal Mine Safety and Health Act of 1977, as amended, (30 USC 801 et seq.) and the Mine Improvement and New Emergency Response Act of 2006 (P.L. 109-236; 120 Stat. 493-505). MSHA works to prevent death, illness, and injury from mining and to promote safe and healthful workplaces for US miners. The agency develops and enforces safety and health rules for all US mines, and it provides technical, educational, and other types of assistance to mine operators. MSHA works cooperatively with industry, labor, and other Federal and state agencies to improve safety and health conditions for all miners in the United States. The BLM coordinates closely with MSHA in approval of the Resource Recovery and Protection Plans (R2P2) for each lease to assure the R2P2 are consistent with MSHA safety requirements and approved safety plans.

Other surface management agencies participate in the Federal coal leasing process. As previously stated, the Mineral Leasing Act gives the BLM responsibility for managing coal leasing on the mineral estate that is owned by the Federal Government. Depending on the location, the surface estate of these lands could be managed by the BLM, United States Forest Service, private landowners, state landowners, or other Federal agencies. The BLM is required to receive consent or concurrence from the appropriate surface management agency before issuing a lease or approving an exploration plan (43 CFR, Subparts 3425.3[b], 3482.2[a][1]). This occurs most frequently with coal reserves underlying National Forest System lands. In these cases, the BLM is required to apply any stipulations provided by the Forest Service to a lease or reject the lease application if the Forest Service does not give its consent.

5.3 HISTORICAL PERSPECTIVE

Prior to passage of the Mineral Leasing Act of 1920, the Coal Lands Acts of 1864 and 1873 provided for the public auction of lands containing coal for private ownership and extraction. The passage of the Mineral Leasing Act took place in the context of a larger national debate about public land management. Until that point, Federal land policy had consistently been aimed at encouraging economic development of natural resources. Homesteading, railroad grants, state land grants, forestry programs, and the patenting process all sought to stimulate settlement, especially in more sparsely populated western lands. By the early 20th century, however, an opposing philosophy of managed development asserted that the public deserved compensation for private profit made on Federal land. The Mineral Leasing Act was the first in a series of laws that sought to balance development with revenue collection and management of leasing scale and location by the Federal government.

In 1920, the Mineral Leasing Act consolidated management of Federal coal resources with oil, natural gas, and certain other minerals and established a system of managed leasing of minerals on Federal lands. This allowed the government and tribes to retain control of public and tribal minerals and property while still encouraging development of the mineral resources they contained. This new program established the expectation that the public should be compensated for minerals mined on public land, and granted the Federal government control over the location and scale of that mining. It introduced the concepts of setting leasing levels, competitive bidding, and production royalties. The Mineral Leasing Act, along with amendments to the Act, forms the basis of the current Federal coal program.

From the passage of the Mineral Leasing Act to the early 1960s, low demand led to very little Federal coal leasing. The coal that was produced was typically in small quantities for railroad or local use, reflecting the absence of any large-scale demand for western coal. The 1960s saw an uptick in Federal coal leasing as interest in western coal began to increase. While from 1920 to 1960 Federal coal leasing averaged slightly more than 4 leases per year, the 1960s averaged 31

leases issued per year. However, many of these leases were speculative. By 1973, over 70 percent of the Federal coal leases ever issued had not produced any coal.

Public opposition to new hydroelectric dams and nuclear power that occurred in the 1960s combined with the formation of the Organization of the Petroleum Exporting Countries (OPEC) spurred increases in oil and gas prices, which positioned coal as the principal power plant fuel in the United States. Additionally, the passage of the CAA of 1970 created new incentives for cleaner burning, low-sulfur western coal. Utilizing this low-sulfur coal allowed coal-fired power plants to attain the standards set forth in the CAA of 1970 without the need to install costly flue-gas desulfurization units. The shift to western coal also spurred the construction and operation of a number of mine mouth power plants (i.e., power plants built on site at the coal mine) in part due to the cost benefits of shipping electricity through power lines compared with shipping coal by rail.

The interest in the vast reserves of western Federal coal brought new scrutiny to the management of the resource. As noted above, many leases in the west were being held in speculation and had not produced any coal. Concerns regarding speculation and nonproductive leases, as well as a lack of a clear regulatory framework, motivated the Department of the Interior to place a moratorium on Federal coal leasing in May 1971. Congress passed both FCLAA in 1976 and SMCRA in 1977. These two acts fundamentally changed the authorizing framework for the Federal coal program, thus requiring a programmatic review of the Federal coal leasing program to establish a new implementing regulatory structure. In 1979, the BLM published the Final Programmatic Environmental Statement Federal Coal Management Program.¹⁷ The final rulemaking was published on July 19, 1979 (44 Fed. Reg. 42584). The results of this effort provided the framework for a largely revised coal leasing program, including guidance for the administration of existing leases, the processing of Preference Right Lease Applications, and the review of Federal lands to determine unsuitability for certain types of mining. The new final regulations established standards and procedures for determining when, where, and how to lease Federal coal (principally through competitive sales under a regional leasing program) and implemented FCLAA, as well as those aspects of SMCRA that were under the BLM's authority. As a result of these reforms, the moratorium was lifted in January of 1981.

The Powder River Basin of Wyoming held its first regional coal lease sale under the new program in 1982. However, irregularities with the sale led to questions as to whether the BLM had realized a FMV for the leases. These concerns prompted Congress to create the Commission on Fair Market Value Policy for

¹⁷ The 1979 programmatic review document was titled "Programmatic Environmental Statement." The subsequent supplement used the more modern terminology "Programmatic Environmental Impact Statement."

Federal Coal Leasing (known as the Linowes Commission) chaired by economist David F. Linowes, who had recently chaired Congress's Commission on the Fiscal Accountability of the Nation's Resources. Congress instituted another leasing moratorium during the Linowes Commission's review, which concluded 90 days after the publication of the Commission's report in February 1984.¹⁸ The report provided 36 recommended changes to the Federal coal leasing program, some of which were gradually implemented over the next several years, while others were not. A key recommendation of the Linowes Commission was that "[t]he government should establish and announce in a timely fashion a coal leasing schedule to promote predictability and stability of federal leasing actions. In doing so, the government should have the flexibility to change the timing of lease sales and the quantity of coal offered based on its assessment of market conditions." The BLM published a Supplement to the Final Programmatic EIS of 1979 in October 1985 in response to these recommendations.

As a result of the Commission's report, the Department of the Interior revised the coal regulations to incorporate a two-tiered leasing structure. In certified coal producing regions where exploration and new mining was occurring, the BLM, through the Regional Coal Teams, would select tracts for lease sale. In areas outside of coal producing regions, mining companies would apply for specific tracts of lands to be leased (i.e., LBA), generally adjacent to their existing mines, also known as maintenance leasing. Notwithstanding this initial effort to inject competition into the lease sale process by planning in advance what resources were offered for sale in a region, the changes were short lived. Between 1987 and 1990, all six coal producing regions were "decertified" by the BLM, which cited considerations such as weak current and projected coal market conditions, the level of leasing interest in Federal coal and new mine development, public input, and views expressed by the Regional Coal Teams and the affected governors.¹⁹ This had the effect of replacing the competitive regional leasing process with the LBA process.²⁰ Today, there are no regional

¹⁸ The coal leasing moratorium was not lifted upon publication of the Commission's report. Interior Secretary William P. Clark extended the suspension of coal leasing (with exceptions for emergency leasing and processing preference right lease applications, among other things) while the Interior completed its comprehensive review of the program. This review included proposed modifications to be made by the Department in response to the Linowes Commission, as well as other reports. Secretary Clark announced on August 30, 1984, that the Department of the Interior would prepare an EIS supplement to the 1979 Final Environmental Statement for the Federal Coal Management Program. The Department issued the Record of Decision for the PEIS supplement in January 1986, in the form of a Secretarial Issue Document. This document recommended continuation of the leasing program with modifications. In conjunction with those modifications, Secretary Donald Hodel lifted the leasing moratorium in 1987.

¹⁹ BLM Handbook, H-3420-1, *Competitive Coal Leasing*, allows a lead state director to request decertification of a designated coal production region if this is the course recommended by the Regional Coal Team. A proposal to decertify a designated coal production region must be announced in the *Federal Register* (H-3420-1, Rel. 3-325).

²⁰ BLM. 1999. Public Participation in Coal Leasing. Final Rule. *Federal Register* Vol 52. Pp. 239-240. September 28, 1999. Available at <https://www.blm.gov/nhp/news/regulatory/3400-3420/3400-20f.pdf>

lease sales, and all new leasing is done through either the LBA process or lease modifications.

The Federal coal program remained relatively unchanged throughout the 1990s and 2000s. During that time, the Powder River Basin became the primary area of Federal coal leasing and production, and Federal coal commanded a much larger share of national coal production. The Federal coal program was last reviewed in 2013 by the Department of the Interior OIG and the GAO in two separate audits.^{21,22} The OIG and GAO focused their specific recommendations on improving existing agency procedures (such as how to conduct FMV appraisals), however, both reviews made clear that Federal coal lease sales continue to suffer from a fundamental lack of competition under the LBA process. While BLM LBA sales are conducted through a competitive bidding process, the GAO noted that in fact, of the 107 tracts leased from 1990 to 2012, “sales for 96 (about 90 percent) involved a single bidder...which was generally the company that submitted the lease application. More than 90 percent of the lease applications BLM received were for maintenance tracts used to extend the life of an existing mine or to expand that mine’s annual production.” Combined, the audits resulted in 21 recommended changes to the BLM’s coal program covering coal leasing and exports, inspection and enforcement activities, transparency of the process, and timely processing of royalty rate reduction applications. The BLM addressed all 21 recommendations in new BLM guidance (including two new manuals and handbooks²³) and development of additional mine inspector and valuation training.

Many stakeholders expressed concerns that BLM’s corrective actions, while helpful, were insufficient to rectify fundamental weaknesses in the program. To further explore these concerns, Secretary Jewell and the BLM hosted a series of listening sessions in March 2015 across the country to hear from the public their views on what, if any, reforms were seen as needed to the Federal coal program.

In response to the broad range of issues raised over the course of the past few years and through the listening sessions, on January 15, 2016, Secretary Jewell issued Order 3338 (see **Section 2.2**). The Order directs the BLM to carry out the following:

- I. A formal, comprehensive review of the Federal coal program through a discretionary programmatic EIS under NEPA

²¹ OIG. 2013. Final Evaluation Report-Coal Management Program. CR-EV-BLM-0001-2012. June 11, 2013 Available at <https://www.doi.gov/sites/doi.gov/files/CR-EV-BLM-0001-2012Public.pdf>;

²² GAO. 2013. Coal Leasing: BLM Could Enhance Appraisal Process, More Explicitly Consider Coal Exports, and Provide More Public Information. GAO-14-140. Published December 18, 2013. Publicly Released February 4, 2014. Available at <http://www.gao.gov/products/GAO-14-140>.

²³ US EIA. 2016. Changing US Energy Mix Reflects Growing Use of Natural Gas, Petroleum, and Renewables. July 21, 2016. Available at <http://www.eia.gov/todayinenergy/detail.php?id=27172>

2. A pause on significant new coal leasing decisions on public lands while the programmatic review is underway, with limited, enumerated exemptions and exclusions
3. A series of good government reforms to improve transparency and program administration, including establishing a public database to account for the carbon emissions from fossil fuels on public lands

5.4 STATE OF THE COAL INDUSTRY

According to the US Energy Information Administration (EIA), US coal consumption declined by more than 12 percent in 2015, relative to 2014, and is now at its lowest level since 1982.²⁴ New mine starts are very rare, and mining generally occurs in mature basins where there are active mines with known additional reserves. When existing mines need to secure additional coal reserves, it is generally to maintain current production levels necessary to fulfill existing contracts. The greatest percentage of Federal coal can be classified as “thermal” coal and is used for electrical generation. Approximately 33 percent of the nation’s electricity was produced from coal in 2015. Coal produced from Federal leases is generally sold into the domestic market, and at this time, only a small share of coal produced in Federal coal producing states is exported. For instance, coal exports from the Powder River Basin (where most Federal coal is located) were approximately 10 million tons (2.5 percent) out of the 404 million tons produced in 2015.²⁵ The reasons for a softening market are varied, but include a reduction in coal-fired generating capacity is primarily due to the decrease in natural gas prices, the aging coal fleet, and expanded requirements that coal plants install pollution controls. There has been an increase in coal companies filing for bankruptcy, which began in 2012 and recently included three of the nation’s largest producing companies.

5.4.1 Energy in the United States

Coal has been a significant contributor to total US energy consumption since the industrial revolution when steam-powered ships and railroads dominated transportation. In the latter half of the 1800s, coal was first used to generate electricity.²⁶ However, its role has decreased substantially over the past century (see **Figure 5-1**). At the beginning of the 20th century, coal provided for 75 percent of all US energy consumption with biomass and hydroelectric generation also providing significant sources of energy. By the mid-20th century coal had dropped to 36 percent of total US energy consumption in large part due to the role of increased demand for petroleum and mass production of the automobile. As natural gas consumption quadrupled over the next half century

²⁴ US EIA. 2016. Changing US Energy Mix Reflects Growing Use of Natural Gas, Petroleum, and Renewables. July 21, 2016. Available at <http://www.eia.gov/todayinenergy/detail.php?id=27172>

²⁵ Woods Mackenzie. 2016. Powder River Basin Coal Supply Summary. June 2016.

²⁶ US Department of Energy. 2013. A Brief History of Coal Use. February 12, 2013. Available at http://www.fe.doe.gov/education/energylessons/coal/coal_history.html

and nuclear energy was developed, coal's share of total energy consumption decreased to 23 percent of total energy consumption by 2000.²⁷

Since the turn of the century, energy consumption from natural gas has increased by nearly another 20 percent in large part due to advances in hydraulic fracturing. Renewable energy, such as wind and solar, have also become more cost competitive and widely available over the past 5 years. Energy demand growth has also slowed relative to historical averages due to some shifting from a manufacturing-based economy to a services-based economy and demand side energy efficiency breakthroughs. By 2015, coal constituted just 16 percent of total energy consumption in the United States. Early 2016 data suggest that its share will be even smaller as coal production and consumption reached multi-decade lows throughout the first three quarters of the year.²⁸

Figure 5-1. US Energy Consumption by Fuel Type

Source: EIA 2016²⁹

5.4.2 Major Coal Basins and Characteristics

Major coal fields of the United States are shown in **Figure 5-2**. For the purposes of this overview in the scoping report, coal mining in the United States is divided into three primary regions: Appalachian, Interior, and Western.³⁰ In 2015, 42 percent of all coal produced in the United States came from Federal lands. The vast majority of coal mined on Federal lands (more than 99 percent)

³⁰ The regional breakdown in the PEIS may differ from the overview in the scoping report.

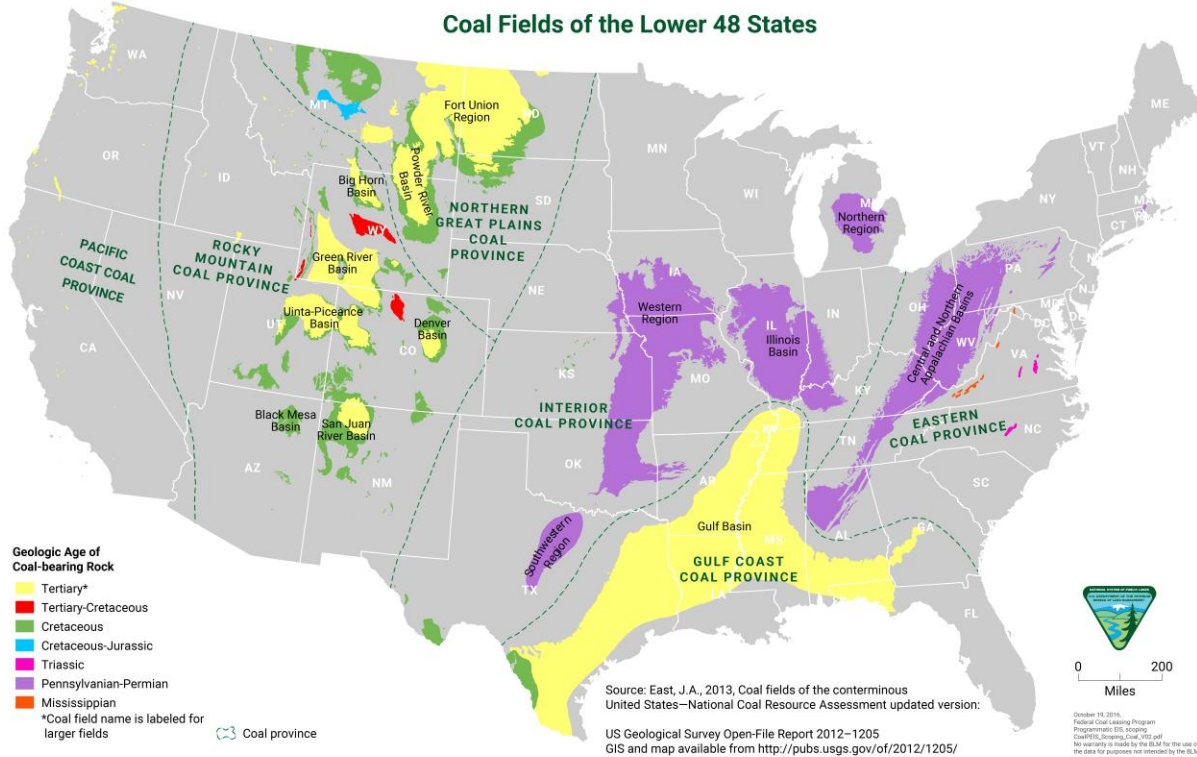

Figure 5-2. Coal Fields of the Lower 48 States

is located in the western region. Of the 306 active Federal leases in 2015, all but six of those leases were located in the western region.³¹ More narrowly, nearly 90 percent of the coal mined on Federal lands occurs in the Powder River Basin located in Wyoming and Montana. Any changes to the Federal coal program will have a more direct impact in the western region and Powder River Basin due to this heavy concentration of leases and production from the Federal estate.

As described below, coal has different characteristics in energy content and environmental properties that vary both within and between basins. The variation in the characteristics of coal typical to each basin can be significant, and, therefore, coals are not perfect substitutes for each other. For example, some western coals have less energy content than some eastern counterparts. Therefore, it takes more tons of these western subbituminous coals as compared with eastern bituminous coals to generate a given amount of electricity. Moreover, some power plants are designed to best accommodate certain ranks of coal. Coal switching is possible at most plants, but they may

³¹ BLM. 2016. Total Federal Coal Leases in Effect, Total Acres Under Lease, and Lease Sales by Fiscal Year Since 1990. July 7, 2016. Available at http://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy/coal_lease_table.html

need modifications (such as increased material handling capacity) to accommodate a different coal rank.

Production from the western coal region is largely comprised of the Powder River Basin subbituminous coal and other western bituminous coals. Among coal nationwide, the Powder River Basin is the single largest producing basin. In 2015, approximately 44 percent of United States coal production came from the Powder River Basin.³² It is generally the lowest cost coal to produce due to thick coal seams reaching up to 400 feet and the proximity of the coal seams to the earth's surface, which allows surface mining generally. The subbituminous coal has lower heat content generally ranging from 8,200 to 8,900 Btu (British thermal units)/lb and lower sulfur content.³³ Due to both its low-heating value per ton and its distance from the eastern United States, where many coal-fired power plants are located, transportation costs become more significant for this basin.

Other Federal coal production occurs in the western bituminous region comprised of mines in Colorado, Utah, Arizona, southwestern Wyoming, and New Mexico. These western bituminous coals generally have higher mining costs due to thinner seams generally in the 5-15 feet range, though they tend to have higher heat content on average than the Powder River Basin coal. Outside of the Powder River Basin states of Wyoming and Montana, Colorado and Utah are the next highest producing coal states on Federal lands. They are generally considered to be high-quality coals, having high energy value and low sulfur content (averaging around 11,000 Btu/lb), and many have a 1.2 pound or less of sulfur dioxide content (SO₂/mmBtu). Like the Powder River Basin, the western bituminous region is mainly utilized as thermal coal as well. However, there is one mine that produces a significant amount of metallurgical coal. Metallurgical coal is generally higher in carbon content and calorific value and is used in the production of steel rather than electricity generation purposes.

The Appalachian region is generally characterized as having three basins: the southern Appalachian, central Appalachian, and northern Appalachian coal basins. Coal produced in these basins generally have higher mining costs than the rest of the country as the coal seams are, on average, thinner and deeper relative to other regions. This results in high strip ratios for surface mines (the amount of material/earth that must be removed in order to remove a unit of coal), which drives up capital and operating cost, or underground mining operations which also drive up costs. The region is predominantly bituminous coal with high energy and low sulfur content. Higher energy content allows power plants to consume less coal to extract a given amount of energy. It also

³² US EIA. 2016. Coal Production and Number of Mines by State and Mine Type, 2015 and 2014. Annual Coal Report. November 3, 2016. Available at <https://www.eia.gov/coal/data.php#production>

³³ A small amount of bituminous coal occurs within the Powder River Basin in the Bull Mountain coalfield. See Woods Mackenzie. 2016. Powder River Basin Coal Supply Summary. June 2016.

has the advantage of being located in the east, where the majority of electricity demand and coal generation occurs, making transportation from mine to power plant relatively less expensive. Nevertheless, the Appalachian region is generally characterized as the highest cost coal of the major regions with the southern basin being the highest, followed by central and northern Appalachian basin coals.

The Interior region is largely comprised of the Illinois Basin, Gulf Lignite, and Western Region (Interior) coals. The Illinois Basin is the largest producing basin in this region and is comprised of bituminous coal with slightly less heat content than Appalachian coals on average. The coal seams are most often in the 1- to 10-foot thickness range and are generally located at depths less than 1,000 feet. Coal mining costs are lower in this region relative to the Appalachian due to more favorable seam thickness, mining conditions, and advances in long-wall mining technology. The coal mines also have the advantage of being at the center of the coal transportation network with all four major rail lines having a presence in the area, as well as the Ohio and Mississippi River barge traffic. Gulf lignite coal generally has much lower heat content and is, therefore, usually only transported short distances or used at mine mouth power plants.

The Western Region of the Interior is small in terms of production capacity and coal reserves. It is mainly comprised of Kansas and Oklahoma. These are bituminous coals that have high heat content and high sulfur content with a relatively high extraction cost. Oklahoma has some coal mines located on Federal leases that account for approximately 0.1 percent of Federal coal production.

5.4.3 Maintenance Leasing

Since the last remaining certified coal producing region was decertified in 1990, all Federal coal leasing has been made up of maintenance leases issued through the LBA process where tracts are nominated by an applicant (see **Section 5.3**). The areas where the BLM currently manages leases support a mature industry (i.e., existing mines that are well-established with all necessary infrastructure, equipment, rail facilities, etc.) and where opening new mines has proved to be cost prohibitive. This has led to the majority of existing lease sales only receiving one bid, typically from the operator of a mine adjacent to the new lease. While the Mineral Leasing Act, as amended, requires competitive leasing, the nature of the current coal industry is not generally conducive to multiple bidders bidding against each other for the same tract. The BLM, however, takes a number of steps in the LBA process to create as competitive an environment as possible.

In those unique areas where a lessee for an existing mine applies for a lease and other mines are nearby or adjacent, the BLM routinely reconfigures the proposed lease tract to try to make the tract attractive as a potential maintenance lease for those other nearby or adjacent mines, in addition to the applicant. However, the majority of coal mines do not adjoin or abut another

coal mine, and even if the mines adjoin or abut, the prospective lease might not be reconfigured for increased competition due to local physical limitations in geology and ownership.

The BLM recognizes that to remain truly competitive in a one-bidder environment, the pre-sale estimate of the tract's FMV must not only be factually supported and defensible, but also kept confidential. For a bidder to successfully win a Federal coal lease sale, the bid must meet or exceed the BLM's pre-sale estimated FMV. The BLM follows established appraisal methods in estimating the value, and the Office of Valuation Services (OVS), Division of Mineral Evaluation (DME) reviews each evaluation to assure it follows established procedures, is rational, and is supported by facts.

The BLM's pre-sale estimated FMV functions similarly to a "reserve value" in an auction. The result is that even if a sale receives only one bid, the bidder is "playing against the house" with the BLM's confidential pre-sale FMV estimate representing the lowest possible bid that can be accepted. After the coal lease sale, the BLM reviews the bids received and if none meets or exceeds the pre-sale estimated FMV (as reviewed by OVS), the BLM will reject all bids and may, at its discretion, re-offer a lease sale. Therefore, the lease applicant is cognizant of the real possibility that the years of planning and NEPA review and associated costs may result in not being awarded the lease if they do not provide a sufficient bid.

As seen in **Figure 5-3** below, over the period from 1990 to 2015, the BLM has generally leased Federal coal at approximately the same rate it has been mined. This trend supports the goal of the FCLAA to restrict speculation in Federal coal reserves. Leasing Federal coal at a rate that exceeds the rate at which it has been mined would be an indicator of increased speculation. Since 2012, the amount of Federal coal leased has been significantly less than the amount of Federal coal mined. This drop in leasing levels is reflective of the decline in the US and global coal market (see **Section 5.4.5**).

5.4.4 Reserves

The United States leads the world in demonstrated reserve base for coal. As of 2016, the EIA estimated the United States had 477 billion tons of a demonstrated reserve base with approximately 255 billion tons being identified as recoverable.³⁴ Recoverable reserves at currently producing mines are approximately 18.3 billion tons.

Averaged across all Federal leases, at the end of 2015, there were approximately 20 years of production of Federal coal reserves under lease, assuming continued production at recent levels (approximately 375,000,000

³⁴ US EIA. 2016. US Coal Reserves. November 4, 2016. Available at <http://www.eia.gov/coal/reserves/>

Figure 5-3. Cumulative Tons of Federal Coal Leased Versus Mined

Source: BLM 2016³⁵

tons/year in 2015).³⁶ It is important to put this number into context, however, since it represents an average.

Mines under existing lease in the Powder River Basin, which accounts for nearly 90 percent of the total annual Federal coal production, cumulatively hold approximately 25 years of Federal reserves, assuming current production levels.^{37,38,39,40} But for states and especially for individual mines, both within and outside of the Powder River Basin, there is quite a lot of variation in the years of remaining Federal reserves.

For instance, since Kentucky has a relatively small amount of leased Federal reserves (approximately 4.8 million tons) and low annual Federal production

³⁵ BLM. 2016. Total Federal Coal Leases in Effect, Total Acres Under Lease, and Lease Sales by Fiscal Year Since 1990. July 7, 2016. Available at https://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy/coal_lease_table.html

(approximately 29,000 tons in 2016), the state has nearly 160 years of production remaining in Federal coal leases, assuming current production levels. Utah, on the other hand, has approximately 96 million tons of Federal reserves leased with an annual Federal production of about 12 million tons in 2016. This amounts to approximately 8 years of remaining Federal reserves, assuming current production levels.⁴¹

The BLM estimates that, as of September 2016, there are approximately 7.4 billion short tons of coal reserves available under existing leases (see **Table 5-1**).⁴²

5.4.5 Production

The BLM currently administers 306 coal leases encompassing over 462,000 acres in 10 states, with an estimated 7.4 billion tons of recoverable coal. Between 80 and 90 percent of coal produced in the United States is used for domestic electricity generation, with the remainder primarily being exported and used for industrial purposes.^{44,45,46} In 2015, US coal production levels experienced one of its steepest declines since recordkeeping began. Production levels decreased from over 1 billion tons in 2014 to just under 0.9 billion tons in 2015.⁴⁷

*"Other" reflects coal produced on Federal leases, but state and county information is withheld in order to not reveal proprietary data. For example, North Dakota production from Mercer County is withheld in 2010 due to proprietary data concerns, and instead placed in the "other" category.

According to the most recent EIA Short-Term Outlook, 2016 coal production is expected to decrease by 138 million tons (15 percent), which would be the largest annual decline based on data going back to 1949.⁴⁹ These reductions have been felt most sharply in the Appalachian basin, particularly Central Appalachian coal, but are also observed in other basins with significant declines in the Powder River Basin production. These reduced production levels are driven by a variety of factors, including low natural gas prices, which drives some displacement of coal-fired electric generation by natural gas-fired generation.⁵⁰ In addition to low natural gas prices, reduced electricity demand growth, pollution control requirements, and a number of other reasons are cited by the EIA and industry for recent coal plant retirements that totaled 41 gigawatts (GW) between 2010 and 2015.^{51,52} The coal plants anticipated to retire between 2015 and 2022 accounted for 30 GW and 56 million tons of 2014 coal deliveries. From the Powder River Basin alone, over 32 million tons of 2014 Powder River Basin deliveries (9 percent) were to plants expected to

⁵² US EIA. 2015 Form 860. Schedule 3 "Generator Data (Retired and Canceled Units)"

retire by 2022. These drivers, along with other market and regulator drivers, are discussed in more detail below.

Coal prices have fallen in recent years, in large part due to shrinking demand. As annual coal production in 2016 is expected to be more than 24 percent lower than 2014 levels, producers have focused on minimizing coal production costs and closing higher cost mines over the past several years.⁵³ Lower petroleum prices have also helped reduce mining cost. The nationwide average delivered coal price was \$2.38/mmBtu in 2012, but dropped to \$2.14/mmBtu by 2016.⁵⁴

5.4.6 Main Drivers of Coal Demand

The demand for US coal is driven by a variety of market and regulatory factors. Electricity demand growth, installed coal-fired generating capacity, the relative prices of alternative fuel sources, coal demand from the domestic metallurgical and industrial markets, net US exports of coal, and existing and proposed environmental rules all affect the future supply and demand for US coals, which in turn affect coal pricing. The price of US coals drives domestic coal production. Several of the market and regulatory drivers impacting coal-fired electricity production and, consequently, demand for US coal production are highlighted below.

Market Drivers

Natural Gas Price

The availability and the price of natural gas is one of the single biggest drivers of US coal demand. As noted above, the bulk of coal demand in the United States stems from electricity generation. As a fuel for electricity generation, coal primarily competes with natural gas generation, as both are dispatchable resources that can be ramped up or down in response to market dynamics. Together, the two fuel sources account for approximately two-thirds of the electricity generated in the United States.

The breakthroughs in the cost and performance of hydraulic fracturing technology in the late 2000s increased the supply of domestic natural gas for electricity generation while lowering the cost. The Henry Hub natural gas spot price dropped significantly following this technology maturation. Prices were near \$13.00/mmBtu in June of 2008, but had dropped to less than \$3/mmBtu in June of 2015.⁵⁵ Natural gas gross withdrawals rose by more than 25 percent over this time frame.⁵⁶

⁵³ US EIA. 2016. Short-Term Energy Outlook. US Coal Production Figure. December 2016. Available at <http://www.eia.gov/forecasts/steo/data.cfm?type=figures>

⁵⁴ US EIA. 2016. Short-term Energy Outlook. December 6, 2016. Available at <http://www.eia.gov/beta/steo/#?v=8>

⁵⁵ US EIA. 2016. Henry Hub Natural Gas Spot Price. Available at <https://www.eia.gov/dnav/ng/hist/rngwhhdd.htm>

⁵⁶ US EIA. 2016. Natural Gas Gross Withdrawals and Production. Available at https://www.eia.gov/dnav/ng/ng_prod_sum_a_EPG0_FGW_mmcf_a.htm

The lower natural gas price enabled natural gas-fired generation to become more competitive with coal-fired generation. In 2005, coal-fired generation accounted for approximately 50 percent of the domestic electricity generation, and natural gas generation was less than 20 percent. In 2015, with the increased supply and reduced price of natural gas, each fuel constituted approximately one-third of US electricity generation.⁵⁷ The reduction in natural gas price also spurred a significant build out in new natural gas-fired combined-cycle power plants. Since the beginning of 2012, 24 GW of new natural gas-fired combined-cycle power plants have been built while less than 5.9 GW of coal-fired power plants have been added to the grid during the same period.⁵⁸ New natural gas combined-cycle generation units have seen significant decreases in the expected levelized cost of electricity (LCOE). EIA's Annual Energy Outlook projections for the technology LCOE dropped to below \$50/MWh in some regions while the projected LCOE for new conventional coal remains near \$100/MWh. The combined drop in fuel cost and generating technology cost for natural-gas generation makes it difficult for new coal generation to compete.^{59,60}

Renewable Energy

Wind and solar generation have also grown significantly in recent years and have provided another source of competition for fossil-fuels in electricity generation. These technologies have low variable operating costs and will, therefore, once built, generally be deployed before any fossil-fuel source. The combined total generation from these two sources in 2005 provided less than 1 percent of the country's electricity generation, but represented more than 5 percent by 2015.⁶¹ The growth is driven by improvements in performance and reductions in the cost of the renewable energy technology. Policy measures, such as renewable energy tax credits and state renewable energy portfolio standards, create an additional push for the expansion of renewable energy generation. The 2016

Annual Energy Outlook reference case anticipates that renewable energy generation will continue to grow by 3.6 percent per year on average between 2015 and 2040.⁶² This growth in renewable energy generation is expected to add to the downward pressure on coal demand. Both wind and solar generation have seen precipitous drops in projected LCOE for new generation, both dropping to averages well below \$100/MWh and, therefore, less than new coal, in the latest Annual Energy Outlook reference case.⁶³

Electricity Demand

Electricity demand has leveled off in recent years in the wake of the 2009 recession due to both slower economic growth and advancements in demand-side energy efficiency. Demand growth has slowed every decade since the 1950s when it was above 10 percent per year, but it has reached new lows since the 2009 recession with some years even experiencing negative demand growth.⁶⁴ The 2016 Annual Energy Outlook reference case anticipates average growth of 0.9 percent from 2015 to 2040.⁶⁵ As the largest source for coal demand, this slow rate of electricity demand growth limits the opportunity for increased coal production.

Exports

The high price and high demand for coal in Asian markets at the beginning of the decade has rapidly subsided. The Newcastle, Australia benchmark thermal coal price was approximately \$145/ton in 2011, but experienced continued and steady decline down to \$53/ton in June of 2016.⁶⁶ Slow global economic growth, decoupling of electricity demand with China's gross domestic product, protectionist policies regarding China's domestic coal industry, aggressive air pollution mitigation policies in China's 13th Five-Year Plan that involve promoting non-coal alternatives, and a cancellation of most of the proposed Northwest coal export terminals have combined to significantly lower the expected levels of US coal exports.⁶⁷

Current total US coal export capacity is 234 million tons per year nationwide with 180 million tons being located on the East or Gulf Coast. Most US coal

exports have been non-Federal coals and non-western coals and only use a fraction of this export capacity.⁶⁸ In 2015, coal export levels were 74 million tons.⁶⁹ Moreover, most of the coal exported is metallurgical coal and is exported from terminals in the eastern United States or the Gulf Coast.⁷⁰ Significant ramp-up in coal exports would require increased export infrastructure. Of the six large coal export terminals proposed since 2010 when Asian coal prices were enticing supplier interest, not one has been built or permitted. Moreover, support and permits for all but one of the projects have been withdrawn as international demand has weakened and resistance from local communities has increased. The one remaining project, Millennium Bulk Longview Terminal, is down to just one backer after Arch Coal sold its position in the project in 2016.⁷¹ Moody's financial services notes that export potential will remain capped by port capacity limitations.⁷²

Rail Availability

Rail shipments account for 67 percent of the coal shipped in the United States to power plants.⁷³ Western coal mines are primarily served by the Union Pacific and BNSF carriers, while Norfolk Southern and CSX are the dominant carriers in the eastern United States. In 2015, coal shipments accounted for 37 percent of the freight shipments in the rail industry and about 17 percent of the rail industry revenues.⁷⁴ With the fast growth of oil production in the Bakken Shale region, competition for rail space between coal and oil had sharpened in recent years and made it more difficult at times for coal companies to connect with utility consumers. Some power customers are beginning to hedge their coal deliveries by railroads with barge and truck delivery capability. However, in the arid west where most Federal coal is found, transportation distance from the mine is generally too great for truck transportation to be competitive with railways, and waterways are too limited in their occurrence and flowrates for

barge transport to be viable. If competition for rail space among commodities continues to stiffen, it will put increasing upward pressure on delivered coal prices. The more recent downturn in oil prices and expansion in western rail capacity have alleviated some of the competition for rail space.

Current and Future Policy and Regulatory Drivers

Paris Agreement

On December 12, 2015, 196 Parties to the United Nations Framework Convention on Climate Change (UNFCCC or Paris Agreement) adopted a framework to coordinate climate change mitigation and adaptation efforts. The Paris Agreement aims to limit global warming to less than 2 degree Celsius by limiting the amount of greenhouse gas emissions and by increasing the amount of sequestration. This goal is put into operation through each country's submission of emission reduction goals, referred to as intended nationally determined contributions (INDCs). Countries will report their reduction targets every 5 years starting in 2020. Although emission reduction and climate change abatement strategies are still forthcoming to establish and achieve the INDCs, significant reductions in fossil fuel consumption are one likely component of many such plans and necessary to remain below the 2 degree Celsius target.⁷⁵

The EIA does not yet model the Agreement explicitly in its International Energy Outlook, as it is still awaiting more clarity on implementation strategies. However, as Federal, regional, or state emission reduction programs that reflect parallel carbon dioxide (CO₂) reduction efforts are codified into law through regulations, such as the CPP, Regional Greenhouse Gas Initiative, or Assembly Bill 32, they are captured in the EIA Annual Energy Outlook. The Paris Agreement is anticipated to apply downward pressure to coal consumption both domestically and internationally.

US-China Bilateral Agreement

The US-China Bilateral Agreement announced in November 2014 reflected significant commitments to CO₂ reductions by two of the world's largest CO₂ emitters, as well as two of the largest coal producers, consumers, and holders of reserves. The United States agreed to an emission reductions target of 26-28 percent below 2005 levels by 2025. China committed to peaking emissions around 2030. The two sides intend to cooperate on advanced coal technologies, nuclear energy, shale gas, and renewable energy to help optimize the energy mix

⁷⁵ Currently, the United States has committed to reduce net greenhouse gas emissions in the range of 17 percent by 2020 and 26-28 percent by 2025, relative to 2005 levels. This target is consistent with a straight-line emissions reduction pathway from 2020 to deep, economy-wide emission reductions of 80 percent or more by 2050. See International Energy Agency. 2015. Energy and Climate Change. p.150. Available at <https://www.iea.org/publications/freepublications/publication/WEO20>

and to reduce emissions, including from coal, in both countries.⁷⁶ These reduction targets would put additional downward pressure on coal demand.

North America Climate, Clean Energy, and Environment Partnership Action Plan

On June 29, 2016, the leaders of Canada, Mexico, and the United States announced a plan to pursue 50 percent clean power generation collectively by 2025. These carbon-free emissions sources would include renewable energy, nuclear generation, demand reduction through energy efficiency, and potential carbon capture and storage technologies. These carbon-free or low-carbon technologies would reduce the need for some carbon-intensive electricity generating sources, such as coal-fired power plants. The realization of this clean energy target would likely put downward pressure on domestic coal production relative to current projected levels.

Morocco Conference of the Parties (2016) and Mid-Century Strategy

On November 16, 2016, the United States submitted its Mid-Century Strategy for Deep Decarbonization to the United Nations Convention on Climate Change at the Conference of Parties hosted in Morocco.⁷⁷ The submission was consistent with the Paris Agreement's requirement to submit climate action plans called INDCs to keep global temperatures from rising by more than 2 degrees Celsius. While not policy prescriptive, the technical document highlights key opportunities and challenges for reducing CO₂ emissions 80 percent below 2005 levels by 2050. The Mid-Century Strategy for Deep Decarbonization illustrates pathways that include a deep decarbonization of the electricity sector that includes a decrease in coal's share of electricity generation. The amount of the decrease is expected to vary significantly depending on the future commercial deployment of carbon capture and sequestration, with enhanced use of carbon capture and sequestration associated with greater use of coal.

Clean Power Plan and the Carbon Pollution Standards

On August 3, 2015, the US Environmental Protection Agency (EPA) finalized the CPP as the first ever US national standards to address carbon pollution from existing power plants. Power plants are historically the largest source of greenhouse gas emissions in the United States, accounting for about 30 percent of the total. Coal has been the dominant fuel for power plants, and coal-fired power plants are, on average, the most carbon-intensive sources of electricity generation.

The CPP requires that states develop and implement plans to ensure the power plants in their state—either individually, together, or in combination with other measures—achieve the emission requirements starting in 2022, with full

⁷⁶ The White House. 2016. US-China Joint Announcement of Climate Change. November 11, 2014. Available at <https://www.whitehouse.gov/the-press-office/2014/11/11/us-china-joint-announcement-climate-change>

⁷⁷ The White House. 2016. US Mid-Century Strategy for Deep Decarbonization. November 2016. p.26. Available at https://www.whitehouse.gov/sites/default/files/docs/mid_century_strategy_report-final.pdf

implementation by 2030. The rule is also anticipated to trigger additional investment in demand-side energy efficiency, resulting in less overall demand for electricity generation. On February 9, 2016, the US Supreme Court issued a stay of the regulation, halting its implementation until the litigation concludes. On September 27, 2016, oral arguments were held in front of a 10-judge panel at the DC Circuit Court of Appeals.

While the CPP addressed emissions from existing power plants, the EPA also finalized the Carbon Pollution Standards on the same day in 2015 to reduce emissions from new, modified, and reconstructed sources.⁷⁸ This rule established standards for electric utility steam-generating units (generally coal-fired), along with stationary combustion turbines, that reflect the degree of emissions limitation achievable and consistent with the Clean Air Act requirements.

Mercury Air Toxics Standard

The EPA Mercury Air Toxics Standard was finalized in 2012, and its compliance requirements began in 2015 and 2016. The rule puts limits on toxic air pollution, including mercury, arsenic, and metals, from fossil-fuel-fired power plants. To comply with the rule's emission standards, many sources would need to install capital-intensive pollution control equipment, such as flue gas desulfurization or dry sorbent injection.

Cross-State Air Pollution Rule

On July 6, 2011, the EPA finalized the Cross-State Air Pollution Rule under section 110 of the Clean Air Act to protect downwind states from upwind sources of air pollution in other states. The rule places limits on the amount of SO₂ and nitrogen oxides (NO_x) emissions that the eastern states' power fleet may emit in a given year. It allows for limited emissions trading, but provides a mechanism to ensure that each state meets a specific level of reductions. Phase I of the rule went into effect in 2015, and phase 2 is scheduled to go into effect in 2017. In September of 2016, the EPA issued an update to the Cross-State Air Pollution Rule to incorporate the 2008 ozone National Ambient Air Quality Standards, which resulted in different, often tighter, state ozone-season NO_x emission limits for some of the affected states. By limiting the emissions of a pollutant associated with combusting coal, the rule is anticipated to put downward pressure on coal demand.

Coal Ash

In December 2014, the EPA finalized national regulations to provide a comprehensive set of requirements for the safe disposal of coal combustion residuals, commonly known as coal ash, from coal-fired power plants. The rule establishes technical requirements for coal combustion residual landfills and

⁷⁸ 80 FR 64510

surface impoundments under Subtitle D of the Resource Conservation and Recovery Act.

Effluent Limitations Guidelines

On September 30, 2015, the EPA finalized a revision to the discharge limitations for toxics in power plant wastewater. The rule will likely drive additional investment for some coal steam power plants to reduce current discharge rates to levels commensurate with the new regulatory requirements.

Clean Water Act 316(b)

This EPA rulemaking required certain impingement and entrainment safeguards at power plants for cooling water intake. This rule covered roughly 1,065 existing facilities that are designed to withdraw at least 2 million gallons per day of cooling water. The EPA estimates that 544 power plants are affected by this rule.

State Regulations and Programs

In addition to Federal and international drivers, there are numerous state drivers to reduce greenhouse gas emissions that may affect coal demand as well. For instance, California's Assembly Bill 32 is an economy-wide greenhouse gas emission reduction program for the state aimed at reducing greenhouse gas emissions to 1990 levels by 2020. The regional greenhouse gas initiative is a collective effort among nine New England and Mid-Atlantic states to reduce emissions from the power sector. Many states have clean energy and renewable energy incentives as well. As of late 2015, 29 states and the District of Columbia have renewable energy portfolio standards to support the development of renewable energy. New York State announced in August 2016, a new Clean Energy Standard that requires the utilities to procure 50 percent of the state's electricity from eligible clean energy sources by 2030. Similarly, in March 2016, Oregon adopted legislation that requires two large investor-owned utilities operating in the state to supply 50 percent of the state's electricity from renewable sources by 2040. The law also requires these utilities to phase out electricity from coal by 2030.

5.5 MARKET PROJECTIONS

A variety of government and private sector sources of energy market projections are available and will be considered as the PEIS process continues. Due to the large number of variables and assumptions inherent in forecasting energy markets, projections vary from model to model and from year to year as data is updated. The Energy Information Administration (EIA) notes that multiple organizations issue projections for the coal sector and compares projections for some key metrics in a report.⁷⁹ For the purposes of this scoping report, the BLM provides summaries of the projections from models used by the EIA and EPA. These are projections from particular versions and platforms

⁷⁹ US EIA. 2016. Annual Energy Outlook 2016. CP7 Available at http://www.eia.gov/outlooks/aeo/section_comparison.cfm

of those models, but the BLM notes that subsequent or alternative versions may contain different projections as assumptions are periodically updated. For instance, a 2017 version of a model may contain information and assumptions not known and, therefore, not included in the 2016 version. These are not predictions, but projections under one reasonable set of assumptions and current best available data.

On September 8, 2016, the Columbia School of Law's Sabin Center also hosted a workshop titled "US Coal in the 21st Century: Markets, Bankruptcy, Finance and Law," with panelist from financial, consulting, non-profit, government, and academic sectors. Panelists generally highlighted the growing market headwinds against coal, primarily due to lower cost gas and renewable generation, and mid- and long-term outlooks that showed coal demand well below historical levels.⁸⁰ These findings are consistent with some of the recent modeling and forecasts by the EIA and the EPA discussed below.

5.5.1 Energy Information Administration

The EIA Annual Energy Outlook released in 2016 provides projections for energy markets, including US coal and electricity markets using the National Energy Modeling System model. The most recent version contained a reference case reflecting the known technology and regulatory environment.⁸¹ The outlook contains projections for the energy sectors through 2040. The 2016 reference case included a mass-based version of the CPP implementation. The Annual Energy Outlook projections for US coal consumption, production, and prices from the reference case are discussed below.

In the Annual Energy Outlook 2016 reference case, coal's share of total US electricity generation is projected to drop from 33 percent in 2015 to 21 percent in 2030 and 18 percent in 2040. Total coal production is projected to fall from 896 million tons in 2015 down to 827 million tons in 2022 when CPP compliance begins, and drop down to 664 million tons in 2030 at full CPP compliance.⁸²

In the near term, coal generation resumes its role as the largest source of US electricity, but natural gas generation is projected to surpass it by the late 2020s in the reference scenario. Renewable generation is also projected to surpass coal generation by 2030 due to a combination of environmental policies, Federal

⁸⁰ A summary of the panel discussions conducted during the US Coal in the 21st Century: Markets, Bankruptcy, Finance and Law workshop, as well as presentations offered by the panelists in PDF and PPT format, can be found in Volume 2 of this scoping report.

⁸¹ The EIA Annual Energy Outlook also includes a variety of side cases that offer projections under alternative market, macroeconomic, and regulatory assumptions.

⁸² US EIA. 2016. Annual Energy Outlook 2016 Early Release: Annotated Summary of Two Cases. May 17, 2016. Available at [https://www.eia.gov/forecasts/aeo/er/pdf/0383er\(2016\).pdf](https://www.eia.gov/forecasts/aeo/er/pdf/0383er(2016).pdf)

tax incentives, and declining capital cost.⁸³ The reference case projects 45 GW of US coal-fired power plant retirements in the near term (by end of 2016) due to low natural gas prices and implementation of the EPA's Mercury and Air Toxics Standard. This leaves 226 GW of coal remaining in service in 2016. Another 56 GW of that capacity is projected from coal-fired power plant retirements by 2040, leaving 170 GW of coal-fired power plant capacity in service. The United States is projected to be a small net exporter of coal through the 2040 time horizon.⁸⁴

In the western coal markets, where over 99 percent of Federally mined coal is located, the Annual Energy Outlook reference case projects the most significant decline in coal production, with levels dropping from current levels near 500 million tons to 378 million tons in 2030 and 329 million tons in 2040.⁸⁵ This drop accounts for 52 percent of the projected nationwide decline in coal production by 2030.

The 2016 Annual Energy Outlook projects that real average mine mouth coal prices rise due to falling productivity as geological conditions become less favorable. In the reference scenario, 2015 average mine mouth prices of \$33.80 per short ton are expected to remain mostly flat at \$33.84 through 2030 and then up to \$38.68 by 2040.^{86,87} For the western states, where coal prices are below the nationwide average due to a variety of factors, including more favorable geology, reference case prices are anticipated to climb from 2015 levels of \$18.7 per ton to \$19 per ton in 2030 and \$21.6 per ton in 2040.⁸⁸

5.5.2 Environmental Protection Agency

The EPA maintains an application of the Integrated Planning Model (IPM) to analyze the impact of power sector regulations. The IPM is a linear programming, least-cost optimization model of the US power sector developed by ICF consulting. It provides forecasts of least-cost capacity expansion and electricity dispatch to meet energy demand subject to market and regulatory

⁸⁸ US EIA. 2016. Annual Energy Outlook 2016. Coal Production and Minemouth Prices by Region. Available at http://www.eia.gov/outlooks/aeo/data/browser/#!/?id=94-AEO2016&cases=ref2016~ref_no_cpp&sourcekey=0

factors. It captures a wide range of issues related to the power sector, including fuel markets such as coal. The model is widely used by the government and industry to assess policy and market influences.⁸⁹

The EPA's Regulatory Impact Analysis for the CPP was informed by IPM modeling conducted that reflects market and regulatory outlooks, as well as the final CPP emission limitations.⁹⁰ This scenario includes projections on coal production and consumption through a 2050 time frame, as coal is an instrumental commodity to power sector operations, and, thus, its demand is shaped by power-sector regulations. The EPA application of IPM to reflect the CPP provides projections for the power sector comparable to the Annual Energy Outlook reference scenario. The IPM projections are specific to US thermal coal markets.

In the EPA's modeling of the mass-based CPP, nationwide coal generation was projected to be 28 percent and 25 percent of electricity generation in 2030 and 2040, respectively. These levels reflected more demand-side energy efficiency and more renewable generation relative to today's levels, which allow for a more balanced nationwide generation portfolio. This coal-fired generation totaled 1,144 Terawatt hours (TWh) in 2030 and 1,092 TWh in 2040 and corresponded to about 685 and 692 million tons of US coal production in those same years.⁹¹

Under this model, renewable electricity generation is projected to be a larger share of total electricity generation by 2040. There is also a significant amount of coal-fired power plant retirements due to an aging fleet, more competitive capital cost for competing technologies, lower gas prices, and lower demand growth. The EPA modeling projects 174 GW remaining in service in the CPP scenario in 2030 and 170 GW in 2040.

In the western coal basins, the EPA application of IPM projected coal production decreasing from current levels of 484 million tons to 317 million tons in the CPP scenario by 2030. The decrease is driven, in part, by increased inter-basin competition as eastern interior coal becomes more competitive due to advances in low-cost, long-wall mining technologies and because of less consumer sensitivity to the higher sulfur content of interior coal as more plants install flue-gas desulfurization equipment.

⁸⁹ US EPA. 2013. Documentation for Base Case v.5.13 Modeling Framework. Chapter 2: Modeling Framework. November 27, 2013. Available at <https://www.epa.gov/airmarkets/documentation-base-case-v513-modeling-framework>

⁹⁰ US EPA. 2015. Regulatory Impact Analysis for the Clean Power Plan Final Rule. Table 3-11. October 23, 2015. Available at <https://www.epa.gov/sites/production/files/2015-08/documents/cpp-final-rule-ria.pdf>

⁹¹ The uptick in production in spite of the drop in coal-fired power plant electricity generation is due to increased demand from industrial sources and exports in 2040.

Projected coal prices are similar to the Annual Energy Outlook 2016 outlook. For western coals they are in the \$20/ton to \$24/ton range, and nationwide they are in a \$35/ton to \$40/ton range for years 2030 to 2040.⁹² Western coal prices remain the lowest in the country on a per ton and a per Btu basis among all major coal producing regions reflecting the high productivity and low production cost characteristic of that region.⁹³

5.5.3 Coal Exports

Global coal pricing is US dollar-denominated. As the US dollar strengthens relative to other currencies, US coal becomes more expensive relative to coal exported from competing countries. As the US dollar weakens, US coal becomes relatively more competitive.

Coal exports accounted for a small share, approximately 8 percent, of total US coal production in 2015 at 74 million tons.^{94,95} The majority of that export is metallurgical coal, primarily used for industrial purposes, which comes from non-Federal lands. The amount of thermal coal, the predominant coal type produced on Federal lands, exported was 28 million tons or approximately 3 percent of total US production in 2015.⁹⁶ The 2016 EIA Annual Energy Outlook projections for total coal export going forward are relatively flat through 2030 and then increase upward by approximately 20 million tons, from current levels of 74 million tons, and constitute approximately 15 percent of total US production in 2040.⁹⁷ The US thermal coal portion of coal exports is projected to follow a similar trajectory but increase at a higher rate, reaching 56 million tons or approximately 9 percent of total production by 2040.⁹⁸ This uptick from 2015 levels is partially due to reduced US demand. But even with the reduced US demand, these projected steam coal export levels reflect a relatively small portion of US production and do not exceed 2012 tonnage export levels.⁹⁹

In all scenarios examined, projected coal exports have declined from prior year projections and are anticipated to remain a small source of demand for US coal

⁹² All EPA IPM coal prices are listed in \$ per short ton.

⁹⁹ US EIA. 2016. Imports Data. Available at <http://www.eia.gov/coal/data.php#imports>

production. US coal export is generally viewed as a swing supplier of international markets, meaning it is one of the last suppliers to serve international markets after other exporting countries are at capacity, and one of the first exporting countries to pull back supply as demand goes down. Export demand has a significant degree of uncertainty related to currency valuations, international economic growth, climate policy, and trade protectionist policies from importing countries. In addition, the upward reaches of US steam coal export are limited in the near and medium term by export terminal capacity in the northwestern United States.¹⁰⁰

5.6 GREENHOUSE GAS EMISSIONS

Greenhouse gas emissions trap heat in the atmosphere and, as emissions and atmospheric concentrations have increased, are associated with an increase of 1.5 degrees Fahrenheit in average global temperatures over the past century.¹⁰¹ These increases in global mean temperature drive changes in climate and weather patterns. CO₂ is the most abundant form of greenhouse gas. CO₂ enters the atmosphere through the burning of fossil fuels, such as coal, natural gas, and oil, and accounts for 82 percent of total US greenhouse gas emissions in 2014. Other greenhouse gases, such as methane, are emitted during the production of fossil fuels. Each greenhouse gas has a different atmospheric lifetime and radiative forcing (heat trapping) potential. Their emission volumes can be converted to a CO₂ equivalent (CO₂e) to normalize the greenhouse effect across different pollutants.

In 2014, total US emissions were 6,870 million metric tons of CO₂e.¹⁰² Electricity generation was the largest greenhouse gas emitting sector in the United States, accounting for 30 percent, or 2,081 million metric tons, of CO₂e in 2014.¹⁰³ US coal production and combustion were responsible for more than 1,720 million metric tons, or about 25 percent, of US greenhouse gas emissions.¹⁰⁴ Most of these coal-related emissions (1,570 million metric tons) occur at the point of combustion within the electricity sector. Industrial CO₂e emissions from coal combustion added another 75 million tons of CO₂e. Coal extraction activities (without considering combustion emissions) account for

¹⁰³ Ibid.

¹⁰⁴ Ibid.

approximately 68 million metric tons of CO₂e.¹⁰⁵ Abandoned underground coal mines added another 6.3 million metric tons of CO₂e emissions.

The domestic electricity sector drives between 80 and 90 percent of the US coal consumption each year. Coal combustion for electricity is more carbon intensive than other fossil fuels, accounting for 75 percent of the CO₂ emissions from the electricity sector even though it accounts for only 39 percent of the total electricity generated in 2014.¹⁰⁶

With respect to federally owned coal, as stated, 42 percent of total US coal production occurred on Federal lands in 2015.^{107,108} Using data available at the time, a report by Stratus Consulting states that in 2012 the combustion of Federal coal and coalbed methane emissions resulting from Federal coal production together accounted for nearly 770 million metric tons of CO₂e emissions, or over 10 percent of total US greenhouse gas emissions.¹⁰⁹ Estimates by BLM using more recent data suggest that as of 2014, CO₂ emissions attributable to federal coal accounted for 11 percent of total US greenhouse gases and a recent report noted that they account for 13 percent of all US energy-related CO₂ emissions.¹¹⁰

Greenhouse gas emissions associated with coal production can generally be divided into two broad categories: upstream emissions associated with the mining and transportation of the coal, and downstream emissions associated with the combustion of the coal. The greenhouse gas implications of each category are discussed below.

5.6.1 Upstream Emissions

Measuring the level and source of greenhouse gas emissions from coal production and consumption starts with emissions released during coal mining. These upstream greenhouse gas emissions primarily occur in the form of methane released from coal seams to the atmosphere in the coal mining

process. Methane is a potent greenhouse gas that has approximately 25 times more warming potential than carbon dioxide over a 100-year life period. It is the second-most prevalent greenhouse gas from human activities in the United States and accounts for approximately 10 percent of all US greenhouse gases. Coal mining accounts for approximately 9 percent of total US methane emissions.¹¹¹ The amount of average methane release associated with removing a ton of coal varies significantly depending on whether it occurs at an underground or at a surface mine. Underground mines contain more methane, as they are under more geological pressure. In 2015, the United States had 305 underground coal mines and 529 surface mines operating.¹¹² Using EPA and EIA data results in estimates for the amount of greenhouse gas emissions from coal mine methane and post-mining processing per ton of coal mined of 0.02 tons of CO₂e per ton of coal mined for surface mines and approximately 0.16 tons of CO₂e per ton of coal mined for underground mines.^{113,114}

While methane is the largest greenhouse gas source from coal production, other mining operations add to the emission total. Diesel, which emits CO₂ when combusted, is a primary energy source for mining operations and is often used to move coal by trucks on-site. Electricity, most often dependent on the combustion of a fossil fuel, is also used to power mine operations. Coal production-associated emissions are small relative to emissions associated with combustion, averaging 2.7 percent of the lifecycle CO₂ emissions.¹¹⁵

Transportation of coal from the mine to the point of consumption, generally a power plant, is another significant source of greenhouse gas emissions. Coal is most frequently transported by rail, but river barges and trucks play a significant role as well. These modes of transportation rely on diesel fuel, which emits CO₂ when combusted. The greenhouse gas emissions associated with transportation are more significant for western coals, where more than 99 percent of Federal coal is located, as they have a greater distance to travel on average to reach their end use. In Wyoming, approximately 90 percent of the coal is shipped out of the state by rail. Transportation-associated emissions are small relative to emissions associated with combustion, averaging 1.7 percent of coal's lifecycle

CO₂ emissions.¹¹⁶ However, when taking into account specific mine location and transportation distance and method, the share of greenhouse gas emission associated with transportation from a particular mine or basin may be higher.

5.6.2 Downstream Emissions

The most significant greenhouse gas impacts associated with coal occur at the point of combustion, estimated at 95.6 percent of coal's lifecycle CO₂e emissions.¹¹⁸ As stated, coal is the most CO₂ emissions-intensive fossil fuel, accounting for over 70 percent of CO₂ emissions from the power sector.

Coal's carbon intensity is significantly higher than natural gas's carbon intensity at the site of combustion. Taking into account the heat rate of coal plants versus that of natural gas combined-cycle plants, the average emission rate of a coal plant at 2,215 lbs of CO₂/MWh is more than double that of a gas-fired combined-cycle plant at 902 lbs of CO₂/MWh. Coal-fired electricity generation has been the most significant contributor to CO₂ emissions from the power sector, and that is projected to continue under the latest Annual Energy Outlook reference case scenarios. CO₂ content can vary significantly on a per ton basis for different coal types, such as subbituminous or bituminous. However, on an energy basis, CO₂ emission factors from coal are fairly consistent across coal types and geography, occupying a narrow range of 205 – 215 lbs CO₂ per mmBtu.¹¹⁷

In 2015, Federal coal accounted for 42 percent of total US coal production at 375 million tons with nearly all of this supplying the US electricity generation. Greenhouse gas emissions from coal-fired electricity generation have been decreasing due primarily to market drivers reducing coal-fired electricity consumption in recent years and are expected to reach new lows in 2016.

Future coal production will likely be influenced by these same market drivers as well as existing state, regional, and Federal policies that partially address some of the externalities associated with CO₂ emissions at the point of combustion. These include programs like California's Assembly Bill 32, the Northeast's Regional Greenhouse Gas Initiative, and the EPA's CPP. A small amount of Federal coal is also exported and combusted outside of the United States, but export markets are limited as is port capacity. As discussed in more detail in **Section 5.5.3**, exports are anticipated to remain a small portion of demand for US coal in future years.¹¹⁸

5.6.3 Quantifying Greenhouse Gas Emissions on Federal Lands

As part of Secretarial Order 3388, the Secretary instructed the Department of the Interior, through the USGS, to establish and maintain a public database to account for the annual carbon emissions from fossil fuels developed on Federal lands. Although not complete, this data source is under development and will be one potential database informing the Draft and Final PEIS.

The USGS is designing this database to report both emissions and sinks for CO₂, methane, and nitrous oxide resulting from the coal production on Federal lands by state. The database aims to combine ONRR, BLM, and BOEM data along with EPA emissions data to estimate total greenhouse gas emissions from fossil fuel extracted on Federal lands. It also aims to use USGS data to measure biological sequestration on Federal lands that serve as emissions sinks. By subtracting the sequestration estimates from the emission estimates, this tool can provide a net emissions value for Federal lands. An initial public release of the data is expected in mid-2017. This data will provide additional refinement and verification of coal lifecycle emission estimates.

5.7 SOCIOECONOMIC CONSIDERATIONS

The PEIS will evaluate a number of potential changes to the Federal coal program. Some of these potential changes could have impacts on the livelihoods and fiscal soundness of coal-dependent communities, particularly those near the Powder River Basin, due to the heavy concentration of leases and production from the Federal lands there. Appalachian coal communities could also be affected, as changes in the demand for predominantly western Federal coal in turn can affect the market for Appalachian coal. This section provides baseline socioeconomic information relevant to the PEIS.

5.7.1 Communities Dependent on Coal Extraction

Community Impacts

Viewed globally, the development potential of energy resources has been interpreted through two very different frameworks. The positive view holds that investment in mineral extraction literally unlocks buried treasure, leading to a “virtuous cycle of socioeconomic change.”¹¹⁹ A more skeptical view (the “resource curse”) suggests that the wealth generated by mineral extraction may not be shared locally and that an emphasis on resource extraction may deter development in other economic sectors. Recent research is clarifying the conditions that encourage local and regional economic gains from mining activity.¹²⁰

Since World War II, US coal mining employment has been in a long-term decline, falling from 533,000 jobs in 1948 to 78,000 in 2000.¹²¹ Technological change, resulting in rising productivity per worker, has been the primary driver of the decline.¹²² The downward trend was interrupted by a demand-driven employment boom in the 1970s (employment rose 74 percent in the period 1970 – 1980), followed by a bust in the 1980s.¹²³ The employment boom resulted not only from an increase in coal mining operations, but also from construction of a number of coal-fired generating plants (see **Figure 5-4**).

Figure 5-4. Coal Mining – Employment, 1948 – 2015

Sources:

Bureau of Economic Analysis 2016¹²⁴

MSHA 2016¹²⁵

Most studies of the community-level effects of US coal mining expansion come from this boom/bust cycle of the 1970s and 1980s. Many communities underwent rapid change. As a result of construction of the coal-fired Intermountain Power Project—with a proposed capacity of 3,000 megawatts—

the population of Delta, Utah rose from 1,930 people in 1980 to 6,670 in 1984 at the height of construction, and declined to 3,000 by 1990.¹²⁶

Many boomtowns experienced an acute shortage of infrastructure and services, particularly housing. Studies from the 1970s painted a negative picture of widespread social disruption, sometimes termed the “Gillette Syndrome.” Effects included “dramatic increases in divorce, depression[,] . . . criminal activity, mental disorders, and other social problems.”¹²⁷ Later research suggested a more complex picture, recognizing recovery and adaptation to changing circumstances, in addition to tempering the overly negative characterization of social change under rapid energy development.¹²⁸

As shown in **Figure 5-5**, there are major regional differences in the trends of both coal employment and production. Nationwide coal industry employment fell some 50 percent between 1987 and 2014 while nationwide production rose slightly. The dramatic change is in western coal production. Western production doubled between 1987 and 2008, but then began to decline. It is the far lower labor intensity of western coal operations, dominated by the Powder River Basin, over eastern coal that made it possible for production to increase while national employment fell dramatically (see **Section 5.4.5** for more information).¹²⁹ Today the western coal industry, faced with declining employment, is following the trend seen earlier in Appalachia and other eastern coal regions.¹³⁰

Many of the social effects of abruptly lower coal production noted from the bust of the 1980s are evident today as part of a longer-term decline in coal employment and production. Simple models of the economy assume labor mobility; as jobs disappear in one region or sector, workers relocate to more favorable labor markets. For a variety of reasons, the reality is far more complex; many factors work to keep people in place, even after mines have cut back production or closed. In coal country, as in many other rural areas centered on resource extraction, communities reflect a distinctive way of life that involves social ties and cultural values as much as economic activities. The

way of life in coal communities is based on ties of employment and friendship, ties of family across multiple generations, and ties to place. As one author wrote of the anthracite mining towns of northeastern Pennsylvania:

“The people remaining in these towns – half or one-third the 1920 number – have a powerful sense of belonging just where they are.”¹³⁴

Renewable energy and natural gas are rapidly gaining ground relative to coal as the sources for generating electricity. But there is no assurance that this shift can provide a lifeline to struggling coal-dependent communities or workers who are unwilling to relocate. Notwithstanding these challenges, commitment to place and community can be a very positive force in finding a path to a more resilient and diversified local economy. There are numerous case studies of formerly coal-reliant Appalachian communities that have used economic

development strategies that invest in local and regional assets—such as human capital, infrastructure, entrepreneurs, and emerging industry clusters—to successfully diversify their economies.¹³⁵

Demographic and Employment Data for Areas Supplying Coal

As described above, coal production occurs in three broad regions: Appalachian, Interior, and Western. Because the vast majority of coal from Federal lands is produced in the western region, this section divides the western region into 13 subregions, based on the coal supply regions used in the EPA Base Case v5.13.¹³⁶

Table 5-3, below, describes the 15 regions and subregions, and includes both Federal and non-Federal coal resources. A map is shown in **Figure 5-6**.

Table 5-3
Coal Supply Regions

Region	Subregion	Description	Number of Counties
Appalachian	None	Includes portions of Pennsylvania, West Virginia, Ohio, Maryland, Virginia, Eastern Kentucky, Tennessee, and Alabama	193

¹³⁶ The EPA maintains an application of the IPM to analyze the impact of power sector regulations. IPM is a linear programming, least-cost optimization model of the US power sector developed by ICF consulting. It provides forecasts of least-cost capacity expansion and electricity dispatch to meet energy demand subject to market and regulatory factors. It captures a wide range of issues related to the power sector, including fuel markets such as coal. The model is widely used by government and industry to assess policy and market influences. See US EPA. 2013. Documentation for EPA Base Case v.5.13 Using the Integrated Planning Model. EPA #450R13002. Available at https://www.epa.gov/sites/production/files/2015-07/documents/documentation_for_epa_base_case_v.5.13_using_the_integrated_planning_model.pdf

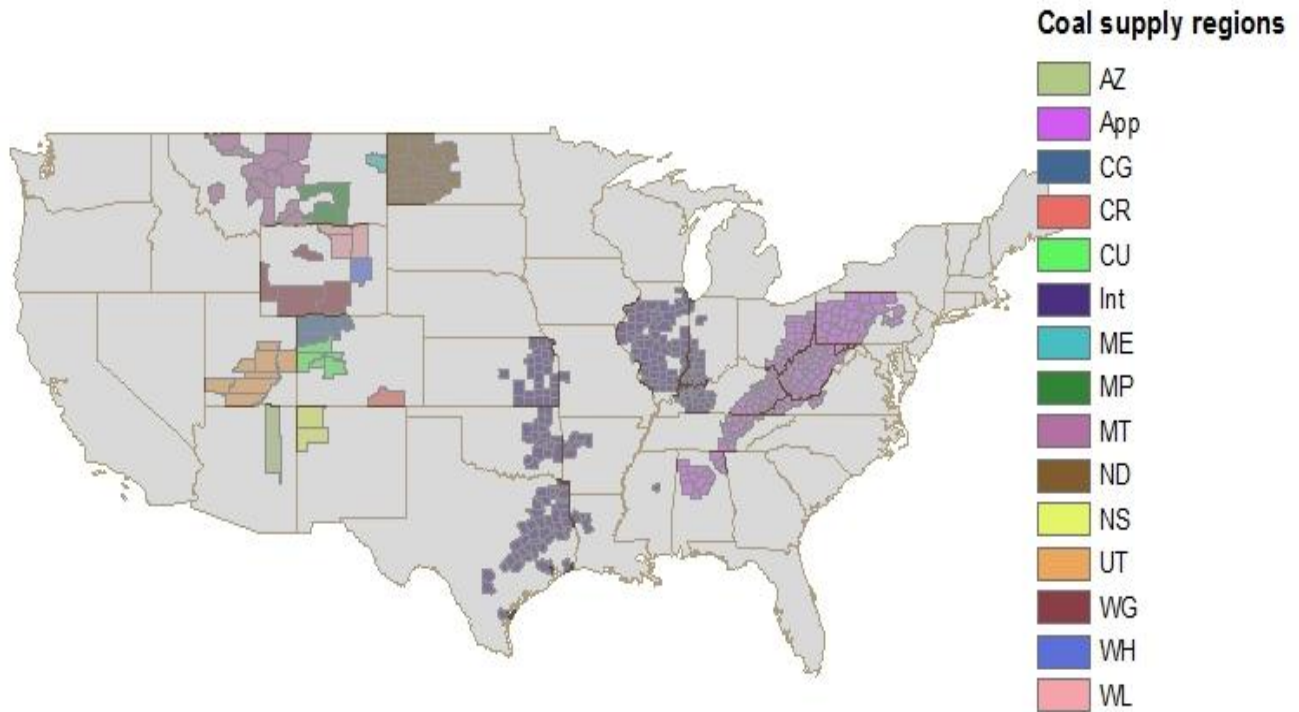

Figure 5-6. Coal Supply Regions

Table 5-4 presents population, wage, and income information for the 15 coal supply regions and the United States. As the data show, these parameters vary widely across regions. Employment growth between 1970 and 2014 ranged from half of the national rate (e.g., in the Appalachian, Rocky Mountain CR, and Western Montana MT regions) to over three times the national rate (e.g., Rocky Mountain CU region). Personal income growth showed similar trends. With a few exceptions, average annual wages were at or below the national average in 2015. However, with the exception of the Rocky Mountain CU region, the average annual wages for mining (except oil and gas), for regions reporting this variable, substantially exceeded the national and regional average wages.

Table 5-5 presents coal mine employment in 2014 and 2015 and total employment in 2014 for each region. The Appalachian and Interior regions accounted for about 80 percent of the total coal employment across all the regions. The proportion of employment associated with coal varies across regions and was highest in the Montana MP and Wyoming WL regions. While these data provide a useful overview of where coal employment exists, the role of coal employment may be more significant at local levels. The subsequent section explores this point.

Figure 5-7 displays coal mine employment trends between 2000 and 2015 for the three broad supply regions. This figure demonstrates that the larger downward trend in employment beginning around 2011 has been driven primarily by coal employment reductions in the Appalachian region.

Table 5-5

County-level Socioeconomic Variability

The previous section provides an aggregate view of broad coal-producing regions. Assessing the likely effects on counties and communities from changes to coal leasing policy requires some recognition of their economic and demographic variability. A contrast of three coal-producing counties reveals some of the relevant variation (see **Table 5-6**). These counties include:

- Boone County, WV. With some of the highest production in West Virginia, this county exemplifies the coal conditions of Appalachia, dominated by private mineral holdings.¹⁴³
- Campbell County, WY. In the Powder River Basin, this county has the highest coal production in Wyoming.¹⁴⁴

- Delta County, CO. On the Gunnison River's North Fork, this county has a relatively more diverse economic base, but coal jobs remain important.

Since 2000, the level of coal sector employment in the three counties has diverged (see **Figure 5-8**). In 2015, Campbell County coal employment was 157 percent of the employment of 2000. Delta County, after doubling the 2000 employment level in 2013, by 2015 had declined to 104 percent of its 2000 level, while in Boone County's coal sector employment stood at 66 percent of its earlier level. While the statistics are abstractions, local examples better convey the extent of the decline. From a 2016 news story in Delta County, Colorado:

Figure 5-8. Change in Coal Employment

Sources:

MSHA. 2016¹⁵⁰

Bureau of Economic Analysis. 2014¹⁵¹

“Bowie Resource Partners said Friday that depressed coal prices have forced it to idle the Bowie #2 Mine near Paonia in the latest mine closure to hit Colorado’s Western Slope. BRP, through its subsidiary Bowie Resources LLC, employed 108 full-time workers and one contractor at the facility. The closure is another big economic blow to Delta County, whose coal industry employment has dropped from 1,200 positions to less than 400 since 2013. That doesn’t include the hundreds of support jobs in fields like construction and logging that helped keep the county’s mines running. ‘The coal mines are very

critical to the economy of Delta County. We have lost two-thirds of those jobs in the last three years,' said Robbie LeValley, Delta County administrator."¹⁵²

The loss of coal jobs can have an outsized effect on communities, because the coal industry pays far higher than average wages. In the three counties, average coal wages were between 150 percent and 221 percent of average wages in all sectors. The proportion of jobs provided by mining, in contrast, varies greatly across the three counties, ranging from nearly 30 percent in Boone County in 2014 to less than 3 percent in Delta County.

Industries Related to Coal Production

Beyond the local economic activity directly supported by coal operations (e.g., employment at coal operations), additional economic activity, including secondary or multiplier effects and upstream effects (e.g., economic activity associated with the sale of coal such as rail transportation and electricity generation), can be linked to coal operations. Multiplier effects arise from the fact that local businesses, households, and governmental agencies purchase goods and services from one another. These effects include indirect impacts (economic activity affected by sectors that supply inputs to coal operations) and induced impacts (economic activity affected by income expenditures, such as expenditures on groceries or housing of employees in both the coal sector and supplying sectors).¹⁵³

The magnitude of multiplier and upstream economic effects varies by region. A February 2015 study by the University of Wyoming's Center for Energy Economics and Public Policy estimated these additional economic effects for Wyoming.¹⁵⁴ The study found that, in 2012, for every coal mining operation job in Wyoming, an additional 1.32 jobs were supported in Wyoming as a result of indirect and induced economic effects. Rail and electric generation associated with coal supported an additional 7,105 jobs in Wyoming (including indirect and induced economic effects). This upstream employment represented approximate 30 percent of the "total coal economy" in Wyoming.

The Utah Governor's Office of Energy Development commissioned a similar analysis focused on multiplier effects and found that for every coal mining operation job in Utah, an additional 1.21 jobs were supported in Utah as a result

of indirect and induced economic effects.¹⁵⁵ An economic study of coal in Colorado concluded that, in 2012, about 1.44 indirect and induced jobs were supported for every coal sector job in Colorado as a whole, and 1.04 indirect and induced jobs in northwest Colorado for every northwest Colorado coal mining job.¹⁵⁶

5.7.2 Externalities Associated with Coal

An externality is defined as a side effect or consequence of an industrial or commercial activity that affects other parties without this being reflected in the cost of the goods or services. There are a number of externalities cited in conjunction with coal production, transportation, and consumption.^{157,158,159} Environmental, social, and economic values that can be particularly vulnerable near coal-fired power plants or along coal transportation networks include those related to air quality, water quality, noise, and wildlife populations. Ecosystem services associated with these values provide many market and nonmarket benefits. While the costs of these externalities may not be fully reflected in the fiscal terms of Federal coal leases, it is important to note that there are a number of Federal, state, and local laws and regulations that control such impacts.

Coal mining can produce several production-related externalities, including the emission of greenhouse gases; air and water pollution, including associated negative health effects; and water use. Methane, a potent greenhouse gas, is released when gases trapped in coal seams are released when they are cut to extract coal. Running equipment (drills, bulldozers, and trucks) causes additional types of air pollution, in addition to greenhouse gas emissions, particularly criteria pollutants (i.e., carbon monoxide, lead, ground-level ozone, particulate matter, nitrogen dioxide, and sulfur dioxide). Coal mining can affect water quality and, thus, human health, livestock, fishing stocks, and aquatic species. In addition, coal mining can use a significant amount of water for dust

control, extraction (i.e., to cool equipment and prevent fire), and processing (e.g., coal washing).

The transportation of coal requires large amounts of energy and includes some risks. According to a study by the Institute for Policy Integrity at New York University, in the United States, coal companies transport 70 percent of their product by rail, approximately 10 percent by truck, 10 percent or more by waterways, and the rest using a variety of means including conveyor belts and slurry pipelines.¹⁶⁰ Transportation of coal can result in multiple externalities, including increased risk to public health through accidents and air pollution, emission of greenhouse gases, and noise.

The combustion of coal can contribute to air quality externalities, as the burning of coal results in emissions of nitrogen oxides, sulfur dioxide, the particulates PM₁₀ and PM_{2.5}, and mercury, all of which can affect air quality and public health.¹⁶¹ Importantly, the greenhouse gas emissions associated with coal consumption contribute to global climate change.¹⁶² According to the National Research Council, “Emissions of CO₂ from the burning of fossil fuels have ushered in a new epoch where human activities will largely determine the evolution of Earth’s climate. Because CO₂ in the atmosphere is long lived, it can effectively lock Earth and future generations into a range of impacts, some of which could become very severe. Therefore, emission reduction choices made today matter in determining impacts experienced not just over the next few decades, but in the coming centuries and millennia.”¹⁶³

In 2009, based on a large body of robust and compelling scientific evidence, the EPA Administrator issued the Endangerment Finding under CAA section 202(a)(1).¹⁶⁴ In the Endangerment Finding, the Administrator found that the current, elevated concentrations of greenhouse gases in the atmosphere—already at levels unprecedented in human history—may reasonably be anticipated to endanger public health and welfare of current and future generations in the United States. We summarize these adverse effects on public health and welfare briefly here.

Public Health Impacts

Climate change caused by human emissions of greenhouse gases threatens the health of Americans in multiple ways. By raising average temperatures, climate change increases the likelihood of heat waves, which are associated with increased deaths and illnesses. While climate change also increases the likelihood of reductions in cold-related mortality, evidence indicates that the increases in heat mortality will be larger than the decreases in cold mortality in the United States. Compared with a future without climate change, climate change is expected to increase ozone pollution over broad areas of the United States, especially on the highest ozone days and in the largest metropolitan areas with the worst ozone problems, and thereby increase the risk of morbidity and mortality. Climate change is also expected to cause more intense hurricanes and more frequent and intense storms and heavy precipitation, with impacts on other areas of public health, such as the potential for increased deaths, injuries, infectious and waterborne diseases, and stress-related disorders. Children, the elderly, and the poor are among the most vulnerable to these climate-related health effects.

Public Welfare Impacts

Climate change impacts touch nearly every aspect of public welfare. Among the multiple threats caused by human emissions of greenhouse gases, climate changes are expected to place large areas of the country at serious risk of reduced water supplies, increased water pollution, and increased occurrence of extreme events such as floods and droughts. Coastal areas are expected to face a multitude of increased risks, particularly from rising sea level and increases in the severity of storms. These communities face storm and flooding damage to property, or even loss of land due to inundation, erosion, wetland submergence, and habitat loss.

Impacts of climate change on public welfare also include threats to social and ecosystem services. Climate change is expected to result in an increase in peak electricity demand. Extreme weather from climate change threatens energy, transportation, and water resource infrastructure. Climate change may also exacerbate ongoing environmental pressures in certain settlements, particularly in Alaskan indigenous communities, and is very likely to fundamentally rearrange US ecosystems over the 21st century. Though some benefits may balance adverse effects on agriculture and forestry in the next few decades, the body of evidence points toward increasing risks of net adverse impacts on US food production, agriculture, and forest productivity as temperature continues to rise. These impacts are global and may exacerbate problems outside the United States that raise humanitarian, trade, and national security issues for the United States.

New Scientific Assessments and Observations

Since the administrative record concerning the Endangerment Finding closed following the EPA's 2010 Reconsideration Denial, climate change impacts have

continued to intensify, with new records being set for a number of climate indicators, such as global average surface temperatures, Arctic sea ice retreat, CO₂ concentrations, and sea level rise. Additionally, a number of major scientific assessments have been released that further improve understanding of the climate system and further strengthen the case that greenhouse gases endanger public health and welfare both for current and future generations. These assessments from the Intergovernmental Panel on Climate Change (IPCC), the US Global Change Research Program, and the National Research Council (NRC) include:

- IPCC's 2012 Special Report on Managing the Risks of Extreme Events and Disasters to Advance Climate Change Adaptation and the 2013–2014 Fifth Assessment Report (AR5)
- The US Global Change Research Program 2014 National Climate Assessment, *Climate Change Impacts in the United States* (NCA3)
- The NRC's 2010 *Ocean Acidification: A National Strategy to Meet the Challenges of a Changing Ocean* (Ocean Acidification); 2011 *Report on Climate Stabilization Targets: Emissions, Concentrations, and Impacts over Decades to Millennia* (Climate Stabilization Targets); 2011 *National Security Implications for US Naval Forces* (National Security Implications); 2011 *Understanding Earth's Deep Past: Lessons for Our Climate Future* (Understanding Earth's Deep Past); 2012 *Sea Level Rise for the Coasts of California, Oregon, and Washington: Past, Present, and Future*; 2012 *Climate and Social Stress: Implications for Security Analysis* (Climate and Social Stress); and 2013 *Abrupt Impacts of Climate Change* (Abrupt Impacts) assessments.

The findings of the recent scientific assessments confirm and further strengthen the conclusion that greenhouse gases endanger public health, now and in the future. The NCA3 indicates that human health in the United States will be impacted by “increased extreme weather events, wildfire, decreased air quality, threats to mental health, and illnesses transmitted by food, water, and disease-carriers such as mosquitoes and ticks.” The most recent assessments now have greater confidence that climate change will influence production of pollen that exacerbates asthma and other allergic respiratory diseases such as allergic rhinitis, as well as effects on conjunctivitis and dermatitis. Both the NCA3 and the IPCC AR5 found that increasing temperature has lengthened the allergenic pollen season for ragweed, and that increased CO₂ by itself can elevate production of plant-based allergens.

The NCA3 also concludes that children's unique physiology and developing bodies contribute to making them particularly vulnerable to climate change. Impacts on children are expected from heat waves, air pollution, infectious and waterborne illnesses, and mental health effects resulting from extreme weather events. The IPCC AR5 indicates that children are among those especially

susceptible to most allergic diseases, as well as health effects associated with heat waves, storms, and floods. The IPCC finds that additional health concerns may arise in low-income households, especially those with children, if climate change reduces food availability and increases prices, leading to food insecurity within households.

Both the NCA3 and IPCC AR5 conclude that climate change will increase health risks facing the elderly. Older people are at much higher risk of mortality during extreme heat events. Pre-existing health conditions also make older adults susceptible to cardiac and respiratory impacts of air pollution and to more severe consequences from infectious and waterborne diseases. Limited mobility among older adults can also increase health risks associated with extreme weather and floods.

The new assessments also confirm and further strengthen the conclusion that greenhouse gases endanger public welfare, and emphasize the urgency of reducing greenhouse gas emissions due to their projections that show greenhouse gas concentrations climbing to ever-increasing levels in the absence of mitigation. The NRC assessment *Understanding Earth's Deep Past* projected that, without a reduction in emissions, CO₂ concentrations by the end of the century would increase to levels that the Earth has not experienced for more than 30 million years.¹⁶⁵ In fact, that assessment stated that “the magnitude and rate of the present greenhouse gas increase place the climate system in what could be one of the most severe increases in radiative forcing of the global climate system in Earth history.”¹⁶⁶ Because of these unprecedented changes, several assessments state that we may be approaching critical, poorly understood thresholds. As stated in the assessment, “As Earth continues to warm, it may be approaching a critical climate threshold beyond which rapid and potentially permanent—at least on a human timescale—changes not anticipated by climate models tuned to modern conditions may occur.”

The NRC *Abrupt Impacts* report analyzed abrupt climate change in the physical climate system and abrupt impacts of ongoing changes that, when thresholds are crossed, can cause abrupt impacts for society and ecosystems. The report considered destabilization of the West Antarctic Ice Sheet (which could cause 3–4 meters (9–12 feet) of potential sea level rise) as an abrupt climate impact with unknown but probably low probability of occurring this century. The report categorized a decrease in ocean oxygen content (with attendant threats to aerobic marine life); increase in intensity, frequency, and duration of heat waves; and increase in frequency and intensity of extreme precipitation events (droughts, floods, hurricanes, and major storms) as climate impacts with moderate risk of an abrupt change within this century.

¹⁶⁵ National Research Council. 2011. *Understanding Earth's Deep Past. Lessons for Our Climate Future*. p.1. Available at <https://www.nap.edu/catalog/13111/understanding-earths-deep-past-lessons-for-our-climate-future>

¹⁶⁶ *Ibid.*, p.138.

The NRC Abrupt Impacts report also analyzed the threat of rapid state changes in ecosystems and species extinctions as examples of an irreversible impact that are expected to be exacerbated by climate change. Species at most risk include those whose migration potential is limited, whether because they live on mountaintops or fragmented habitats with barriers to movement, or because climatic conditions are changing more rapidly than the species can move or adapt. While the NRC determined that it is not presently possible to place exact probabilities on the added contribution of climate change to extinction, they did find that there was substantial risk that impacts from climate change could, within a few decades, drop the populations in many species below sustainable levels, thereby committing the species to extinction. Species within tropical and subtropical rainforests, such as the Amazon, and species living in coral reef ecosystems were identified by the NRC as being particularly vulnerable to extinction over the next 30 to 80 years, as were species in high-latitude and high-elevation regions.

Since the 2009 Endangerment Finding, the USGCRP NCA3, and multiple NRC assessments have projected future rates of sea level rise that are 40 percent larger to more than twice as large as the previous estimates from the 2007 IPCC 4th Assessment Report due in part to improved understanding of the future rate of melt of the Antarctic and Greenland Ice sheets. These assessments continue to recognize that there is uncertainty inherent in accounting for ice sheet processes. Additionally, local sea level rise can differ from the global total depending on various factors. The east coast of the US in particular is expected to see higher rates of sea level rise than the global average. The NCA3 states that “five million Americans and hundreds of billions of dollars of property are located in areas that are less than four feet above the local high-tide level,” and the NCA3 finds that “[c]oastal infrastructure, including roads, rail lines, energy infrastructure, airports, port facilities, and military bases, are increasingly at risk from sea level rise and damaging storm surges.”¹⁶⁷

Events outside the US, as also pointed out in the 2009 Endangerment Finding, will also have relevant consequences. The NRC Climate and Social Stress assessment concluded that it is prudent to expect that some climate events “will produce consequences that exceed the capacity of the affected societies or global systems to manage and that have global security implications serious enough to compel international response.” The NRC National Security Implications assessment recommends preparing for increased needs for humanitarian aid; responding to the effects of climate change in geopolitical hotspots, including possible mass migrations; and addressing changing security needs in the Arctic as sea ice retreats.

¹⁶⁷ Melillo, J. M., T. Richmond, and G. W. Yohe, Eds. 2014. *Climate Change Impacts in the United States: The Third National Climate Assessment*. US Global Change Research Program, p. 9. Available at <http://www.globalchange.gov/browse/reports/climate-change-impacts-united-states-third-national-climate-assessment-0>

These assessments and observed changes make it clear that reducing emissions of greenhouse gases across the globe is necessary in order to avoid the worst impacts of climate change, and underscore the urgency of reducing emissions now. Moreover, due to the time lags inherent in the Earth's climate, the NRC Climate Stabilization Targets assessment notes that the full warming from any given concentration of CO₂ reached will not be fully realized for several centuries, underscoring that emission activities today carry with them climate commitments far into the future.

5.7.3 Fiscal Implications of Coal

Federal, state, and local governments collect revenues from coal operations through various taxes, fees, and royalties. This section summarizes the revenue mechanisms and describes how revenues are disbursed.

Revenue and Disbursement Associated with Federal Royalties, Bonus Bids, and Rents

The Federal government receives revenue from coal leasing in three ways:

- Bonus bids
- Rental fees
- Production royalties

These revenues are collected and disbursed by the ONRR. In addition to these three channels, the ONRR also collects and tracks “other revenues” that consist of advance royalty payments, minimum royalty payments, estimated royalty payments, settlement agreements, and interest. Over the last 10 years, average annual revenues from coal leasing have amounted to slightly more than \$1 billion, representing approximately one-quarter of all revenues associated with onshore Federal minerals collected by the ONRR. **Table 5-7**, below, shows the revenues collected from coal in fiscal year 2015 associated with Federal coal leases by state, as well as the 10-year average by state and revenue type.

Over the last 10 years, almost 90 percent of total revenues collected from coal leases originated in Wyoming. Rent and other revenues generally represent a small proportion of overall revenue with less than 5 percent in any state and less than 0.5 percent of the national total. Bonus bids (36 percent) and royalties (63.6 percent) make up the greatest percentage of overall revenues from coal leasing.¹⁶⁸

¹⁶⁸ Bonus bids actually make up a relatively small proportion of the total revenue by state (less than 10 percent) with the exception of Wyoming. On average, bonus bids have represented about 40 percent of revenues from leases in Wyoming.

Table 5-7
Summary of Federal Revenues Associated with Coal Leases

State	Fiscal Year	10-year Average				
	2015 Total	Bonus	Other Revenues	Rent	Royalties	Total
Alabama	\$87,791	\$25,645	-\$102,705	\$12,120	\$3,810,903	\$3,745,963
Colorado	\$45,946,041	\$2,799,763	\$307,583	\$183,152	\$47,004,798	\$50,295,297
Kentucky	\$158,280	\$52,935	\$10,200	\$15,923	\$1,110,040	\$1,189,098
Montana	\$43,259,597	\$3,489,852	\$2,137,707	\$130,007	\$38,823,202	\$44,580,768
Oklahoma	\$825,481	\$80,999	\$2,655	\$36,382	\$723,083	\$843,118
North Dakota	\$3,483,815	\$64,906	\$0	\$33,176	\$1,244,067	\$1,342,149
Utah	\$34,545,089	\$1,338,104	\$98,931	\$225,425	\$28,753,933	\$30,416,393
Wyoming	\$987,724,580	\$372,599,892	\$842,377	\$555,832	\$550,402,368	\$924,400,469
Total	\$1,116,030,675	\$380,452,096	\$3,296,747	\$1,192,017	\$671,872,395	\$1,056,813,255

Source: ONRR 2016

The Mineral Leasing Act specifies that 50 percent of Federal revenues from leasable minerals (including coal) are paid to the US Treasury (40 percent appropriated to the Reclamation Fund and 10 percent to the General Fund), and 50 percent are paid “to the State within the boundaries of which the leased land is located or the deposits were derived” (30 USC, Subsection 191[a]). The Act further states that “[i]n determining the amount of payments to the States...beginning in fiscal year 2014 and for each year thereafter, the amount of such payments shall be reduced by 2 percent for any administrative or other costs incurred by the United States in carrying out the program authorized by this chapter, and the amount of such reduction shall be deposited to miscellaneous receipts of the Treasury” (30 USC, Subsection 191[b]). Thus, States effectively receive 49 percent of the revenues collected on leases within their state. The Act also recommends that “the legislature of the State may direct giving priority to those subdivisions of the State socially or economically impacted by development of minerals leased under this Act, for (i) planning, (ii) construction and maintenance of public facilities, and (iii) provision of public service” (30 USC, Subsection 191[a]). Given this recommendation, states have broad discretion in using these funds, and each state distributes them differently.

For example, Wyoming distributes mineral royalty and bonus payments to a range of funds, including the School Foundation Fund, School Construction Fund, Highway Fund, General Fund, and Budget Reserve Account. Portions of these payments are also distributed directly to cities and towns; cities, counties, and special districts capital construction; the community college commission; and the University of Wyoming. **Table 5-8**, below, summarizes the distribution of payments in Wyoming in fiscal year 2015 for payments associated with all Federal mineral leases (including coal). Based on the current level of revenues generated from coal leases, approximately 60 percent of the total distribution could be attributed to coal.

Table 5-8
State of Wyoming's Distribution of Federal Mineral Revenues

Funds / Recipient	Fiscal Year 2015
Cities & Towns	\$18,562,500
Cities, Counties & Special Districts Capital Const.	\$13,050,000
Foundation Fund	\$251,827,747
School Capital Construction	\$215,609,844
School Districts – Grants	\$5,346,000
Highway Fund / State Roads	\$66,472,500
1% General Fund	\$2,000,000
University of Wyoming	\$13,365,000
Community College Commission	\$1,600,000
Budget Reserve Account	\$326,149,640
Total	\$913,983,231

Source: Wyoming State Treasurer's 2015 Report (p. 52)

Funds distributed directly to cities and towns are generally based on population. The funds allocated to cities, counties, and the special districts capital construction account allow for grants or loans to district construction projects when specific circumstances are met. As shown in the table, a substantial proportion of the funds are allocated to schools. The Foundation Fund is a major revenue source to the Wyoming's Department of Education's annual budget and supports K-12 funding throughout the state.

Other Federal Taxes and Fees Associated with Coal Production

In addition to Federal revenues in the form of royalties, rents, and bonus bids, all coal mining operations are subject to:

- A per ton reclamation fee established by SMCRA, as amended
- The Black Lung Excise Tax enacted under Black Lung Benefits Revenue Act of 1977

Reclamation Fee

Title IV of the SMCRA established an Abandoned Mine Reclamation Fund (Fund)¹⁶⁹ that is administered by OSMRE. The primary source of revenue for the Fund is a reclamation fee paid by operators of coal mining operations. Currently, the fees are \$0.28 per ton of non-lignite coal produced by surface coal mining and \$0.12 per ton of non-lignite coal produced by underground mining or 10 percent of the value of the coal at the mine, whichever is less. The fee for lignite coal is 8 cents per ton or 2 percent of the value of the coal at the mine, whichever is less. SMCRA specifies how the collected funds are used, including "reclamation and restoration of land and water resources adversely affected by past coal mining" and grants to states to accomplish the purposes of Title IV (30 USC, Subsection 1231 [c]).

¹⁶⁹ 30 USC, Section 1232

In addition, interest is earned on the Fund, which is used to make transfers to three health care plans that are part of the United Mine Workers of America Health and Retirement Fund (30 USC, Subsection 1231[e]). Since SMCRA's enactment in 1977, the OSMRE has collected over \$10.5 billion in fees and distributed more than \$8.0 billion for grants to states and tribes, transfers to the health care plans, and its own operation of the national program to reclaim land and waters damaged by coal mining before SMCRA's passage.¹⁷⁰ In fiscal year 2015, OSMRE collected about \$195 million in fees, and the average between fiscal year 2011 and fiscal year 2015 was just over \$220 million annually.¹⁷¹

Black Lung Excise Tax

The Black Lung Excise Tax became effective in 1978 with the passage of the Black Lung Benefits Reform Act that enacted the Black Lung Disability Trust Fund. The departments of Labor, Treasury, and Health and Human Services jointly administer the fund. Currently, the excise tax is \$1.10 per ton on underground-mined coal and \$0.55 cents per ton on surface-mined coal, in either case not to exceed 4.4 percent of the sale price.¹⁷² Between 2009 and 2014, the average annual collections from this excise tax were approximately \$595 million.¹⁷³ The Department of Labor's Division of Coal Mine Workers' Compensation administers the Black Lung Program and uses funds to compensate "coal miners who are totally disabled by pneumoconiosis arising out of coal mine employment, and to survivors of coal miners whose deaths are attributable to the disease" and provide "eligible miners with medical coverage for the treatment of lung diseases related to pneumoconiosis."¹⁷⁴

State and Local Taxes and Fees Associated with Coal Production and Operations

State and local governments collect revenues from coal mining operations through a variety of channels. This section provides an overview of these revenue streams.

Severance Taxes

Many states collect severance taxes from the production of non-renewable mineral resources, regardless of the surface land owner. Severance tax rates vary by state and can be based on value or volume. Not all states collect

¹⁷⁴ Department of Labor. 2016. About the Black Lung Program. Available at: <https://www.dol.gov/owcp/dcmwcl/>

severance taxes, and, for those that do, the approach and level of the severance tax rate varies widely. Many of the states allow for some deductions and exceptions on severance taxes. Along with variation in the collection of severance taxes, the distribution of these revenues to state and local funds varies widely.

Taxes on Production and Property

In addition to severance taxes, many states collect tax revenues based on the value of coal produced in a given year, or the value of the real and personal property of coal operations.

An ad valorem tax is one based on the monetary value of an item, including property. States that have an ad valorem tax on coal production may refer to the tax as a gross products or gross proceeds tax, based on the total value of the item. Property taxes are ad valorem taxes applied to real and personal property. Real property generally refers to fixed property, such as land and buildings (e.g., the land in which a coal mining operation is located and any fixed structures). Personal property typically refers to property that can be moved, such as most equipment and vehicles used in the mining process. It is important to note that Federal land is exempt from real property tax. However, any improvements on Federal lands associated with a private operation are typically subject to property tax.

Ad valorem taxes on coal production and property associated with coal mining are primarily collected by local governments and some states. These taxes are typically set by taxing entities at the state and local level, including counties, cities, towns, school districts, and special districts (e.g., hospital district, soil and water conservation district, regional transportation authority, etc.). Commonly, the county treasurer is responsible for the collection of these taxes and then distributes the collections back to the taxing entities.

Other Local Taxes

Two additional tax revenue sources may exist that are applied to coal operations. One source, which would not apply to Federal coal leases, would be royalty and rents collected by states from state-owned coal resources. The other is sales and use taxes. Capital investment and other operating expenses at coal operations may generate additional state and local revenues.

5.8 FEDERAL COAL LEASING PROCESS

The BLM is the Federal agency that is responsible for leasing Federal coal. As previously discussed, the BLM coordinates with other Federal, state, and local agencies and governments that may be affected by coal-related activities and with representatives of industry and environmental groups that may be affected by how Federal coal is leased and managed. The BLM leases coal through a competitive sales process using a fixed royalty-variable cash bonus bidding system. The BLM prepares the paperwork necessary to evaluate tracts for sale,

holds the lease sale using sealed bidding procedures, and evaluates the high bids received to determine if they constitute FMV.

5.8.1 Land Use Planning

The first major step in the Federal coal leasing process is land use planning. Decisions resulting from the land use planning process identify lands acceptable for further consideration for coal leasing. These areas are identified after reviewing all lands in the planning area using the four screens established by the Federal coal management program in 1979 and memorialized in Federal regulations. The four screens are:

1. Identification of areas with coal development potential - areas are eliminated from coal leasing consideration if they do not possess coal development potential (43 CFR, Subparts 3420.1-4[e][1]).
2. Determining if lands are unsuitable for coal development - areas are eliminated if they contain coal but are judged unsuitable for surface coal mining after the application of 20 coal unsuitability criteria, if exemptions and exception do not apply (43 CFR, Subparts 3420.1-4[e][2]; 43 CFR, Subpart 3461).
3. Multiple use conflict analysis - additional coal areas may be eliminated on multiple use grounds if other resource values are determined to be more valuable than coal (43 CFR, Subparts 3420.1-4[e][3]).
4. Surface owner consultation - potential elimination of split-estate mineral lands where surface mining is proposed and a significant number of qualified surface owners have stated a preference against surface coal mining (43 CFR, Subparts 3420.1-4[e][4]).

Pursuant to the Mineral Leasing Act and BLM regulations, lands cannot be offered for lease if they are not identified by the BLM as acceptable for further consideration for coal leasing. This is also true where lands overlying Federal coal resources are managed by a Federal surface management agency other than the BLM.

5.8.2 Competitive Leasing Processes

Federal coal regulations at 43 CFR, Part 3420 identify two types of competitive leasing processes: regional leasing and lease by application. The BLM no longer employs regional leasing; the last “certified” Federal coal production region, the Powder River Coal Production Region, was decertified in 1990 (see **Section 5.3** for more information).

Regional Coal Leasing

Under the previous regional coal leasing process—which is described in 43 CFR, Part 3420—the BLM would set leasing levels and select potential coal leasing tracts for sale based on land use planning, expected coal demand, and potential environmental and economic impacts. This process required close consultation

with local governments and citizens through a Federal/state advisory board known as a Regional Coal Team. All costs associated with conducting regional leasing were borne by the Federal Government.

Under this process, regional leasing levels were established by the Secretary of the Interior based on recommendations of Regional Coal Teams. Leasing levels were based on the following factors (43 CFR, Subpart 3420.2):

1. Advice from governors of affected states as expressed through the regional coal team
2. The potential economic, social, and environmental effects of coal leasing on the region, including recommendations from affected Indian tribes
3. Expressed industry interest in coal development in the region and indications of the demand for coal reserves
4. Expressed interests for special opportunity sales
5. Expected production from existing Federal coal leases and non-Federal coal holdings
6. The level of competition within the region and recommendations from the Department of Justice
7. US coal production goals and projections of future demand for Federal coal
8. Consideration of national energy needs
9. Comments received from the public in writing and at public hearings
10. Other pertinent factors

The Regional Coal Team would delineate tracts in any areas acceptable for further consideration for leasing whether or not expressions of leasing interest had been received for those areas. Upon completion of tract delineation and preparation of the tract profiles, the Regional Coal Team would rank the tracts in classes of high, medium, or low desirability for coal leasing. Three major categories of consideration would be used in tract ranking: coal economics, impacts on the natural environment, and socioeconomic impacts (43 CFR, Subparts 3420.3-4).

The delineated tracts selected for further study would be analyzed in a regional EIS. These tracts would be grouped into leasing alternatives, with at least one alternative falling into the recommended leasing level range. Before making a final leasing decision, the Secretary would consult with the governors of the affected states, the surface management agencies, and the Department of Justice. The Secretary's final decision would include whether to offer coal for lease and if so, how much coal to offer, when to hold the lease sale (or sales), and how the coal would be offered for sale.

Under the regional leasing process, if a mine were in a situation in which it was running out of reserves to maintain existing production or existing contracts, prior to the next scheduled regional coal lease sale, the regulations allow for the filing of an emergency LBA.¹⁷⁵ Emergency lease sales are held when coal is needed within 3 years to maintain production at existing mines, to meet contractual obligations, or to prevent the bypass of Federal coal.

Lease-by-Application

All current leasing under the Federal coal program is conducted through the LBA process (43 CFR, Subpart 3425; see **Section 5.4.3** for more information). Under this process, coal tracts are applied for by an adjacent mine operator in order to maintain production levels and extend the life of the mine. The processing of LBAs has many steps, some running concurrently, but in general, the broad steps taken prior to offering a tract for sale are:¹⁷⁶

1. Receipt and initial review of the application for completeness and conformance with the applicable land use plan, and if complete, a cost recovery account is established
2. Ensure adequate data exists to determine the amount and characteristics of coal reserves within (and if applicable outside of) the application boundary (exploration)
3. Develop a preliminary tract delineation
4. Prepare a document to comply with the NEPA, preparing the decision on whether to offer a selected coal tract for sale and which tract to offer
5. Prepare and finalize all reports associated with the presale FMV estimate
6. Offer the selected tract for competitive bid

Review of Application

The application must be filed in the proper BLM State Office (SO) having jurisdiction over the lands and/or minerals involved. Once received, the SO assigns a serial number and reviews the application for completeness, ensuring the lands are properly described and available for lease in the approved Resource Management Plan.¹⁷⁷ The SO notifies the appropriate governor(s) that an LBA has been received. Staff confirms the application conforms to the land use plan, and the lands have been determined to be acceptable for further consideration for coal leasing. If the application is located on lands where the surface is administered by another agency, the BLM must confirm with the

¹⁷⁵ 43 CFR, Part 3420

¹⁷⁶ 43 CFR, Part 3420

¹⁷⁷ Leases within the decertified Powder River Coal Production area will take the application before the Powder River Regional Coal Team to get a recommendation from that team prior to processing.

surface management agency that coal leasing is in conformance with their approved land use plan. If private lands are noted in the application, it should be determined as soon as possible if a qualified surface owner is present, and whether the applicant has received consent to mine.

The applicant for a new Federal coal lease is required to reimburse the BLM for all processing costs incurred by the BLM through a cost recovery account. The processing costs include reimbursement of the BLM's time to provide information for and review of the NEPA document, and time to prepare the geologic, engineering, economic, and valuation documents that establish the presale FMV estimate. Total processing costs will be disclosed in the lease sale notice, and if the successful bidder is not the applicant, that bidder will be required to reimburse the applicant for the cost recovery fees.

Coal Exploration

The BLM must have adequate data to determine the quality and quantity of recoverable coal before a tract can be delineated and recommended for leasing. If geologic information is inadequate, the BLM will ask the applicant to conduct exploration drilling. A BLM-issued exploration license is required to conduct exploration activities on unleased Federal coal. However, the license confers no right to lease the lands where the exploration occurs. Applicants for exploration licenses must provide opportunity for other parties to participate in the exploration, on a pro rata cost share basis. A public Notice of Invitation to Participate is published in the local newspaper as well in the *Federal Register*.

Developing a Preliminary Tract

Production maintenance tracts generally do not contain sufficient recoverable reserves necessary to support an entirely new operation. Recoverable reserves are present only in sufficient quantities to extend the life of an adjacent, existing mine, or to permit expansion of the mine's annual production. The tract nominated for leasing by the applicant may be reconfigured by the BLM for reasons of Public Interest and resource conservation. Some common reasons to reconfigure the tract are in order to achieve maximum economic recovery and reduce the potential for bypass, increase potential value, promote competition, reduce potential impacts on other resources, and accommodate qualified surface owner constraints.

In order to enhance competition among companies, if a portion of an applied for tract lies near a competing mine, the BLM may split lands in an LBA into individual tracts in the hopes a competing mine may place a bid. The BLM will also try to delineate a tract that will enhance FMV. Often the BLM does this by pacing the rate of leasing to match the rate of coal production. Rapid leasing in excess of reserve needs could adversely affect bonus values, and the BLM is obligated not to lease speculative coal resources. The BLM attempts to configure these tracts to contain only those reserves needed to meet

production needs, recover all coal resources, avoid speculation or high grading, and encourage competition.

Preparing the NEPA Document/Decision to Lease

All coal lease applications will undergo NEPA analysis in the form of an environmental analysis or EIS with full public involvement consistent with regulation and policy. The BLM will also invite agencies involved with post-lease decision-making—often the OSMRE, the Forest Service, or other Surface Management Agency—and the State RA to become Cooperating Agencies in preparing the NEPA document.

Through NEPA, the BLM will evaluate the potential direct, indirect, and cumulative environmental and socioeconomic impacts of leasing and developing Federal coal in the application area. The BLM evaluates the environmental impacts of coal mining that would be expected to result if leases are issued for maintenance coal tracts. Although the BLM does not authorize mining by issuing leases for Federal coal, the impacts of mining the coal are considered in the environmental analyses, because it is a logical consequence of issuing a maintenance lease next to an adjacent mine.

Determining Fair Market Value

All successful lease bonus bids must meet or exceed the FMV established by the BLM prior to offering the lease for sale. The estimate of FMV is prepared in accordance with standard appraisal methods and is kept strictly confidential. The term is defined as the “amount in cash, or on terms reasonably equivalent to cash, for which in all probability the coal deposit would be sold or leased by a knowledgeable owner willing, but not obligated to sell or lease to a knowledgeable purchaser who desires but is not obligated to buy” (43 CFR, Subparts 3400.0-5[n]).

The presale estimate of the FMV relies on information about the geology and characteristics of the coal in the application area, the engineering report that considers an optimum mine plan, mining cost associated with extracting the identified reserves in the preferred tract, an economic report that establishes the market for the coal lying within the selected tract, and finally the appraisal/valuation report. The economic report identifies the most likely market(s) for coal lying within the tract, including an evaluation of whether the coal is suitable for export. The BLM is also required by statute and regulation to conduct a public hearing between the Draft and Final EIS to receive comments from the public on the tract proposed for leasing to inform the calculation of the FMV.

The BLM uses a sealed bid system as a measure to ensure FMV is received and the Public Interest is protected. In most instances, particularly in coal areas where lease sales are held on a consistent basis, the BLM keeps the presale estimate of FMV, and the information used to establish this value, confidential even after a lease sale is complete.

Conducting the Sale and Issuing the Lease

Once a decision is made to move forward and offer a coal tract for competitive sale, an announcement will be made in proposed and final sale notices in the *Federal Register* that give the time, date, and procedures of the lease sale and description of the coal to be offered. Other methods of notifying the public of the sale may also be employed.

The lease sale begins with receipt of sealed bids. All sealed bids are opened at the public lease sale. The apparent high bid is accepted contingent upon it meeting or exceeding the BLM's presale estimate of FMV, adjudication requirements (bidders must meet regulatory requirements necessary to be qualified to hold a Federal coal lease), and the appropriate fees and payments being attached.

Before a lease is issued, the lessee must furnish a bond in an amount determined by the agency to ensure compliance with the terms and conditions of the lease and to provide a bond to cover the remaining balance of the bonus bid.¹⁷⁸ A sale panel consisting of a mineral appraiser/economist, geologist, mining engineer, and Washington Office delegate will review the apparent high bid to determine if it has met or exceeded the presale FMV.

If the apparent high bid meets the FMV and the bidder is qualified to hold a Federal coal lease, the recommendation is sent before the BLM Authorized Officer, who will accept the bid and send the provided information to the Department of Justice for antitrust review. Upon hearing from Department of Justice, the Authorized Officer will either issue or reject the lease.

Should the apparent high bid not meet the FMV, the BLM Authorized Officer will send notice rejecting the bid and the right to appeal. The notice also allows a bidder to request the BLM to reoffer a tract if they waive their right to appeal. If no bid is received during the reoffer, the decision to hold the sale is complete, and the BLM Authorized Officer will close the case with no further action.

Public Interest

Throughout the coal leasing process, the BLM takes into careful consideration whether leasing the applied for lands would be in the public interest (30 USC, Sections 181-287, 351-359; 43 CFR, Subparts 3425.1, 3472.1). The regulations state the BLM must reject an application if "leasing of the land covered by the application, environmental or other sufficient reasons, would be contrary to the public interest" (43 CFR, Subparts 3425.1-8[a][3]). Many, often competing, interests must be considered in arriving at a Public Interest determination,

¹⁷⁸ Lessees are required to pay the bonus bids in five equal installments beginning with the first payment due at the time of the lease sale and the remaining payments due on the following four anniversary dates of the lease. Per the Energy Policy Act of 2005, if a successful bidder can demonstrate they have a history of timely payments, the requirement to cover any outstanding balance with a bond can be waived.

including, but not limited to, the applicant's request; the environmental impacts; the economic benefit to the local, state, and national economy; rights of qualified surface owners; ensuring a fair return for the use of the public resources; and conservation of the public resource (BLM Manual 3435).

The Federal Coal Lease

A Federal coal lease grants the right to explore for, extract, remove, and dispose of some or all of the coal deposits that may be found on the leased lands. After a lease is issued, the BLM will review and approve a Resource Recovery and Protection Plan, which describes how maximum economic recovery of the coal resource will be achieved. The BLM does not, however, approve any mining activities. A Federal coal lease is granted on the condition that the lessee will obtain the appropriate permits and licenses from other Federal, state, and local agencies. Before the lessee may initiate any mining activity, as required by SMCRA, OSMRE or the state RA must approve a permit. In addition, the Assistant Secretary, Land and Minerals Management, after receiving a recommendation from OSMRE, must approve a mining plan as required by the Mineral Leasing Act. As part of a permit issued by OSMRE or the state RA, the permittee is required to post a reclamation bond to cover the costs of returning the land to the pre-mining state.

A Federal coal lease has an initial term of 20 years, but it may be terminated within 10 years if the coal resources are not diligently developed. A lease is readjusted at the end of the 20-year primary term and every 10 years thereafter for the life of the lease. Diligent development occurs when the lessee mines one percent of the established recoverable reserves. Once that threshold is met, the lessee is required to continue to produce one percent of their original recoverable reserves on an annual basis, or pay an advance royalty.¹⁷⁹ Lessees who fail to comply with continued operation provisions subject their leases to cancellation. Because mines may be located in areas with various coal owners and mining occurs in a logical sequence, establishing a logical mining unit¹⁸⁰ allows lessees to consolidate the diligent development and continuous operations requirements for Federal leases within the boundary of the mine.

¹⁷⁹ Upon request by the lessee, the BLM may accept, for a total of not more than 20 years, the payment of advance royalties in lieu of continued operation, consistent with the regulations. The advance royalty will be based on a percentage of the value of a minimum number of tons determined in the manner established by the advance royalty regulations in effect at the time the lessee requests approval to pay advance royalties in lieu of continued operation (30 USC, Sections 181-287; 20 USC, Sections 351-359 (acquired lands); 43 CFR, Part 3483; BLM Coal Lease Form 3400-12).

¹⁸⁰ A logical mining unit is an administrative construction that allows the lessee or operator to consolidate the diligent development and continued operations requirements for all the Federal leases and other coal tracts within the boundaries of the mine. A logical mining unit provides for continuity in management of the coal resource whenever the geologic characteristics of a coal seam cross property boundaries. A logical mining unit has been defined as an area of land in which the coal can be developed in an efficient, economical, and orderly manner as a unit with due regard for conservation of the coal and other resources. An application is required to be filed with the BLM for approval to form a logical mining unit.

At any time, a lessee may surrender, in whole or in part, its Federal coal lease by filing a written request for relinquishment. Before a lease can be relinquished, the lessee must be in compliance with all lease terms and conditions, and have paid all payments and fees.

CHAPTER 6

PROGRAMMATIC ENVIRONMENTAL IMPACT STATEMENT

The BLM has received a large amount of substantive input from a diverse array of stakeholders through both the internal and external scoping process. **Chapter 5** includes a summary of the comments raised through the scoping process, and **Appendix D** includes a full record of all comments received. The BLM has undertaken a thorough review of the scoping record and developed a preliminary framework for the PEIS based on this input. This chapter presents a purpose and need statement, reform options that meet identified policy objectives to be carried forward for further consideration by the BLM, a rationale for dismissing some options from further consideration, a framework for developing program reform alternatives, issues for analysis, an analytical approach, analytical considerations, and a schedule for completion of the PEIS.

6.1 PURPOSE AND NEED STATEMENT

An EIS “shall briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action” (40 CFR, Subpart 1502.13). For many types of actions, the “need” for the action can be described as the underlying problem or opportunity to which the BLM is responding with the action. The “purpose” can be described as a goal or objective that the BLM is trying to reach (BLM NEPA Handbook Section 6.2).

6.1.1 Need for the Federal Action

The need for this action is to undertake a comprehensive review of the Federal coal program and to consider how the program can be improved and modernized in the areas of fair return, climate change, resource management and protection, and program administration. The last time the Federal coal program received a comprehensive review was in the mid-1980's, and most of the existing regulations which were promulgated in the late 1970's, have been only slightly modified since that time. Further, the direct, indirect, and

cumulative impacts of the Federal coal program have not been fully analyzed under NEPA in over 30 years. As described in Secretarial Order 3338, this has led to calls from a variety of stakeholders, including the GAO, OIG, members of Congress, interested stakeholders, and the public for review of many facets of the Federal coal program.

This need is a part of the BLM's stewardship role as a proprietor and sovereign regulator, which is charged by Congress with managing and overseeing mineral development on the public lands, not only for the purpose of ensuring safe and responsible development of mineral resources, but also to ensure conservation of the public lands; the protection of their scientific, historic, and environmental values; and compliance with applicable environmental laws. In addition, the BLM has a statutory duty to ensure a fair return to the taxpayer and broad discretion to decide where, when, and under what terms and conditions mineral development should occur.

Based primarily on the input received through the listening sessions and scoping process, it appears that modernization of the Federal coal program is warranted. While energy markets, communities, environmental conditions, and national priorities have changed dramatically, the program has remained fairly static in its administration over the last thirty years.

There are three general areas in particular that should be modernized to ensure that the program continues to accomplish its responsibilities to the American public. In each of these areas additional analysis is necessary prior to the recommendation of specific policy choices, in order to provide a complete understanding of the likely impacts of various policies on energy markets, electricity prices, employment, and other critically important issues. These issues will be the focus areas of analysis for the PEIS going forward. However, it is possible at this stage in the process to identify the most promising policies for consideration, and those are also set out below. In addition, there are some simpler good government improvements that can be made without significant additional analysis. These may be undertaken in parallel with the PEIS process and they are set out below as well.

The three general areas requiring modernization are: fair return to Americans for the sale of their public coal resources; impact of the program on the challenge of climate change and on other environmental issues; and efficient administration of the program in light of current market conditions including impacts on communities.

First, the program must ensure that the public owners of this coal receive a full and fair return for this resource. Addressing this issue will benefit not only the general public but the states and communities in which Federal coal is located, since 50 percent of most revenue generated by the program goes to those states.

In 2013, both GAO and OIG issued reports making specific recommendations regarding the Federal coal program, particularly with respect to the leasing process and fair market value. The BLM addressed these recommendations through the development of new protocols and issuance of policy guidance, a manual, and a handbook. In the broader context of these reports, stakeholders have expressed additional concerns with what they believe are fundamental weaknesses in the program with respect to fair return.

These concerns arise, at least in part, because there is currently very little competition for Federal coal leases. About 90 percent of lease sales receive bids from only one bidder, typically the operator of a mine adjacent to the new lease, given the investment required to open a new mine. While the BLM conducts a peer-reviewed analysis to estimate a pre-sale fair market value of the coal and will not sell a lease unless the bid meets or exceeds that value, commenters have questioned whether an accurate fair market value can be identified in the absence of a truly competitive marketplace. As OIG pointed out, “since even a 1-cent-per-ton undervaluation in the fair market value calculation for a sale can result in millions of dollars in lost revenues, correcting the identified weaknesses could produce significant returns to the Government.”¹⁸¹

Commenters have also raised concerns about the royalty rates in Federal leases, which are set by regulation at a fixed 8 percent for underground mines and not less than 12.5 percent for surface mines. Some stakeholders have suggested that the large volumes and relatively low costs of Federal coal, which currently represents approximately 42 percent of total domestic production, have the effect of artificially lowering market prices for coal, further reducing the amount of royalties received. There are also concerns that the Federal coal program obtains even lower returns through certain types of leasing actions, such as lease modifications, and through royalty rate reductions, which may result in royalty rates as low as 2 percent. In addition, stakeholders have noted that the \$100/acre minimum bid requirement has not been updated since it was established in the regulations in 1982. Some stakeholders further suggest that a fair return to the taxpayer should also include compensation for externalities such as the environmental damage (or lost environmental benefits) from the removal and combustion of the coal. Through the PEIS, the BLM will consider reform options to address these and other aspects of fair return.

Second, the program must ensure appropriate alignment with US climate goals and adequately reflect the impact of the program on climate change. Virtually every community in the US is being impacted by climate change, and Federal programs have an obligation to be administered in a way that will not worsen and help address these impacts. The United States has pledged under the United

¹⁸¹ OIG. 2013. Coal Management Program, US Department of the Interior, Report No. CR-EV-BLM-0001-2012. June 2013. Available at <https://www.doioig.gov/sites/doioig.gov/files/CR-EV-BLM-0001-2012Public.pdf>

Nations Convention of Climate Change to reduce its greenhouse gas emissions by 26-28 percent below 2005 levels by 2025. Efforts are already being made to reduce US greenhouse gas emissions in line with this target through measures such as vehicle efficiency standards, the CPP, energy efficiency standards, requirements to reduce methane reductions from oil and gas production, and many other measures.

However, numerous scientific studies indicate that reducing greenhouse gas emissions from coal use worldwide is critical to addressing climate change. As noted above, the Federal coal program is a significant component of overall US coal production. In 2015, 42 percent of total US coal production occurred on Federal lands.¹⁸² When combusted, this Federal coal contributes roughly 10 percent of total US greenhouse gas emissions. Many stakeholders highlighted the tension between producing very large quantities of Federal coal while pursuing policies to reduce US greenhouse gas emissions substantially, including from coal combustion. Furthermore they stated that the current leasing system does not provide a way to systematically consider the climate impacts and costs to the public of Federal coal development, either as a whole or in the context of particular projects, and suggested tools such as royalty adders and compensatory mitigation.

Several of the most promising reforms in this area also are linked to fair return in that they would require an increase in the cost of this coal through price or royalty increases or compensatory mitigation to reflect and help to address its climate change impact. Like other fair return approaches, these reforms would benefit not just the public generally, but more specifically the states in which the Federal coal is located and their communities. Through the PEIS, the BLM will consider reform options to better align the Federal coal program with the challenges presented by climate change.

In addition, there is a need for program reform to better protect the nation's other natural resources (e.g., air, water, and wildlife). Commenters suggested a variety of options for improving protection and management of resources as part of the Federal coal program in accordance with the "multiple use" and "sustained yield" principals of FLPMA. Commenters expressed concern that the unsuitability criteria are not consistently applied at the land use plan level, which they believe disregards important landscape-scale land use allocation considerations. Commenters also suggested that the current unsuitability criteria should be revised and expanded to provide greater protection to important resources such as bats and Greater sage-grouse. Commenters requested that the BLM develop strategic leasing plans that would address resource issues at an appropriate scale and with consideration of the need for mitigation. Options were suggested for strengthening lease applicant

¹⁸² US Extractive Industries Transparency Initiative. Full dataset. Table I. Available at <https://useiti.doi.gov/downloads/Federal-production/>. See also EIA. Annual Coal Report. Available at <http://www.eia.gov/coal/annual/>

qualifications to ensure that future leases are only offered to companies that have a proven track record with successful environmental performance, including reclamation. Still other commenters suggested using a pricing mechanism (adder associated with royalties) to account for the environmental externalities associated with coal production and use such as air quality impacts. Through the PEIS, the BLM will consider reform options to improve the protection of natural resources.

Finally, there is a need for common-sense reforms to the Federal coal program that provide for the efficient and orderly administration of coal on Federal lands in light of current market conditions. A number of commenters expressed concern over the length of time it takes to obtain a Federal coal lease (in some cases 10+ years) and what they perceive as redundancies in the process between the other agencies involved. They urged the BLM to consider as part of the PEIS ways to improve the administration of the lease process itself. Others offered information to suggest that current leasing processes do not fully promote competition in the current marketplace. And many, particularly in coal states and communities, made a powerful case that the program administration does not appropriately consider or address the impact on communities from changes in the market. The BLM will consider reform options aimed at improving the administration of the Federal coal leasing process in all of these areas.

6.1.2 Purpose of the Federal Action

The purpose of this action is to identify, evaluate, and recommend comprehensive reforms to the Federal coal program. Through the PEIS, the BLM will consider how the program can be improved and modernized to foster the orderly development of BLM-administered coal on Federal lands in a manner that gives proper consideration to the impact of that development on important stewardship values while also ensuring a fair return to the American public.

Programmatic NEPA reviews address the general environmental issues relating to broad decisions, such as those establishing policies, plans, or programs, and can effectively frame the scope of subsequent site- and project-specific Federal actions.¹⁸³ The PEIS provides the BLM with an efficient and effective tool to consider a wide range of reasonable reform alternatives for the Federal coal program and adequately assess the cumulative effects of those alternatives across many factors such as market and climate effects. The analysis in the PEIS will inform, and possibly streamline, future decisions for individual actions under the Federal coal program through the ability to tier. Importantly, the PEIS provides an excellent venue for meaningful public involvement, collaboration

¹⁸³ Executive Office of the President, Council on Environmental Quality “Effective Use of Programmatic NEPA Reviews.” December 2014. Available at https://ceq.doe.gov/current_developments/docs/Effective_Use_of_Programmatic_NEPA_Reviews_Final_Dec2014_searchable.pdf

with interested parties, and ultimately transparent, accountable, and informed government decision-making.

6.2 OPTIONS AND ALTERNATIVES

6.2.1 Options to Be Evaluated

Table 6-1 outlines the reform options that the BLM is proposing to carry forward for further consideration that may be analyzed in the PEIS and used as the basis for alternatives development. The options are organized by the policy objectives described in the Need for Federal Action in **Section 6.1.1**.

Table 6-1
Options Proposed for Analysis by Policy Objective

Fair Return	Reduce/Account for Greenhouse Gas Emissions	Improve Resource Protection and Management	Increase Lease Process Efficiency
1. Increase royalty rate	1. Account for carbon-based externalities through royalty rate increase or royalty adder	1. Improve application of unsuitability criteria; modify criteria	1. Develop strategic leasing plans that allow for tiering of future lease decisions
2. Implement FMV process changes (i.e., transparency and consistency)	2. Require compensatory mitigation for greenhouse gas emissions	2. Develop strategic leasing plans that address landscape scale issues, multiple use, and mitigation planning	2. Create pre-application process
3. Limit the use and improve the transparency of royalty rate reductions	3. Lease based on a carbon budget	3. Account for additional coal-related externalities	3. Create a standardized lease application form and develop an electronic application platform
4. Increase rental rate	4. Create incentives for methane capture	4. Strengthen lease applicant qualification requirements	4. Establish a single team to develop FMV
5. Raise minimum bonus bid	5. No new leasing, with limited modifications	5. Apply environmental protections to existing leases	5. Work with other agencies to evaluate means for eliminating overlapping requirements and redundant processes
6. Implement inter-tract or modified inter-tract bidding processes to increase competition		6. Develop regional mitigation strategies for existing and new coal development (to address public health and environmental impacts)	6. Improve transparency in the leasing process
7. Evaluate current performance bonding amounts; increase bonding levels as necessary		7. Develop best management practices	
8. Convene a royalty policy commission			

The reform options presented were raised through the scoping process or developed through internal scoping conducted by the BLM's Interdisciplinary Team. These options are described in greater detail in the text that follows based on best available information. The options presented will be evaluated in terms of benefits, impacts, and overall feasibility, including the BLM's legal and statutory authority for implementation. The BLM may use the options in combination to develop alternatives to be considered in the PEIS, as described in more detail below. Options raised through the scoping process that the BLM proposes not to carry forward for further consideration are discussed in **Section 6.2.3**. Based on further analysis, some of the options identified in **Table 6-1** may also be eliminated from further consideration.

Fair Return

A central objective of the BLM's reform effort for the Federal coal program is the level of return that it provides to the American public. The BLM received a number of comments suggesting reform options that would help better reflect FMV and consequently improve return to the taxpayer. The Federal Government receives revenues generated through the mining of Federal coal in three ways: production royalties, bonus bids, and rental fees (see **Section 5.7.3** for more information). The BLM will assess the following options in terms of the degree to which they would improve fair return to the taxpayer as well as their overall feasibility and practicality.

- I. **Royalty Rate Increase:** The BLM will evaluate the ability of using the royalty rate to better reflect FMV and assess the impacts of increasing the royalty rate on Federal coal. Royalty rates are currently set by statute at a minimum of 12.5 percent of the gross value of the coal produced for surface mines and 8 percent for underground mines (43 CFR, Subparts 3473.3-2). The rate for surface mines may be increased on a lease-by-lease basis but may not be set below 12.5 percent. Currently, most leases contain a royalty rate of 12.5 percent. The BLM will analyze a range of royalty rate increases as part of the PEIS effort to secure fair return. The BLM will consider the effective royalty rate (royalty rate when accounting for deductions and royalty relief) for other federally leased commodities, considering royalties, bonus bids, and rental rates. This may include, but is not limited to basing the royalty rate on the market price for nearby regional coal, basing the royalty rate on the market price for non-Federal coal nationwide, or making the royalty rate commensurate with the rate used on other resources such as offshore oil and gas (18.75 percent). The BLM may also consider adjusting existing royalty rates upward until they are commensurate (on an energy content basis) with royalties that would be collected on substitute fuels, such as natural gas, or possibly consider a royalty rate aimed at maximizing revenues.

For context, the Council of Economic Advisers (CEA) in their study entitled, "The Economics of Coal Leasing on Federal Lands: Ensuring a

Fair Return to Taxpayers,”¹⁸⁴ estimated the necessary royalty rate in the year 2025 based on mine mouth prices to ensure a fair return as follows: 17 percent based on regional coal prices, 29 percent based on non-Federal nationwide coal, and 29 percent based on natural gas prices.¹⁸⁵ The CEA concluded that a policy goal of maximizing return to the taxpayer would require royalty rates of 304 percent¹⁸⁶ (equal to approximately a \$30/ton royalty charge on Powder River Basin coal), which would curtail future Federal coal production by more than half from projected levels (partially offset by increased production from other regions) while increasing revenue by \$2.7-\$3.1 billion. No other studies submitted during the scoping process went into this level of detail on royalty rate increases for the purposes of fair return.

Because royalty charges are related to production levels and gross revenues, the BLM will model the impact various royalty rates have on total Federal coal production and corresponding revenues. For example, the CEA study estimated that Federal coal production based on the royalty rate increases described above would decrease between 3 and 53 percent, respectively, and revenue would increase between \$0-290 million to \$2.7-3.1 billion annually.

The BLM will also evaluate in more detail than the CEA study how raising the royalty rate may depress bonus bids. As previously discussed, total returns are composed of revenues from royalty rates, bonus bids, and rental fees, less administrative costs. Increasing any single component may reduce one of the other components or vice versa. Revenue collection is split among these components as a risk-sharing mechanism between lessors and lessees.

Implementation of this option could be accomplished through policy under the Secretary’s discretion under the Mineral Leasing Act for surface mines; however, rulemaking would be required to increase royalty rates for underground mines. Additionally, rulemaking would be required if the regulatory minimum royalty rate is to be increased.

2. **Fair Market Value Transparency:** The BLM will consider various ways to build on processes that improve consistency and transparency in the FMV calculation process without jeopardizing the competitive process. These include the new oversight process in which the

¹⁸⁴ Council of Economic Advisers, Executive Office of the President. 2016. The Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to Taxpayers. June 2016. Available at https://www.whitehouse.gov/sites/default/files/page/files/20160622_cea_coal_leasing.pdf

¹⁸⁵ These percent values are relative to an estimated 9.3 percent weighted average royalty rate based on production in 2025 and accounting for waivers, suspensions, and reductions.

¹⁸⁶ The royalty rates increases pertain to mine mouth, initial point of sale, cost of coal. For most Federal coals, this is only a small portion of the totaled delivered cost of coal to a power plant. Therefore, the actual percent increase in price observed by the end user will be significantly lower than the values reflected here.

OVS/DME reviews the BLM’s FMV calculations (see **Section 5.8.2**, Competitive Leasing Process), or the establishment of a single team to develop FMV. Regarding transparency, the BLM Handbook instructs that:

“While much of the data and information used to develop a pre-sale estimate of value have proprietary and confidential characteristics, it is the policy of the BLM that the Federal coal leasing processes are as transparent as the law and regulations allow. To this end, consideration must be given while developing reports that support FMV estimates to the ease with which sensitive, confidential, and proprietary data can be redacted to provide publicly available documents. It is not acceptable to redact an entire document. Further, consideration should be given to timely posting public versions of FMV related documents prominently on publicly available web sites after a successful lease sale, consistent with law and regulation.”¹⁸⁷

As part of the PEIS, the BLM will look at ways to improve the amount and timeliness of information available to the public for FMV, as well as improved transparency of the process. FMV process improvements will require, at a minimum, modification or additions to BLM policy and guidance to implement, and they may require rulemaking based on options to be evaluated.¹⁸⁸

3. **Royalty Rate Reductions:** The BLM will evaluate its current use of royalty rate reductions and consider ways to limit the use of those reductions. Under certain circumstances the BLM can, upon application by the lessee or operator, temporarily reduce the royalty rate for a specific area of coal. Since the passage of FCLAA in 1976, the BLM has frequently granted royalty rate reductions.¹⁸⁹ In their scoping comment letter, Taxpayers For Common Sense noted that the BLM has reduced the royalty rates on 35 of 80 Federal coal leases in 9 states during the last 25 years, more than half of which occurred between 2001 and 2007 based on data they obtained from the ONRR.¹⁹⁰

The general consideration for a royalty rate reduction is to encourage the greatest ultimate recovery of the coal resource. Analysis will be

¹⁸⁷ BLM. 2014. BLM H-3073-1, Coal Evaluation Handbook. October 12, 2014. Available at https://www.blm.gov/style/medialib/blm/wo/Information_Resources_Management/policy/blm_handbook.Par.58766.File.dat/H-3073-1.pdf

¹⁸⁸ Pursuant to Mineral Leasing Act § 201(a), “[n]o bid shall be accepted which is less than the fair market value[.]” The Mineral Leasing Act does not provide a definition for FMV. Changes to the FMV process may require modifications to 43 CFR, Subpart 3422.1.

¹⁸⁹ ONRR. 2016. Royalty Reporting (except Solid Minerals). Available at <http://www.onrr.gov/ReportPay/royalty-reporting.htm>

¹⁹⁰ Taxpayers For Common Sense. 2016. Scoping comment letter on Coal PEIS. July 28, 2016. See Volume 2 Appendix D.

needed to determine the overall revenue impact of royalty rate reductions and the potential for improved return if reductions were curtailed. Analysis will be needed to determine if limitations on royalty rate reductions could result in reduced revenue to the government, as rate reductions are most applicable to already marginal investments (i.e., without the reduction, the coal would not be recovered and no revenue would be generated).

The BLM will also consider ways to improve the transparency associated with the use of royalty rate reductions. As described in scoping comments from Taxpayers For Common Sense and others, the BLM could improve transparency in royalty rate reductions by providing public updates of the applications received and/or approved. This work has already been initiated through the implementation of BLM Instruction Memorandum No. 2014-156 and the associated justification that State Directors are required to provide to the Washington Office any application to ensure consistency in the BLM's review and decisions related to royalty rate reductions.¹⁹¹ These policies may be further modified through the PEIS and formalized as part of the proposed program reform alternatives.

4. **Rental Rate:** The BLM will consider increasing the rental rate associated with coal leases, which is currently set at a minimum \$3 per acre as established in 1979 (43 CFR, Subparts 3473.3-1). At a minimum, the BLM will consider increasing rental rates to reflect inflation since 1979. Given the small percentage of overall revenues that are generated by rental rates (see **Section 5.7.3**), it is not expected that this option will result in a substantial increase in return. This option may be implemented without rulemaking on an individual lease basis; however, rulemaking would be required to increase the regulatory minimum rate.
5. **Minimum Bonus Bid:** The BLM will consider raising the minimum bonus bid for coal leases that is currently set at \$100 per acre and was established in 1982. The minimum bonus bid represents the minimum value that can be received by the Treasury for a coal lease (43 CFR, Subpart 3422.1[c][2]). The minimum regulatory value is used only when other methods of estimating value (i.e., FMV) yield results that are less than the equivalent of \$100 per acre. At a minimum, the BLM will consider increasing the minimum bonus bid to reflect inflation since 1982. Accounting for inflation alone would increase the minimum bid to approximately \$250 per acre as pointed out by the Institute for Policy

¹⁹¹ BLM. 2014. BLM Instructional Memorandum 2014-156. Supplemental Guidance on Processing Royalty Rate Reduction Applications. September 26, 2014. Available at http://www.blm.gov/wo/st/en/info/regulations/Instruction_Memos_and_Bulletins/national_instruction/2014/IM_2014-156.html

Integrity in their paper entitled, “Illuminating the Hidden Costs of Coal.”¹⁹²

Raising the minimum bid is not likely to result in a substantial improvement in return since the minimum bonus bid has historically only been employed for leasing in North Dakota and Oklahoma. Minimum bids can vary regionally, and the BLM may also consider establishing minimum bonus bids by coal region taking into account regional economic, geologic, and engineering variables. An additional consideration may be to remove the \$100 bid floor and use the FMV process for setting the statutory minimum bid. The BLM will also consider the feasibility of and need for considering the option value associated with future information and/or changed conditions when establishing the minimum bonus bid.

6. **Alternative Leasing Mechanism:** The BLM will consider the use of alternative leasing mechanisms as a potential means to increase competition among bidders with the goal of improving return. Consideration will be given to inter-tract bidding and modified inter-tract bidding processes.

An inter-tract bidding requires mining companies that are interested in different tracts to compete among themselves for the right to produce on those tracts. As a general overview, the BLM would determine a leasing level for the region being covered before the lease sale. The BLM would then offer tracts for sale, or accept industry requests, in excess of the determined leasing level. The companies would all bid at once on the tracts they most prefer, and their bids would be ranked (e.g., based on \$/ton or \$/Btu). Tracts would then be subtracted from the leasing level in order until the leasing level is met. At this point, the remaining tracts would be rejected. The accepted tracts would be subjected to standard post-sale review to ensure that they achieved FMV.

Under a modified inter-tract bidding process, the BLM would determine a maximum tonnage or maximum number of Btus (or possibly carbon credits that would give the right to mine a volume of coal) to be leased for a region. All interested companies would bid among themselves for the right to produce coal. It could be conducted such that each bidder bids for a specified quantity of coal, and the highest bidders’ quantities are subtracted in order from the level. Alternately, bids could be accepted on a proportional basis, where each bidder bids in a price per ton or per Btu and wins a proportion of the total leasing level equivalent to the value of their bid. The former option consolidates production among the highest bidders, while the latter ensures that

¹⁹² Bureau of Labor Statistics. 2016. Consumer Price Index Inflation Calculator. Available at <http://data.bls.gov/cgi-bin/cpicalc.pl?cost=100.00&year1=1982&year2=2016>

every reasonable bidder receives some production. Once the lessees have received their production quantities, they would be free to allocate the increase on Federal lands of their choice subject to suitability review and NEPA analysis.

Both of these alternative bidding processes imply the need for a strategic plan that sets leasing level for a given region or nationally. Analysis will be needed to determine the potential for increased return associated with modified bidding systems in comparison to the administrative costs. If adopted, the design of this option would be critical. Any procedure to establish leasing levels is subject to uncertainty about future supply and demand conditions in energy markets. For example, the government should have the flexibility to adjust leasing levels to changing market conditions. The methods for how to determine a leasing cap will have to be established (see for example Reduce/Account for Greenhouse Gas Emissions #3). This option may also be considered in connection with the greenhouse gas issues to be discussed below.

It should be noted that the BLM leased coal based on regional plans that included the amount of coal to be leased starting in the late 1970s. This system was suspended due in part to low bidding activity. However, this system did not include the aforementioned alternative leasing mechanisms, and consideration of these options would not be limited to the specific processes and requirements previously used for regional leasing.

7. **Lease Bonding:** The BLM will assess whether current performance lease bonding procedures are sufficient to provide assurance of payment of obligations required under a lease. The BLM is not responsible for establishing bonds to cover environmental protection and reclamation requirements within a SMCRA permit, but rather is responsible for establishing bonds to protect the Federal government from losses in rentals and royalties (and in certain cases unpaid deferred bonus). The bonds are calculated using guidance established in BLM Manual Section 3474 and WO IM 86-145. At minimum, a bond must cover one-fifth of the bonus bid if there is any unpaid balance, as well as one year of advance rental and one-quarter year of royalties if the lease is in production. Bond reviews are currently conducted at least annually but may be increased based on circumstances, such as an anticipated increase/decrease in lease production. The BLM will accept a number of different types of lease bonds but does not accept self-bonds (43 CFR, Subpart 3471.1). This option may be implemented without rulemaking. However, rulemaking would be necessary to make the BLM regulations consistent with section 436 of the Energy Policy Act of 2005, 42 USC, Sections 15801 et seq, amending the Mineral Leasing Act at section 201(a)(4)(A).

8. **Royalty Policy Commission:** A number of commenters suggested that the BLM should immediately reconvene the Royalty Policy Committee, which was established by charter in 1995 under the authority of the Federal Advisory Committee Act. The Committee advised the Secretary on royalty management issues and other mineral-related policies, and also provided a forum for mineral lessees, operators, revenue payers, royalty recipients, government agencies, and interested public to express their views on those issues. The Committee charter required biennial review and could be renewed in 2-year increments by the Secretary as long as the Minerals Management Service required the expertise and advice of the Committee.

The Royalty Policy Committee was terminated on April 2, 2014, due to lack of participation. While the BLM does not believe there is a need to reconvene the Royalty Policy Committee in its previous form, as the Department of the Interior has in place various advisory bodies to address key minerals issues, it will consider the potential value in a policy commission that could assist with rate setting for the Federal coal program and will give that further consideration in the PEIS. Implementation of this option may require development of a charter pursuant to the Federal Advisory Committee Act and Secretarial action to convene a committee.

Reduce/Account for Greenhouse Gas Emissions

A related central objective to the BLM's reform effort for the Federal coal program is consideration of the effect of the program on, and alternatives for alignment with, US climate goals. Many stakeholders highlighted the tension between producing large quantities of Federal coal while pursuing policies to restrict global warming to a 2 degrees Celsius outcome, in line with the Paris Agreement (see **Section 5.4.6** for more information). The BLM received a number of suggestions for reform options that would help limit greenhouse gas emissions associated with Federal coal production. Future BLM analysis will evaluate the comparative effectiveness of these options at mitigating greenhouse gas emissions while still respecting the BLM's multiple use and fair return statutory mandates.

- I. **Accounting for Carbon-Based Externalities Through a Royalty Rate Increase or Royalty Adder:** The BLM will consider options to account for the carbon-based environmental and social costs of coal production and use (e.g., climate change damages such as net agricultural productivity, human health, and property damages from increased flood risk). Two possible methods of adjusting the royalty to account for carbon-based externalities will be considered: an increase in the royalty rate (i.e., a percent increase) to account for carbon-based externalities and a carbon adder (or carbon fee) generally expressed as a \$/ton fee that would be in addition to the royalty rate. The advantages and drawbacks of a royalty rate increase versus an adder will be

explored in the PEIS. As has been suggested by commenters, the BLM could also theoretically account for carbon-based externalities through changes to rental rates or bonus bids. The BLM has determined that using royalty-based changes would directly connect impacts to the coal production and consumption—the activities that generate externalities—whereas rental rates are denominated in acres, and bonus bids are dependent on upfront estimates of total coal production.

Consideration will be given to the appropriateness of accounting for individual segments of, or the full lifecycle emissions of, CO₂ from coal. This includes the upstream carbon-related impacts associated with coal production, such as methane released during mining, and the midstream and downstream carbon-related impacts associated with transportation and combustion. For context, in their assessment of royalty rate adjustments to account for upstream externalities in coal production, the Institute for Policy Integrity estimated surface mine royalties would increase from 12.5 percent to 18.7 percent, and underground mine royalties would increase from 8 percent to 28.7 percent when accounting for the social cost of methane emissions from coal production.¹⁹³ Their analysis suggested a surface mine royalty of 82.6 percent when incorporating environmental and social externalities from coal transportation.¹⁹⁴ Royalty charge estimates increased higher still when the social cost of carbon related to coal combustion was internalized in other studies.

The BLM's consideration of the external costs associated with coal may, among others, rely on estimates for CO₂ and methane from the Federal Interagency Working Group on the Social Cost of Carbon.¹⁹⁵ The estimates of the social cost of carbon vary over time. Thus, in order to apply the social cost of carbon to Federal coal, analysis will be needed to link coal production and/or combustion to the social cost of carbon or social cost of methane specific to that year.

As this option results in higher prices for coal, it is likely to result in decreased Federal coal production and, therefore, greenhouse gas

¹⁹³ Foley, J. H. and P. Howard. 2016. Illuminating the Hidden Cost of Coal. New York University School of Law Institute of Policy Integrity. p. A-13. Available at http://policyintegrity.org/files/publications/Hidden_Costs_of_Coal.pdf

¹⁹⁴ These royalty percentages pertain to mine mouth prices, but constitute a much smaller percentage of the delivered price of coal that informs power plant's fuel purchase decisions.

¹⁹⁵ Interagency Working Group on Social Cost of Greenhouse Gases. 2016. Addendum to the Technical Support Document on Social Cost of Carbon for Regulatory Impact Analysis under Executive Order 12866: Application of the Methodology to Estimate the Social Cost of Methane and the Social Cost of Nitrous Oxide. Participation by the Council of Economic Advisers, Council on Environmental Quality, Department of Agriculture, Department of Commerce, Department of Energy, Department of the Interior, Department of Transportation, Department of the Treasury, Environmental Protection Agency, National Economic Council, Office of Management and Budget, Office of Science and Technology Policy. August 2016. Available at https://www.whitehouse.gov/sites/default/files/omb/inforeg/august_2016_sc_ch4_sc_n2o_addendum_final_8_26_16.pdf

emissions, but as a price mechanism it has no pre-determined CO₂ emissions or coal production outcomes, and levels can be expected to vary based on future market conditions and the availability of substitutes. Higher Federal coal prices may lead to increased non-Federal coal consumption that has similar lifecycle CO₂ emissions, which could partially offset some of the climate-related benefits to reduced Federal coal consumption. The environmental effectiveness of a royalty rate increase or adder would be largely contingent on the degree to which the substitute fuel sources are less carbon intensive (e.g., natural gas-fired generation or renewable generation) as opposed to similarly carbon intensive (e.g., non-Federal coal). The BLM will develop and use economic models to assess these substitution dynamics and the impact they have on the costs and benefits of any changes. Although there is less certainty around CO₂ emission under this option, in comparison to a carbon budget or other quantity-based option, a price-based mechanism would provide greater cost certainty to the coal industry.

Initial analysis conducted by Vulcan Philanthropy using the IPM model suggested a wide range of substitution rates of non-Federal coal for Federal coal, largely in the 0.2 to 0.7 range, depending on base case assumptions regarding the CPP and the percentage of the social cost of carbon incorporated into the royalty rate.¹⁹⁶ Two additional studies (one using the IPM model) project a small amount of substitution, while another study has posited that it may be more significant.^{197,198,199} The BLM will be conducting independent analysis similar to these as part of the PEIS. The BLM could also use modeling to test for economic efficiency by identifying at what level of royalty rate increase or adder the marginal benefit from avoided climate damages is greater than or equal to the marginal cost of that royalty adder.

Another consideration in the design of this option will be downstream emissions regulations. For instance, if existing downstream regulation at the point of combustion of coal is already addressing carbon

¹⁹⁶ A value of 0.2 would suggest that each decrease in a ton of Federal coal production would result in an increase of 0.2 tons of non-Federal coals. (Note: on average, non-Federal coals have higher Btu and CO₂ content per ton). See:

externalities (partially or fully) through Federal or State regulatory initiatives, or if there is carbon capture and sequestration at the point of combustion, then those impacts could be netted out against any assumed social cost of carbon before converting into an adder as suggested by commenters. One such final downstream regulation is the CPP, which regulates CO₂ from existing power plants and, in effect, causes the internalization of a portion of the social cost of carbon. Because this downstream regulation partially captures the social cost of carbon, optimal upstream policies reflecting the social cost of carbon could be less than 100 percent of the full social cost of carbon to account for the CPP's effects.

With these substitution effects and downstream regulations in mind, some commenters have suggested only incorporating a percentage of the social cost of carbon into any royalty adjustments.^{200,201} However, the percentages used in these studies was illustrative and would require further refinement by the BLM. For example, research by Kenneth Gillingham and James Stock found that a carbon adder accounting for 20 percent of the social cost of carbon would amount to between \$15 and \$20 per ton for Powder River Basin coal.²⁰² Relative to current coal prices and the current surface mining royalty of 12.5 percent, this would equate to a royalty rate of roughly 160 percent to 210 percent.

The BLM may also consider as part of the PEIS opportunities for directing increased revenue streams to address climate adaptation and preparedness practices (e.g., develop and implement comprehensive climate adaptation plans, update stormwater infrastructure, and wildfire programs). Opportunities to direct revenue streams may require recommendations to Congress for statutory amendments.

2. **Compensatory Mitigation:** The BLM will consider adopting requirements for the use of compensatory mitigation to offset the greenhouse gas emissions and climate change impacts associated Federal coal production and use. According to the Department of the Interior's Departmental Manual chapter on implementing mitigation, compensatory mitigation is defined as means to compensate for remaining unavoidable impacts after all appropriate and practicable avoidance and minimization measures have been applied, by replacing or

²⁰⁰ Vulcan Philanthropy. 2016. Federal Coal Leasing Reform Options: Effects on CO₂ Emissions and Energy Markets. Fairfax, Virginia: Vulcan Philanthropy/ICF International. January 2016. Available at <http://www.vulcan.com/MediaLibraries/Vulcan/Documents/Federal-Coal-Lease-Model-report-Jan2016.pdf>

providing substitute resources or environments through the restoration, establishment, enhancement, or preservation of resources and their values, services, and functions. Impacts are authorized pursuant to a regulatory or resource management program that issues permits and licenses, or otherwise approves activities.²⁰³

Under this option, the BLM could receive compensation for unavoidable impacts associated with carbon-based externalities from lessees in the form of a fee paid at lease issuance based on the units of coal produced. Once the fee is paid, the BLM could assume responsibility for ensuring that the desired outcomes of compensatory mitigation are achieved. This approach has been used by the BLM in solar development and is proposed to be used in oil and gas development in the Northeastern National Petroleum Reserve in Alaska. Through the PEIS, the BLM will look at ways to calculate mitigation fees for unavoidable carbon-related impacts and ways to invest the fees collected. Alternately, under this option, the BLM could approve transactions proposed by lessees that would achieve the desired outcome of compensatory mitigation, but for which projects were carried out by private businesses, non-profits, or state or local agencies. This approach has been used under the Endangered Species Act and Clean Water Act as an efficient way to provide appropriate and measurable benefits to a resource that has been negatively affected through a proposed action.

Suggestions made through scoping comments on ways to spend compensatory mitigation funds include carbon offsets, carbon sequestration, climate adaption, and community resilience. As with option #1, Royalty Rate Accounting for Externalities, a compensatory mitigation fee would generate revenue. Careful consideration will be given to which carbon-related externalities should be mitigated for: upstream, or upstream and downstream. Another consideration in the design of this option will be existing regulations for downstream emissions. Like a royalty rate increase or royalty adder, compensatory mitigation may result in substitution from Federal to non-Federal coal and/or other energy sources. This substitution effect would need to be incorporated into BLM's analysis. In comparison to a royalty rate increase or carbon adder, this approach may offer the BLM the ability to direct how mitigation dollars are spent.

3. **Carbon Budget:** The BLM will consider establishing a carbon budget to guide Federal coal leasing in an effort to limit the amount of greenhouse gas emissions associated with Federal coal production. Under this quantity based option, the BLM would offer leases in

²⁰³ Department of the Interior. 2015. Departmental Manual Part 600 Public Land Policy, Chapter 6 Implementing Mitigation at the Landscape-scale, Section 6.4.C. October 2015. Available at <https://www.doi.gov/sites/doi.gov/files/uploads/TRS%20and%20Chapter%20FINAL.pdf>

accordance with an established carbon budget. A carbon budget would reflect the estimated annual volumes of CO₂ from Federal coal that align with US climate goals (see **Section 5.4.6**) and give consideration to the role of Federal coal in the emissions profile. Under this option, the BLM would identify the amount of Federal coal production and desired additional leasing over a specified time period that would be consistent with current national greenhouse gas emission reduction goals. Like a royalty rate increase or royalty adder, the carbon budget approach may result in substitution from Federal to non-Federal coal and/or other energy sources, so reducing federal leasing by a given amount may not lead to a commensurate reduction in greenhouse gas emissions. This substitution effect would need to be incorporated into BLM's analysis. In comparison to a royalty rate increase or royalty adder approach to addressing carbon-based externalities, a carbon budget approach would not link the climate cost of coal to consumption or provide cost certainty to industry.

In November 2016, the White House released its Mid-Century Strategy for Deep Decarbonization, which lays out the long-term pathways to achieve reductions in net economy-wide emissions of 80 percent below 2005 levels by 2050.²⁰⁴ This is consistent with the global ambition necessary to avoid most costly climate impacts and risks by meeting the long-term Paris Agreement aim of limiting the increase in the global average temperature to well below 2 degrees Celsius. Other studies have estimated that the US will have to reduce emissions an average of 83 percent below 2005 levels by 2050 (to do its part in limiting the concentration of greenhouse gases in the atmosphere to around 450 parts per million of CO₂).²⁰⁵

Studies acknowledge there are multiple potential pathways to a 2 degree compliance scenario, and there is not a single coal production level specific to these broader climate goals at a given point in time. The BLM may consider a carbon budget that is commensurate with Federal coal's appropriate contribution to meeting economy-wide greenhouse gas emission reduction targets. The BLM may also consider phasing in a budget over time to reduce the economic impact to coal producing regions. Furthermore, the BLM could analyze alternative carbon budgets that strive to align with other metrics such as EIA's projected demand for coal in its reference case scenario, or the anticipated amount of coal demand when social cost of methane and/or social cost of carbon dioxide are internalized into its price. Establishment of any carbon budget would have to consider the amount

²⁰⁴ The White House. 2016. US Mid-Century Strategy for Deep Decarbonization. November 2016. p.26. Available at https://www.whitehouse.gov/sites/default/files/docs/mid_century_strategy_report-final.pdf

²⁰⁵ See International Energy Agency. 2015. Energy and Climate Change. p.151. Available at [publication/WE02015SpecialReportonEnergyandClimateChange.pdf](https://www.iea.org/publications/WE02015SpecialReportonEnergyandClimateChange.pdf)

of coal already available under lease, production capacity, demand, and substitution effects.

Leasing per a carbon budget implies the need for a strategic leasing plan that guides how coal resources will be allocated overtime in a given region or nationally (see Improve Resource Protection & Management #2). It also would likely have to be coupled with a modified bidding system in order to allocate the coal per the budget as discussed under Improve Return #6.

4. **Methane Emissions:** The BLM will consider opportunities to address methane emissions associated with coal mining operations through the PEIS. This includes creating incentives for operators to capture waste mine methane (e.g., for free on-lease use, or capture, storage and sale to the market). The BLM initiated rulemaking through an Advanced Notice of Proposed Rulemaking for waste mine methane use or capture in April 2014 that considers the capture of waste mine methane, for use or sale, that would otherwise be vented.²⁰⁶ This proposed rulemaking asked for comments and suggestions that might assist the agency in the establishment of a program to capture, use, or destroy waste mine methane that is released into the mine environment and the atmosphere as a direct result of underground coal mining operations. As suggested in scoping comments, the BLM will consider incorporating some of these concepts into the PEIS.
5. **No New Leasing:** The BLM will fully analyze a no new leasing alternative as part of the PEIS as a means to reduce greenhouse gas emissions. Under this alternative, the BLM would issue no future leases for Federal coal with the exception of lease modifications within the defined acreage limitations; existing coal already under lease would not be impacted. Commenters have raised differing opinions on the BLM's legal authority with respect to ceasing all leasing of Federal coal. As part of the PEIS, the BLM will examine its statutory authority regarding implementing a no new leasing alternative and will consider alternative ways this option may be accomplished.

This alternative will require modeling and analysis of substitution, or "leakage," effects to determine net impacts on greenhouse gas emissions and climate change. For example, in the study entitled "How Would Phasing Out US Federal Leases for Fossil Fuel Extraction Affect CO₂ Emission and 2 Degree Celsius Goals?" the authors concluded that if the Federal government stopped all new leasing and did not renew non-producing leases, 3.1 Qbtu of Federal coal would not be extracted that

²⁰⁶ BLM. 2014. Waste Mine Methane Capture, Use, Sale, or Destruction. Proposed Rule. *Federal Register* 79 (82): 23923. April 29, 2014. Available at <https://www.gpo.gov/fdsys/pkg/FR-2014-04-29/pdf/2014-09688.pdf>

otherwise would be between now and 2030.²⁰⁷ In terms of greenhouse gas emission reductions, assuming CPP implementation, the authors found that leasing restrictions would reduce CO₂ emissions in 2030 from coal by about 107 million metric tons of CO₂, but increased use of gas would increase emissions by about 36 million metric tons of CO₂, resulting in a net reduction of 71 million metric tons of CO₂. Supporting modeling showed that approximately 60 percent of the decreased Federal coal production would be made up by increased production in the Illinois Basin and (to a lesser extent) Appalachia. The resulting increased coal prices also led to some substitution by gas in domestic power systems, which also reduced emissions.

The BLM could consider including a conditional no new leasing option in which the BLM would issue new and renewed leases conditioned only upon a demonstration that the United States is on track to meet its economy-wide carbon reduction goals. If current emissions and projected emission levels did not suggest that the United States was on track to meet its emissions reduction goals, such as, for example, an 80 percent reduction from 2005 levels by 2050, then the BLM could withhold all new and renewed Federal leases on coal. If the United States were meeting or exceeding the economy-wide percent reduction goals for 2050, then new and renewed coal leasing could continue with no need for any climate-based royalties or budgets discussed in other options.

Improve Resource Protection and Management

The BLM will consider options aimed at improving resource protection and management, beyond the climate considerations described previously. These options will be analyzed to determine effectiveness at avoiding, minimizing, and/or mitigating impacts on resources of concern. This includes impacts on natural resources and communities as well as impacts related to public health.

- I. **Unsuitability Criteria:** In accordance with the BLM's coal leasing regulations (43 CFR, Subparts 3420.1-4[a]), coal cannot be leased until it has been evaluated in a comprehensive land use plan or land use analysis. As part of the planning process for coal resources, the BLM must identify areas acceptable for further consideration for leasing using four screening procedures (see **Section 5.8.1** for more information). Commenters expressed concern that the BLM does not consistently apply these screens at the land use plan level however. As part of the PEIS, the BLM will identify mechanisms to improve the application of these screens, which include the 20 defined unsuitability criteria, in

²⁰⁷ Erickson, P. and M. Lazarus. 2016. How would phasing out US federal leases for fossil fuel extraction affect CO₂ emissions and 2°C goals? The Stockholm Environmental Institute. 2016 Working Paper. Available at <https://www.sei-international.org/mediamanager/documents/Publications/Climate/SEI-WP-2016-02-US-fossilfuel-leases.pdf>

Resource Management Plans (43 CFR, Part 3461), such as requiring documentation and updating plans where this analysis is lacking.

As part of the PEIS, the BLM will also evaluate and modify as necessary the existing 20 criteria listed in the regulations that define areas as unsuitable for surface mining (43 CFR, Subpart 3461.5). For example, The Wilderness Society in their scoping comment letter suggested that the current unsuitability criteria be revised or expanded to include bat roosts and colonies, and important greater sage-grouse habitats, including priority habitat management areas (PHMA) and sagebrush focal areas (SFA).²⁰⁸ In their scoping comment letter, the Center for Biological Diversity provided specific suggested modification to individual criteria, such as increasing the buffer distance for public building or homes to 500 feet in Criterion 3 and including inventoried roadless areas in Criterion 4.²⁰⁹ The BLM will consider these suggestions as well as others as part of this option. Each of the unsuitability criteria contains specific information about exceptions or exemptions. As part of the PEIS, the BLM will also evaluate and modify as necessary the application of exceptions and exemptions to ensure adequate resource protection and consistency in application (43 CFR, Part 3461).

2. **Strategic Coal Leasing Plans:** The BLM will consider the development of strategic coal leasing plans as a means to guide Federal coal leasing for a given region or nationally. These plans would likely be step-downs to (or tiered to) an existing Resource Management Plan. However, the opportunity exists to include many of the same decisions and considerations in a Resource Management Plan. These strategic plans would be developed by the BLM on a reoccurring time frame. Many commenters have suggested a 5-year planning horizon for such plans, consistent with the Secretary's leasing program for offshore oil and gas. Commenters have also advocated for a regional approach to strategic planning in order to recognize the significant differences in geology, coal rank and quality, mining conditions, and socioeconomic conditions across various coal regions (see **Sections 5.4.2** and **5.7.1** for more information). As envisioned, these strategic plans could serve a variety of purposes that meet a number of policy objectives. Specific to the policy objective of improving resource protection and management, these plans could address resource management concerns at a landscape scale and potentially incorporate mitigation planning. These plans could recommend how much coal should be leased, in what

²⁰⁸ The Wilderness Society. 2016. Scoping comment letter on the Coal PEIS. July 28, 2016. See Volume 2, Appendix D.

²⁰⁹ Center for Biological Diversity. 2016. Scoping comment letter on the Coal PEIS. July 28, 2016. See Volume 2, Appendix D.

locations, and on what timeline to facilitate management of the Federal coal program under a carbon budget (Reduce/Account for Greenhouse Gas Emissions #3) and accommodate modified bidding procedures (Fair Return #6). These plans could also help streamline future leasing actions and provide a mechanism for future decisions to “tier” to or incorporate by reference (see Increase Lease Process Efficiency #1).

3. **Accounting for Additional Externalities:** The BLM will evaluate the impacts of increasing the royalty rate or including an adder for Federal coal to account for the environmental and social costs of coal production and use beyond carbon-based externalities. These externalities may include, but are not limited to, public health, safety, air quality, water quality, and wildlife impacts. Similar to Option #1, Royalty Rate Accounting for Externalities, an important consideration in the design of this option is what externalities at what point in the coal lifecycle to account for (i.e., upstream, or upstream and downstream). Coordination will be needed with many other agencies to avoid duplicate accounting for these externalities and to establish dollar values for impacts that are not easily quantified.

Inclusion of all of these values is likely to increase the cost of Federal coal substantially. For example, the study entitled “Full Accounting of the Life Cycle of Coal,” published by the New York Academy of Sciences, provided an estimate for all lifecycle externalities (upstream and downstream) related to Federal and non-Federal coal, including carbon-related externalities that ranged from \$175 to \$523 billion in 2008 dollars.²¹⁰ The authors point out that their review was limited by the omission of many environmental, community, mental health, and economic impacts that are not easily quantifiable or monetized. The BLM will develop a similar calculation for both upstream and downstream externalities specific to Federal coal production and use.

As with other options, the BLM will use modeling and analysis to determine the impact of coal price increases on Federal coal production. With increased costs, there is also the potential for switching to non-Federal coal or other energy sources, which could have a net effect on impacts and externalities associated with energy generation. Modeling and analysis will be needed to determine the projected level of substitution associated with various price increases on Federal coal. With these factors in mind, the BLM may consider applying only a percentage of the externality costs as a component of this option.

4. **Applicant Qualifications:** The BLM will consider strengthening the self-certification requirements for companies bidding on leases (43 CFR,

²¹⁰ Epstein, P. R. et al. 2011. “Full cost accounting for the life cycle of coal”. *Ann. N.Y. Acad. Sci.* 1219(2011):73-98. Available at http://www.chgeharvard.org/sites/default/files/epstein_full%20cost%20of%20coal.pdf

Subparts 3472.1-2[e][2]). As suggested in comments, requirements to be evaluated should include prohibiting leasing to self-bonded companies, ensuring sufficient financial resources, ensuring companies have not been cited for major violations of environmental regulations in connection with other operations, and verifying companies have been fulfilling reclamation obligations in connection with other operations. This option would require substantial coordination between the BLM, OSMRE, and the states to obtain this information on companies before they bid on leases.

5. **Environmental Protections:** The BLM will consider improving mechanisms that apply environmental protections in the form of stipulations (e.g., to reduce groundwater depletions, conduct breeding bird surveys, establish a monitoring program to assess mining impacts, and address any adverse impacts on surface resources from subsidence as a result of underground mining) to existing leases. The BLM currently has the authority to modify the terms and conditions of a lease at lease readjustment. This occurs upon the expiration of the initial 20-year lease period and any 10-year period thereafter (30 USC, Subsection 207[a]; 43 CFR, Subpart 3451.1[a][1]). The BLM also has the authority to apply additional stipulations to existing leases if the leases are modified and additional acreage is added (43 CFR, Subpart 3432.3).
6. **Regional Mitigation Strategies:** Commenters suggested that the BLM develop regional mitigation strategies for existing and new coal development to address environmental and public health impacts. Regional mitigation strategies identify and facilitate mitigation opportunities at the regional scale, allowing for pre-planning for mitigation opportunities. Guidance on preparing regional mitigation strategies is included in BLM Manual Section 1794.²¹¹ Where the BLM anticipates large-scale development, regional mitigation strategies can be an effective tool to increase permitting efficiency and financial predictability for applicants by studying potential mitigation needs and opportunities on both BLM and non-BLM-administered lands, which can help to inform subsequent permits and authorizations. Regional mitigation strategies can also enhance the ability of Federal and state governments, tribes, nongovernmental organizations, and resource users to invest in larger-scale mitigation efforts through prioritization of investments and pooling of financial resources. The BLM will consider its existing authority with respect to environmental and public health impacts and determine if the concept of regional mitigation strategies could be applied to the Federal coal program to further the goal of improving resource protection and management. This option will

²¹¹ BLM 2013. BLM Manual Section 1794. Available at https://www.blm.gov/sites/blm.gov/files/uploads/BLM_MS-1794%20Mitigation%20FINAL.docx

require close coordination with the OSMRE to identify appropriate mitigation actions.

7. **Best Management Practices:** The BLM will consider the use of best management practices to meet resource protection goals for the Federal coal program. Best management practices are state-of-the-art mitigation measures to be applied on a site-specific basis to reduce, prevent, or avoid adverse environmental or social impacts. The BLM often applies best management practices in the context of oil and gas development and will evaluate the use of best management practices to meet resource protection goals in the coal leasing and management context. These best management practices may be incorporated as stipulations in individual new leases as appropriate. Best management practices would serve a similar purpose as design features, which were suggested by some commenters as an option to protect resources.

Increase Lease Process Efficiency

The BLM will consider options that are intended to improve the lease process itself. A number of commenters expressed concern over the time it takes to obtain a Federal coal lease and what they perceive as redundancies in the process. These options will be analyzed to determine the degree to which the BLM can increase the efficiency of the lease process while maintaining the integrity and intent.

1. **Strategic Coal Leasing Plans:** As discussed under the policy objective Improve Resource Protection and Management, the BLM will consider the development of strategic coal leasing plans as a means to guide Federal coal leasing for a given region or nationally. These plans would likely be step-downs to (or tiered to) an existing Resource Management Plan. However, the opportunity exists to include many of the same decisions and considerations in a Resource Management Plan. These strategic plans would be developed by the BLM on a reoccurring time frame. Many commenters have suggested a 5-year planning horizon for such plans, consistent with the Secretary's leasing program for offshore oil and gas. Commenters have also advocated for a regional approach to strategic planning in order to recognize the significant differences in geology, coal rank and quality, mining conditions, and socioeconomic conditions across various coal regions (see **Sections 5.4.2** and **5.7.1** for more information). As envisioned, these strategic plans could serve a variety of purposes that meet a number of policy objectives. Specific to the policy objective of increasing lease process efficiency, these plans could be designed to help streamline future leasing actions, providing a mechanism for future decisions to "tier" to or incorporate by reference addressing regional issues that tend to be cumulative in nature, such as air quality and climate change. In addition, these plans could address resource management concerns at a

landscape scale and potentially incorporate mitigation planning (see Improve Resource Protection and Management #2). These plans could recommend how much coal should be leased, in what locations, and on what timeline to facilitate management of the Federal coal program under a carbon budget (Reduce/Account for Greenhouse Gas Emissions #3) and accommodate modified bidding procedures (Fair Return #6).

2. **Pre-Application Process:** The BLM will consider creating a pre-application process in which lease applicants would be required to complete some work prior to the BLM accepting an application (e.g., Qualified Surface Owner consent/identification). This would be intended to help reduce time delays that take place after an application is received.
3. **Standardized Lease Application Form:** The BLM will consider establishing a standardized lease application form to include minimum requirements found in 43 CFR, Subparts 3425.1-7 and other requirements, as determined appropriate. The BLM will also consider developing an electronic platform for the submission of applications. This could improve the consistency and efficiency of the application process.
4. **Single Fair Market Value Team:** The BLM will consider establishing a single team nationwide that conducts the FMV calculations for all offices. This is expected to bring a higher level of consistency and efficiency to the process. This work is currently carried out by a mix of field and state office personnel. This team would prepare the geologic, engineering, economic, and valuation reports to support the estimate of FMV associated with a coal tract proposed for leasing.

Chapter 2 of the BLM's Coal Evaluation Handbook, H-3073-1 describes evaluation team members and their roles in the estimate of FMV. Secretarial Order 3300 established that the Department of the Interior, OVS has the sole responsibility for all real estate valuation functions of the BLM. Based on recent GAO/OIG recommendations, the BLM and OVS revised the Coal Evaluation Handbook (H-3073-1) to establish the procedures under which OVS reviews the BLM's FMV estimates to assure compliance with all applicable guidance and professional standards.

5. **Eliminating Redundant Processes:** The BLM will work with other agencies to evaluate means for eliminating identified overlapping requirements and redundant processes associated with the Federal coal leasing and permitting process. There are existing interagency memorandums of understanding that outline the roles and responsibilities of the various agencies involved in Federal coal activities. The OSMRE is the Federal agency with the primary responsibility to

administer programs that regulate surface coal mining and reclamation operations in accordance with SMCRA and with oversight over state RAs. The state RAs in primacy states have primary responsibility to administer and regulate surface coal mining operations within their jurisdiction subject to the OSMRE's oversight. The OSMRE also is responsible for providing the Mineral Leasing Act mining plan recommendations to the Assistant Secretary of the Interior, Land and Minerals Management. The Forest Service also has jurisdictional responsibilities (i.e., they must provide consent or concurrence to the BLM) when coal is proposed for leasing or exploration on National Forest System lands. Both Federal agencies, as well as state and tribal RAs, may participate as cooperating agencies on the BLM's NEPA analysis for a given coal lease and use that analysis (e.g., through tiering or incorporation by reference) to prepare a decision for actions under their jurisdiction.

6. **Improve Transparency:** The BLM will continue to seek opportunities to improve transparency associated with the Federal coal leasing process. This work has already been initiated through the development of an Instruction Memorandum expected to be finalized in early calendar year 2017. In accordance with that Instruction Memorandum, state offices are directed to maintain on their publicly accessible websites information regarding:
 - a. Lease and lease modification applications covered by one of the exceptions to the Pause
 - b. Coal leasing information including the number of coal leases that are currently in effect; the total acreage under lease; the number of sales held in each fiscal year, including both successful and unsuccessful lease sales; and noncompetitive lease modifications
 - c. Exploration licenses and licensing applications
 - d. Previously granted and pending royalty rate reduction applications.

These policies may be further modified through the PEIS and formalized as part of the proposed program reform. These options may be implemented without rulemaking.

6.2.2 Development of Alternatives

The BLM will conduct an evaluation of the options in **Table 6-1**. Once the benefits, impacts, and overall feasibility of the various options are understood, the BLM will be better equipped to blend the options into reform alternatives for the Federal coal program and consider their combined impacts. Program alternatives will be analyzed in a comparative way in the Draft PEIS to determine

their overall impact on the energy markets, energy prices, socioeconomics, and the environment as described in more detail in **Section 6.4**.

The BLM believes that there are a number of the options that represent more modest reforms that could be combined with almost any combined option package or future alternative, or implemented as standalone actions. These options represent beneficial program modernization activities and good government practices.

For fair return, these include FMV determination process changes aimed at transparency and consistency, limiting the use of royalty rate reductions and improving the transparency associated with the use of royalty rate reductions, rental rate adjustments to reflect inflation, minimum bonus bid adjustments to reflect inflation, and evaluation of current performance bonding amounts. For greenhouse gas emissions, this includes creating incentives for methane capture.

For resource protection and management, this includes strengthening requirements for companies bidding on leases, all of which would require coordination with the OSMRE. The requirements include prohibiting leasing to self-bonded companies, ensuring sufficient financial resources, ensuring companies have not been cited for major violations of environmental regulations in connection with other operations, and verifying companies have been fulfilling reclamation obligations in connection with other operations. It also includes developing best management practices for resource protection and improving planning to avoid land use conflicts, such as through the modification and improved application of unsuitability criteria or through the development of strategic coal leasing plans. For lease process efficiency, these include standardizing lease application forms, developing an electronic platform for the submission of applications, working with other agencies to evaluate means for eliminating redundant processes, and improving transparency.

At the Secretary's direction in connection with Order 3338, the BLM is in the process of developing guidance to implement several of these improvements. Additional reforms may be implemented prior to completion of the Final PEIS if further analysis supports taking action on a more expedited timeframe.

To demonstrate how the various options could be combined to develop alternatives in the PEIS, the BLM sets out three possible option combination packages. Because each option presents its own range of analytic issues and because that complexity may be compounded by interactions among the reform options if they are implemented in combination, additional analysis is needed before these or other combinations of options can be included as alternatives for consideration in the PEIS. The Draft PEIS also will analyze a "no action" and a "no leasing" alternative.

Possible Option Combination Package #1

1. Fair Return

Increase the royalty rate to reflect the fair return for coal produced on Federal land. The BLM would identify the most appropriate metric and corresponding royalty rate for Federal coal, reflecting on analysis already conducted by other groups such as the CEA. The BLM would also assess the net impact on revenues from such changes, including any potential reduction in bonus bids and production.

2. Climate Change/Resource Protection

Require compensatory mitigation for Federal coal leases. The BLM would require lessees to carry out or fund activities that proportionally offset climate-related impacts, including through investment in a fund managed by an entity that takes on the liability to proportionally offset those greenhouse gas emissions and climate-related impacts. Contribution to the fund would be tied to the unit of coal produced. Funds could be used for activities including, but not limited to, carbon offsets, carbon sequestration, climate adaptation, and community resilience.

3. Leasing Process

- a. *Develop strategic leasing plans and utilize modified inter-tract bidding on a \$/ton or \$/Btu basis.* Strategic leasing plans would be developed based on regular reviews of projected domestic coal demand (e.g., over a 5-year window) and the role of Federal coal resources in meeting domestic energy needs. These plans would set lease sales on a regular schedule to accommodate a modified inter-tract bidding system. The BLM would determine a maximum tonnage of coal or maximum number of Btus to be leased consistent with projected demands. Under a modified inter-tract leasing process, all interested companies would bid among themselves for the right to produce a specified quantity of coal in the location of their choice, assuming it is suitable for mining and consistent with the approved land use plan and strategic leasing plan. To the extent that auctions become more competitive through the use of modified inter-tract bidding, resulting in increased bonus bids, the need for a higher royalty rate could be revisited on a periodic basis.
- b. *Develop regional mitigation strategies.* Regional mitigation strategies would be developed by the BLM to identify and facilitate compensatory mitigation opportunities at the regional scale, allowing for pre-planning for, and advanced investment in, mitigation opportunities.

4. Community Assistance

- a. *Explore use of compensatory mitigation funds to invest in affected communities experiencing reduced coal production.* The BLM would seek to use compensatory mitigation funds to invest in economic diversification and workforce development efforts.
- b. *Direct a portion of Federal coal revenues to community assistance.* The BLM would seek to secure Congressional authorization to direct a portion of increased Federal coal revenues toward investments in impacted communities that support economic diversification, job training, mine reclamation, and other community priorities.

Possible Option Combination Package #2

1. Fair Return

Increase the royalty rate to reflect the fair return for coal produced on Federal land. The BLM would identify the most appropriate metric and corresponding royalty rate for Federal coal reflecting on analysis already conducted by other groups. Because a carbon-based royalty adder, as described under 2, could be instituted in combination with or independent of a potential royalty rate increase based on fair return principles, the BLM will analyze the effects of such changes both individually and cumulatively.

2. Climate Change/Resource Protection

Apply a royalty adder to royalty rates to account for carbon-based environmental and societal costs of coal production and use (\$/ton of coal). A royalty adder would tie climate costs directly to production/consumption. As a price mechanism, a royalty adder would provide price certainty to mining operators and downstream purchasers. A royalty adder would apply only to new and renewed leases and, therefore, would be necessarily phased in over time. The BLM would conduct analysis to identify the most appropriate royalty adder taking into account downstream regulations and substitution effects, and reflecting on analysis already completed by other groups. The BLM would also assess the net impact on revenues from such changes, including any potential reduction in bonus bids and production.

3. Leasing Process

Develop strategic leasing plans and utilize modified inter-tract bidding on a \$/ton or \$/Btu basis. Strategic leasing plans would be developed based on regular reviews of projected Federal coal demand (e.g., over a 5-year window) and could serve a variety of purposes that meet a number of policy objectives, including addressing resource management concerns at a landscape level and helping to streamline future leasing actions. These plans would set lease sales on a regular

schedule to accommodate a modified inter-tract bidding system. The BLM would determine a maximum tonnage of coal or maximum number of Btus to be leased consistent with projected demands. Under a modified inter-tract leasing process, all interested companies would bid among themselves for the right to produce a specified quantity of coal in the location of their choice, assuming it is suitable for mining and consistent with the approved land use plan and strategic leasing plan. To the extent that auctions become more competitive through the use of modified inter-tract bidding, resulting in increased bonus bids, the need for a higher royalty rate could be revisited on a periodic basis.

4. Community Assistance

- a. *Direct a portion of Federal coal revenues to community assistance.* The BLM would seek to secure Congressional authorization to direct a portion of increased Federal coal revenues toward investments in impacted communities that support economic diversification, job training, mine reclamation, and other community priorities.
- b. *The states' portion of increased revenues would be available to invest in impacted communities experiencing reduced coal production.* The additional revenues generated by a royalty rate adder would be split with states consistent with current law and could be used by states to support economic diversification efforts in communities and related activities.

Possible Option Combination Package #3

1. Fair Return

Increase the royalty rate to reflect the fair return for coal produced on Federal land. The BLM would identify the most appropriate metric and corresponding royalty rate for Federal coal, reflecting on analysis already conducted by other groups. The BLM would also assess the net impact on revenues from such changes, including any potential reduction in bonus bids and production.

2. Climate Change/Resource Protection

- a. *Periodically evaluate and ensure that coal production and associated life-cycle emissions are consistent with the need to reduce net domestic greenhouse gas emissions 80 percent below 2005 levels by 2050.* This tracks to a straight-line reduction from the US 2025 Intended Nationally Determined Contribution (INDC),²¹² and it is also consistent with the long-term pathway set forth in the US Mid-

²¹² Actions described by the UNFCCC in December 2015 to achieve the long-term goals of the Paris Agreement: to hold the increase in global average temperature to well below 2°C, to pursue efforts to limit the increase to 1.5°C, and to achieve net zero emissions in the second half of this century.

Century Strategy for Deep Decarbonization.²¹³ *The BLM would limit the amount of Federal coal leased at a given time based on a carbon budget. The Federal coal leasing levels would be premised on a carbon budget that is commensurate with Federal coal's appropriate contribution to meeting economy-wide greenhouse gas emission reduction targets. In other words, the total amount of coal offered and made accessible under Federal leases would contain lifecycle CO₂ emission levels that are less than or equal to the anticipated emissions from Federal coal under an INDC strategy.*²¹⁴ The BLM would also need to evaluate the effectiveness of applying INDC-based limits to Federal coal leasing if and when no similar limitations are applied to substitute non-Federal energy sources to address concerns over emissions shifting to non-Federal coal sources. This potential shifting to non-Federal coal sources could reduce the environmental benefit of such limits (i.e., due to emissions leakage).

- b. *Develop strategic leasing plans.* Strategic leasing plans would incorporate the carbon budget and set lease sales on a regular schedule to accommodate a modified bidding system (see 3a below). These strategic plans could help meet a variety of policy objectives, including addressing resource management concerns at a landscape level and helping to streamline future leasing actions.

3. Leasing Process

Use modified inter-tract bidding on a \$/ton or \$/Btu basis. The BLM would determine a maximum tonnage of coal or carbon or maximum number of Btus to be leased consistent with the defined carbon budget. Under a modified inter-tract leasing process, all interested companies would bid among themselves for the right to produce a specified quantity of coal in the location of their choice, assuming it is suitable for mining and consistent with the approved land use plan and strategic leasing plan. To the extent that auctions become more competitive through the use of modified inter-tract bidding, resulting in increased bonus bids, the need for a higher royalty rate could be revisited on a periodic basis.

4. Community Assistance

Direct a portion of Federal coal revenues to investments in communities experiencing economic impacts from reduced coal production. The BLM would seek to secure Congressional authorization to direct a

²¹³ The White House. 2016. US Mid-Century Strategy for Deep Decarbonization. November 2016. Available at https://www.whitehouse.gov/sites/default/files/docs/mid_century_strategy_report-final.pdf

²¹⁴ One way to implement this approach would be for the BLM to use an economy-wide model to estimate least cost compliance strategies for meeting INDCs. The BLM could use the model output to derive anticipated Federal coal consumption levels over a 20-year period, and then use that level, in conjunction with reserves already under lease, as a limit on the amount of reserves that are leased.

portion of increased Federal coal revenues toward investments in communities that support economic diversification, job training, mine reclamation, and other community priorities.

No Action Alternative

Under the no action alternative, the Federal coal program would continue to be administered in the manner in which it is administered currently. Leasing would be conducted through LBA. The current means of determining FMV, royalty rate reductions, minimum bonus bids, and rental rates would remain unchanged. The no action alternative would not address concerns raised by numerous parties about the Federal coal program, including concerns raised by the GAO, the OIG, members of Congress, interested stakeholders, and the public.

No Leasing Alternative

Under a no leasing alternative, the BLM would issue no new leases for Federal coal except for lease modifications within the defined acreage limitations (960 acres or less²¹⁵). Existing coal already under lease would not be impacted. Administration of existing leases would remain unchanged, including existing royalty rates and rental rates. The BLM may also consider combining the no new leasing alternative with other reform options aimed at modernizing the administration of existing leases as part of separate reform packages or alternatives.

6.2.3 Options Not Carried Forward for Further Analysis

The following section includes a summary of additional reform options suggested through the scoping process that the BLM is proposing not to carry forward for analysis in the PEIS. A rationale has been provided as appropriate. Many of these options are already undertaken by the BLM, are under the authority of another agency, or would not meet the policy objectives outlined in BLM's Need for Federal Action in **Section 6.1.1**.

Fair Return

Comments were submitted suggesting that the FMV calculation for Federal coal should be redefined to account for environmental and social costs of coal production and use. While the BLM agrees that consideration should be given to such costs, the agency does not believe the FMV is the appropriate place for this to be applied. FMV is defined at 43 CFR, Subparts 3400.0-5(n) as the "amount in cash, or on terms reasonably equivalent to cash, for which in all probability the coal deposit would be sold or leased by a knowledgeable owner willing but not obligated to sell or lease to a knowledgeable purchaser who desires but is not obligated to buy or lease." The Coal Evaluation Handbook (H-3073-1) describes FMV as a determination made by reference to a competitive market rather than to personal or inherent value of the property. Therefore, the BLM believes accounting for the social and environmental costs of coal to be

²¹⁵As defined in the Energy Policy Act of 2005 Section 432

produced in the future would be too remote or speculative to include in the FMV calculation. Alternatively, the BLM is proposing to consider the environmental and social costs of coal production and use as part of an increased royalty rate or adder (see Reduce/Account for Greenhouse Gas Emissions #1 and Improve Resource Protection and Management #3).

Other comments made with respect to the FMV calculation asked the BLM to consider non-Federal coal, exports, and extraction costs in their calculation methods. The BLM's calculation of FMV already takes these factors into consideration. Chapter 3 of H-3073-1 discusses both export coal market data and lease-specific comparable sales data requirements, including information about private coal property market transactions.

A number of commenters suggested that the BLM should subject the FMV calculation to public hearing(s) ahead of the competitive leasing process. The BLM's FMV process currently includes the opportunity for public input as part of the information gathering process that goes into the FMV calculation (see **Section 5.8.2**). Because the Mineral Leasing Act requires competitive leasing, the BLM believes that opening up the FMV estimate to the public would undermine the bidding process, especially on those tracts where only one bid is received.

Some commenters requested that the BLM maintain the existing royalty rates and consider reducing the existing royalty rates as a means to increase production and, therefore, improve return. The BLM will consider no change in the existing royalty rates as part of the no action alternative. An option to reduce the royalty rate is not proposed to be carried forward for further analysis in the PEIS, however, as royalty rates are already at their statutory defined floor (43 CFR, Subparts 3473.3-2). The BLM has determined that this option would not meet the object of improving fair return to the American taxpayer.

As described in **Section 5.4.6, Main Drivers**, the demand for coal is driven by a variety of complex market and regulatory factors. A simple reduction in the current royalty rate on coal would not necessarily lead to increased demand levels that offset the revenue loss. Therefore, this may have the impact of decreasing return to the Federal taxpayer. Moreover, while more analysis is needed, most preliminary qualitative and quantitative assessments suggest increasing, not decreasing, royalty rates is the appropriate direction to evaluate to enhance FMV and revenues. This is supported by the market projections for coal (see **Section 5.5**).

A number of commenters suggested alternative ways that the value of coal production, on which royalties are assessed, should be calculated. Options included basing the value of coal production on the final sale price to a power plant or other end user or applicable market price; basing the value of coal production on the average price of nearby regional coal, the price of nationwide

coal, or the price of a substitute in the electricity dispatch order; basing the value of coal production on sales prices of coal with similar characteristics from both Federal and non-Federal lands; and directly valuing coal production using an appraisal approach rather than basing the value on individual sales transactions.

Other comments suggested capping transportation deductions, establishing cost of allowable transportation deductions based on the most efficient means of transport, or establishing the cost of allowable transportation deductions based on observable indices of coal transportation costs per rail mile, rather than self-reported cost numbers. Comments were also raised regarding the elimination of coal washing deductions, the practice of selling to affiliates at artificially low prices, and take or pay contracts. The BLM has no authority over the valuation of coal production for purposes of royalty payments; this is the ONRR's responsibility (see **Section 5.2**). The ONRR has recently completed rulemaking on Consolidated Federal Oil and Gas and Federal and Indian Coal Valuation Reform (30 CFR, Parts 1202 and 1206), which will become effective January 1, 2017.

In terms of bonus bids, commenters suggested that the BLM should base bonus bids on the amount of recoverable coal rather than the amount of coal reserves. This is already the case, as the BLM bases the pre-sale FMV on recoverable coal estimates. This will be considered as part of the no action alternative. In order to provide additional clarity, the BLM will consider revising guidance to ensure consistency among states on how to apply recoverable coal estimates.

Commenters also suggested that the BLM should abandon bonus bids for maintenance tracts, and instead employ an adjusted revenue-neutral royalty schedule for those tracts. The BLM experimented with this approach in the past and found that it did not meet the goals of obtaining fair return for the coal resource. If the coal were never produced, there would be no benefit associated with issuing a maintenance tract, whereas a bonus bid ensures a return to the public. Therefore, this suggestion would be ineffective, as it does not meet the purpose and need of the PEIS.

Commenters suggested that the BLM incorporate into coal leases the authority to adjust rental and royalty fees over time. The BLM currently has the authority to modify the terms and conditions of a lease, including rental fees and royalty rates at lease readjustment (43 CFR, Part 3451). This occurs at the end of the 20-year primary term and then every 10 years for the life of the lease (43 CFR, Part 3451). It should also be noted that royalty rates are assessed on the value of coal production, which is determined by the ONRR at the time of the first arm's-length sale (30 CFR, Part 1206).

Commenters also suggested the BLM should cancel existing leases that are not producing. While the BLM is not authorized to cancel an existing lease specifically for "not producing," it can cancel an existing lease for not meeting

the terms and conditions of the lease, which include diligent development (43 CFR, Subparts 3452.2-1). Therefore enforcing diligent development of existing leases will be considered as part of the no action alternative.

Commenters requested that the BLM modify the time frame over which bonus bid payments are made (i.e., over a longer or shorter period of time). This option would not impact the overall value of the bonus bid. The BLM has decided not to carry this option forward for further analysis, because it does not meet any of the objectives stated as part of the purpose and need of the PEIS.

Commenters also suggested that the BLM consider delaying collection of bonus bids until mining begins on the leases and allow a royalty credit for the capital costs to establish a mining operation to increase competition for bids. The BLM has decided not to carry this option forward for further analysis, because it does not meet any of the policy objectives stated as part of the purpose and need of the PEIS.

Commenters suggested that the BLM should ban companies from selling coal to subsidiaries to depress rates (i.e., captive transactions). This issue is outside of the BLM's authority, but is addressed by the ONRR in the methods by which it values coal production. The ONRR has procedures in place to ensure proper valuation of coal production sold to affiliates or subsidiaries under non-arm's-length transactions. Effective January 1, 2017, the ONRR amended their regulations governing valuation, for royalty purposes, of oil and gas produced from Federal onshore and offshore leases and coal produced from Federal and Indian leases (81 FR 43337).

Commenters asked the BLM to consider how the leasing of smaller tracts might better ensure the maximum economic recovery of coal (e.g., reduce market uncertainties and ensure a higher fair market valuation associated with shortened duration of mining operations). Other commenters suggested that the BLM only lease 10 years or less of coal reserves under a single lease. The BLM already considers the size of the tract and potential amount of reserves as part of the leasing process and has the ability to reconfigure tracts prior to lease sale. Tract reconfiguration is done to increase competition when another existing mine is nearby and to carve out areas not suitable for leasing (e.g., raptor nests and cultural sites). The BLM also may reconfigure a LBA tract to ensure that Federal coal reserves are not bypassed and the amount of reserves is reasonable based on the annual production at that mine. This will be considered as part of the no action alternative.

Commenters suggested two ways to potentially reduce costs with respect to the coal leasing process. These included waiving the BLM cost recovery imposed during the Federal coal leasing process and not charging lease applicants for the third-party NEPA associated with NEPA actions. These suggestions run counter to the objective of orderly administration of coal on Federal lands. Without

cost recovery, the BLM would have to allocate appropriated budget dollars from other priorities for processing coal lease applications. The BLM would also have to identify staff to undertake NEPA analyses for leasing actions or allocate budget dollars to hire third-party NEPA consultants to undertake this work. Given resource limitations, this would have a negative impact on the efficiency of the process, which is already the subject of criticism for the length of time it takes to complete.

Reduce/Account for Greenhouse Gas Emissions

Regarding Social Cost of Carbon, commenters recommend the inclusion of a net “social benefit” standard for coal that includes both the social cost of carbon and the positive economic benefits of coal jobs and revenue, schools, infrastructure, and reliable, low-cost electricity. While the BLM agrees that there are benefits associated with the production and use of Federal coal, many of these “benefits” are captured in the market value of coal. Additional nonmarket benefits can be assessed qualitatively. While not necessarily in the form requested by commenters, the PEIS will include consideration of both the market and nonmarket values associated with coal (see **Section 5.7**).

Some commenters suggested the BLM should not allow leasing of Federal coal if it is intended to be used for export. It should be noted that exports have historically and currently make up a very small part of Federal coal market (see **Section 5.4.6**). Opportunities for exports are limited by the availability of export terminals, transportation costs, and global coal prices. Because the BLM has very limited, if any, control over where Federal coal is ultimately consumed (i.e., coal may change hands multiple times before its final end use), this option will not be carried forward for further analysis. The BLM does however identify coal export market information during the preparation of the economic evaluation report supporting BLM’s FMV estimate (Chapter 3 of H-3073-1), and will consider it in the context of evaluating strategic leasing plans that could be developed based on regular reviews of projected domestic coal demand (e.g., over a 5-year window) and the role of Federal coal resources in meeting domestic energy needs.

A number of commenters emphasized the need to require carbon capture and sequestration for coal energy generators, and to invest in carbon capture and storage technologies and clean coal technologies. The BLM does not have the authority to require any action of coal consumers or dollars to invest in new technologies. While not carried forward as an option in the PEIS, it is worth noting there are a number of Federal programs in place that target these topics. For example, the Department of Energy’s Office of Fossil Energy manages a Clean Coal Research and Development program that is focused on developing and demonstrating advanced power generation and carbon capture, utilization and storage technologies for existing facilities and new fossil-fueled power plants by increasing overall system efficiencies and reducing capital costs. Their Carbon Capture, Utilization and Storage program advances safe, cost effective, capture

and permanent geologic storage and/or use of CO₂ and their Advanced Energy Systems program focuses on improving the efficiency of coal-based power systems, enabling affordable CO₂ capture, increasing plant availability, and maintaining the highest environmental standards.²¹⁶

Some commenters stated support for investing in renewable energy programs over coal mining operations, due to the decreased environmental impact and efforts to mitigate climate change. The promotion of renewable energy programs over coal leasing is outside of the scope of the PEIS. The BLM will however consider as part of the PEIS analysis the impacts of coal program reform alternatives on the larger power sector including other energy sources such as wind and solar energy generation (see **Section 6.4**).

Improve Resource Protection and Management

Some commenters suggested that the BLM should modify regulations to require the application of unsuitability criteria only at the time an applicant submits an application for leasing (versus at the Resource Management Plan stage). The BLM believes that there are benefits to applying the unsuitability criteria at both stages in the process, and the regulations allow for consideration at both levels (43 CFR 3461.3-1). The application of unsuitability criteria at the Resource Management Plan level allows for landscape-scale land use allocation decisions to be made and areas to be identified as unsuitable for coal leasing. Once an application has been submitted for an area allocated as suitable for coal leasing, the BLM has the obligation to take a second look at the area under consideration to determine if any of the unsuitability criteria are triggered based on site-specific information.

Commenters suggested that the BLM should provide clarification around “contemporaneous” reclamation and develop rules that require diligent reclamation. Commenters also submitted comments suggesting that the BLM evaluate alternatives for funding reclamation and post-closure activities. While the BLM understands the importance of timely, successful reclamation, the BLM does not have authority over the reclamation process associated with Federal coal production. This authority is held by OSMRE (see **Section 5.2**). As appropriate, the BLM will work with OSMRE to improve reclamation planning and implementation opportunities for Federal coal.

A larger number of commenters expressed concern about the practice of self-bonding for reclamation requirements and requested amendment to the regulations at 30 CFR 800.23 and any other regulations, as appropriate, to prohibit self-bonding whenever publicly owned coal is permitted to be mined. This is particularly troublesome with the recent rash of bankruptcies among many large coal companies. While the BLM is aware of the issues associated

²¹⁶ Department of Energy, Office of Fossil Energy Clean Coal Research Program. 2016. Clean Coal Research. Available at <https://energy.gov/fe/science-innovation/clean-coal-research>

with self-bonding for reclamation, the BLM does not have the authority over bonding for reclamation. This authority is held by OSMRE (see **Section 5.2**) and primacy states. OSMRE recently announced its intention to initiate rulemaking on the practice of self-bonding.²¹⁷ As appropriate, the BLM will work with OSMRE to improve self-bonding regulations.

Increase Lease Process Efficiency

Commenters suggested consolidating the Federal coal leasing and permitting process into the hands of fewer agencies. SMCRA prohibits this (30 USC 1211). There are inherent differences in the duties of OSMRE and the BLM. To combine the agencies would require amending the SMCRA. Further, Department of the Interior experience has shown that it is best to keep leasing and environmental enforcement separate. For example, the Minerals Management Service, which previously managed the nation's natural gas, oil, and other mineral resources on the outer continental shelf split into the BOEM, the Bureau of Safety and Environmental Enforcement (BSEE), and the Office of Natural Resources Revenue. In lieu of consolidation, the BLM is proposing to consider options to work with other agencies to evaluate means for eliminating the overlapping requirements and redundant processes (see Increase Lease Process Efficiency #5).

Commenters suggested the BLM establish specific timelines and procedures for the various steps in the leasing process. The BLM's existing coal regulations (43 CFR Part 3400) delineate the process for issuing leases (see **Section 5.8** on Leasing Process). While the BLM agrees that improvements in efficiency may be needed (and will be considered as part of the PEIS), past experience with many other programs has proven that mandatory timelines often are not effective in improving efficiency, therefore this option is not considered further.

Other

A large number of commenters discussed the pause on significant new coal leasing decisions instituted through Secretarial Order 3338. Some commenters expressed support for the coal leasing pause, stating that it should be extended or made permanent and reasoned that a sufficient amount of coal has already been leased. Other commenters stated opposition to the coal leasing pause, stating that it should be removed because it negatively impacts the economy and violates laws. The leasing pause does not apply to existing leases and coal production activities and is intended to be in place temporarily while the PEIS is underway.

Some commenters stated concern over both the environmental impacts of leasing and the economic impacts of delays for specific coal lease applications (e.g., Alton Mine, Bull Mountain Mine, and Greens Hollow Coal tract). Consideration of specific leasing actions is outside of the scope of the PEIS. The

²¹⁷ OSMRE Decision on Petition to Initiate Rulemaking, 81 Fed. Reg. 61612 (September 7, 2016).

BLM will however consider the full portfolio of existing BLM leasing activities as part of the analysis in the PEIS.

6.3 COMMUNITY TRANSITION CONSIDERATIONS

A central theme in many of the comments raised by stakeholders is concern about the implications of current and future coal market conditions. As discussed in **Section 5.4.5** and reported by the EIA, in 2015, the United States' total coal production was roughly 900 million short tons, 10 percent lower than in 2014. The 2016 production levels are expected to decrease further, reaching levels not seen since the 1970s. Worldwide, demand for coal appears to be softening as well, with EIA projections for coal exports (the majority of which is metallurgical coal) being relatively flat through 2030, accounting for only approximately 8 percent of total US coal production (see **Section 5.5.3**). As a result of the softening of both the domestic and export markets, a number of mines in the United States have idled production, several major coal companies have entered Chapter 11 bankruptcy, many coal miners have been laid off, and coal-dependent communities have suffered. The EIA and other projections of future coal production show anticipated continuing declines.

Commenters have urged the BLM to take these significant market changes into account when considering reform options for the Federal coal program. In order to make fully informed decisions, stakeholders have requested that the BLM determine what the impacts of reform options will be on factors such as coal production, energy supply, energy prices, state revenues, and jobs (direct and indirect). As discussed in more detail in **Section 6.4**, the BLM intends to evaluate all program alternatives against a set of defined issues for analysis that include all of these critical metrics.

Through the scoping process, stakeholders also provided suggestions to help communities currently in transition or communities that may find themselves in need of transitioning in the near future. While many of these suggestions do not fall under the authority of the BLM's coal program, the BLM believes they are an important part of the larger conversation about coal's future in the United States. The BLM is committed to working with the White House, Congress, and other Federal, state, and local agencies throughout the PEIS process to further these ideas and to address Federal coal reform in the most comprehensive manner possible. The stakeholders' suggestions are summarized below, and it is worth noting that the BLM could seek to secure Congressional authorization to direct a portion of increased Federal coal revenues toward such community assistance programs.

- Undertake meaningful collaboration with coal-producing states concerning socioeconomic impacts related to Federal coal mining
- Develop a program to hire mine workers for restoration and rehabilitation associated with mining operations

- Explore changes to revenue-sharing statutes to improve community access to funding for local school and other community priorities
- Provide communities a comprehensive review of tools to help diversify their economies
- Work to secure Congressional authorization to direct increased royalty and rental payments toward worker and community support
- Establish an Economic Transition Fund that would be sustained by an increase in reimbursement fees charged by the Department of the Interior when processing coal-related applications
- Prioritize support and assistance to help communities transition (e.g., Secretarial Order)
- Accelerate the transition to renewable energy production on Federal lands, identify new opportunities to use abandoned or reclaimed mine lands as renewable energy production sites, and work with partner agencies to assist in retraining coal workers for the renewable energy industry
- Provide assistance to help coal miners transition to other jobs
- Undertake severance tax reform and ensure that taxes that are intended to provide funds to invest in economic diversification in the coalfields are actually being invested back into coal producing counties at a higher rate and in a timely manner
- Look for ways to ensure coal revenue is reinvested in communities to help them break from the boom and bust cycles of fossil fuel extraction

The Power Plus (POWER+) Plan,²¹⁸ proposed in President Obama's FY2016 and FY2017 budgets, and the Obama Administration's corollary POWER Initiative provide an example of recent efforts by the Federal government to help coal communities in transition.

The POWER+ Plan proposed a range of investments in economic diversification, employment and training services, and abandoned mine reclamation targeted to coal communities and workers. It also included Federal transfers to rescue the solvency of the largest multi-employer pension plan serving retired coal miners and their families, and to extend health care coverage to beneficiaries who were going to lose their coverage at the end of 2016.²¹⁹ In addition, it included two

²¹⁸The White House. 2016. Investing in Coal Communities, Workers, and Technology: The POWER+ Plan. Available at https://www.whitehouse.gov/sites/default/files/omb/budget/fy2016/assets/fact_sheets/investing-in-coal-communities-workers-and-technology-the-power-plan.pdf

²¹⁹ The Further Continuing and Security Assistance Appropriations Act of 2017 provided funds to ensure that the health care coverage to these beneficiaries was extended until April 30, 2017. Pub. L. No. 114-254 (Dec. 12, 2016).

new proposed tax credits to catalyze the deployment of carbon capture, utilization, and sequestration (CCUS) technologies in the power sector.

Starting in 2015, the Administration began in parallel—because the economic need was so urgent—the POWER (Partnerships for Opportunity and Workforce and Economic Revitalization) Initiative, which is effectively the economic and workforce development component of the POWER+ Plan. It was a coordinated effort involving ten Federal agencies—including the DOE—with the goal of effectively aligning, leveraging, and delivering a range of Federal economic and workforce development resources to assist communities negatively impacted by changes in the coal industry and coal-fired segment of the power sector.

Since October 2015, as part of the POWER Initiative, Federal agencies have awarded to date roughly \$80 million to support economic and workforce development projects in coal-impacted communities in 15 states. These projects will catalyze economic diversification in industry clusters ranging from advanced manufacturing and agriculture to information technology and tourism and recreation.^{220,221} In addition, in the Consolidated Appropriations Act of 2016, Congress appropriated OSMRE \$90 million for a pilot program in three Appalachian states, inspired by a proposal in the POWER+ Plan, to use General Treasury funds for the reclamation of abandoned mine land sites in conjunction with economic and community development and reuse goals.²²²

6.4 ISSUES FOR ANALYSIS

According to the BLM NEPA Handbook (Section 6.4), an “issue” is a point of disagreement, debate, or dispute with a proposed action based on some anticipated environmental effect. Analysis of an issue is necessary to make a reasoned choice between alternatives. Based on the input received through the scoping process, the BLM has identified the following issues for analysis in the PEIS. Each program reform alternative will be evaluated against these issues, and a comparative analysis will be presented in the Draft PEIS. Consistent with guidance in the BLM’s NEPA Handbook (Section 9.2.9), the BLM will attempt to quantify the effects analysis in the PEIS as much as possible.

Available at <https://www.whitehouse.gov/the-press-office/2016/10/26/fact-sheet-administration-announces-additional-economic-and-workforce>

²²¹ The White House. 2015. FACT SHEET: Administration Announces New Workforce and Economic Revitalization Resources for Communities through POWER Initiative. October 15, 2015. Available at <https://www.whitehouse.gov/the-press-office/2015/10/15/fact-sheet-administration-announces-new-workforce-and-economic>

²²² OSMRE. 2016. Guidance for Eligible Projects To Be Funded Under The Abandoned Mine Land Reclamation Economic Development Pilot Program For Fiscal Year 2016. Available at <https://www.osmre.gov/programs/aml/pilotProgramGuidance.pdf>

- What would be the effect of the alternatives on Federal coal production?
- What would be the effect of the alternatives on other energy sources?
- What effect would the alternatives have on substitution between energy sources and between Federal and non-Federal coal?
- What would be the effect of the alternatives on energy prices (wholesale and retail)?
- What would be the effect of the alternatives on net coal exports?
- What would be the change in effect of the alternatives considering sensitivity analysis (e.g., natural gas prices)?
- What would be the effects of the alternatives on socioeconomic factors, including but not limited to, national revenues, state revenues, and employment (direct and indirect)?
- What would be the effect of the alternatives on fair return to the American taxpayer?
- What would be the effect of the alternatives on greenhouse gas emissions (separated by streams: production, transportation, and combustion)?
- What would be the effect of the alternatives in terms of achieving US climate goals?
- What would be the effect of the alternatives on the environment?
- What would be the effect of the alternatives on public health?

6.5 ANALYTICAL APPROACH

Consistent with the requirements of NEPA, the BLM will prepare the PEIS using an interdisciplinary approach, and the disciplines of the preparers will be appropriate to the scope of the analysis and to the issues identified in the scoping process (40 CFR, Subpart I 502.6). As can be seen in the issues identified for analysis (see **Section 6.4**), the PEIS will require economic and national and global energy market expertise among the more traditional disciplines. Further, many of the issues identified for analysis will require the use of sophisticated power sector modeling. The BLM is in the process of assessing the various models that are available and will determine which model or models best meet the analytical needs of the PEIS.

The BLM will prepare a reasonably foreseeable development scenario to support the analysis in the PEIS. The reasonably foreseeable development scenario will forecast coal exploration, development, and production for the planning area for a defined time horizon. This baseline scenario will inform the analysis of the no action alternative and other program reform alternatives.

In accordance with the requirements of NEPA, the PEIS will analyze the direct, indirect, and cumulative impacts of the proposed coal reform alternatives (40 CFR, Subpart 1508.25[c]). As determined appropriate, this will include considerations such as transportation related impacts, health impacts, socioeconomic impacts, and ecological impacts. As discussed in CEQ's guidance "Effective Use of Programmatic NEPA Reviews," a broad (e.g., regional or landscape) description may suffice for characterizing the affected environment in programmatic NEPA reviews, so long as potentially impacted resources are meaningfully identified and evaluated. Further impacts in programmatic reviews are typically discussed in a broad geographic and temporal context with particular emphasis placed on cumulative effects.²²³

In developing the PEIS, the BLM will adhere to CEQ's Final Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in NEPA Reviews (August 1, 2016). This includes an assessment of greenhouse gas emissions and the effects of climate change on a proposed action and its environmental impacts. The BLM will quantify the projected direct and indirect greenhouse gas emissions associated with the proposed coal reform alternatives to the extent practicable. The BLM will also evaluate the appropriate application of the social cost of carbon and the social cost of methane in the PEIS.

The BLM will use the best available science to support its NEPA analyses in the PEIS (BLM NEPA Handbook Section 6.8.1.2) and will adhere to the five Principles and Practices of Science-Management Integration identified in the March 2015 publication *Advancing Science in the BLM: An Implementation Strategy*²²⁴:

1. Use the best available scientific knowledge relevant to the problem or decision being addressed, relying on peer-reviewed literature when it exists.
2. Recognize the dynamic and interrelated nature of socioecological systems within which the BLM operates.
3. Acknowledge, describe, and document assumptions and uncertainties.
4. Use quantitative data when it exists, in combination with internal and external professional scientific expertise.
5. Use transparent and collaborative methods that consider diverse perspectives.

²²³ Executive Office of the President, Council on Environmental Quality. 2014. Effective Use of Programmatic NEPA Reviews. December 2014. Available at https://ceq.doe.gov/current_developments/docs/Effective_Use_of_Programmatic_NEPA_Reviews_Final_Dec2014_searchable.pdf

²²⁴ BLM. 2015. Advancing Science in the BLM, an Implementation Strategy. Available at http://www.blm.gov/style/medialib/blm/wo/blm_library/BLM_pubs.Par.38337.File.dat/BLMAdvSciImpStratFINAL032515.pdf

The BLM will conduct a thorough review of all data, reports, and studies submitted to the BLM over the course of the NEPA process and incorporate them as appropriate into the NEPA analysis. A list of the data and reports submitted through the scoping process can be found in the annotated bibliography in **Appendix E** (see **Section 4.6.I** for more information). The BLM will work with Cooperating Agencies and other industry experts as necessary in conducting this work.

Consistent with NEPA, the PEIS will concentrate on the issues that are truly significant to the action in question rather than amassing needless detail (40 CFR, Subpart 1500.1). While the reform options under consideration are fairly expansive, the BLM will work to keep the PEIS as focused as possible with a goal of developing a document that is understandable to the larger public and completed in a timely manner.

6.6 ENERGY AND ECONOMIC ANALYTICAL CONSIDERATIONS

The development of the PEIS will involve detailed analysis of options, option combination packages, and alternatives with a goal of addressing the issues for analysis described in **Section 6.4**.

Of particular relevance will be analyzing effects on energy markets and the energy economy as well as fiscal effects. Most obviously, adjustments to the Federal coal program have the potential to impact Federal coal production as well as employment and the state and Federal revenues associated with production. Moreover, policy options also have the potential to impact greenhouse gas emissions directly through limitations on production or indirectly through mechanisms that factor in the environmental externalities of coal production. However, as illustrated by comments and accompanying studies and reports, there are a wide array of variables and constraints to consider when examining how coal reform would interact with other components of the national energy and economic systems. Some of these considerations are highlighted below. These considerations present key next steps for the BLM, Cooperating Agencies, and other interested stakeholders in examining reform opportunities for the Federal coal program.

Modeling choice for energy sectors: The impacts from reforms to the PEIS would be absorbed over an extended period of time as it is adopted through new or renewed coal leases as current lease contract periods expire.²²⁵ As noted above, reform options would have the potential to affect not just Federal coal production, but national energy and economic systems as a whole. Estimating these potential system wide effects requires modeling the complex interactions of the power sector and various fuel sources. There are a number of power

²²⁵ Existing leases are generally structured as 20-year contracts and would not be directly impacted by the reform until up for renewal.

sector models available to assist the BLM in this task.²²⁶ The power sector represents the chief source of demand for Federal coal; its detailed representation and ability to respond to changes in fuel cost through dispatch and capacity changes are critical to accurately modeling any leasing reform.

Capacity expansion models that optimize electricity dispatch and generation subject to fuel costs and regulatory constraints are ideal for analyzing these types of long-run power generation scenarios and the policies that drive them.²²⁷ Production cost models and network reliability models have higher temporal resolutions focused on near-term electricity production and dispatch decisions and generally apply to more narrow geographies. Given the nationwide power market implications of Federal coal leasing reform and the extended time horizon for which its impact would be assessed, capacity expansion models would offer an advantage over other power-sector models. These types of models can provide the temporal and spatial dimensions necessary to best capture the full impacts of leasing decisions. The discussion below highlights important considerations regarding modeling assumptions and inputs and outputs.

Model Inputs

- I. *Coal Supply Representation:* With slightly over 40 percent of coal produced in the United States coming from Federal lands, a key data element for analysis and modeling will be distinguishing between coal supplied from Federal coal leases and other non-Federal mineral ownership. This distinction would allow the BLM, when specifying modeling inputs, to most accurately link any coal reform changes to the mines on the supply-side that will absorb those changes. Furthermore, being able to distinguish between the types of mine—surface or underground—will also be a relevant distinction for analytic efforts. Federal coal leasing currently involves different royalty rates for surface and underground mines, and it is likely that any alterations that address fair return or environmental impacts would likely impact these mine types differently. Finally, a data field that distinguishes whether a particular mine is an existing lease, a renewed mine lease, or a new lease would be central to appropriately reflecting Federal coal leasing changes when designing modeling parameters. Any Federal coal leasing changes would likely only apply to renewed and new leases and, therefore, having a detailed mine-by-mine coal supply representation that made this distinction would allow the BLM to best reflect the policy parameters in its analysis. In summary, having detailed mine-by-mine

²²⁶ Howard, P. 2016. The Bureau of Land Management's Modeling Choice for the Federal Coal Programmatic Review. New York University Institute for Policy Integrity. June 10, 2016. Available at <http://policyintegrity.org/publications/detail/BLM-model-choice>

²²⁷ Ibid.

supply assumptions that include data on each mine's Federal/non-Federal, surface/underground, and existing/new status will equip the BLM with the appropriate data necessary to best analyze any coal reform changes.

2. *Coal Transportation Representation:* The primary consumer of Federal coal is the power sector. Many of these buyers are located far away from the western coal lands where the majority of coal from Federal leases is produced. Consequently, compared with other domestic coal sources, the cost of transportation is typically a more significant factor into the delivered price of western coal. Therefore, having an accurate representation of the linkages from coal supply regions to the power plant is critical to assessing the delivered price of coal to power markets and the corresponding dispatch decisions to meet electricity demand. Data regarding the mode of transportation (e.g., rail, barge, and truck) from mine to power plant and the cost per ton-mile transported will likely be an important model input. Any capacity limitations would also be critical to understand—and to capture as a constraint—in analysis to ensure that significant changes in coal supply origins are compatible with current and future infrastructure. Finally, coal transportation cost and supply linkages between plant and supply region may be informed by historical data (such as fuel receipts provided in EIA Form 923). However, the BLM would likely need to identify possible rail linkages, not just historical ones, between supply regions and plants to ensure that new transportation options to competing basins are an option, where appropriate, for power plants in optimization models to prevent any bias against substitution in its analysis.
3. *Coal Demand Representation:* Demand for Federal coals is almost entirely from US power plants. Power plants base their purchase decisions on a variety of factors, including the delivered price per mmBtu of a particular coal, compatibility with boiler design, and the environmental properties of the coal, the compatibility with current pollution control equipment (e.g., flue gas desulfurization or dry sorbent injection), and emission requirements. Moreover, coal plants may have captive competition where they only access coal markets through a single rail carrier, or they may have a more competitive position where they can access coal supply through a variety of the primary rail carriers. While a mine-by-mine representation of coal supply will allow the BLM to most accurately estimate the effect of coal reform adjustments on availability of different types of coal, a detailed plant-by-plant representation of the power sector will help best capture how any changes affect the demand for coal as well as other fuel sources. A bottom-up model that starts with a database of the power plant fleet and contains capacity, historical fuel consumption, boiler design, plant-specific pollution controls, and emissions constraints for each power plant will be a central data element to future PEIS analysis.

Model Outputs/Impacts Dependent on Model Outputs

- I. *Substitution:* With appropriate model structure and supply and demand representation, the impact of any Federal coal program reforms will ultimately pivot on substitution. Specifically, this includes estimated shifts to/away from Federal coal and estimated shifts to/away from competing electricity generation (e.g., non-Federal coal, natural gas, renewable, etc.). To inform substitution effects, the BLM may use power-sector models that accurately reflect electricity generation capacity and capacity expansion, as well as cost and performance metrics of each form of electricity generation.

In regard to coal switching between Federal and non-Federal it is important to fully capture the cost of such switching to ensure there is no bias for or against substitution. For instance, the majority of Federally produced coal is subbituminous, and the majority of non-Federal coal is bituminous. When a coal boiler built for subbituminous substitutes to bituminous, it may require soot blowing or heat transfer surface modifications to handle the low ash fusion temperatures and/or corrosive nature of its higher chlorine content. These costs, in addition to the fuel costs, are critical data elements to capture when assessing substitution. Likewise, when a boiler built for consuming bituminous coals substitutes to subbituminous, it may experience additional capital cost in the form of increased material handling, milling capacity, and dust control. Finally, a plant may have an investment in certain control technologies, such as dry sorbent injection, that only function with certain coal ranks and, thus, this data needs to be considered when assessing substitution costs.

When switching to/from natural-gas fired generation, it is important to have production and pipeline data to ensure that the levels of substitution are not inconsistent with infrastructure capabilities. Likewise, it is important to appropriately reflect the cost and performance of renewable technologies to identify the degree to which this technology serves as a substitute. Due to the long time horizon under consideration when evaluating PEIS reform and the rapidly evolving changes regarding renewable energy costs, it is a data component that may benefit from sensitivity analysis. For example, its viability as a substitute may be informed by current cost and performance metrics in one sensitivity, but a different set of technology cost and performance assumptions reflecting recent trends and growth may be used for sensitivity.

Some commenters have conducted initial analysis that informs the likely substitution effects from different policy scenarios and may help inform further exploration of substitution effects. For example, Vulcan Philanthropy looked at varying scenarios where different royalty rates were applied. With CPP, the royalty change resulted in a substitution as high as 0.75 tons of non-Federal coal for every ton of Federal coal decline

in 2030. At higher royalty rates, these substitution rates reached levels where only 0.5 tons of additional non-Federal coal were produced for every ton of Federal coal reduced in 2030 as the power sector increasingly looks for non-coal energy (e.g., natural gas) sources to replace larger decreases in Federal coal production.²²⁸ As the substitution rate to non-Federal coal became smaller, the substitution to natural gas became larger, reflecting the competitive reality of these two fuels as marginal dispatch sources.

The environmental (including climate change) and economic impacts of reform alternatives depend, in large part, on the estimated substitution effects. For a variety of reform options, identifying substitution will be a critical early data element to enable the BLM to subsequently determine the power system impacts, corresponding cost and benefits, changes to state/Federal revenues, employment, and greenhouse gas emissions impacts. Some of those impacts are explored further below.

2. *Employment Impacts:* The BLM will analyze employment impacts (as well as impacts on other economic metrics such as output, gross domestic product, and labor income) to sectors potentially affected by reform alternatives. The prior discussion highlights that these impacts extend beyond the coal sector to the energy industry as a whole, as well as other industries affected by the multiplier impacts of coal production, transportation, and generation. The estimated substitution results of alternative reforms will serve as primary input for such an analysis on employment impacts to various sectors.

One key consideration for analyzing coal employment impacts relates to differences in labor intensity of Federal and non-Federal coal. The majority of Federal coal is surface mined and has the lowest labor intensity in the nation, whereas the non-Federal coals generally require much more labor per ton of coal removed. For instance, in Wyoming, where the majority of Federal coal is located, the aggregate coal mine productivity is 29 tons per labor hour. Illinois, Pennsylvania, and West Virginia, where many of the competing non-Federal coals are mined, have productivity rates in the range of 2 to 6 tons per labor hour due to the thinner and more difficult-to-reach seams (see **Table 6-2**, which shows coal labor employment and productivity for the seven largest states by employment).²²⁹ This means that for each ton of Federal coal

Table 6-2
Labor Requirements to Mine Coal

	Employment	Productivity (tons per labor hour)
West Virginia	18,330	2.69
Kentucky	11,834	2.8
Pennsylvania	7,938	3.52
Wyoming	6,624	28.62
Illinois	4,218	5.99
Indiana	3,810	4.21
Alabama	3,694	1.88

Source: US EIA 2016²³⁰

replaced by a ton of non-Federal coal, the amount of coal labor may increase by a factor of 10. The BLM will examine the substitution impacts from any coal reform to assess the impact on employment markets in non-Federal coal mining markets and in natural gas markets. The EIA data on productivity and employment will be one critical element to understanding coal mining job impacts from any reform efforts and subsequent substitution.

Initial analysis provided by commenters examining the impact of various coal reform options, such as royalty rate adders, highlighted that nationwide coal mining employment increased (by more than 5 percent) as a result of Federal royalty rate adders that made non-Federal coals more competitive.²³¹ With appropriate data on substitution and employment, the BLM can further explore the potential to simultaneously increase coal revenues and employment. **Figure 6-1** highlights the negative correlation historically observed between Powder River Basin production and coal mining jobs. The BLM analytical efforts could help ensure that the price for which Federal coals are leased reflects FMV in order to prevent any effective subsidization of western coal mining jobs at the expense of eastern coal mining jobs.

3. *Electricity Prices* - Any changes that make fuel more expensive will likely be carried through to the end user of the fuel—the electric ratepayer. The BLM will assess how these changes to Federal coal leasing impact fuel cost and related capital cost, and how those costs are passed through to ratepayers.

4. *Revenue Impacts:* The BLM will analyze data on government revenues as a result of any coal leasing changes. This includes assessing effects on the Federal revenue sources, particularly revenues associated with bonus bids, rental rents, and royalties. To the extent feasible, the BLM will assess effects on other Federal taxes (e.g., Reclamation Fee and Black Lung Excise Tax) and effects on relevant state and local revenues. The analysis released by the Council of Economic Advisors suggests that as coal royalties increase up to a certain point so too do government revenues.²³⁵ That is, the increase in revenue from higher royalties more than offsets any decline in production and bonus bids. For example, their analysis suggested that a royalty charge of \$30/ton would result in an additional 2.7 to 3.1 billion dollars in government revenues each year after 2025 when the changes are fully phased in even though total annual production would decrease by 53 percent. Regional coal

production forecasts, including forecasts specific to Federal leases, are the key input for analyzing revenues. Therefore, outputs that detail production levels from different coal supply regions and Federal mines will be critical results from the energy sector model.

5. *Externalities*: Economic theory indicates that markets are optimized when the full marginal cost of production (including externalities) is equal to the marginal benefits. In order to reflect this optimal level, fuels such as coal would have a cost that reflects not only the extractive component but also any environmental or social damages associated with them. When examining externalities, the BLM would need data and analysis regarding the social cost of methane and the social cost of carbon per ton of coal produced. These values, and instructions on how to incorporate them, are available from the Interagency Working Group on the Social Cost of Carbon. The BLM would also need to project the incremental changes in methane and CO₂ emissions from upstream, midstream, and downstream portions of coal's lifecycle. These estimates are needed for all coal not just coal from Federal leases, as well as from competing fossil fuel substitutes such as natural gas. Having this price and volume data would allow the BLM to assess the total impact of any coal reform changes.

Commenters also pointed out other, non-climate-based externalities on which the BLM would need better data quantification. These include the ecosystem impacts from coal mining, lifecycle criteria pollutant impacts, rail transportation fatalities, etc. Emission estimates for SO₂, NO_x, and mercury will be useful data points for informing the benefits of any coal reform changes. These changes will largely manifest themselves in the power sector, so using a model that included outputs for these variables will be an important consideration in the BLM's analytic endeavors. Finally, being able to understand the locational impact of these changes will empower the BLM and the public to best understand the distributional aspects of the cost and benefits to coal reform. Having this data will help the BLM consider environmental justice impacts as required under NEPA and to consider how best to address adverse community impacts from any coal job loss as well as other labor impacts.

6. *Sensitivity*: Sensitivity analysis will be central to any assessment of Federal coal leasing reform due to the uncertainty of energy markets over the extended time horizon affected by any leasing changes. Therefore, specifying modeling runs that test the same policy scenario under different market and regulatory assumptions (i.e., sensitivity analysis) will be useful to determine a range of possible results that capture the uncertainty of policy impacts. These sensitivities may include, but are not limited to, testing policy changes:

- a) With reference case natural gas prices, as well as high and low natural gas prices scenarios
- b) With high and low renewable technology cost and performance assumptions
- c) With and without additional coal export terminal capacity on the West Coast
- d) With and without improved cost performance of carbon capture and sequestration

6.7 SCHEDULE

As discussed previously, on January 15, 2016, Secretary Jewell issued Secretarial Order 3338 directing “the BLM to prepare a discretionary PEIS that analyzes the potential leasing and management reforms to the current Federal coal program.” In the press release and other materials released with the Secretarial Order and Notice of Intent, the Secretary indicated that the PEIS would take approximately 3 years to complete.

Following the CEQ regulations at 40 CFR, Subpart 1508.22, a Notice of Intent to prepare a PEIS was issued on March 30, 2016, which initiated the scoping process. The proposed schedule for the PEIS can be found in **Table 6-3**. The BLM will prepare a Draft PEIS using the information received during the scoping process and will provide, at minimum, a 45-day public comment period on the Draft PEIS (43 CFR, Subpart 1506.10). The BLM plans to release the Draft PEIS in January 2018. The BLM will incorporate public comments received on the Draft PEIS and prepare a Final EIS (40 CFR, Subpart 1502.9) by January 2019, with a Record of Decision to follow by March 2019 (40 CFR, Subpart 1506.10).

Table 6-3
Proposed Schedule for the PEIS

Milestone	Proposed Date
Scoping Report	January 2017
Draft PEIS	January 2018
Public Comment Period	January – March 2018
Final PEIS	January 2019
Record of Decision	March 2019

Federal Coal Program

Programmatic Environmental Impact Statement - Scoping Report Appendices

Our Vision

To enhance the quality of life for all citizens through the balanced stewardship of America's public lands and resources.

Our Mission

To sustain the health, diversity, and productivity of the public lands for the use and enjoyment of present and future generations.

Bureau of Land Management Federal Coal Leasing Program

2015 National Listening Sessions

- **Washington, D.C. – July 29**
- **Billings, Montana – August 11**
- **Gillette, Wyoming – August 13**
- **Denver, Colorado – August 18**
- **Farmington, New Mexico – August 20**

BLM Coal Program Quick Statistics

- BLM currently administers **310** coal leases
- **In the last 10 years:**
 - BLM-managed lands produced approximately 5.1 billion tons of coal worth over \$72 billion
 - This production generated \$7.9 billion in royalties and nearly \$4.0 billion in revenues from rents, bonuses, and other payments.
 - BLM held 39 coal lease sales
- **In 2014:**
 - Approximately 40% of Nation's electricity was produced from coal.
 - It is expected to account for 30% by 2040
 - Approximately 40% of the coal produced was from federal coal; 85% of that was from the Powder River Basin in Wyoming.

Federal Coal Tons Leased and Mined 2005 - 2014

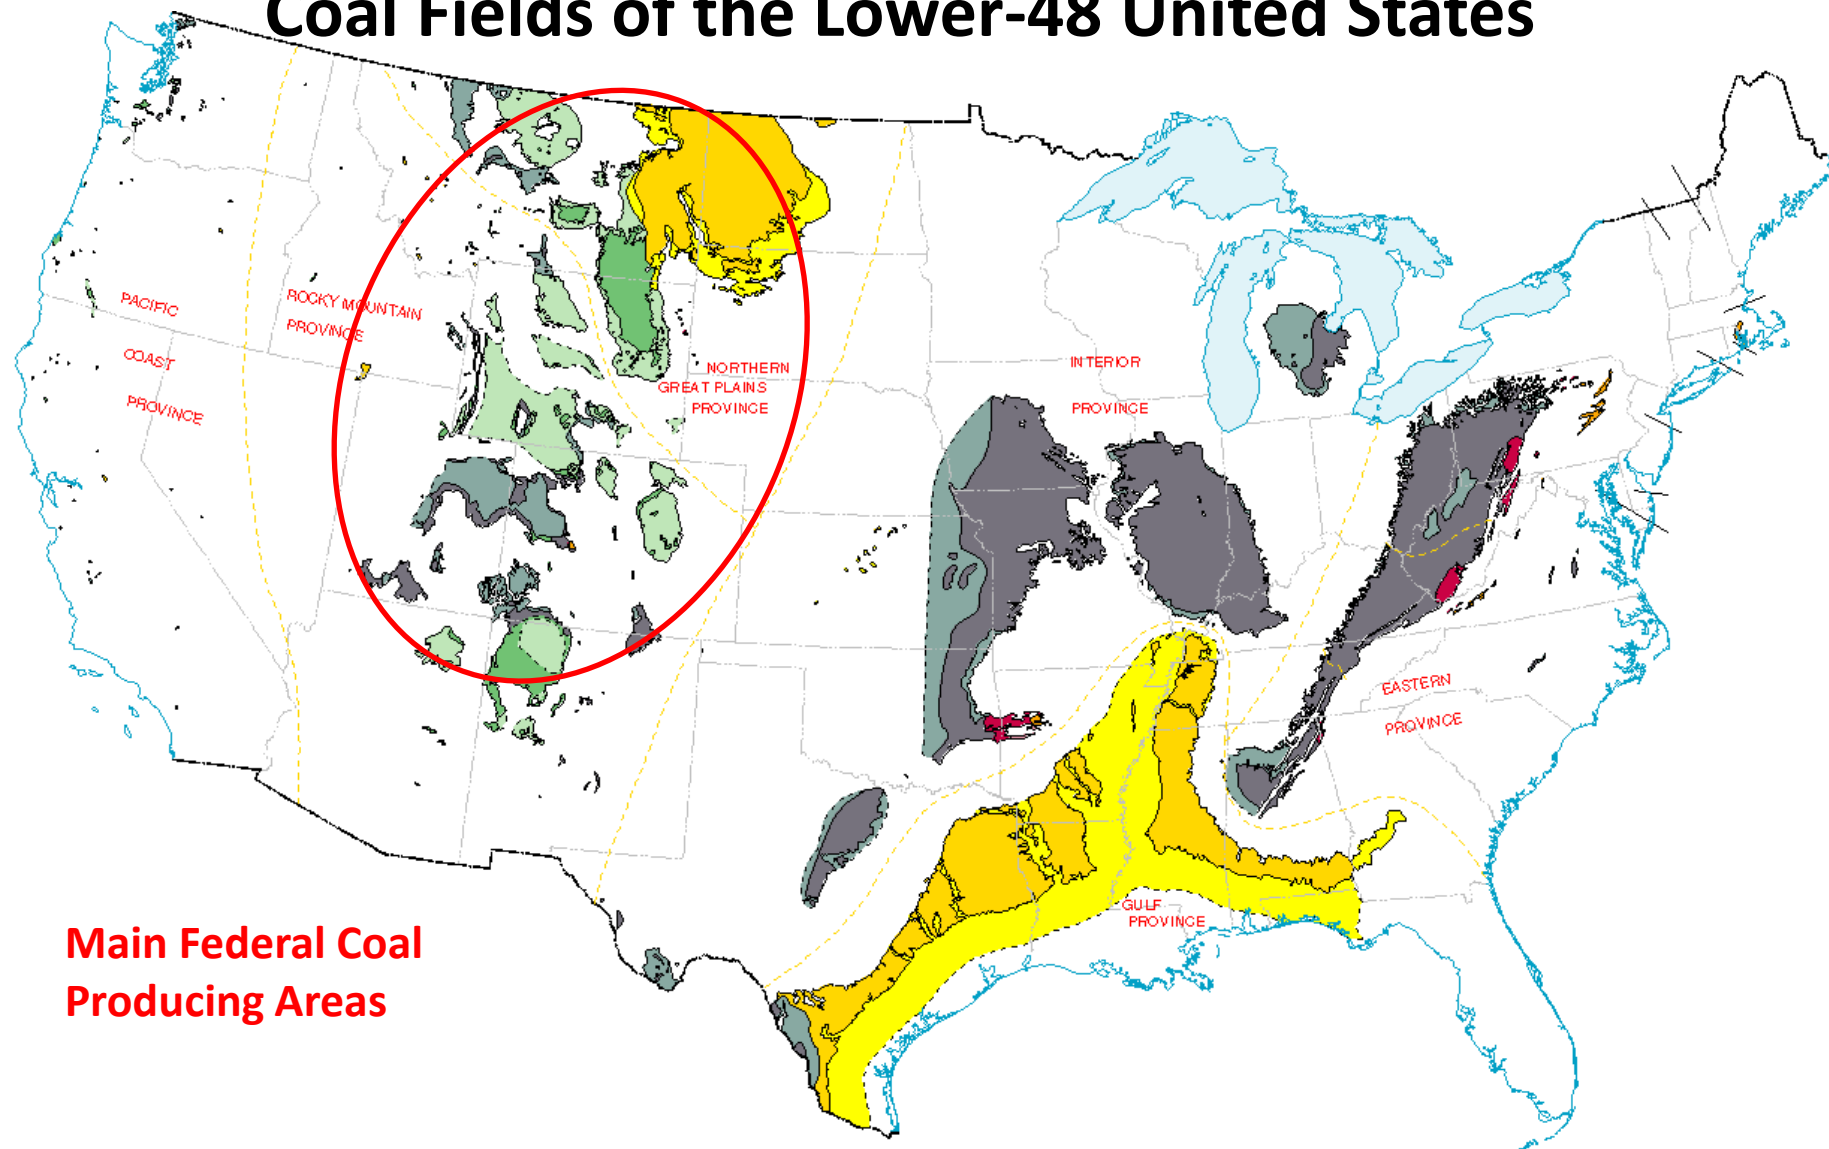

Federal Coal Bonus Bids and Royalty Collected 2005 - 2014

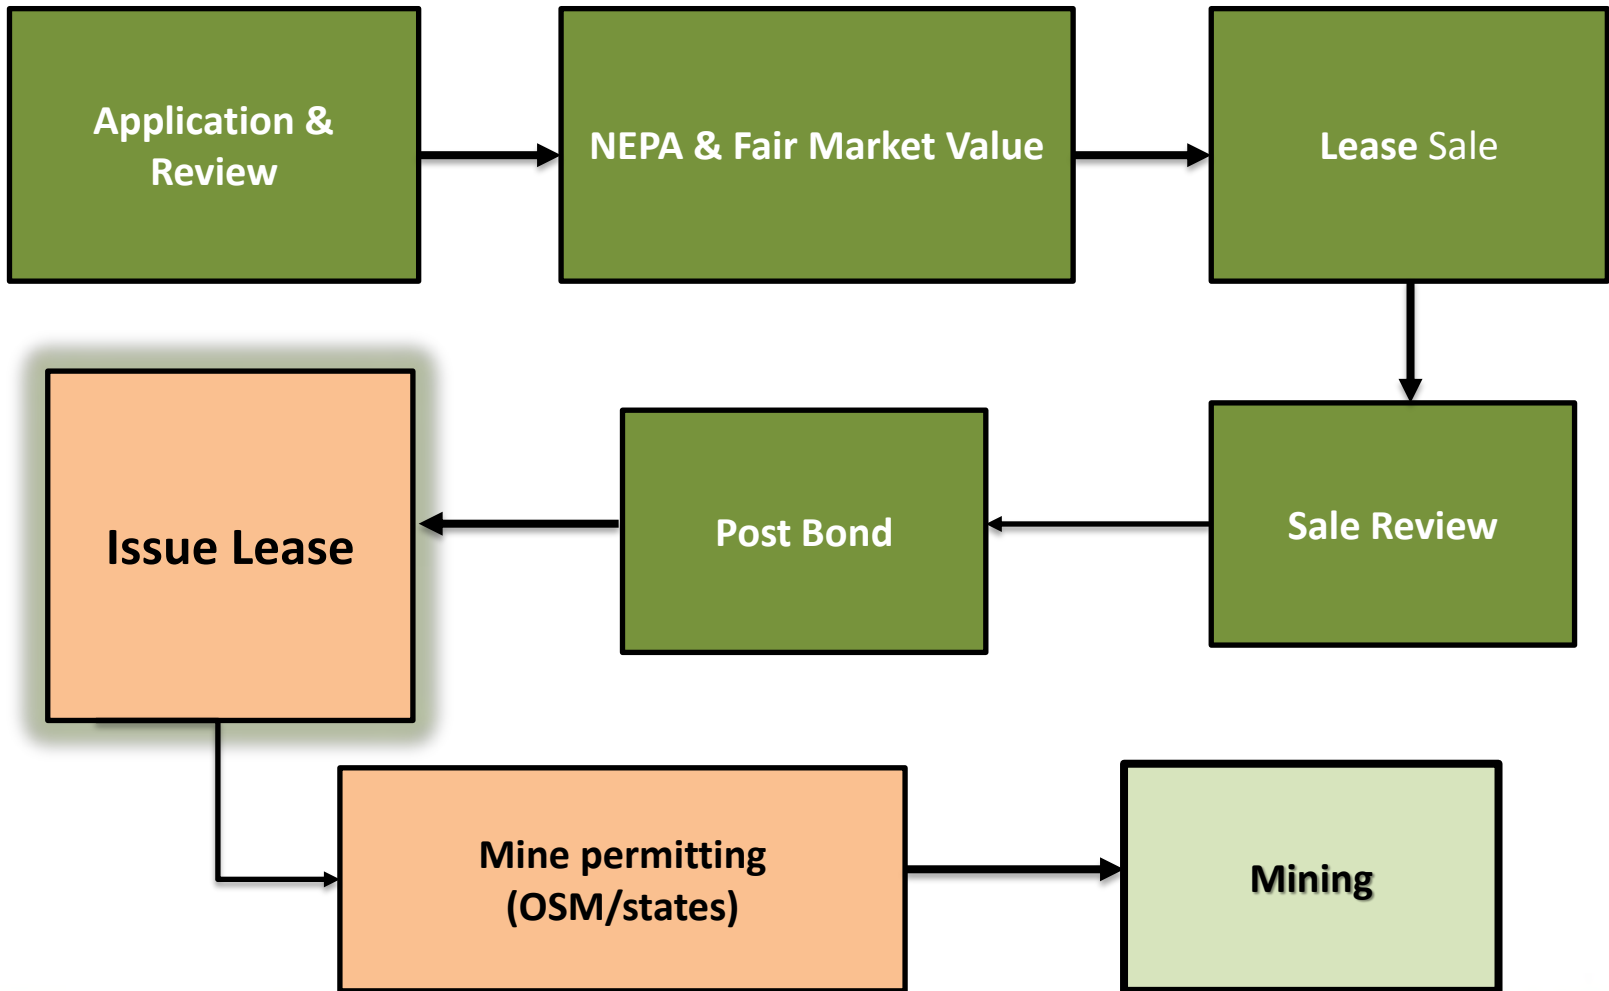

Coal Fields of the Lower-48 United States

**Main Federal Coal
Producing Areas**

Federal Coal Leasing Process

General Steps for Federal Coal Leasing and Mining

- Land Use Planning (Resource Management Plans)
 - Determines lands open to leasing consideration
- Application Submittal
- Environmental Analysis
- Mineral Authorization (Right of Entry)
 - Coal lease sale (bonus bid revenue generated)
- SMCRA Permit (Right to Mine)
 - Granted by Office of Surface Mining, Reclamation and Enforcement (OSMRE) or state
- Mining (royalty revenue generated)
- Reclamation
 - OSMRE or state

Royalty and Royalty Rate Reductions for Federal Coal

By **statute** (30 U.S.C. 209)

- Lessees must pay a royalty of not less than 12 ½% on the sale price of the coal
- The Secretary may determine a lesser royalty rate for underground mining to promote development
- The Secretary may consider lease or region-specific royalty rate reductions under certain circumstances (30 U.S.C. 209)

By **regulation** (43 CFR 3473.3-1 & 2)

- Lessees must pay a royalty of 8% for underground mining and not less than 12 ½% for surface mining
- Lessees must pay an annual rent of not less than \$3 per acre

Bonding Requirements

- Both BLM and the Office of Surface Mining, Reclamation and Enforcement (OSMRE) administer bonds for coal mines, which serve different purposes

Coal Lease Bonds (BLM)

BLM is responsible for the administration of lease bonds.

- Lease bonds assure those aspects of the mining operation **other than reclamation operations** on a lease are conducted in conformity with the approved mining or exploration plan.
- BLM lease bonds typically cover:
 - Three months of production royalty
 - One year of lease rental
 - Remaining balance of deferred bonus bids

Bonding requirements (Cont'd)

Performance Bonds (OSMRE)

OSMRE is responsible for the administration of performance bonds.

- A performance bond is a surety bond, collateral bond and/or self-bond to assure the permittee performs the requirements of the permit and reclamation plan.

Lease Protection Bonds (OSMRE)

OSMRE is responsible for the administration of Federal lessee protection bonds.

- These bonds hold the permittee responsible for any damages to crops or tangible improvements on Federal lands.

Note: States with OSMRE approved SMCRA regulatory programs may enter into cooperative agreements with OSM in order to become the regulatory authority for coal mining on Federal lands.

Recent Improvements to the Management of the Federal Coal Program

Developed in response to recommendations from the OIG (2013) and GAO (2014) which focused on the:

1. Lease Sale Valuation Process
2. Royalty Rate Reductions

The lease valuation process is critically important because it establishes the pre-sale estimate of the fair market value (FMV) for a given tract.

The high bid at a given sale must meet or exceed that estimate.

Lease Valuation Process Improvements

Published an updated Coal Evaluation Manual and Handbook

- Providing more robust guidance on FMV procedures
- Standardizing requirements for sales and reoffers
- Establishing internal controls and safeguards
- Requiring additional information, including third party review and consideration of export markets
- Increasing transparency of process
- Recommends use of two most common appraisal methods

Income Approach

Geologic analysis
Engineering analysis
Market analysis
Valuation

Comparable Sales

Valuation based on recent
similar sales

Royalty Rate Reductions Process Improvements

- Issued new RRR guidance to streamline the application review and consultation process;
- Required ONRR consultation for financial hardship RRR application processing.

Thank You

For further information of BLM's coal program:

http://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy.html

- 1. Are existing royalty rates appropriate in light of the value of the federal coal resources, the costs of their development, and the returns due to American taxpayers?**
- 2. How might different levels of royalty rates affect: Return? viability of mining operations? Revenues for states and communities? Levels and locations of coal production? Jobs and coal exports markets?**
- 3. What are reasonable economic and market assumptions about Federal coal in the future, particularly in the West? In particular, what role might coal exports play? Do BLM's lease sale valuation and royalty policies appropriately consider exports or other market forces or economics?**
- 4. Are there other ways in which BLM might promote greater competition in the coal leasing process?**
- 5. Are there other aspects of the BLM coal program that should also be considered with respect to ensuring a fair return to the taxpayer, such as appraisals, leasing procedures, lease terms, bonding, cost recovery, or penalties?**
- 6. What actions might the BLM take to address any of these issues, consistent with our existing statutory authority?**

APPENDIX B

SCOPING MATERIALS

Public scoping for the Federal Coal Program Programmatic EIS included a press release, six public scoping meetings, and a project website (<https://www.blm.gov/programs/energy-and-minerals/coal/coal-peis>). The formal public scoping period began on March 30, 2016, with the publication of an NOI in the Federal Register (Vol. 81, No. 61, page 17720), and comments were accepted through September 15, 2016.

Information provided to the public during the public scoping period is included in this appendix, as follows:

1. Secretarial Order 3338. Discretionary Programmatic Environmental Impact Statement to Modernize the Federal Coal Program (10 pages)
2. Federal Register NOI to Prepare a Programmatic Environmental Impact Statement to Review the Federal Coal Program and to Conduct Public Scoping Meetings (Federal Register Vol. 81, No. 61, March 30, 2016; 9 pages)
3. Sample newspaper advertisement from the Grand Junction Daily Sentinel (1 page)
4. Press release, “BLM Gathering Public Input on Coal Program at Six Public Meetings,” released May 16, 2016 (1 page)
5. Sample speaker registration card (1 page)
6. Public scoping meeting presentation (14 pages)
7. Question and Answers on the Department of Interior Federal Coal Reform (10 pages)

This page intentionally left blank.

THE SECRETARY OF THE INTERIOR
WASHINGTON

ORDER NO. 3338

Subject: Discretionary Programmatic Environmental Impact Statement to Modernize the Federal Coal Program

Sec. 1 Purpose. The Department of the Interior (Department) is entrusted with overseeing Federal land and resources for the benefit of current and future generations. This responsibility includes advancing the safe and responsible development of our energy resources, while also promoting the conservation of our Federal lands and the protection of their scientific, historic, and environmental values for generations to come. The production of federally managed coal presently accounts for approximately 41 percent of the coal produced in the Nation. However, the existing regulatory and programmatic scheme for leasing that coal has been in place, with only relatively minor adjustments, since 1979. It was established at a time when market conditions, environmental concerns, and energy infrastructure were considerably different from today. To help determine whether and how the current system for developing Federal coal should be modernized, this Secretarial Order directs the Bureau of Land Management (BLM) to prepare a discretionary Programmatic Environmental Impact Statement (PEIS) that analyzes potential leasing and management reforms to the current Federal coal program. The PEIS will provide a vehicle for the Department to undertake a comprehensive review of the program and consider whether and how the program may be improved and modernized to foster the orderly development of BLM administered coal on Federal lands in a manner that gives proper consideration to the impact of that development on important stewardship values, while also ensuring a fair return to the American public. This Order does not apply to the coal program on Indian lands as that program is distinct from the BLM's program and is subject to the unique trust relationship between the United States and federally recognized Indian tribes and government-to-government consultation requirements, nor does it apply to any action of the Office of Surface Mining Reclamation and Enforcement (OSMRE) or the Office of Natural Resources Revenue (ONRR).

Sec. 2 Background.

a. Summary of the Federal Coal Program.

The BLM has responsibility for coal leasing on approximately 570 million acres where the coal mineral estate is owned by the Federal Government. The owner of the surface estate of these lands varies and may be the BLM, other Federal agencies, state and local governments, or private landowners. Under authorities, such as the Mineral Leasing Act (MLA), the Mineral Leasing Act for Acquired Lands, and the Federal Land Policy and Management Act, the BLM regulates the leasing and development of this coal. Other Department bureaus, in particular OSMRE and ONRR, also have responsibilities in administering coal mining operations. The OSMRE and those states that have regulatory primacy under the Surface Mining Control and Reclamation Act

(SMCRA) have regulatory responsibilities over surface coal mining and reclamation operations. The ONRR collects, disburses, and verifies revenues from the lease, including bonus bids, royalties, and rental payments, and distributes those funds evenly between the Federal Treasury and the states where the coal resources are located.

The BLM issued coal leasing regulations in 1979 that contemplated two separate competitive coal leasing processes: regional leasing, where the BLM selects tracts within a region for competitive sale, and leasing by application, where the public nominates a particular tract of coal for competitive sale. The regional leasing system has not been used since the 1980s, and currently all BLM coal leasing is done by application. Leasing by application begins with BLM review of an application to ensure completeness, that it conforms to existing land use plans, and that it contains sufficient geologic data to determine the fair market value of the coal. The Agency then prepares an environmental analysis in compliance with the National Environmental Policy Act (NEPA). At the same time, the BLM will also consult with tribal governments and appropriate Federal and state agencies, and will determine whether the surface owner consents to leasing in situations where the surface is not administered by the BLM.

Preparations for the actual lease sale begin with the BLM formulating, after obtaining public comment, an estimate of the fair market value of the coal. This number is kept confidential and is used to evaluate the bids received during the sale. Sealed bids are accepted prior to the date of the sale and are publicly announced during the sale. The winning bid is the highest bid that meets or exceeds the coal tract's presale estimated fair market value, assuming that the bidder meets all eligibility requirements and has paid the appropriate fees and payments.

The BLM receives revenue from coal leasing in three ways: (1) a bonus that is paid at the time BLM issues a lease; (2) rental fees; and (3) production royalties. The royalty rates are set by regulation at a fixed 8 percent for underground mines and not less than 12.5 percent for surface mines. All receipts from a lease are shared equally with the state in which the lease is located.

Over the last few years, approximately 41 percent of the Nation's annual coal production has come from Federal land. Federal coal produced from the Powder River Basin in Montana and Wyoming accounts for over 85 percent of that Federal coal production. Federal coal was used to generate about 14 percent of the Nation's electricity in 2015. Coal is also used for other critical processes, including making steel (metallurgical coal).

As of Fiscal Year 2014, the BLM administered 310 Federal coal leases, encompassing 475,692 acres in 10 states, with an estimated 7.75 billion tons of recoverable Federal coal reserves. Over the last decade, the BLM has held 39 coal lease sales and managed leases that produced approximately 4.4 billion tons of coal and \$10.3 billion in revenue. The recoverable reserves of Federal coal currently under lease are estimated to be sufficient to continue production from federal leases at current levels for 20 years, which does not take into account projections from the Energy Information Administration (EIA) showing that demand for coal is declining.

b. Open Conversation about Modernizing the Coal Program.

On March 17, 2015, I called for "an honest and open conversation about modernizing the Federal coal program." The last time the Federal coal program underwent comprehensive review was in

the mid-1980s, and market conditions, infrastructure development, and national priorities have changed considerably since that time. My call also responded to continued concerns from numerous stakeholders about the Federal coal program, including concerns raised by the Government Accountability Office (GAO), the Department's Office of Inspector General (OIG), Members of Congress, and interested stakeholders. The concerns raised by the GAO and OIG centered on whether taxpayers are receiving fair market value from the sale of coal. Other commenters raised concerns that the current Federal leasing structure lacks transparency and competition and is therefore not ensuring that the American taxpayer receives a fair return from Federal coal resources. These groups also questioned whether the leasing program results in over-supply of a commodity that has significant environmental and health impacts, including impacts on global climate change.

In response to my call for a conversation to address these concerns, the BLM held 5 listening sessions on the Federal coal program in the summer of 2015. Sessions were held in Washington, D.C.; Billings, Montana; Gillette, Wyoming; Denver, Colorado; and Farmington, New Mexico. The Department heard from 289 individuals during the sessions and received over 92,000 written comments before the comment period closed on September 17, 2015. The oral and written comments revealed several recurring themes:

- Concern about global climate change and the impact of coal production and use.
- Concern about the loss of jobs and local revenues if coal production is reduced.
- Support for increased transparency and public participation in leasing and royalty decisions and concern about whether the structure of the leasing program does not provide for adequate competition or a fair return to the taxpayer for the use of federal resources.
- Support for increasing the coal royalty rate, because: (1) the royalty rate should account for the environmental costs of coal production; (2) the royalty rate should match the rate for offshore Federal leases; and (3) taxpayers are not receiving a fair return.
- Support for maintaining or lowering royalty rates, because: (1) the coal industry already pays more than its fair share because existing Federal rates are too high given current market conditions; (2) raising rates will lower production and revenues; and (3) raising rates will cost jobs and harm communities.
- Support for streamlining the current leasing process, so that the Federal coal program is administered in a way that better promotes economic stability and jobs, especially in coal communities which are already suffering from depressed economic conditions.

Of these concerns, three aspects of the current coal program received the most attention. First, numerous stakeholders are concerned that American taxpayers are not receiving a fair return on public coal resources. Second, many stakeholders are concerned that the Federal coal program conflicts with the Administration's climate policy and our national climate goals, making it more difficult for us to achieve those goals. Third, there are numerous and varying concerns about the structure of the Federal coal program in light of current market conditions, including how implementation of the Federal leasing program affects current and future coal markets, coal-dependent communities and companies, and the reclamation of mined lands. These three main concerns are addressed in more detail below.

i. Concerns about Fair Return. In 2013, both GAO and OIG issued reports expressing concerns about the Federal coal program, particularly with respect to the leasing process and fair market value. In response, in 2014 the BLM developed new protocols and issued policy guidance, as well as a manual and handbook, to implement these changes. Nevertheless, stakeholders have expressed concerns that the BLM's response, while helpful, was insufficient to rectify fundamental weaknesses in the program with respect to fair return.

These concerns arise, at least in part, because there is currently very little competition for Federal coal leases. About 90 percent of lease sales receive bids from only one bidder, typically the operator of a mine adjacent to the new lease, given the investment required to open a new mine. While the BLM conducts a peer-reviewed analysis to determine the "fair market value" of the coal and will not sell a lease unless the bid meets or exceeds that value, commenters have questioned whether an accurate fair market value can be identified in the absence of a truly competitive marketplace.

Commenters also raised concerns about the royalty rates set in Federal leases, which are set by regulation at a fixed 8 percent for underground mines and not less than 12.5 percent for surface mines. Many stakeholders believe that these rates do not adequately compensate the public for the removal of the coal and the externalities associated with its use. Still others have suggested that the impact of Federal coal sales, which currently represent approximately 41 percent of total domestic production, artificially lowers market prices, further reducing the amount of royalties received.

Stakeholders also criticize the Federal coal program for obtaining even lower returns through certain types of leasing actions, such as lease modifications, and through royalty rate reductions, which may result in royalty rates as low as 2 percent. In addition, stakeholders have noted that the \$100 acre minimum bid requirement, which is rarely applicable due to fair market value requirements, but occasionally relevant, is outdated.

ii. Concerns about Climate Change. The second broad category of concerns about the Federal coal program relates to its impacts on climate change. The United States has pledged to the United Nations Framework Convention on Climate Change (UNFCCC) to reduce its greenhouse gas (GHG) emissions by 26-28 percent below 2005 levels by 2025. The Obama Administration has made, and is continuing to make, unprecedented efforts to reduce GHG emissions in line with this target through numerous measures. Numerous scientific studies indicate that reducing GHG emissions from coal use worldwide is critical to addressing climate change.

At the same time, as noted above, the Federal coal program is a significant component of overall United States' coal production. Federal coal represents approximately 41 percent of the coal produced in the United States, and when combusted, it contributes roughly 10 percent of the total U.S. GHG emissions.

Many stakeholders highlighted the tension between producing very large quantities of Federal coal while pursuing policies to reduce U.S. GHG emissions substantially, including from coal combustion. Critics also noted that the current leasing system does not provide a way to systematically consider the climate impacts and costs to taxpayers of Federal coal development.

iii. Concerns about Market Conditions. Stakeholders raised various concerns about the implications of current and future coal market conditions. As reported by EIA, between 2008 and 2013, United States' coal production fell by 16 percent, as declining natural gas prices and other factors made coal less competitive as a fuel for generating electricity. In 2015, United States' coal production was roughly 900 million short tons (MMst), 10 percent lower than 2014—the lowest level since 1986. Worldwide, demand for coal appears to be softening as well, with EIA projecting a 21 percent decline in total U.S. coal exports in 2015 from the previous year. As a result, a number of mines in the U.S. have idled production, several major coal companies have entered Chapter 11 bankruptcy, many coal miners have been laid off, and coal-dependent communities have suffered. The EIA and other projections of future coal production show anticipated continuing declines.

Stakeholders have urged the BLM to change the Federal coal program to take these significant market changes into account, although the recommended changes vary. Some suggest that the program should attempt to improve the economic viability of the coal industry and help coal-dependent communities by reducing royalties and streamlining the leasing and permitting processes. Others raise concerns that the program has contributed to low coal prices by incentivizing over-production through non-competitive sales that oversupply the market.

Some have focused on how current market conditions threaten reclamation of lands disturbed by coal mining and may leave state and Federal governments with billions of dollars of unfunded reclamation liabilities. Specifically, many coal companies “self-bond” to meet reclamation bonding requirements, and some stakeholders have asserted that these companies may no longer have the funds to support reclamation activities, and/or they may attempt to shed reclamation obligations in bankruptcy.

Stakeholders also expressed various views regarding exports of Federal coal. Some see export markets as a possible way to maintain or expand Federal coal production, while others view the production of coal for export as a less valuable activity than coal production for domestic use. Still others expressed concern that the export of U.S. coal will contribute to GHG emissions worldwide, which undermines our climate objectives. A number of stakeholders expressed concern that exports, or the potential for exports, were not adequately considered as part of leasing decisions or fair market value determinations.

c. Previous Comprehensive Reviews.

The Department has previously conducted two separate comprehensive reviews of the Federal coal program. In the late 1960s, there were serious concerns about speculation in the coal leasing program. A BLM study discovered a sharp increase in the total Federal acreage under lease and a consistent decline in coal production. In response, the Department undertook the development of a planning system to determine the size, timing, and location of future coal leases, and the preparation of an environmental impact statement (EIS) for the entire Federal coal leasing program. The short-term actions included a complete moratorium on the issuance of new coal prospecting permits, and a moratorium with limited exceptions on the issuance of new Federal coal leases. New leases were issued only to maintain existing mines or to supply reserves for production in the near future, where “near future” meant that development and production were to commence within 3 and 5 years, respectively. The moratorium was scaled

back over time, but was not completely lifted until 1981, after a PEIS had been completed, a new leasing system had been adopted through regulation, and litigation was resolved.

In 1982, concerns about the Federal coal program arose again, this time related to allegations that the Government did not receive fair market value from a large lease sale in the Powder River Basin under the new procedures adopted as part of the programmatic review in the 1970s. Among other reports on the issue, in May 1983, GAO issued a report concluding that the Department had received roughly \$100 million less than it should have for the leases sold, although the Department disputed this conclusion. In response, in July 1983, Congress directed the Secretary to appoint members to a commission, known as the Linowes Commission, to investigate fair market value policies for Federal coal leasing. Congress also, in the 1984 Appropriations Act, directed the Office of Technology Assessment (OTA) to study whether the Department's coal leasing program was compatible with the nationally mandated environmental protection goals.

As part of the 1984 Appropriations Bill, Congress imposed a moratorium on the sale or lease of coal on public lands, subject to certain exceptions, starting in 1983 and ending 90 days after publication of the Linowes Commission's report. The Linowes Commission published the *Report of the Commission on Fair Market Value Policy for Federal Coal Leasing* in February 1984. The OTA report, *Environmental Protection in the Federal Coal Leasing Program*, was released in May 1984. The principal thrust of these reports was that the Department should: (1) temper its pace of coal leasing; (2) improve and better document its procedures for receiving fair market value; and (3) take care to balance competing resource uses in making lease decisions.

Interior Secretary William P. Clark extended the suspension of coal leasing (with exceptions for emergency leasing and processing preference right lease applications, among other things), while the Department completed its comprehensive review of the program. This review included proposed modifications to be made by the Department in response to the Linowes Commission and OTA reports. Secretary Clark announced on August 30, 1984, that the Department would prepare an EIS supplement to the 1979 Final Environmental Statement for the Federal Coal Management Program. The Department issued the Record of Decision for the PEIS supplement in January 1986, in the form of a Secretarial Issue Document. That document recommended continuation of the leasing program with modifications. In conjunction with those modifications, Interior Secretary Donald Hodel lifted the leasing moratorium in 1987.

Sec. 3 Authorities. This Order is issued under statutory authority that includes, but is not limited to, the Mineral Leasing Act, 30 U.S.C. §§ 181 *et seq.*; the Mineral Leasing Act for Acquired Lands, 30 U.S.C. §§ 351 *et seq.*; the National Environmental Policy Act, 42 U.S.C. §§ 4321 *et seq.*; the Surface Mining Control and Reclamation Act, 30 U.S.C. §§ 1201 *et seq.*; and the Federal Land Policy and Management Act, 43 U.S.C. §§ 1701 *et seq.*

Sec. 4 Discretionary Programmatic Environmental Impact Statement. Given the broad range of issues raised over the course of the past year (and beyond) and the lack of any recent analysis of the Federal coal program as a whole, a more comprehensive, programmatic review is in order, building on the BLM's public listening sessions. Accordingly, to meaningfully address the breadth and complexity of the issues raised by commenters regarding the Federal coal

program, I hereby direct the BLM to conduct a broad, programmatic review of the Federal coal program it administers through the preparation of a PEIS under NEPA.

The Department is authorized to undertake this effort in its stewardship role as a proprietor and sovereign regulator which is charged by Congress with managing and overseeing mineral development on the public lands, not only for the purpose of ensuring safe and responsible development of mineral resources, but also to ensure conservation of the public lands, the protection of their scientific, historic, and environmental values, and compliance with applicable environmental laws. Additionally, the Department has the statutory duty to ensure a fair return to the taxpayer and broad discretionary authority to decide where, when, and under what terms and conditions, mineral development should occur, including with regard to the issuance of Federal coal leases.

Although I am not proposing any regulatory action at this time, the purpose of the PEIS is to identify, evaluate, and potentially recommend reforms to the Federal coal program. This review will enable the Department to consider how to modernize the program to allow for the continued development of Federal coal resources while addressing the substantive issues raised by the public, other stakeholders, and the Department's own review of the comments it has received.

While the precise issues to be assessed in the PEIS will be determined through the public scoping process, the PEIS should at a minimum address the following topics:

a. How, When and Where to Lease. The regional leasing program authorized in the 1979 regulations has not worked as envisioned and, instead, BLM has conducted leasing only in response to industry applications. Given concerns about the lack of competition in the lease-by-application system, as well as consideration of environmental goals, the PEIS should examine whether the current regulatory framework should be changed to provide a better mechanism or mechanisms to decide which coal resources should be made available and how the leasing process should work.

As part of this evaluation, the PEIS should explicitly examine the issue of when to lease. Some leasing programs for other Federal resources operate with an established schedule for leasing or consideration of leasing (*e.g.*, BLM holds onshore oil and gas lease sales on a quarterly basis if parcels are available; offshore oil and gas leasing occurs using a schedule established in a five-year plan). The PEIS should examine whether scheduled sales should be used for Federal coal.

The PEIS should also examine where to lease. In other contexts, the Department has identified areas to promote certain kinds of resource development. For example, the BLM's Solar PEIS (Western Solar Plan) amended land use plans across six southwestern states and established preferred locations for solar development. The PEIS should examine whether a similar approach would be useful for coal to minimize potential user conflicts and streamline leasing decisions.

b. Fair Return. The PEIS should address whether the bonus bids, rents, and royalties received under the Federal coal program are successfully securing a fair return to the American public for Federal coal, and, if not, what adjustments could be made to provide such compensation. As part of this analysis, the PEIS should examine whether the decision to lease large amounts of relatively low cost coal artificially drives down pricing in the U.S. market and, if so, how the taxpayer may best be compensated for the reduced royalties due to artificially low

prices. The PEIS should also examine whether the BLM estimates of fair market value for purposes of establishing minimum bids successfully substitute for competition in the bidding process, and if not, how to better estimate fair market value.

c. Climate Impacts. With respect to the climate impacts of the Federal coal program, the PEIS should examine how best to assess the climate impacts of continued Federal coal production and combustion and how to address those impacts in the management of the program to meet both the Nation's energy needs and its climate goals, as well as how best to protect the public lands from climate change impacts.

d. Socio-Economic Considerations. Beyond the issue of fair market value, the PEIS should assess whether the current Federal coal leasing program adequately accounts for externalities related to Federal coal production, including environmental and social impacts. It should more broadly examine how the administration, availability, and pricing of Federal coal affect regional and national economies (including job impacts), and energy markets in general, including the pricing and viability of other coal resources (both domestic and foreign) and other energy sources. The impact of possible program alternatives on the projected fuel mix and cost of electricity in the United States should also be examined.

e. Exports. The PEIS should address whether leasing decisions should consider whether the coal to be produced from a given tract would be for domestic use or export. In consultation with other applicable executive branch offices, the PEIS should examine how to estimate export potential, particularly given potential differences between the estimates of industry and independent economic experts about the prospects for exports in a given circumstance.

f. Energy Needs. Finally, the PEIS should examine the degree to which Federal coal supports, or should support, fulfilling the energy needs of the United States. The evaluation should include an assessment of how the administration, availability, and pricing of Federal coal impacts electricity generation in the United States, particularly in light of other regulatory influences, and what other sources of energy supply (including efficiency) are projected to be available.

Sec. 5 Pause on the Issuance of New Federal Coal Leases for Thermal (Steam) Coal. Lease sales and lease modifications result in lease terms of 20 years and for so long thereafter as coal is produced in commercial quantities. Continuing to conduct lease sales or approve lease modifications during this programmatic review risks locking in for decades the future development of large quantities of coal under current rates and terms that the PEIS may ultimately determine to be less than optimal. This risk is why, during the previous two programmatic reviews, the Department halted most lease sales with limited exceptions for small sales, emergencies and other situations involving potential economic hardship. Considering these factors and given the extensive recoverable reserves of Federal coal currently under lease, I have decided that a similar policy is warranted here. A pause on leasing, with limited exceptions, will allow future leasing decisions to benefit from the recommendations that result from the PEIS while minimizing any economic hardship during that review.

a. Pursuant to my discretionary authority under the Mineral Leasing Act (e.g., 30 U.S.C § 201) and other statutes, and based on the reasons discussed herein, I conclude that further evaluation, additional receipt of public input, and comprehensive consideration of the Federal coal program is warranted, and accordingly, I hereby direct BLM to apply the following limitations on the issuance of Federal coal leases until the completion of the PEIS:

(i) No new applications for thermal (steam) coal leases or lease modifications will be processed, subject to the enumerated exclusions in Section 6 of this Order; and

(ii) For pending applications, no lease sales will be held, leases issued, or modifications approved for thermal (steam) coal, subject to the enumerated exclusions in Section 6 of this Order. At an applicant's request, preparatory work on pending applications may continue (including the preparation of NEPA analyses), but no final decision on whether to hold a lease sale will be made unless one of the exceptions listed in Section 6 of this Order applies.

b. This pause in holding lease sales, issuing coal leases, and approving lease modifications will apply to applications for both surface and underground thermal coal, but it does not apply to metallurgical coal. Metallurgical coal is produced at far fewer mines and in much smaller quantities than thermal coal, and recoverable metallurgical coal reserves may not be sufficient to support current production levels for that resource during the pause. In addition, metallurgical coal is required for key applications, such as steelmaking, for which substitutes are not readily available. Given that the Federal mineral estate includes comparatively very small quantities of metallurgical coal, we expect potential impacts from any leasing activities for metallurgical coal during the review period to be very limited.

c. This pause does not constitute a decision on the merits of any application, but is merely a deferral of the decision to allow the PEIS to be considered in making future final decisions. The pause applies only to the Federal mineral estate administered by the BLM and does not apply to coal leases on tribal or allotted lands, which are regulated by the Bureau of Indian Affairs under a different regulatory structure. The pause applies only to lease sales and modifications. It does not apply to other BLM actions related to the Federal coal program, including the processing and issuance of coal exploration licenses, the issuance of renewal leases when required by the terms of existing leases, and the development and implementation of resource management plans. Similarly, the pause does not apply to any actions undertaken by ONRR, OSMRE, or any other agency, office, or bureau with duties related to the development, production or reclamation of Federal or non-Federal coal resources.

Sec. 6 Exclusions. Nothing in this Order will be deemed to prohibit or restrict:

- a. emergency leasing as defined in 43 C.F.R. § 3425.1-4;
- b. lease modifications, as defined in 43 C.F.R. § 3432.1, that do not exceed 160 acres or the number of acres in the original lease, whichever is less;
- c. lease exchanges as defined in 43 C.F.R. §§ 3435.1, 3436.1, and 3436.2;
- d. the rights of preference right lease applicants based on prospecting permits issued prior to August 4, 1976; and

- e. the sale and issuance of new thermal coal leases by application, 43 C.F.R. Subpart 3425, or the issuance of thermal coal lease modifications, 43 CFR Subpart 3432, under pending applications for which the environmental analysis under NEPA has been completed and a Record of Decision or Decision Record has been issued by the BLM or the applicable Federal surface management agency as of the date of this Order. This exception extends to previously issued Records of Decision or Decision Records that have been (or may be) vacated by judicial decision and are undergoing re-evaluation in accordance with the judicial decision. Before holding any lease sale or issuing any lease under this exception, the BLM must confirm and ensure that the applicable NEPA document for a project is adequate and includes, at a minimum, an analysis of the direct and indirect greenhouse gas emissions resulting from the proposed leasing action.

Sec. 7 Implementation.

- a. The Director of the BLM is responsible for implementation of this Order. This responsibility may be delegated as appropriate.
- b. The Director will expeditiously initiate the NEPA scoping process by inviting Federal, State, and local agencies, Indian tribes, and the public to help identify the environmental issues and reasonable alternatives to be examined in the PEIS. Upon completion of the scoping process, the Director will provide a scoping report to me along with a proposed schedule for the completion of the PEIS.

Sec. 8 Effect of the Order. This Order is intended to provide for a comprehensive review of the Federal coal program and allow for the Department to improve the program going forward. This Order and any resulting report or recommendation are not intended to, and do not, create any right or benefit, substantive or procedural, enforceable at law or equity by a party against the United States, its departments, agencies, instrumentalities or entities, its officers or employees, or any other person. To the extent there is any inconsistency between the provisions of this Order and any Federal laws or regulations, the laws or regulations will control.

Sec. 9. Effective Date. This Order is effective immediately and will remain in effect until its provisions are amended, superseded, or revoked, whichever occurs first.

Secretary of the Interior

Date: **JAN 15 2016**

FOR FURTHER INFORMATION CONTACT: Mr. Cade London, Policy Advisor, International Affairs, U.S. Fish and Wildlife Service, by email at cade.london@fws.gov (preferable method of contact); by U.S. mail at U.S. Fish and Wildlife Service; 5275 Leesburg Pike, MS: IA; Falls Church, VA 22041-3803; by telephone at (703) 358-2584; or by fax at (703) 358-2276.

SUPPLEMENTARY INFORMATION: In accordance with the requirements of the Federal Advisory Committee Act (5 U.S.C. App.), we announce that the Advisory Council on Wildlife Trafficking (Council) will hold a meeting to discuss the implementation of the National Strategy for Combating Wildlife Trafficking, and other Council business as appropriate. The Council's purpose is to provide expertise and support to the Presidential Task Force on Wildlife Trafficking.

You may attend the meeting in person, or you may participate via telephone. At this time, we are inviting submissions of questions and information for consideration during the meeting.

Background

Executive Order 13648 established the Advisory Council on Wildlife Trafficking on August 30, 2013, to advise the Presidential Task Force on Wildlife Trafficking, through the Secretary of the Interior, on national strategies to combat wildlife trafficking, including, but not limited to:

1. Effective support for anti-poaching activities;
2. Coordinating regional law enforcement efforts;
3. Developing and supporting effective legal enforcement mechanisms; and
4. Developing strategies to reduce illicit trade and consumer demand for illegally traded wildlife, including protected species.

The eight-member Council, appointed by the Secretary of the Interior, includes former senior leadership within the U.S. Government, as well as chief executive officers and board members from conservation organizations and the private sector. For more information on the Council and its members, visit <http://www.fws.gov/international/advisory-council-wildlife-trafficking/>.

Meeting Agenda

The Council will consider:

1. Task Force discussions,
2. Administrative topics, and
3. Public comment and response.

The final agenda will be posted on the Internet at <http://www.fws.gov/>

[international/advisory-council-wildlife-trafficking/](http://www.fws.gov/international/advisory-council-wildlife-trafficking/).

Making an Oral Presentation

Members of the public who want to make an oral presentation in person or by telephone at the meeting will be prompted during the public comment section of the meeting to provide their presentation and/or questions. If you want to make an oral presentation in person or by phone, contact Mr. Cade London (**FOR FURTHER INFORMATION CONTACT**) no later than the date given in the **DATES** section.

Registered speakers who want to expand on their oral statements, or those who wanted to speak but could not be accommodated on the agenda, are invited to submit written statements to the Council after the meeting. Such written statements must be received by Mr. London, in writing (preferably via email), no later than April 22, 2016.

Submitting Public Comments

You may submit your questions and information by one of the methods listed in **ADDRESSES**. We request that you send comments by only one of the methods described in **ADDRESSES**.

If you submit information via the Federal eRulemaking Portal (<http://www.regulations.gov>), your entire submission—including any personal identifying information—will be posted on the Web site.

If your submission is made via a hardcopy that includes personal identifying information, you may request at the top of your document that we withhold this information from public review. However, we cannot guarantee that we will be able to do so. We will post all hardcopy submissions at <http://www.regulations.gov>.

Reviewing Public Comments

Comments and materials we receive will be available for public inspection at <http://www.regulations.gov>. Alternatively, you may view them by appointment during normal business hours at 5275 Leesburg Pike, Falls Church, VA 22041-3803. Please contact Mr. London (see **FOR FURTHER INFORMATION CONTACT**).

Obtaining Meeting Minutes

Summary minutes of the meeting will be available on the Council Web site at <http://www.fws.gov/international/advisory-council-wildlife-trafficking/>. Alternatively, you may view them by appointment during normal business hours at 5275 Leesburg Pike, Falls Church, VA 22041-3803. Please contact

Mr. London (see **FOR FURTHER INFORMATION CONTACT**).

Gloria Bell,

Deputy Assistant Director, International Affairs, U.S. Fish and Wildlife Service.

[FR Doc. 2016-07113 Filed 3-29-16; 8:45 am]

BILLING CODE 4333-15-P

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

[16X.LLWO320000.L13200000.PP0000]

Notice of Intent To Prepare a Programmatic Environmental Impact Statement To Review the Federal Coal Program and To Conduct Public Scoping Meetings

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice.

SUMMARY: In compliance with the National Environmental Policy Act of 1969, as amended (NEPA), the Bureau of Land Management (BLM), Washington Office, intends to prepare a Programmatic Environmental Impact Statement (EIS) to review the Federal coal program.

This Notice of Intent begins the process of defining the scope of the Programmatic EIS by providing background on the Federal coal program and identifying the issues that may be addressed in the Programmatic EIS. This Notice informs the public about: Concerns that have been raised about the Federal coal program; issues that are expected to be assessed in the Programmatic EIS; and potential modifications to the Federal coal program suggested by stakeholders during the listening sessions that could be considered in the Programmatic EIS. This Notice of Intent also announces plans to conduct public scoping meetings, invites public participation in the scoping process, and solicits public comments for consideration in establishing the scope and content of the Programmatic EIS.

DATES: The BLM will invite interested agencies, States, American Indian tribes, local governments, industry, organizations and members of the public to submit comments or suggestions to assist in identifying significant issues and in determining the scope of this Programmatic EIS.

The BLM will be holding public scoping meetings to obtain comments on the Programmatic EIS and plans to hold these meetings in the following locations: Casper, WY; Grand Junction, CO; Knoxville, TN; Pittsburgh, PA; Salt

Lake City, UT; and Seattle, WA. The BLM will announce the specific dates and locations of the scoping meetings at least 15 days in advance through local media, newspapers, and the project Web site at: http://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy/details_on_coal_peis.html. In addition, the BLM will consider all written comments received or postmarked during the public comment period on scoping, which will close 30 days after the final public meeting.

ADDRESSES: You may submit written comments by the following methods:

- *Email:* BLM_WO_Coal_Program_PEIS_Comments@blm.gov. This is the preferred method of commenting.
- *Mail, personal, or messenger delivery:* Coal Programmatic EIS Scoping, Bureau of Land Management, 20 M St. SE., Room 2134LM, Washington, DC 20003.

FOR FURTHER INFORMATION CONTACT:

Mitchell Leverette, Chief, Division of Solid Minerals, email: mleveret@blm.gov, telephone: 202-912-7113, or visit the Coal Programmatic EIS Web site at: http://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy/details_on_coal_peis.html.

SUPPLEMENTARY INFORMATION: On January 15, 2016, the Secretary of the Interior issued Order No. 3338 directing the BLM to conduct a broad, programmatic review of the Federal coal program it administers through preparation of a Programmatic EIS under NEPA. 42 U.S.C. 4321 *et seq.* The Order was issued in response to a range of concerns raised about the Federal coal program, including, in particular, concerns about whether American taxpayers are receiving a fair return from the development of these publicly owned resources; concerns about market conditions, which have resulted in dramatic drops in coal demand and production in recent years, with consequences for coal-dependent communities; and concerns about whether the leasing and production of large quantities of coal under the Federal coal program is consistent with the Nation's goals to reduce greenhouse gas emissions to mitigate climate change. In light of these issues, the Programmatic EIS will identify and evaluate potential reforms to the Federal coal program. This review will enable the Department to consider how to modernize the program to allow for the continued development of Federal coal resources, as appropriate, while addressing the substantive issues raised by the public, other stakeholders, and the Department's own review of the comments it has received during recent

listening sessions held last year in Washington, DC; Billings, Montana; Gillette, Wyoming; Denver, Colorado; and Farmington, New Mexico.

Background and Need for Agency Action

A. Overview of Federal Coal Program

Under the Mineral Leasing Act of 1920, as amended, 30 U.S.C. 181 *et seq.*, and the Mineral Leasing Act for Acquired Lands of 1947, as amended, 30 U.S.C. 351 *et seq.*, the BLM is responsible for the leasing of Federal coal and regulation of the development of that coal on approximately 570 million acres of the 700 million acres of mineral estate that is owned by the Federal government. This includes Federal mineral rights on Federal lands and Federal mineral rights located under surface lands with non-Federal ownership. Under the authority of the Mineral Leasing Act, the BLM administers leasing and monitors coal production. Other Departmental bureaus, in particular the Office of Surface Mining Reclamation and Enforcement (OSMRE) and the Office of Natural Resources Revenue (ONRR), also take actions related to coal mining on Federal lands. The OSMRE, and those States that have regulatory primacy under the Surface Mining Control and Reclamation Act of 1977 (SMCRA), permit coal mining and reclamation activities, and monitor reclamation and reclamation bonding actions. The ONRR collects and audits all payments required under the lease, including bonus bids, royalties, and rental payments, and distributes those funds between the Federal Treasury and the States where coal resources are located.

1. Federal Coal Leasing and Production

On average, over the last few years, about 41 percent of the Nation's annual coal production came from Federal land. Federal coal produced from the Powder River Basin in Montana and Wyoming accounts for over 85 percent of all Federal coal production. Federal coal was used to generate an estimated 14 percent of the Nation's electricity in 2015. Coal is also used for other critical processes, including making steel (metallurgical coal).

As of FY2015, the BLM administered 306 coal leases, covering 482,691 acres in 11 States, with an estimated 7.75 billion tons of recoverable Federal coal. Over the last decade (2006–2015), the BLM sold 32 coal leases and managed leases that produced approximately 4.3 billion tons of coal and resulted in \$9.55

billion in revenue collections by the United States.

The U.S. Energy Information Administration (EIA) estimates total U.S. coal production in 2015 was about 895 million short tons (MMst), 10 percent lower than in 2014 and the lowest level since 1986.¹ EIA projects that coal production will fall by another 12 percent in 2016, then rise by 2 percent in 2017.² The approximately 7.75 billion tons of recoverable reserves of Federal coal currently under lease is estimated to be sufficient to continue production at current levels for 20 years, averaged across all leases, and these reserves would be sufficient to cover production, on average, for even longer if coal production declines, as is projected.

EIA estimates that U.S. coal exports decreased 23 MMst (24 percent) from 2014 levels to 74 MMst in 2015, and EIA expects the current global coal market trends to continue.³ EIA forecasts that coal exports will decline by an additional 10 MMst (13 percent) in 2016 and by 1 MMst (2 percent) in 2017.⁴

In terms of employment and revenues to the States, coal mining employed almost 90,000 people in 2012. More recently, there were an estimated 74,000 direct jobs in coal mining as of May 2014, including roughly 6,500 in Wyoming.⁵ Revenues from Federal coal provided Wyoming approximately \$556 million in FY2014. Other States received the following approximate amounts: Utah—\$44 million; Montana—\$43 million; Colorado—\$36 million; and New Mexico—\$16 million.

2. Federal Coal Program

The current BLM coal leasing program includes land use planning, processing applications (*e.g.*, for exploration licenses and lease sales), estimating the value of proposed leases, holding lease

⁵ Bureau of Labor Statistics, *May 2014 National Industry-Specific Occupational Employment and Wage Estimates: NAICS 212100—Coal Mining* (http://www.bls.gov/oes/current/naics4_212100.htm); Wyoming Department of Workforce Services, *Wyoming Labor Market Information* (<http://doe.state.wy.us/lmi/CES/nawy14.htm>).

sales, and post-leasing actions (e.g., production verification, lease and production inspection and enforcement, royalty reductions, and bond review).

The Federal Government receives revenue from coal leasing in three ways: (1) A bonus that is paid at the time BLM issues a lease; (2) Rental fees; and (3) Production royalties. The royalty rates are set by regulation at a fixed 8 percent for underground mines and not less than 12.5 percent for surface mines. All receipts from a lease are shared with the State in which the lease is located (51 percent to the Federal Government and 49 percent to the State).

The BLM's planning process for Resource Management Plans, supported by environmental analysis under NEPA, identifies areas that are potentially available to be considered for coal leasing. The planning process considers, among other things, the impacts of a "reasonably foreseeable development scenario," but it does not directly authorize any coal leasing or determine which coal will actually be leased.

The Federal Coal Leasing Amendments Act of 1976 (FCLAA), which amended Section 2 of the Mineral Leasing Act of 1920, requires that, with limited exceptions, Federal lands available for coal leasing be sold by competitive bid, with the BLM receiving "fair market value" for the lease. While multiple bids are not required, all successful bids must equal or exceed the estimated pre-sale fair market value for the lease, as calculated by the BLM. Competitive leasing is not required for: (1) Preference right lease applications for owners of pre-FCLAA prospecting permits; and (2) Modifications of existing leases, where Congress has authorized the Secretary to allow up to 960 acres (increased from 160 acres by the Energy Policy Act of 2005) of contiguous lands for noncompetitive leasing by modifying an existing lease.

The BLM issued coal leasing regulations in 1979 that provided for two separate competitive coal leasing processes: (1) Regional leasing, where the BLM selects tracts within a region for competitive sale; and (2) Leasing by application, where an industry applicant nominates a particular tract of coal for competitive sale.

Regional coal leasing requires the BLM to select potential coal leasing tracts based on land use planning, expected coal demand, and potential environmental and economic impacts.⁶ This process includes use of a Federal/State advisory board known as a

Regional Coal Team,⁷ to provide input on leasing decisions. The regional leasing system has not been used since 1990, and currently all BLM coal leasing is done by application.⁸ Leasing by application begins with the submission of an application to lease a tract of coal identified by the applicant.⁹ The BLM reviews the application for completeness, to ensure that it conforms to existing land use plans, and to ensure that it contains sufficient geologic data to determine the fair market value of the coal. The agency then prepares an analysis under NEPA (either an Environmental Assessment or an EIS) and seeks public comment on the proposed lease sale. Through this process, the BLM evaluates alternative tract configurations to maximize competitiveness and value, and to avoid bypassing Federal coal. The BLM also consults with other appropriate Federal, State, and tribal government agencies, and the BLM determines whether the surface owner consents to leasing in situations where the surface is not administered by the BLM. Preparations for the actual lease sale begin with the BLM formulating, after obtaining public comment, a pre-sale estimate of the fair market value of the coal. This estimate is kept confidential and is used to evaluate the bids for the lease "bonus" received during the sale. Sealed bids are accepted prior to the date of the sale and are publicly announced during the sale. The winning bid is the highest bid that meets or exceeds the coal tract's presale estimated fair market value, assuming that the bidder meets all eligibility requirements and has paid the appropriate fees and payments.

There are two separate bonding requirements for Federal coal leases. The BLM requires a bond adequate to ensure compliance with the terms and conditions of the lease, which must cover a portion of potential liabilities associated with the bonus bid, rental fees, and royalties. In addition, under SMCRA, the OSMRE or the State with regulatory primacy requires sufficient bonding to cover anticipated reclamation costs.

⁷ The BLM regulations require a Regional Coal Team to be established for each coal production region, comprised of representatives from the BLM and the Governors of each State in the region. The Regional Coal Teams are to guide the coal planning process for each coal production region, serve as the forum for BLM and State consultation, and make recommendations on coal leasing levels. 43 CFR 3400.4.

⁸ While the Powder River Basin (PRB) coal production region was decertified in 1992, the PRB regional coal team is still in place and meets periodically to review regional activity and make recommendations on coal leasing in the region.

⁹ See 43 CFR subpart 3425.

A Federal coal lease has an initial term of 20 years, but it may be terminated after 10 years if the coal resources are not diligently developed. 30 U.S.C. 207. Existing leases that have met their diligence requirements may be renewed for additional 10 year terms following the initial 20 year term.

3. Previous Comprehensive Reviews

The Department has previously conducted two separate, comprehensive reviews of the Federal coal program. In the late 1960s, there were serious concerns about speculation in the coal leasing program. A BLM study discovered a sharp increase in the total Federal acreage under lease and a consistent decline in coal production. In response, the Department undertook the development of a planning system to determine the size, timing, and location of future coal leases, and the preparation of a Programmatic EIS for the entire Federal coal leasing program. Beginning in February 1973, the short-term actions included a complete moratorium on the issuance of new coal prospecting permits, and a moratorium with limited exceptions on the issuance of new Federal coal leases. New leases were issued only to maintain existing mines or to supply reserves for production in the near future, where "near future" meant that development and production were to commence within 3 and 5 years, respectively. The moratorium was scaled back over time, but was not completely lifted until 1981, after the Programmatic EIS had been completed, a new leasing system had been adopted through regulation, and litigation was resolved.

In 1982, concerns about the Federal coal program arose again, this time related to allegations that the Government did not receive fair market value from a large lease sale in the Powder River Basin under the new procedures adopted as part of the programmatic review in the 1970s. Among other reports on the issue, in May 1983, the Government Accountability Office (GAO) issued a report concluding that the Department had received roughly \$100 million less than it should have for the leases sold. In response, in July 1983, Congress directed the Secretary to appoint members to a commission, known as the Linowes Commission, to investigate fair market value policies for Federal coal leasing. Congress also, in the 1984 Appropriations Act, directed the Office of Technology Assessment (OTA) to study whether the Department's coal leasing program was compatible with the nationally mandated environmental protection goals.

⁶ 43 CFR part 3420.

As part of the 1984 Appropriations Bill, Congress imposed a moratorium on the sale or lease of coal on public lands, subject to certain exceptions, starting in 1983 and ending 90 days after publication of the Linowes Commission's report. The Linowes Commission published the *Report of the Commission on Fair Market Value Policy for Federal Coal Leasing* in February 1984. The OTA report, *Environmental Protection in the Federal Coal Leasing Program*, was released in May 1984. The principal thrust of these reports was that the Department should: (1) Temper its pace of coal leasing; (2) Improve and better document its procedures for receiving fair market value; and (3) Take care to balance competing resource uses in making lease decisions.

Interior Secretary William P. Clark extended the suspension of coal leasing (with exceptions for emergency leasing and processing preference right lease applications, among other things), while the Department completed its comprehensive review of the program. This review included proposed modifications to be made by the Department in response to the Linowes Commission and OTA reports. Secretary Clark announced on August 30, 1984, that the Department would prepare an EIS supplement to the 1979 Programmatic EIS for the Federal coal management program. The Department issued the Record of Decision for the Programmatic EIS supplement in January 1986, in the form of a Secretarial Issue Document. That document recommended continuation of the leasing program with modifications. In conjunction with those modifications, Interior Secretary Donald Hodel lifted the coal leasing moratorium in 1987.

B. Need for Comprehensive Review of Federal Coal Program

On March 17, 2015, Secretary Jewell called for "an honest and open conversation about modernizing the Federal coal program." As described above, the last time the Federal coal program underwent comprehensive review was in the mid-1980s, and market conditions, infrastructure development, scientific understanding, and national priorities have changed considerably since that time. The Secretary's call also responded to continued concerns from numerous stakeholders about the Federal coal program, including concerns raised by the GAO,¹⁰ the Department's Office of

Inspector General (OIG),¹¹ members of Congress, interested stakeholders, and the public. The concerns raised by the GAO and OIG centered on whether taxpayers are receiving fair market value from the sale of coal. Others raised concerns that the current Federal leasing structure lacks transparency and competition and is therefore not ensuring that the American taxpayer receives a fair return from Federal coal resources, while also raising questions regarding current market conditions for the coal industry generally and related implications for Federal resources. Stakeholders also questioned whether the leasing program results in over-supply of a commodity that has significant environmental and health impacts, including impacts on global climate change.

In response to the Secretary's call for a conversation to address these concerns, the BLM held 5 listening sessions regarding the Federal coal program in the summer of 2015. Sessions were held in Washington, DC; Billings, Montana; Gillette, Wyoming; Denver, Colorado; and Farmington, New Mexico. The Department heard from 289 individuals during the sessions and received more than 92,000 written comments before the comment period closed on September 17, 2015. The oral and written comments reflected several recurring themes:

- Concern about global climate change and the impact of coal production and use.
- Concern about the loss of jobs and local revenues if coal production is reduced.
- Support for increased transparency and public participation in leasing and royalty decisions and concern that the structure of the leasing program does not provide for adequate competition or a fair return to the taxpayer for the use of Federal resources.
- Support for increasing coal royalty rates because: (1) The royalty rate should account for the environmental costs of coal production; (2) The royalty rate should match the rate for offshore Federal leases; and (3) Taxpayers are not receiving a fair return.
- Support for maintaining or lowering coal royalty rates because: (1) The coal industry already pays more than its fair share and existing Federal rates are too high given current market conditions; (2) Raising rates will lower production and revenues; and (3) Raising rates will cost jobs and harm communities.
- Support for streamlining the current leasing process, so that the Federal coal program is administered in a way that better promotes economic stability and jobs, especially in coal communities which are

Exports, and Provide More Public Information, GAO 14-140 (Dec. 2013).

¹¹ OIG, *Coal Management Program*, U.S. Department of the Interior, Report No.: CR-EV-BLM-0001-2012 (June 2013).

already suffering from depressed economic conditions.

Of these concerns, three aspects of the current Federal coal program received the most attention. First, numerous stakeholders are concerned that American taxpayers are not receiving a fair return on public coal resources. Second, many stakeholders are concerned that the Federal coal program conflicts with the Administration's climate policy and our national climate goals, making it more difficult for us to achieve those goals. Third, there are numerous and varying concerns about the structure of the Federal coal program in light of current market conditions, including how implementation of the Federal leasing program affects current and future coal markets, coal-dependent communities and companies, and the reclamation of mined lands. These three main concerns are addressed in more detail below.

1. Concerns About Fair Return

In 2013, both GAO and OIG issued reports expressing concerns about the Federal coal program, particularly with respect to the leasing process and fair market value. In response, in 2014, the BLM developed new protocols and issued policy guidance, a manual, and a handbook to implement these changes. Nevertheless, stakeholders have expressed concerns that the BLM's response, while helpful, was insufficient to rectify fundamental weaknesses in the program with respect to fair return.¹²

These concerns arise, at least in part, because there is currently very little competition for Federal coal leases. About 90 percent of lease sales receive bids from only one bidder, typically the operator of a mine adjacent to the new lease, given the investment required to

¹² See, e.g., Taxpayers for Common Sense, *Federal Coal Leasing: Fair Market Value and a Fair Return for the American Taxpayer* (Sept. 2013). (http://www.taxpayer.net/images/uploads/downloads/TCS_Federal_Coal_Leasing_Report_-_Final_-_Updated_10.4.13.pdf); Center for American Progress, *Modernizing the Federal Coal Program* (Dec. 2014) (<https://cdn.americanprogress.org/wp-content/uploads/2014/12/FederalCoal.pdf>); Headwaters Economics, *An Assessment of U.S. Federal Coal Royalties* (Jan. 2015) (<http://headwaterseconomics.org/wphw/wp-content/uploads/Report-Coal-Royalty-Valuation.pdf>); Center for American Progress, *Cutting Subsidies and Closing Loopholes in the U.S. Department of the Interior's Coal Program* (Jan. 6, 2015) (<https://cdn.americanprogress.org/wp-content/uploads/2015/01/CoalSubs-brief2.pdf>); Institute for Policy Integrity, *Harmonizing Preservation and Production* (June 2015) (<http://policyintegrity.org/publications/detail/harmonizing-preservation-and-production/>); Institute for Policy Integrity, *Illuminating the Hidden Costs of Coal* (Dec. 2015) (<http://policyintegrity.org/publications/detail/hidden-costs-of-coal/>).

¹⁰ GAO, *Coal Leasing: BLM Could Enhance Appraisal Process, More Explicitly Consider Coal*

open a new mine. While the BLM conducts a peer-reviewed analysis to estimate a pre-sale fair market value of the coal and will not sell a lease unless the bid meets or exceeds that value, commenters have questioned whether an accurate fair market value can be identified in the absence of a truly competitive marketplace.

Commenters also raised concerns about the royalty rates set in Federal leases, which are set by regulation at a fixed 8 percent for underground mines and not less than 12.5 percent for surface mines. Many stakeholders believe that these rates do not adequately compensate the public for the removal of the coal and the externalities associated with its use. Still others have suggested that the large volumes and relatively low costs of Federal coal, which currently represents approximately 41 percent of total domestic production, have the effect of artificially lowering market prices for coal, further reducing the amount of royalties received.

Stakeholders also criticize the Federal coal program for obtaining even lower returns through certain types of leasing actions, such as lease modifications, and through royalty rate reductions, which may result in royalty rates as low as 2 percent. In addition, stakeholders have noted that the \$100 acre minimum bid requirement established in the regulations is outdated, and although the minimum bid does not apply frequently, given fair market value requirements, there are situations in which it sets the floor for the bid price.

Some stakeholders further suggest that a fair return to the taxpayer should also include compensation for externalities such as the environmental damage (or lost environmental benefits) from the removal and combustion of the coal.

2. Concerns About Market Conditions

Stakeholders raised a variety of concerns about the implications of current and future coal market conditions. As reported by EIA, between 2008 and 2013, U.S. coal production fell by 16 percent in total, as declining natural gas prices and other factors made coal less competitive as a fuel for generating electricity.¹³ In 2015, U.S. coal production was roughly 891 MMst, 11 percent lower than 2014, and the lowest level since 1986.¹⁴ World-wide

demand for coal appears to be softening as well, with EIA estimating a 23 percent decline in total U.S. coal exports in 2015 from the previous year.¹⁵ As a result of these market trends, a number of mines in the U.S. have idled production, companies have asked the BLM to hold off on processing certain lease tracts for sale, several major coal companies have entered Chapter 11 bankruptcy, many coal miners have been laid off, and coal-dependent communities have suffered.¹⁶ The EIA and other projections of future coal production anticipate continuing declines.

Stakeholders have urged the BLM to modify the Federal coal program to take these significant market changes into account, although the recommended changes vary. Some suggest that the program should attempt to improve the economic viability of the coal industry by reducing royalties and streamlining the leasing and permitting processes. Others raise concerns that the program has contributed to low coal prices by incentivizing over-production through non-competitive sales that oversupply the market.

Some have focused on how current market conditions threaten reclamation of lands disturbed by coal mining and may leave State and Federal governments with billions of dollars of unfunded reclamation liabilities. Specifically, many coal companies “self-bond” to meet reclamation bonding requirements, and some stakeholders have asserted that these companies may no longer have the funds to support reclamation activities, and/or they may attempt to shed reclamation obligations in bankruptcy.¹⁷ OSMRE currently estimates that there is over \$3.6 billion in outstanding self-bonded reclamation liability in the United States.

Stakeholders also expressed a number of views regarding export of Federal coal. Some see export markets as a possible way to maintain or expand Federal coal production, while others view the production of coal for export

as a less valuable activity than coal production for domestic use. A number of stakeholders expressed concern that exports, or the potential for exports, were not adequately considered as part of the leasing process.

3. Concerns About Climate Change

The third broad category of concerns about the Federal coal program relates to its impacts on climate change. The United States has pledged under the United Nations Framework Convention on Climate Change to reduce its greenhouse gas (GHG) emissions by 26–28 percent below 2005 levels by 2025. The Obama Administration has made, and is continuing to make, unprecedented efforts to reduce U.S. GHG emissions in line with this target through measures such as vehicle efficiency standards, the Clean Power Plan, energy efficiency standards, requirements to reduce methane reductions from oil and gas production, and many other measures. Numerous scientific studies indicate that reducing GHG emissions from coal use worldwide is critical to addressing climate change.¹⁸

As noted above, the Federal coal program is a significant component of overall U.S. coal production. In recent years, Federal coal has comprised about 41 percent of the coal produced in the U.S.¹⁹ When combusted, this Federal coal contributes roughly 10 percent of total U.S. GHG emissions.²⁰

Many stakeholders highlighted the tension between producing very large quantities of Federal coal while pursuing policies to reduce U.S. GHG emissions substantially, including from coal combustion. They also stated that the current leasing system does not provide a way to systematically consider the climate impacts and costs to the public of Federal coal development, either as a whole, or in the context of particular projects. In addition, they raise concerns that exporting Federal coal, and the associated GHG emissions, undermines

¹⁸ See, e.g., McGlade and Ekins, The geographical distribution of fossil fuels unused when limiting global warming to 2 °C, *Nature*, 517, 187–190 (Jan. 8, 2015) (finding that globally over 80% of current coal reserves should remain unused from 2010 to 2050 to meet the target of 2 degrees C).

our nation's efforts to encourage all countries to contribute to climate change mitigation efforts.

C. Secretarial Order

On January 15, 2016, the Secretary of the Interior issued Order No. 3338 directing the BLM to conduct a broad, programmatic review of the Federal coal program it administers through the preparation of a Programmatic EIS under NEPA. The Order stated:

Given the broad range of issues raised over the course of the past year (and beyond) and the lack of any recent analysis of the Federal coal program as a whole, a more comprehensive, programmatic review is in order, building on the BLM's public listening sessions

* * * * *

[T]he purpose of the P[rogrammatic] EIS is to identify, evaluate, and potentially recommend reforms to the Federal coal program. This review will enable the Department to consider how to modernize the program to allow for the continued development of Federal coal resources while addressing the substantive issues raised by the public, other stakeholders, and the Department's own review of the comments it has received.

The Order does not apply to the coal program on Indian lands, as that program is distinct from the BLM's program and is subject to the unique trust relationship between the United States and federally recognized Indian tribes and government-to-government consultation requirements. The Order also does not apply to any action of OSMRE or ONRR.

D. Scoping Discussion

The Programmatic EIS will identify and review potential modifications to the Federal coal program to address the concerns discussed above and others that may be identified during the scoping process, and potentially, identify a preferred set of actions. Such modifications could include changes to guidance, regulations, and/or land use plans. The process of developing the Programmatic EIS will be used to identify and develop potential changes to the program and evaluate their projected effects on the quality of the human environment. In addition, the Programmatic EIS will consider, as an alternative, a continuation of the current Federal coal program without any modifications, as required by NEPA. The scoping process will refine the specific issues to be addressed in the Programmatic EIS and the potential modifications to be evaluated. Cooperating agencies may include any

Federal, State, or local agency or tribal government with jurisdiction or special expertise in matters within the scope of the Programmatic EIS.

1. Issues To Be Addressed

The full set of issues to be assessed in the Programmatic EIS will be determined through the public scoping process, but it is expected to include the following topics. The Order identified most of these, but the following list has been expanded to include additional topics and details raised through the listening sessions.

a. *How, When, and Where to Lease.*

The regional leasing program authorized in the 1979 regulations has not worked as envisioned and, instead, the BLM has conducted leasing only in response to industry applications. Given concerns about the lack of competition in the lease-by-application system, as well as consideration of environmental goals, the Programmatic EIS will examine whether the current regulatory framework should be changed to provide a better mechanism or mechanisms to decide which coal resources should be made available and how the leasing process should work.

As part of this evaluation, the Programmatic EIS will examine the issue of when to lease. Some leasing programs for other Federal resources operate with an established schedule for leasing or consideration of leasing (*e.g.*, BLM holds onshore oil and gas lease sales on a quarterly basis if parcels are available; offshore oil and gas leasing occurs using a schedule established in a five-year plan). The Programmatic EIS will examine whether scheduled sales should be used for Federal coal. In addition, the Programmatic EIS will look at the factors that should be considered in decisions about the timing of leasing. For example, it will evaluate whether market conditions should affect the timing of lease sales, such that sales would occur when coal values are higher rather than during periods of market downturns, when revenues from lease sales would be lower.

The Programmatic EIS will also examine where to lease and where not to lease, consistent with taking a landscape level view of this question. The Federal Land Policy and Management Act requires the BLM to develop land use plans, also known as Resource Management Plans to guide the BLM's management of public lands. The BLM uses this planning process to identify and address, at a broad scale, potential conflicts over and impacts of possible resource uses. The Programmatic EIS will consider whether

the BLM's unsuitability screening criteria adequately address the questions of where and/or where not to lease for coal production, as well as other potential factors that could be applied during the planning process to provide guidance on the most appropriate locations for coal leasing. This question is particularly timely in light of the BLM's recent proposal to update the current planning regulations ("Planning 2.0").²¹ The proposed regulatory changes highlight, in particular, opportunities for early public involvement in the planning process and landscape level planning efforts that may cross traditional administrative boundaries, both of which are relevant for planning related to the coal program.

b. *Fair Return.* The Programmatic EIS will address whether the bonus bids, rents, and royalties received under the Federal coal program are successfully securing a fair return to the American public for Federal coal, and, if not, what adjustments could be made to provide such compensation. As part of this analysis, the Programmatic EIS will examine how each of these components of fair return should be calculated, including whether (and if so, what) externalities should be considered as part of the fair return calculation.

c. *Climate Impacts.* With respect to the climate impacts of the Federal coal program, the Programmatic EIS will examine how best to measure and assess the climate impacts of continued Federal coal production, transportation, and combustion. This will include evaluation of potential substitution effects from any changes in Federal coal production, and consideration of how best to ensure no unnecessary and undue degradation of public lands from climate change impacts. It will also consider whether and how to mitigate, account for, or otherwise address those impacts through the structure and management of the coal program, including, as appropriate, land use planning, adjustments to the scale and pace of leasing, adjustments to royalties or other means of internalizing externalities, mitigation through greenhouse gas reductions elsewhere, information disclosure, and other approaches. The Programmatic EIS will examine the climate impacts of the coal program in the context of the Nation's climate objectives, as well as the Nation's energy and security needs.

d. *Other Impacts.* The Federal coal program has other potential impacts on public health and the environment,

²¹ Dept. of Interior, Bureau of Land Management, Resource Management Planning, Proposed Rule, 81FR 9674 (Feb. 25, 2016).

beyond climate impacts, that will also be assessed in the Programmatic EIS. These include the effects of coal production on: The quantity and quality of water resources, including aquifer drawdown and impacts on streams and alluvial valley floors; air quality and the associated effects on health and visibility; wildlife, including endangered species; and other land uses such as grazing and recreation. These impacts are commonly addressed through mitigation requirements. Recent mitigation directives focus on developing a comprehensive, clear, and consistent approach for avoidance and minimization of, and compensatory mitigation for, the impacts of agency activities and the projects agencies approve.²² The Programmatic EIS will evaluate the BLM's general approach to mitigation for these impacts from coal production, and specifically, whether impacts from mining and combusting Federal coal are adequately mitigated across the Federal coal program, including the timing and certainty of mitigation, and whether standard mitigation at the programmatic level should be required, in addition to on a project-by-project basis.

e. Socio-Economic Considerations. Beyond the issue of fair market value, the Programmatic EIS will assess whether the current Federal coal leasing program adequately accounts for externalities related to Federal coal production, including environmental and social impacts. It will more broadly examine how the administration, availability, and pricing of Federal coal affect State, regional, and national economies (including job impacts), and energy markets in general, including the pricing and viability of other coal resources (both domestic and foreign) and other energy sources. The impact of possible program alternatives on the projected fuel mix and cost of electricity in the United States will also be examined.

f. Exports. The Programmatic EIS will address whether and, if so, how leasing decisions should consider actual and/or

projected exports of domestic coal from any given tract and potential mechanisms that could be used to appropriately evaluate export potential.

g. Energy Needs. Finally, the Programmatic EIS will examine how Federal coal supports fulfilling the energy needs of the United States. The evaluation will include an assessment of how the administration, availability, and pricing of Federal coal impacts electricity generation in the United States, particularly in light of other regulatory influences, and what other sources of energy supply (including efficiency) are projected to be available.

2. Potential Modifications to the Federal Coal Program To Be Considered

The BLM is considering various approaches for reforming the Federal coal program to address some or all of the identified issues above, including providing a fair return to taxpayers and providing appropriate consideration of the impacts the program has on the environment. These approaches may be considered separately or in any combination.

To date, stakeholders have made suggestions that range from maintaining the status quo to undertaking sweeping changes. During the listening sessions, commenters suggested a variety of modifications that could be made to the Federal coal program to better address concerns about fair return to taxpayers, market conditions, and effects on climate change, among others. Some of these suggestions were sufficiently specific to constitute potential approaches that could be evaluated in the Programmatic EIS. These proposals are summarized below.

The BLM requests comment on whether the Programmatic EIS should further evaluate some or all of these specific approaches, or some variation on them. The BLM also welcomes suggestions for other potential approaches that should be evaluated in the Programmatic EIS, including approaches that may be contrary to those articulated below, such as reforming the leasing process to promote coal development through steps that might accelerate leasing and reduce delays and costs. As previously noted, the Programmatic EIS will also consider a “no action alternative”—the continuation of the program without any modifications—as required by NEPA. We encourage commenters to be as specific as possible in identifying the types of changes to the program that the Programmatic EIS should evaluate, including changes to regulations, guidance, and management practices.

To address concerns about fair returns to taxpayers, the BLM is considering evaluating the following approaches:

- Raise the royalty rate or adjust the royalty terms of new leases, such as:
 - Raise the royalty rate to 18.75 percent, consistent with the royalty rate for Federal offshore oil and gas;
 - Raise the royalty rate to a level that would provide parity on an energy content (Btu) basis with the royalties currently collected for Federal onshore natural gas, a common substitute fuel;
 - Raise the royalty rate to the point that would maximize revenues to the taxpayer, taking into consideration any decrease in demand that may result from the higher royalty rate; or
 - Identify and require an “adder” to be paid to reflect the cost of the harm to the public from negative externalities from coal development;
 - Limit the use of royalty rate reductions;
 - Change the methodology for determining fair market value when establishing the minimum bid or valuing lease modifications, such as:
 - Use the market price of non-Federal coal in the region or nation-wide;
 - Include the option value of leasing the coal resource at a given point in time;
 - Include the social cost of mining (*i.e.*, the cost to taxpayers of mining imposed by fixed cost non-internalized externalities, such as loss of recreational or other values, which do not vary by quantity produced);
 - Explicitly include export value in establishing fair market value;
 - Replace the lease by application approach with an open process of setting (after public comment and expert advice) minimal acceptable bid levels for tracts; or
 - Update the minimum bid established by regulation to account for inflation, and/or establish state-specific minimum bids;
 - Raise rental rates to adjust for inflation and/or incorporate lost value of other uses of the land and anticipated externalities of exploratory activities;
 - Do not lease to companies that have more than 10 years of recoverable reserves coal at the time of lease application; and
 - Evaluate whether there is an over-supply of Federal coal that is undercutting market prices for coal in the United States and thereby leading to lower royalty revenue.
- The BLM received the following industry proposals concerned with promoting coal production that are also under consideration:
- Lower royalty rates, including as a means of increasing overall government take;

²² Secretary of the Interior, Secretarial Order 3330 (Oct. 31, 2013) (establishing a Department-wide mitigation strategy) (<https://www.doi.gov/sites/doi.gov/files/migrated/news/upload/Secretarial-Order-Mitigation.pdf>); President Obama, Presidential Memorandum: Mitigating Impacts on Natural Resources from Development and Encouraging Related Private Investment (Nov. 3, 2015) (<https://www.whitehouse.gov/the-press-office/2015/11/03/mitigating-impacts-natural-resources-development-and-encouraging-related>). Consistent with these directives, the BLM is currently working on a mitigation policy that will bring consistency to the consideration and application of avoidance, minimization, and compensatory actions or development activities and projects impacting public lands and resources.

- Broaden the applicability of royalty rate reductions;
- Reform the leasing process to accelerate leasing and reduce delays and costs;
 - Base bonus bids on the amount of recoverable coal, not coal reserves;
 - Convert revenue streams to pay-as-you go, instead of an upfront payment of bonus bids over five years; and
 - Reestablish the Royalty Policy Committee to guide changes to royalties.

To address concerns about climate impacts and/or other public health and environmental harms, the BLM is considering evaluating the following approaches:

- Change the methodology for determining which, or how much, Federal coal and/or acreage is made available for leasing, such as:
 - Establish a “budget,” or other quantity-based schedule, for the amount of Federal coal and/or acreage to be leased over a given period, with the budget set on a declining schedule consistent with the United States’ climate goals and commitments and market demand;
 - Re-establish an updated version of the regional planning and leasing process, using land use planning and environmental evaluation to decide whether an area should be leased; or
 - Develop a landscape-level approach to identify geographic areas for potential leasing to identify and address potential conflicts
 - Raise royalty rates or require an “adder” to be paid to reflect the cost of the harm to the public from negative externalities from coal development (could include production-related externalities, transportation-related externalities, externalities from use of coal, and/or costs of infrastructure demand, such as water and power), such as:
 - Incorporating the social cost of carbon;
 - Incorporating the social cost of methane; or
 - Reflecting other externalities;
 - Require climate and/or other public health and environmental harms to be mitigated; and
 - Prohibit or otherwise limit leasing to entities that are not meeting their environmental responsibilities, such as:
 - Entities listed in the Office of Surface Mining Reclamation and Enforcement Applicator Violator System; or
 - Entities that have not met their reclamation or bonding (including bond release) requirements.

E. Scoping Process

The Federal coal program Programmatic EIS process will provide

opportunities for formal public participation through commenting during public scoping and on the draft Programmatic EIS, when that is published. The BLM aims to complete the Coal Programmatic EIS over roughly 3 years. The process will include public and agency scoping, including public scoping meetings, collection of public comments during the scoping period, issuance of a summary of substantive comments received during the scoping period, as well as issuance of a scoping report at the end of the scoping process; coordination and consultation with Federal, State, tribal and local governments; publication of a draft Programmatic EIS; public review of and comments on the draft Programmatic EIS; and publication of a final Programmatic EIS, which will include the BLM’s responses to substantive comments received on the draft Programmatic EIS. The Programmatic EIS process is intended to involve all interested agencies (Federal, State, county, and local), Native American tribes, public interest groups, businesses, and members of the public.

At this time, interested parties are invited to participate in the scoping process to assist the BLM in identifying and refining the issues and policy proposals to be analyzed in depth and in eliminating from detailed study those policy proposals and issues that are not feasible or pertinent. Participation in the scoping process may take the form of attendance at public scoping meetings, speaking at public scoping meetings, and/or submitting written comments.

In addition to taking comment on the specific approaches discussed above, as well as welcoming suggestions for other potential approaches that should be evaluated in the Programmatic EIS, BLM is soliciting input on the following:

1. Potential new leasing models, or potential reforms to the previous or existing leasing models of regional leasing and lease by application;
2. Other approaches to increase competition in the leasing process;
3. Data or analyses that justify a specific change to the royalty rate;
4. Potential approaches to improve the pre-sale estimate of fair market value;
5. Whether, and how, to account in the leasing process for the extent to which reclamation responsibilities have been met;
6. Potential approaches to design a ‘budget’ for the amount of Federal coal and/or acreage to be leased over a given period; and
7. How to account for export potential in the leasing process.

Public scoping meetings will be held as indicated above under the **DATES** section. These scoping meetings will be

informal. The presiding officer will establish only those procedures needed to ensure that everyone who wishes to speak has a chance to do so, to the extent practicable, and that the agency representatives understand all issues and comments. Persons wishing to speak on behalf of an organization should identify that organization in their request to speak. Should any speaker wish to provide for the record further information that cannot be presented within the designated time, such information may be submitted in writing or electronically by the date listed in the **DATES** section to the addresses listed in the **ADDRESSES** section.

In submitting written comments, individuals should be aware that the entire comment—including personal identifying information (including address, phone number, and email address)—may be made publicly available at any time. While the commenter can request in the comment that the commenter’s personal identifying information be withheld from public review, this cannot be guaranteed. All comments from organizations or businesses, and from individuals identifying themselves as representatives or officials of organizations or businesses, will be available for public inspection in their entirety. If you would like to receive a copy of the draft Programmatic EIS and other project materials, you are encouraged to make this request through the project Web site (http://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy/details_on_coal_peis.html), or you may contact Mitchell Leverette as provided in the **ADDRESSES** section of this notice.

Pursuant to 36 CFR 800.2(d)(3), the BLM will use the NEPA public participation requirements to satisfy the public involvement requirements under Section 106 of the National Historic Preservation Act (NHPA), 16 U.S.C. 470(f). The BLM will consult with Indian tribes on a government-to-government basis in accordance with Executive Order 13175 and other policies. Tribal concerns, including impacts on Indian trust assets and potential impacts to cultural resources, will be given due consideration. Federal, State, and local agencies, along with tribes and other stakeholders that may be interested in or affected by the Federal coal program, are invited to participate in the scoping process and, if eligible, may request or be requested by the BLM to participate in the development of the environmental analysis as a cooperating agency.

After gathering public comments on issues and policy proposals that should be addressed in the Programmatic EIS, the BLM will identify the issues and policy proposals to be addressed in the Programmatic EIS and the issues and proposals determined to be beyond the scope of the Programmatic EIS. Following closure of the scoping period, the BLM will prepare a scoping summary report and will make the report available to the public. The report will be posted on the project Web site (http://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy/details_on_coal_peis.html), or may be requested from Mitchell Leverette, as provided in the **ADDRESSES** section of this notice.

Authority: The BLM will prepare the Programmatic EIS in accordance with, but not limited to, the National Environmental Policy Act, 42 U.S.C. 4321 *et seq.*; the Council on Environmental Quality regulations (CEQ), 40 CFR parts 1500–1508; the U.S. Department of the Interior regulations implementing NEPA, 43 CFR part 46; and the Federal Land Policy and Management Act of 1976 (FLPMA), 43 U.S.C. 1701 *et seq.*

This notice is published in accordance with section 40 CFR 1501.7 of the CEQ regulations and 43 CFR 46.235 of the DOI regulations implementing the NEPA.

Neil Kornze,

*Director, Bureau of Land Management,
Department of the Interior.*

[FR Doc. 2016-07138 Filed 3-29-16; 8:45 am]

BILLING CODE 4310-84-P

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

[LLWO2200000.L10200000.PK0000.
00000000; Control No. 1004-0019]

Renewal of Approved Information Collection

AGENCY: Bureau of Land Management, Interior.

ACTION: 60-Day notice and request for comments.

SUMMARY: In compliance with the Paperwork Reduction Act, the Bureau of Land Management (BLM) invites public comments on, and plans to request approval to continue, the collection of information from individuals, households, farms, and businesses interested in cooperating with the BLM in constructing or maintaining range improvement projects that enhance or

improve livestock grazing management, improve watershed conditions, enhance wildlife habitat, or serve similar purposes. The BLM also invites public comments on this collection of information. The Office of Management and Budget (OMB) has assigned control number 1004-0019 to this information collection.

DATES: Please submit comments on the proposed information collection by May 31, 2016.

ADDRESSES: Comments may be submitted by mail, fax, or electronic mail.

Mail: U.S. Department of the Interior, Bureau of Land Management, 1849 C Street NW., Room 2134LM, Attention: Jean Sonneman, Washington, DC 20240.

Fax: to Jean Sonneman at 202-245-0050.

Electronic mail: Jean_Sonneman@blm.gov.

Please indicate “Attn: 1004-0019” regardless of the form of your comments.

FOR FURTHER INFORMATION CONTACT:

Kimberly Hackett, at 202-912-7216. Persons who use a telecommunication device for the deaf may call the Federal Information Relay Service at 1-800-877-8339, to leave a message for Ms. Hackett.

SUPPLEMENTARY INFORMATION: OMB regulations at 5 CFR part 1320, which implement provisions of the Paperwork Reduction Act, 44 U.S.C. 3501-3521, require that interested members of the public and affected agencies be given an opportunity to comment on information collection and recordkeeping activities (see 5 CFR 1320.8 (d) and 1320.12(a)). This notice identifies an information collection that the BLM plans to submit to OMB for approval. The Paperwork Reduction Act provides that an agency may not conduct or sponsor a collection of information unless it displays a currently valid OMB control number. Until OMB approves a collection of information, you are not obligated to respond.

The BLM will request a 3-year term of approval for this information collection activity. Comments are invited on: (1) The need for the collection of information for the performance of the functions of the agency; (2) the accuracy of the agency’s burden estimates; (3) ways to enhance the quality, utility and clarity of the information collection; and (4) ways to minimize the information collection burden on respondents, such

as use of automated means of collection of the information. A summary of the public comments will accompany our submission of the information collection requests to OMB.

Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

The following information pertains to this request:

Title: Grazing Management: Range Improvements Agreements and Permits (43 CFR Subpart 4120).

OMB Control Number: 1004-0019.

Summary: This request pertains to range improvements on public lands managed by the BLM. Range improvements enhance or improve livestock grazing management, improve watershed conditions, enhance wildlife habitat, or serve similar purposes. At times, the BLM may require holders of grazing permits or grazing leases to install range improvements to meet the terms and conditions of their permits or leases. Operators may also come to the BLM with proposals for range improvements. Often the BLM, operators, and other interested parties work together and jointly contribute to construction of range improvements in order to facilitate improved grazing management or enhance other multiple uses. Cooperators may include lenders which provide the funds that operators contribute for improvements.

Frequency of Collection: On occasion.

Forms:

- Form 4120-6 (Cooperative Range Improvement Agreement); and
- Form 4120-7 (Range Improvement Permit).

Description of Respondents: Holders of BLM grazing permits or grazing leases; affected individuals and households; and affected tribal, state, and county agencies.

Estimated Annual Responses: 1,110.

Estimated Annual Burden Hours: 1,640.

Estimated Annual Non-Hour Costs: None.

The estimated burdens are itemized in the following table:

Public Scoping Meeting for the Bureau of Land Management's Programmatic Environmental Impact Statement to Review the Federal Coal Program

The Bureau of Land Management (BLM) has announced its intent to prepare a Programmatic Environmental Impact Statement (EIS) to examine alternative approaches for reforming the federal coal program. The BLM is seeking public input on the issues and policies that should be outlined in the Programmatic EIS, including topics such as whether Americans are receiving a fair return for federal coal, how market conditions affect coal, how federal coal affects the environment, and how these and other factors impact coal-dependent communities. Public feedback will help inform the size and scope of the review conducted in the Programmatic EIS.

The BLM is hosting six public scoping meetings throughout the country to solicit public input. The meetings will begin with a presentation on the Programmatic EIS process, including an overview of the federal coal program, with the rest of the meeting open for public comment.

Information for the Grand Junction, Colorado meeting is as follows:

Date: Thursday, June 23, 2016

Location: Two Rivers Convention Center's Avalon Theatre, 645 Main Street, Grand Junction, CO 81501; the BLM will also provide an audio link for the meeting at Phone Number: 888-989-5165; Passcode: 1924798.

Time: The meeting will be held from 10 a.m. to 4 p.m. local time. The sign-in process will begin at 8:00 a.m.

Public Comment: The BLM will accommodate those attending the meeting in person who wish to provide public comment on a first-come, first-served basis to the fullest extent possible given the space and time available. The maximum speaking time per speaker will be 3 minutes.

Written comments may be submitted until **July 28, 2016**, using one of the following methods:

BLM Gathering Public Input on Coal Program at Six Public Meetings

Public Participation is Next Step in Comprehensive Coal Program Review

Washington, D.C.—As the next step in the Department of the Interior's comprehensive review of the federal coal program, the Bureau of Land Management (BLM) will solicit public input at six public meetings starting with Casper, Wyo., on May 17.

Meetings in Casper, Wyo., Salt Lake City, Knoxville, Seattle, and Grand Junction, Colo., will be held from 10 a.m. to 4 p.m. local time. The Pittsburgh meeting will be held from 1 to 7 p.m. local time. Specifics for all of the upcoming public scoping meetings can be found below:

May 17, 2016

Casper Events Center
1 Events Drive
Casper, WY 82601
Doors open for speaker registration at 8:30 a.m.; meeting 10 a.m. to 4 p.m.

May 19, 2016

Salt Palace Convention Center
90 South West Temple
Salt Lake City, UT 84101
Doors open for speaker registration at 8:00 a.m., meeting 10 a.m. to 4 p.m.

May 26, 2016

Tennessee Theatre
604 S. Gay Street
Knoxville, TN 37902
Doors open for speaker registration at 8:00 a.m.; meeting 10 a.m. to 4 p.m.

June 21, 2016

Sheraton Seattle Downtown
1400 6th Avenue
Seattle, WA 98101
Doors open for speaker registration at 8:00 a.m.; meeting 10 a.m. to 4 p.m.

June 23, 2016

Two Rivers Convention Center Avalon Theatre
645 Main Street
Grand Junction, CO 81501
Doors open for speaker registration at 8:00 a.m.; meeting 10 a.m. to 4 p.m.

No signs or banners are permitted in the auditorium, and bags and backpacks will be subject to search before entry.

June 28, 2016*

Pittsburgh Convention Center
1000 Fort Duquesne Boulevard
Pittsburgh, PA 15222
Doors open for speaker registration at 11:00 a.m.; meeting 1 to 7 p.m.

No signs or banners are permitted in the auditorium, and bags and backpacks will be subject to search before entry.

**Please note this is a new date; the meeting originally scheduled for June 16, 2016, is now scheduled for June 28, 2016.*

The meetings in Casper, Wyo., Seattle and Pittsburgh will be live-streamed at www.blm.gov/live; meetings in Salt Lake City, Knoxville, Tenn., and Grand Junction, Colo., will have a toll-free, listen-only audio link available via telephone.

Those who attend the meetings in person and who wish to speak will be asked to sign in. Speakers will be called upon on a first-come, first-served basis determined by sign-in order. Attendees wishing to speak will be accommodated to the fullest extent possible given the time available. The maximum speaking time per speaker is three minutes.

Written comments may be submitted until July 28, 2016, using one of the following methods. Comments received after July 28, 2016* will be considered by the BLM and included in the scoping report to the extent practicable:

Email: BLM_WO_Coal_Program_PEIS_Comments@blm.gov

Mail: Coal Programmatic EIS Scoping
Bureau of Land Management
20 M St. SE, Room 2134 LM
Washington, D.C. 20003

Additional information on the PEIS can be found [here](#), and additional information on the federal coal program can be found [here](#). The Notice of Intent to prepare a Programmatic EIS can be found [here](#).

The BLM manages more than 245 million acres of public land, the most of any Federal agency. This land, known as the National System of Public Lands, is primarily located in 12 Western states, including Alaska. The BLM also administers 700 million acres of sub-surface mineral estate throughout the nation. The BLM's mission is to sustain the health, diversity, and productivity of America's public lands for the use and enjoyment of present and future generations. In Fiscal Year 2015, the BLM generated \$4.1 billion in receipts from activities occurring on public lands.

U.S. Department of the Interior
Bureau of Land Management

Bureau of Land Management Federal Coal Leasing Program Programmatic Environmental Impact Statement Scoping Meeting

Federal Coal Regulating Agencies

- **Bureau of Land Management (BLM)**
 - Leasing
 - Production verification
- **Office of Surface Mining, Reclamation & Enforcement**
 - Mine permitting & reclamation (including bonding for reclamation)
- **Office of Natural Resources Revenue**
 - Manages royalty collection and disbursement
- **Mine Safety & Health Administration**
 - Develops and enforces safety and health rules for U.S. mines

BLM Coal Program Quick Statistics

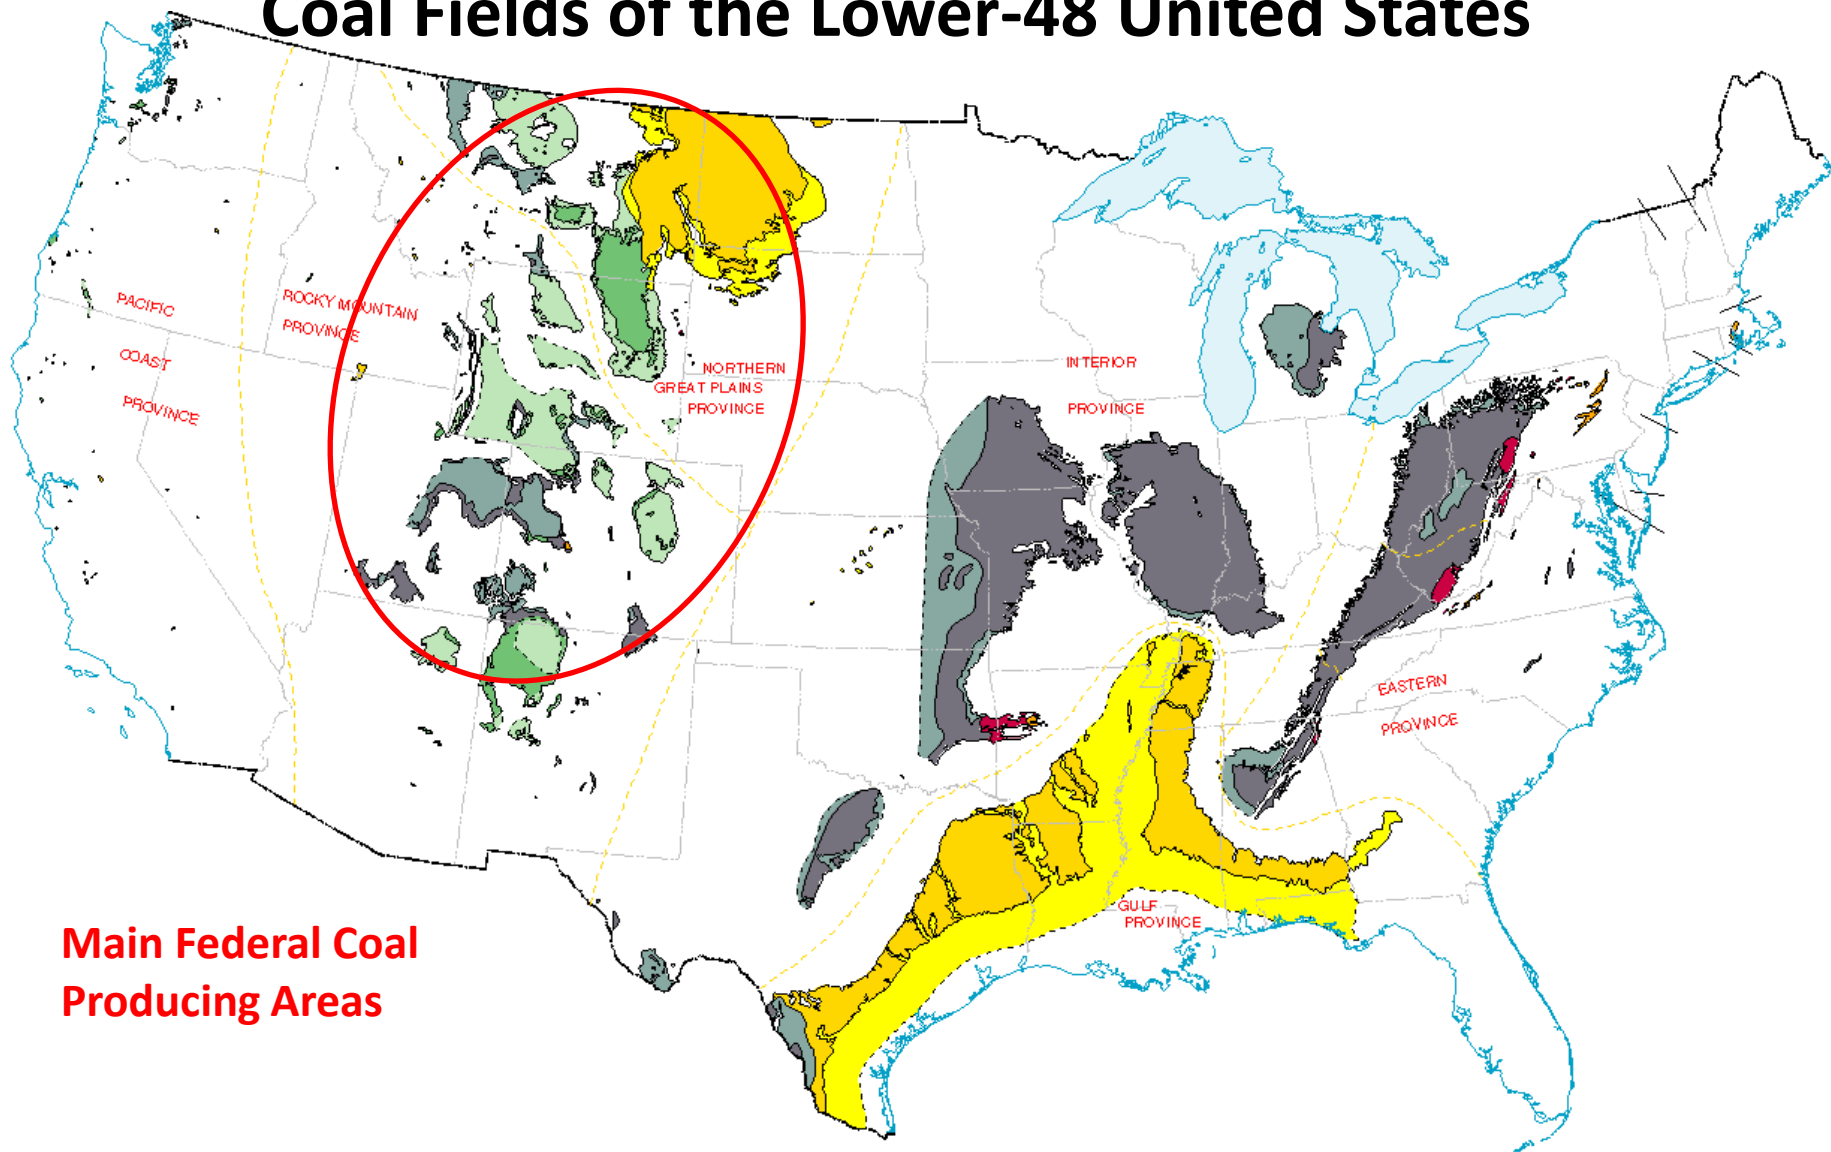

- BLM currently administers **306** coal leases
- **In the last 10 years (2006-2015):**
 - BLM-managed lands produced approximately 4.3 billion tons, worth over \$63.4 billion¹
 - This production generated \$6.8 billion in royalties and \$3.8 billion in rents, bonuses, and other payments¹
 - BLM held 32 coal lease sales
- **In 2015:**
 - 33.2% of Nation's electricity produced from coal²
 - 43.5% of the coal produced was federal coal; 88% of that was from the Powder River Basin in Wyoming and Montana¹

¹ Data from Office of Natural Resources Revenue

² Data from Energy Information Administration

Coal Fields of the Lower-48 United States

**Main Federal Coal
Producing Areas**

Coal Leasing Pause

- The pause does not apply to existing leases and coal production.
 - There are about 20 years of reserves at current production levels already under lease.
- Pending lease applications with signed decisions can proceed to sale if requested by the operator.
- Pending applications without a decision may proceed with NEPA and Fair Market Value analysis .
- Mines that need reserves to continue operations may apply for emergency leasing consideration.
- New applications received during the pause that do not meet emergency criteria or the other exceptions will be deferred for processing.

The Programmatic Environmental Impact Statement (PEIS) initiated by Secretarial Order 3338 will consider:

- How, when and where to lease
- Fair return
- Climate impacts
- Other impacts
- Socio-economic considerations
- Exports
- Energy needs
- Other potential modifications

The full set of issues in the PEIS will be decided through scoping; however, some that will be considered are listed in the Notice of Intent, including:

How, when and where to lease

- Should scheduled sales be used (e.g., like onshore oil & gas)?
- Should market conditions affect the timing of lease sales, such that sales would occur when coal values are higher rather than during downturns?
- Where and where not should the BLM lease consistent with taking a landscape level view?
- Do the BLM's unsuitability screening criteria adequately address the questions of where and/or where not to lease?

Fair Return

- Are the bonus bids, rents, and royalties received under the Federal coal program successfully securing a fair return to the American public?
- How should each of these components of fair return be calculated?
- Should externalities be considered as part of the fair return calculation? If so, what specifically and how?

Climate Impacts

- How can we best measure and assess the climate impacts of continued Federal coal production, transportation, and combustion?
- What are the potential substitution effects from any changes in Federal coal production?
- How may BLM best ensure no unnecessary and undue degradation of public lands from climate change impacts?
- How do we mitigate, account for, or otherwise address those impacts?
- How does the Federal coal program relate to the Nation's climate objectives, as well as its energy and security needs?

Other Impacts

- What are the effects of Federal coal production on water resources, air quality, wildlife, and other land uses such as grazing and recreation?
- Are impacts from mining and combusting Federal coal adequately mitigated?
- Should standard mitigation at the programmatic level be required, in addition to on a project-by-project basis?

Socio-economic Considerations

- Does the current program adequately account for externalities related to Federal coal production, including environmental and social impacts?
- How does the administration, availability, and pricing of Federal coal affect State, regional, and national economies (including job impacts), and energy markets in general?
- What is the impact of possible program alternatives on the projected fuel mix and cost of electricity?

Exports

- Whether and, if so, how should, leasing decisions consider actual and/or projected exports of domestic coal from any given tract?
- What potential mechanisms could be used to appropriately evaluate export potential?

Energy Needs

- How does Federal coal support fulfilling the energy needs of the United States?
- How does the administration, availability, and pricing of Federal coal impact electricity generation in the United States, particularly in light of other regulatory influences?
- What other sources of energy supply (including efficiency) are projected to be available?

We look forward to your comments on these and other important issues related to the Federal coal program

Q&A
Department of the Interior Federal Coal Reforms

OVERALL

What actions are being taken today?

U.S. Secretary of the Interior Sally Jewell announced several actions to strengthen and improve the federal coal program that is managed on behalf of all Americans. There are three main components that the Interior Department is announcing:

- 1) A formal, comprehensive review of the federal coal program that will identify and evaluate potential reforms;
- 2) A pause on new coal leasing on public lands while the review is underway; and
- 3) A series of good government reforms to improve transparency and program administration, including establishing a public database to account for the carbon emissions from fossil fuels on public lands.

Why are you taking these actions?

The federal government has a responsibility to all Americans to ensure that the coal resources it manages are administered in a responsible way to help meet our energy needs and that taxpayers receive a fair return for the sale of these public resources. And yet, over the past few years, it has become clear that many of the decades-old regulations and procedures that govern the federal coal program are outdated and do not fully reflect the realities of today's economy or current understanding of environmental and public health impacts from coal production.

In March 2015, Secretary of the Interior Sally Jewell called for an “open and honest conversation about modernizing the federal coal program,” and she launched a series of listening sessions across the country to hear from the public on complex questions, including: Are taxpayers and local communities getting a fair return from these resources? How can we make coal leasing more transparent and more competitive? How do we manage the program in a way that is consistent with our climate change objectives?

As a direct result of these public listening sessions – as well as concerns raised by the Government Accountability Office, the Interior Department's Inspector General, and Members of Congress – Secretary Jewell is taking the next step in the conversation by launching a formal, comprehensive review of the federal coal program. While the review is underway, consistent with practices during previous programmatic reviews of the federal coal program, Secretary Jewell has ordered a pause on significant new coal leasing decisions on public lands so that those decisions and leases can incorporate lessons learned from the comprehensive review to ensure that taxpayers receive a fair return for the sale of these public resources.

How did the public help shape this path forward?

Over the summer of 2015, the Interior Department hosted five listening sessions across the country (Washington, D.C.; Billings, Montana; Gillette, Wyoming; Denver, Colorado; and Farmington, New Mexico). Over the course of the public comment period, the Interior

Department heard from hundreds of individuals and received over 90,000 written comments that represented a wide variety of views. The Interior Department carefully reviewed the public feedback before crafting a path forward.

What concerns have the GAO, IG and Members of Congress raised?

In June 2013, the Interior Department's Office of Inspector General issued a report ([Coal Management Program, U.S. Department of the Interior](#)) that found weaknesses in the sale process and deficiencies in inspection and enforcement. In December 2013, the Government Accountability Office issued a [report](#) that found the Bureau of Land Management (BLM) could improve its coal leasing program by enhancing the appraisal process, more explicitly considering coal exports, and providing more public information. Over the years, Members of Congress have raised a variety of concerns with the program, including the environmental impacts, and the lack of competitiveness, transparency, and accounting for full costs of carbon.

Has the Interior Department undertaken any steps to address these concerns?

Yes, several. In January 2015, Interior's Office of Natural Resources Revenue published a proposed rule governing the valuation of federal oil and gas, and federal and American Indian coal resources. The proposed rule would modernize existing valuation regulations, which were put in place for natural gas and coal in the late 1980s, and ensure that the valuation process better reflects the changing energy industry while protecting taxpayers and American Indian assets. A final rule will be issued in 2016.

In December 2014, the BLM announced a series of actions aimed at addressing criticisms that its process to determine fair market value at the leasing stage is insufficient and fails to adequately account for higher prices received overseas. The BLM revised its manual and handbooks for the coal program to increase clarity regarding how the agency determines fair market value, provide guidance on independent review of appraisal reports, and make improvements that will enable the BLM to account for export potential through analysis of comparable sales and income. The BLM has also released safety, inspection and enforcement guidance to promote more responsible development of coal resources on the nation's public lands, regarding: improved documentation for coal operation inspections on coal exploration licenses, licenses to mine, leases, and logical mining units; and increased Mineral Mine Inspector training and certification requirements.

In addition, Interior's Office of Surface Mining Reclamation and Enforcement has proposed the Stream Protection Rule, under the Surface Mining Control and Reclamation Act (SMCRA), which would modernize 30-year old rules to better protect communities from the adverse effects of coal mining, and provide greater certainty to the mining industry about what constitutes harm to certain water bodies during mining activities.

COMPREHENSIVE REVIEW OF COAL PROGRAM

What is a PEIS?

A Programmatic Environmental Impact Statement (PEIS) is a formal, comprehensive review, with opportunity for extensive public engagement which evaluates the effects of broad proposals or program-level decisions. In this case, the Interior Department will use the PEIS process to

help identify and evaluate potential reforms to the federal coal program. The PEIS process will be completed consistent with the National Environmental Policy Act. The process is being undertaken as a discretionary action.

What will the PEIS evaluate?

The review will take a careful look at issues related to the BLM's administration of the federal coal program, including:

- The appropriate leasing mechanisms for how, when and where to lease;
- How to account for the environmental and public health impacts of the federal coal program; and
- How to ensure the sale of these public resources results in a fair return to the American taxpayers, including whether current royalty rates should be adjusted.

The review will also explore whether U.S. coal exports should factor into leasing or other program decisions; how the management, availability and pricing of federal coal impacts domestic and foreign markets and energy portfolios; and the role of federal coal in fulfilling the energy needs of the United States.

What are the next steps?

The review will include extensive opportunities for public participation. The PEIS will kick off with public meetings in early 2016 to help determine the precise scope of the review. The Interior Department will release an interim report by the end of 2016 with conclusions from the scoping process about alternatives that will be evaluated and, as appropriate, any initial analytical results. The scoping period will help inform the development of a draft PEIS, which the BLM will issue for public review and comment. Informed by comments on the draft PEIS, the BLM will then issue a Final PEIS. Changes to the coal leasing program may be implemented through a Record of Decision or separate processes.

How can I get involved?

Members of the public and stakeholders are encouraged to participate at all stages of the process, including in the public scoping meetings in 2016. There will also be multiple opportunities to submit written comments throughout the process.

How long will the PEIS take?

A PEIS typically takes several years to complete, providing adequate time for public comment and review at each stage of the process. It is expected that the review will take approximately three years to complete.

Have programmatic reviews of the federal coal program been done before?

Yes – although a programmatic review of the coal program has not been completed in more than 30 years. In 1983 and 1984, Congress established a commission to investigate fair market value policies for coal leasing and required a study of whether the coal leasing program was compatible with national environmental protection goals. The Interior Department followed these reports with a supplemental PEIS on the federal coal program, completed in 1986.

Previously, in 1973, President Nixon's Interior Department launched a PEIS in response to serious concerns about speculation in the coal leasing program, which was completed in 1979. Both programmatic reviews were accompanied by similar pauses in new coal leasing decisions.

PAUSE ON NEW COAL LEASING

Why is the Secretary instituting a pause on new coal leasing?

Given the serious concerns raised about the federal coal program and the large reserves of undeveloped coal already under lease to coal companies, it would not be responsible to continue to issue new leases under outdated rules and processes. While the review is underway, and consistent with the practice during two previous programmatic reviews, the Interior Department is instituting a pause on new coal leasing on public lands so that those leasing decisions can benefit from the recommendations that come out of the review.

What does the pause cover? Will there be exceptions?

During the pause, the BLM will not hold lease sales or process new lease applications for surface and underground coal. Importantly, the pause does not apply to existing leases and coal production activities.

There will be limited, commonsense exemptions to the pause for small lease modifications (160 acres or less), coal lease exchanges, certain preference right lease interests, and emergency leasing as defined by the BLM's current regulations, such as mines where there is a demonstrated safety need or insufficient reserves. Preparatory work on already-pending applications may continue, including NEPA analysis, but the BLM will not make final decisions on new leases, absent an applicable exemption. Pending leases that have already completed NEPA analysis and received a final Record of Decision or Decision Order by a federal agency under the existing regulations will be allowed to complete the final procedural steps to secure a lease or lease modification, including those that are undergoing re-evaluation after having been vacated by judicial decision. The pause does not apply to metallurgical coal (used in steel production), renewals of existing leases, or other BLM, Office of Surface Mining, or Office of Natural Resources Revenue actions related to the federal coal program, such as mine plan approvals. The pause does not apply to coal leases on tribal or allotted lands.

What is an "emergency" that would allow leasing under the exceptions?

The coal leasing regulations at 43 CFR 3425.1-4 allow for an emergency lease sale where the coal is needed within 3 years to maintain production, or where the coal would be bypassed if not leased.

More specifically, the regulations outline two situations in which emergency leasing is allowed. In the first situation, the Federal coal is needed within 3 years either to maintain the mine at its current average annual production levels, or to supply coal for contracts signed prior to July 19, 1979. In the second situation, if the coal deposits are not leased, they would be bypassed in the reasonably foreseeable future, and at least some of the tract applied for would be used within 3 years.

In both cases, the applicant for emergency leasing must also show that the need for the coal

resulted from circumstances that were either beyond the control of the applicant or could not have been reasonably foreseen and planned for in time to allow for the normal leasing process. Leases issued under the emergency provision are limited to 8 years of recoverable reserves at the mine's current rate of production.

Will the pause impact current coal production?

The Interior Department does not anticipate that the pause will significantly alter current production. Under the pause, companies may continue to mine the large reserves of undeveloped coal already under lease.

Based on current production levels, coal companies now have approximately 20 years of recoverable coal reserves under lease on federal lands. This estimate may be conservative as Energy Information Administration analyses and other market trends show continuing declines in demand for coal. Many current lease applications with the BLM are on hold at the companies' request due to reductions in market demand for coal.

Given the abundance of coal reserves under lease, the declining demand for coal, and the accommodations that will be made for emergency circumstances, the pause should have no material impact on the nation's ability to meet its power generation needs.

Is there precedent for such actions?

Yes. In 1973, President Nixon's Interior Secretary Morton suspended coal leasing – including a complete moratorium on the issuance of new prospecting permits, and a prohibition on the issuance of new federal coal leases except in very limited circumstances. The moratorium was lifted in 1981, after a PEIS had been completed, a new leasing system had been adopted, and litigation resolved. In 1984, as part of the 1984 Appropriations Bill, Congress imposed a moratorium on the sale of coal lease tracts starting in 1983 and ending 90 days after publication of the Linowes Commission's report. The Congressional moratorium was set to expire in May 1984, but President Reagan's Interior Secretary Clark continued the moratorium, which continued the suspension of all coal leasing (except for emergency leasing, lease modifications and processing preference right lease applications) while Interior completed its comprehensive review of the program. The leasing moratorium was lifted in 1987.

Does the pause impact existing leases? Coal on tribal lands? Forest Service lands? State or private lands?

The pause does not apply to production on existing leases. The pause only applies to the Federal mineral estate administered by the BLM (regardless of whether the BLM also controls the surface estate), and it does not apply to coal leases on Tribal or allotted lands, which are administered under a different regulatory system. The pause only applies to lease sales and modifications; it does not apply to other BLM actions related to the Federal coal program, including the processing and issuance of coal exploration licenses, the issuance of renewal leases when required by the terms of existing leases, and the development and implementation of resource management plans. Similarly, the pause does not apply to actions undertaken by ONRR, OSMRE, or any other agency, office, or bureau with duties related to the development, production, or reclamation of Federal coal resources. Preparatory work on already-pending

applications may continue, including NEPA analysis, but the BLM will not make final decisions on leases until the review is completed, absent an applicable exemption.

How long will the pause last?

The Secretarial Order calls for the limitations on the issuance of federal coal leases to be applied until the completion of the PEIS. A PEIS typically takes several years to complete, providing adequate time for public comment and review at each stage of the process. It is expected that the review will take approximately three years to complete.

What impact will this pause have on the coal economy? Will this raise electricity rates?

Given the abundance of coal reserves under lease, the declining demand for coal, and the accommodations that will be made for emergency circumstances, the pause should have no material impact on the nation's ability to meet its power generation needs and is not expected to impact electricity production or prices.

What authority does the Secretary have to take this action?

The Secretary has authority under the Mineral Leasing Act, the Mineral Leasing Act for Acquired Lands, and the Federal Land Policy and Management Act to manage federal coal leasing. She has the authority under National Environmental Policy Act to utilize the PEIS process as part of a programmatic review of the federal coal program.

IMPROVING TRANSPARENCY and MEASURING CARBON EMISSIONS ON PUBLIC LANDS

Why are you establishing a database on carbon emissions?

This year the Interior Department's U.S. Geological Survey will complete a national inventory of carbon that is sequestered (stored) in the lands of the United States. Currently, however, there is no dedicated, official measure of the harmful greenhouse gas emissions from coal, oil and gas produced on public lands. An analysis from a non-governmental organization suggests that the emissions from these activities on public lands could amount to 28 percent of the nation's annual total energy-related fossil fuel emissions.

In order to better understand and manage carbon stocks on public lands, the USGS will establish a baseline and public database that accounts for carbon emitted from fossil fuels produced on public lands. Improved, timely and transparent accounting by one of the world's premier Earth science agencies will provide critical information for the public and federal land managers as we work to reduce carbon pollution from fossil fuel activities.

What will be measured?

The USGS will assess for the carbon stored and sequestered on public lands, and the quantities of greenhouse gases emitted from activities on public lands, including potential downstream emissions from fossil fuels.

The publicly available database will include:

- Baseline carbon stocks and sequestration rates;

- Other baseline data products such as habitats, ecosystems, soil conditions, protected status, land use and change, to facilitate analysis of environmental impacts and management policy options;
- Annually updated major land use and land cover change areas (e.g. wildfire, loss of wetlands, new acquisitions) and associated carbon emissions and uptakes;
- Annually updated net ecosystem carbon flux (i.e. sink or source);
- Annual estimates of greenhouse gas emissions resulting from energy development activities;
- Annual quantities of oil and gas extractions from federally managed lands; and
- Potential downstream greenhouse gas emissions associated with oil and gas extraction on federally managed lands.

Who will be involved in the initiative?

The USGS will be the lead agency in developing the database. The database would link to existing data from other government sources, such as the Environmental Protection Agency and the Energy Information Administration.

The accounting methodology will rely on ongoing USGS research and completion of the LCMAP (land change monitoring, assessment, and projection) project, which is expected to provide annual updates of land use/land cover change by 2018. It is also dependent on the development and operational use of the LUCAS (land use and carbon scenario simulator) model to track annual carbon fluxes as a result of land use change.

What are the next steps?

The USGS will first complete its pilot studies of carbon emissions and sequestration on federal lands and other requisite inputs to the LUCAS model. The database of carbon emissions and storage on federal lands would be established in 2018.

Why is the BLM issuing guidance that requires State and field offices to post online each pending request to lease coal or to reduce royalties? When will this go into effect?

Although much of this information is already available online, stakeholders have raised concerns that there is no formal guidance on the matter and not all BLM State and field offices currently post notice of these types of requests in a consistent manner or in real time. The BLM is committed to transparency and providing the public access to the information they need to understand how we are managing public resources, consistent with protections for confidential business information. Updating our guidance to ensure uniform, clear and consistent procedures for posting notice of all coal leasing and royalty rate reduction requests online is simply good government. We anticipate issuing guidance on this matter in the near term.

Why is the BLM conditioning any exchange or sale of federal coal to another owner on the requirement that the new owner obtain surface owner consent to leasing? When will this go into effect?

One of the concerns raised by stakeholders and Members of Congress during the listening sessions was about the potential effect of federal coal exchanges or sales on surface owners.

Owners of surface lands above federal coal deposits must consent to leasing of the federal minerals before the BLM will approve the lease sale. This ensures that a rancher, for example, doesn't unwillingly lose all use of their land for 10 or 20 years during a mining operation and before the land is reclaimed. However, when the federal coal is transferred to another owner through an exchange or sale, currently, the surface owner consent to leasing is no longer required. The BLM recognizes the impact of these situations on surface owners and will issue guidance directing that in situations where the BLM has the discretion to make the sale or exchange, the BLM will condition any such sale or exchange on the new owner obtaining surface owner consent prior to development of the coal. The BLM is working to develop this guidance and expects to issue it in the near term.

Why is the BLM directing new and readjusted leases to authorize the coal lessee to capture and sell methane, provided it does not conflict with pre-existing oil and gas lease interests? When will this go into effect?

At underground coal mining operations, the natural gas that is commonly present must be removed from the mine for miner safety. Natural gas is largely comprised of methane, a greenhouse gas at least 25 times more potent than carbon dioxide. Traditionally, mine operators have released the gas into the atmosphere, adding methane emissions that drive climate change. Some coal mine operators would like to capture the natural gas for use or sale, but do not have authorization in their coal leases to capture the otherwise vented waste mine methane for use or sale.

The BLM intends to address this problem by issuing guidance that would ensure that, in situations where the oil and gas has not already been leased or is owned by another party, the operator of the coal mine would be authorized to capture the natural gas instead of venting it, and use or sell it. The guidance would provide that, for new coal leases and at the time of lease readjustments, the standard lease language would include a provision allowing the coal lessee to capture and use or sell that waste mine methane that would otherwise be vented from the coal mine, as long as such gas had not already been leased or is owned by another party. In addition, the BLM would add this language to existing coal leases with the agreement of the coal lessee. The language would not require the coal lessee to capture the gas, but would allow it. The BLM is working to develop this guidance and expects to issue it in the near term.

ADDITIONAL BACKGROUND

What is the BLM's role in the federal coal program?

The BLM has responsibility for coal leasing on approximately 570 million acres where the coal mineral estate is owned by the federal government. The surface estate of these lands could be controlled by the BLM, the United States Forest Service, private land owners, state land owners, or other Federal agencies. The BLM works to ensure that the development of coal resources is done in an environmentally sound manner and is in the best interests of the nation.

What laws govern the federal coal program?

The Mineral Leasing Act of 1920, as amended, and the Mineral Leasing Act for Acquired Lands of 1947, as amended, give the Secretary responsibility for managing coal leasing on

approximately 570 million acres of the 700 million acres of mineral estate that is owned by the Federal Government, where coal development is permissible. The Secretary has delegated her authority for this responsibility to the BLM.

How does the BLM determine where to lease?

Public lands are available for coal leasing only after the lands have been evaluated through the BLM's multiple-use planning process. Leasing federal coal resources is prohibited on public lands, such as military reservations, National Parks, or National Wildlife Refuges. In areas where development of coal resources may conflict with the protection and management of other resources or public land uses, the BLM may identify mitigating measures which may appear on leases as either stipulations to uses or restrictions on operations.

There is a rigorous land use planning process through which all public lands are reviewed for potential coal leasing. Requirements for the land use plan include multiple use, sustained yield, protection of critical environmental areas, application of specific unsuitability criteria, and coordination with other government agencies.

How does the leasing process work?

There are two distinct procedures for competitive coal leasing: (1) regional leasing, where the BLM selects tracts within a region for competitive sale, and (2) leasing by application, where the public nominates a particular tract of coal for competitive sale.

Regional coal leasing requires the BLM to select potential coal leasing tracts based on multiple land use planning, expected coal demand, and potential environmental and economic impacts. This process requires close consultation with local governments and citizens through a Federal/state advisory board known as a Regional Coal Team. However, for decades the demand for new coal leasing has been associated with the extension of existing mining operation on authorized federal coal leases, so all current leasing is done by application.

Leasing by application begins with BLM review of an application to lease a coal tract to ensure completeness, that it conforms to existing land use plans, and that it contains sufficient geologic data to determine the fair market value of the coal. The Agency then prepares an environmental analysis in compliance with NEPA. At the same time, the BLM will also consult with tribal governments and appropriate Federal and state agencies, and will determine whether the surface owner consents to leasing in situations where the surface is not administered by the BLM.

Preparations for the actual lease sale begin with the BLM formulating an estimate of the "fair market value" of the coal. This number is kept confidential and is only used to evaluate the bids received during the sale.

Sealed bids are accepted prior to the date of the sale and are publicly announced during the sale. The winning bid will be the highest bid that meets or exceeds the coal tract's presale estimated fair market value, assuming that all eligibility requirements are met and the appropriate fees and payments are attached (at a minimum, this amounts to the first year's annual rental payment and one-fifth of the amount bid).

How are revenues generated through leasing coal?

The BLM receives revenues on coal leasing at three points: a bonus paid at the time BLM issues the lease; an annual rental payment of \$3.00 per acre or fraction thereof; and royalties paid on the value of the coal after it has been mined.

The royalty rate for federal coal is currently set at the minimum level allowed by statute, 12.5% of the gross value of the coal produced. The 12.5% royalty rate applies to coal severed by surface mining methods. For coal mined by underground methods, the statute provides that the Secretary may establish a lesser royalty rate. By regulation, the BLM requires an 8% royalty for coal removed from an underground mine. The federal government and the state where the coal was mined share the revenues equally.

APPENDIX C

LIST OF COMMENTERS

The formal public comment period as required by NEPA began on March 30, 2016, with the publication of a Notice of Intent in the Federal Register (Vol. 81, No. 61, page 17720, March 30, 2016), and comments were accepted until September 15, 2016. **Table C-1**, Commenters, lists the commenters who submitted comments to the BLM in writing as part of the public scoping process or provided oral comments at scoping meetings. All comments received on or before September 15, 2016, are included in this scoping report. In addition to unique submissions, organizations submitted form letters. In total, the BLM received 213,748 form letter submissions from 19 form letter campaigns; details of the form letter submissions are shown in **Table C-2**.

APPENDIX D

COMMENTS BY ISSUE CATEGORY

Each unique submission, representative form letter, and form letter with additional comments was reviewed by the BLM to identify substantive comments related to the reform of the Federal coal program. In total, 459 comments were identified with references or data, 130 containing a policy option, and 3,199 related to one or more of 33 issue categories. Summaries of the main themes of comments by issue topic are included in **Section 4.6, Comment Summaries**, in Volume I. A full report of comments by issue categories is included in this Appendix. Comments related to references or data and those containing policy options are not included within separate categories here, but appear under the relevant issue topic.

This page intentionally left blank.

Issue I - NEPA Process**ISSUE I.1 - SCOPING MEETING**

Total Number of Submissions: 23

Total Number of Comments: 23

Comment Number: 00000334 _ Potter _ Carbon County _ 20160519-1

Organization I: County Commissioner

Commenter I: Jay Potter

Comment Excerpt Text:

And I just want to start by telling you that the invitation to come to Carbon, Emery, Sevier, or Sanpete Counties to hold these meetings is always open. You, again, picked the wrong location to really see into the eyes of the people that are affected by the Federal Government and the overreach there. (Applause.) The other thing that goes with that is that, according to NEPA, the best land planning starts in those communities that are affected. Now, you're going across the United States and, yes, we're grateful that you're in Utah, because this is an important part of our economies, but, again, you're not even abiding by your own rules set up by the Federal Government.

Comment Number: 0000793-1

Organization I: Skyline Mine

Commenter I: Anthony Skinner

Comment Excerpt Text:

It would be nice to have these meeting in the counties and town were we work.

Comment Number: 0000798-1

Commenter I: Paul

Comment Excerpt Text:

Your actions of once again holding a meeting 150 miles away from the nearest mine affected even though the BDAC and Carbon Convention Center could easily support this.

Comment Number: 0001166-1

Commenter I: Anne Miller

Comment Excerpt Text:

I would also ask that you expand public hearing to non-stakeholder regions such as New England and California that are also affected by climate change as we all are and they should also be allowed to participate in public hearings about this federal process.

Comment Number: 0002001 _ Stevens _ 20160607-1

Commenter I: Wayne Stevens

Comment Excerpt Text:

Unfortunately, the opposition had little opportunity to speak due to a "first come, first served" system used. A better system would have be alternating pro coal, then opposed to coal.

Comment Number: 0002009_CenterBioDiversity_20160329-10

Organization I: WildEarth Guardians

Comment Excerpt Text:

In publishing the notice of intent, we request that you provide at least a 60-day public comment period. and, at a minimum, we urge you to schedule public hearings in key areas impacted by the federal coal program. We urge you to hold hearings in Billings, MT, Denver, CO, Farmington, NM, and Salt Lake City, UT, and in other locations where federal coal management and/or federal oversight of coal mining is a significant issue, including, but not limited to, Chicago, IL, Pittsburgh, PA, Tulsa, OK, and Charleston, WV. We also strongly urge you to hold hearings in Seattle, WA and Oakland, CA, both areas impacted by the export of publicly owned coal. Finally, we urge you to consider holding hearings in areas of our country already or soon to be hit strongly by coal's climate impacts; place like New York City, Miami, and New Orleans.

Comment Number: 0002019_Emineth_20160623-1

Commenter I: Mike and Lorna Emineth

Comment Excerpt Text:

Montana has the most recoverable coal resources of any other state in the nation. Yet it is unbelievable that the DOI chose Seattle, a place that produces no federal coal and only has 0.26 percent of our nation's resources, over Montana to gather public comment on the federal coal program.

Comment Number: 0002045_Johnson_20160620-1

Organization I: Cloud Peak Energy

Commenter I: Gabriel Johnson

Comment Excerpt Text:

Not including coal mining states such as Montana will not provide a representative public hearing process. Omitting the folks who live in the "sticks" who actually produce the coal, denies us of our constitutional right to participate in our democratic process.

Comment Number: 0002047_Kidd_20160622-1

Commenter I: David Kidd

Comment Excerpt Text:

The DOI chose, Seattle of all places, for public comment on the Federal coal program, a place that produces NO federal coal and only has roughly 1/4 of 1% of our nations resources!

Comment Number: 0002050_Lekse_20160617-1

Commenter I: Margaret Lekse

Comment Excerpt Text:

First of all, this action by the BLM to not schedule their scoping meetings in Montana is the same as crossing the street so one does not have to talk to a person with whom one disagrees.

Comment Number: 0002060_Rowell_20160622-1

Organization I: Outdoor Gear

Commenter I: David Rowell

Comment Excerpt Text:

It is unbelievable that the DOI chose Seattle, a place that produces no federal coal and only has 0.26 percent of our nation's resources, over Montana to gather public comment on the federal coal program.

Comment Number: 0002082_Jensen_20160329-1

Commenter I: Levi Jensen

Comment Excerpt Text:

The BLM needs to add Gillette, WY as a location for a scoping meeting.

Comment Number: 0002100_OHair_20160613-6

Commenter I: Todd O'Hair

Comment Excerpt Text:

And finally, it was a rude snub to the coal miners and affected businesses and individuals of Montana to refuse to hold a public comment period in Montana. I understand the BLM held a listening session in Billings in 2015, but to choose Seattle over a location in Billings Montana is an insult to the people of Montana.

Comment Number: 0002128_Walter_20160623-2

Commenter I: Marlis Walter

Comment Excerpt Text:

It is extremely disappointing that you are not soliciting opinions from the people of Montana. The great state of MT has an enormous amount of coal.

Comment Number: 0002129_Weaver_20160623-1

Commenter I: Janet Weaver

Comment Excerpt Text:

How unfortunate and how telling it is that the Obama Administration has chosen to only hear from certain people on this issue...and they have turned a deaf ear to the people who will be most affected by their decision against coal energy.

Please give us your ear! You are hand picking winners and losers and that is not how our country was founded and has achieved greatness over the last two centuries! The government is supposed to represent all citizens, not just a chosen segment of citizens.

Comment Number: 0002144_Kot_20160519_SweetwtrCnty-1

Organization I: Sweetwater County, Wyoming

Commenter I: Wally Johnson

Comment Excerpt Text:

the county supports Wyoming Governor Mead's request for a public scoping meeting to be held in Rock Springs, WY

Comment Number: 0002149_Hewitt_20160519_WyLSO-7

Organization I: Wyoming Legislature's Select Federal Natural Resource Management Committee

Commenter I: Ted Hewitt

Comment Excerpt Text:

The Committee encourages the BLM to host additional scoping meetings in Wyoming

Comment Number: 0002189_Jozwik_20160517-1

Commenter I: Darryl Jozwik

Comment Excerpt Text:

I ALSO WOULD LIKE TO SEE SOME OF THESE LISTENING SESSIONS TO BE HELD IN AREAS THAT ARE THE MOST IMPACTED, FOR EXAMPLE, CAMPBELL COUNTY AND SWEET WATER COUNTY WYOMING.

Comment Number: 0002215_Pierce_20160622-1

Commenter I: Jerry Pierce

Comment Excerpt Text:

What kind of organization would allow a meeting to be held where public input is being asked for in a place where there is little economic impact realized? You would think if it was a fact gathering opportunity to help make an informed decision possible it would be held in an area where it was going to have the most affect. To talk about coal issues in the city of Seattle makes as much sense as talking about oceanic marine biology issues in Billings.

Comment Number: 0002231_Schwend_20160620-1

Organization I: Cloud Peak Energy

Commenter I: David Schwend

Comment Excerpt Text:

I am disappointed that in this round of public hearings a session was not held in Montana where coal plays a large role in electrical generation, state economics, and community development.

Comment Number: 0002389_Schwend_20160721-2

Organization I: Spring Creek Mine

Commenter I: David Schwend

Comment Excerpt Text:

I am disappointed that in this round of public hearings a session was not held in Montana where coal plays a large role in electrical generation, state economics, and community development.

Comment Number: 0002409-3

Commenter I: Greg Gianforte

Comment Excerpt Text:

You're holding a public meeting in Seattle, and to my knowledge the state of Washington has no federal coal reserves. Montana has the largest holdings of federal coal in the nation. Why should Seattleites get to weigh in on this topic and not Montanans?

Comment Number: 0002493_Mead_20160728_GovWY-5

Organization I: Office of Governor Matthew H. Mead

Commenter I: MATTHEW H. MEAD

Other Sections: 2

Comment Excerpt Text:

I along with Wyoming's Congressional Delegation requested public meetings in Gillette and Rock Springs, Wyoming at a minimum. This did not happen. Coal communities in Wyoming and elsewhere have the most relevant and critical information about the industry and its operation. The "listening" sessions- purposefully or not- did not suggest this kind of action by DOI No one could have anticipated or talked on the impacts. Coal communities deserve an opportunity to provide input. I will assist you in setting up additional public meetings. BLM's NEPA Handbook - Section 6.9- PUBLIC INVOLVEMENT AND RESPONDING TO COMMENTS- requires the BLM to provide for public hearings when there is a substantial interest in holding the hearing. See also 40 C.F.R. § 1506.6(c)(1). I specifically request public hearings be held in Gillette and Rock Springs, Wyoming, now, and at future points in the PEIS process. I expect, in the event the BLM proceeds, that the draft PEIS will be made available to the public at least 15 days in advance of public hearings requested in accordance with 40 C.F.R. § 1506.6(c)(2).

ISSUE I.2 - COOPERATING AGENCY RELATIONSHIP

Comment Excerpt Text:

Ensure that other key Interior Department agencies are cooperating agencies in the development of the programmatic environmental impact statement, including the Office of Surface Mining Reclamation and Enforcement, Office of Natural Resource Revenue, and Geological Survey. We also urge you to request that the U.S. Department of Energy, U.S. Department of Labor, U.S. Environmental Protection Agency, and White House Council on Environmental Quality participate as cooperating agencies pursuant to the National Environmental Policy Act.

Comment Excerpt Text:

Lastly, Campbell County requests that it be given cooperating agency status in the development of the EIS.

Comment Number: 0002393-4

Commenter I: Mike Penfold

Comment Excerpt Text:

Federal and State Governments need to start working together to plan for the full range of problems faced by communities, the workers doing the mining and the reclamation of mined land.

Comment Number: 0002477_Saul_20160728_CBD_UPHE-78

Organization I: Center for Biological Diversity

Commenter I: Michael Saul

Comment Excerpt Text:

Because each significant new addition of greenhouse gases increases the extinction risk for many listed species, the massive greenhouse gas emissions stemming from the federal coal program, which contributes 13% of all US fossil fuel CO₂ emissions, clearly affect many listed species. The continuation of the federal coal program jeopardizes climate-change-vulnerable species, while an end to coal leasing on public lands would be consistent with their continued survival and recovery. As such, the Bureau must consult with the Fish and Wildlife Service and National Marine Fisheries Service on the impacts to listed species of the significant greenhouse gas emissions from the federal coal program.

Organization I: Cloud Peak Energy Inc.

Commenter I: Andrew C. Emrich, P.C.

Comment Excerpt Text:

BLM must engage in meaningful collaboration with both states and America's coal producers in order to fully

consider the impacts on state and local governments and the coal industry resulting from revisions to the federal coal program. First, as part of its collaboration with interested government stakeholders (see Executive Order No. 12866, Section 1(b)(9) (1993), BLM must perform a federalism assessment. A federalism assessment is required for all regulations and policy statements or actions containing federalism implications. Such implications arise when the actions contemplated by the agency have a substantial direct effect on the states, the relationship between the federal government and the states, or on the distribution of power and responsibilities among various levels of government. Exec. Order No. 12612, Sec. 1(a) (1987). BLM's proposed changes to the federal coal program raise sufficient federalism implications to warrant the preparation of a federalism assessment because any regulatory changes would "have substantial direct effects on the States." *Id.*; see also *id.* Sec. 6(b) (when federalism implications exist, "a Federalism Assessment . . . shall be prepared.").

In preparing a federalism assessment, BLM should identify the extent to which the federal government's proposed changes would impose additional costs and burdens on state governments, infringe on the states' ability to discharge traditional state governmental functions, or infringe on other aspects of state sovereignty. BLM must carefully consider and disclose those impacts on state and local governments, communities, and businesses that rely on federal coal leasing and development.

Comment Number: 0002490_Emrich_20160728_CloudPeakEnergy-27

Organization I: Cloud Peak Energy Inc.

Commenter I: Andrew C. Emrich, P.C.

Other Sections: I

Comment Excerpt Text:

BLM must also engage in honest and meaningful discussions with coal producers to better understand the adverse economic impacts associated with federal coal program reform. As discussed throughout this comment letter, America's coal producers are heavily burdened by both current economic conditions and the existing governmental payments required under the current regulatory scheme. To the extent BLM intends to revise the federal regulatory scheme, BLM must prepare a regulatory impact analysis to "assess all costs and benefits of available regulatory alternatives, including the alternative of not regulating." Exec. Order No. 12866, Sec. 1(a)(1993).

Organization I: Cloud Peak Energy Inc.

Commenter I: Andrew C. Emrich, P.C.

Comment Excerpt Text:

BLM should collaborate with OSMRE to streamline the leasing and permitting process. BLM and OSMRE should jointly clarify that when OSMRE participates as a cooperating agency in a BLM-led environmental analysis, OSMRE may rely on that analysis when making its mining plan approval determination. Further, the agencies should jointly clarify that OSMRE, when considering whether to approve the mining plan for federal coal reserves, need not consider any environmental impacts (such as coal combustion) that have already been considered by BLM and which are outside the scope of OSMRE's administrative discretion.

Comment Number: 0002493_Mead_20160728_GovWY-20

Organization I: Office of Governor Matthew H. Mead

Commenter I: MATTHEW H. MEAD

Comment Excerpt Text:

When representing a county as a cooperating agency in matters related to the National Environmental Policy Act and in federal land use planning, implementation and management action, a board of county commissioners shall be deemed to have special expertise on all subject matters for which it has statutory responsibility, including but not limited to, all subject matters directly or

indirectly related to the health, safety, welfare, custom and socioeconomic viability of a county. W.S. 18-5-208(a) (emphasis added). Accordingly, Wyoming's Counties have special expertise in all matters directly or indirectly related to the health, safety, welfare, custom and socioeconomic viability of their county. Wyoming Counties should be engaged as cooperating agencies in accordance with their special expertise.

Comment Number: 0002493_Mead_20160728_GovWY-41

Organization I: Office of Governor Matthew H. Mead

Commenter I: MATTHEW H. MEAD

Comment Excerpt Text:

In order to focus the PEIS process and be able to draw conclusions more definitive than mere speculation, BLM will have to pull in experts from a variety of state and federal agencies to predict the changing energy needs. And, as part of that process, BLM must provide a transparent discussion of the methods and analyses it uses to predict energy supplies and demands as it evaluates the role of federal coal in meeting the nation's energy needs in the PEIS.

Comment Number: 0002493_Mead_20160728_GovWY-6

Organization I: Office of Governor Matthew H. Mead

Commenter I: MATTHEW H. MEAD

Comment Excerpt Text:

If the BLM proceeds with its PEIS reviewing the federal coal program, I request "cooperating agency" status for the State of Wyoming and its agencies. The State of Wyoming is prepared to engage consistent with the requirements of cooperating agencies as outlined in 40 C.F.R. §1501.6 and 43 C.F.R. § 1610.3-1. The State of Wyoming possesses special expertise and jurisdiction by law relevant to the BLM's environmental analysis. I attach a list of agencies, in addition to the Governor's Office, that the State of Wyoming identifies to BLM as cooperating agencies. (Attachment I).

Comment Number: 0002493_Mead_20160728_GovWY-64

Organization I: Office of Governor Matthew H. Mead

Commenter I: MATTHEW H. MEAD

Comment Excerpt Text:

Cooperating Agencies

Infrastructure Authority- The Infrastructure Authority (WIA) was created in 2004 under W.S. 37-5-301 to support the advancement of coal technology and advanced energy technology facilities, electrical transmission, and coal exports. The facilities and related supporting infrastructure may include all facilities, structures and properties incidental and necessary or useful in the production or transmission of energy. The WIA has the ability to issue up to \$1 billion in industrial revenue bonds to assist in financing energy infrastructure.

Department of Environmental Quality- The Department of Environmental Quality (DEQ) serves as the state's regulatory agency charged with protecting, conserving and enhancing Wyoming's land, air and water for the benefit of current and future generations. The DEQ is charged with the administration of the Environmental Quality Act, W.S. 35-11-101 through W.S. 35-11-1803, and the Industrial Siting Act, W.S. 35-12-101 through W.S. 35-12-119. DEQ is responsible for enforcing state and federal environmental laws including:

- Clean Air Act,
- Clean Water Act,
- National Pollution Discharge Elimination System (NPDES),
- Environmental Quality Act,
- Resource Conservation and Recovery Act (RCRA),
- Superfund Amendments and Title III Reauthorization Act (SARA), and
- Federal Surface Mining Control and Reclamation Act.

Land Quality Division- The Department of Environmental Quality- Land Quality Division is charged with administering sections W.S. 35-11-401 through W.S. 35-11-437 of the Environmental Quality Act. The Division serves the citizens of Wyoming by ensuring environmental protection through permitting, inspection, and enforcement of environmental regulations for all mining operations in Wyoming. In addition, the Office of Surface Mining approved the Land Quality Division Permanent Coal Program on November 11, 1980.30 C.F.R. §§ 950.10, 950.15, 950.20. The Land Quality Division has retained primacy for the Coal Program since this original approval.

Air Quality Division - The Department of Environmental Quality - Air Quality Division has primacy to implement the Clean Air Act in accordance with state and federal law. See 42 U.S.C. §§ 7401(a)(3), 7401-7671q, 40 C.F.R. subpart ZZ, and W.S. 35-11-201 through W.S. 35-11-214. Wyoming's Air Quality Division has technical expertise and experience in applying stringent air quality controls and air pollution monitoring requirements in accordance with the Clean Air Act and Wyoming's Environmental Quality Act.

Water Quality Division- The Department of Environmental Quality- Water Quality Division is charged with the administration of sections W.S. 35-11-301 through W.S. 35-11-318 of the Environmental Quality Act. The Division is responsible for protecting surface and ground water quality through permitting, inspection, and enforcement of environmental regulations governing the discharge of waste into waters of the state (including ground water). The Division also coordinates with other Divisions and the Department's Spill Response Program to oversee cleanup of spills and other unpermitted releases of oil and/or hazardous substances that have entered, or threaten to enter waters of the state.

Game and Fish Department- The Wyoming Game and Fish Commission is created and empowered in sections W.S. 23-1-101 through W.S. 23-6-208. The Wyoming Game and Fish Department is created and placed under the direction and supervision of the Commission in W.S. 23-1-401. The responsibilities of the Commission and the Department are defined in W.S. 23-1-103. In these and associated statutes, the Commission and the Department are charged with providing "an adequate and flexible system for the control, propagation, management, protection and regulation of all Wyoming wildlife." The Department is the only entity of state government directly charged with managing Wyoming's wildlife resources and conserving them for future generations. Accordingly, the Department often participates as a cooperating agency providing information on potential wildlife impacts from coal leasing and other mining activities.

School Facilities Department- The School Facilities Department (Department) is under the direction and supervision of the School Facilities Commission (Commission). The Director of the Department is appointed by the Governor. The Department implements policies, guidelines, and standards adopted by the Commission. The Commission includes the State Superintendent of Public Instruction (a statewide elected official) and seven members appointed by the Governor. The Commission is required, primarily by W.S. 21-15-108 through W.S. 21-15-123, to promulgate rules and regulations regarding the planning, design, and construction of schools within the forty eight school districts of Wyoming. The intent is that school facilities be similar to other school facilities in similar situations and that they are adequate to support the delivery of the state approved educational program. Revenue generated from coal leasing and production provides significant funding for the construction of school facilities in Wyoming.

Department of Administration and Information, Economic Analysis Division - The core mission of the Economic Analysis Division of the Department of Administration and Information is to coordinate, develop, and disseminate economic and demographic research and information. Under W.S. 9-10-1024 the division shall "Establish uniform criteria for collecting, compiling, analyzing, reporting and distributing economic data for all Wyoming counties related to uses of and economic impacts to state and federal surface and mineral lands, including but not limited to development of agriculture, grazing, minerals, timber, water, industrial resources, recreation and energy production." Accordingly, the Economic Analysis Division of the Department of Administration and Information has special expertise on the economic impact to Wyoming from the federal coal program.

Department of Revenue - The Department of Revenue administers the collection of mineral and excise taxes as well as the valuation of property. The Administrative Services Division is responsible for the deposit of tax payments received and the distribution of sales and mineral tax funds. The Mineral Tax Division is responsible for collecting mineral severance taxes and providing county governments with an accurate certificate of the mineral production value in their respective counties for the assessment of ad valorem taxes. The Property Tax Division

is responsible for supporting, training, and guiding local governmental agencies in the uniform assessment, valuation and taxation of locally assessed property; assessing, valuing and allocating public utility property; as well as administering, collecting and distributing designated taxes. The Department values and assess coal, and collects and distributes taxes on coal and coal production according to the requirements outlined in Wyoming's Constitution, article 15 §§ 2, 3 and 19, in addition to W.S. 39-14-101 through W.S. 39-14-111. Accordingly, the Wyoming Department of Revenue has special expertise in identifying the fair market value of coal, and assessing various kinds of taxes on coal and coal production.

Public Service Commission- The Public Service Commission regulates the rates, pricing, services, service quality and safety of Wyoming electric, gas, water, essential telecommunications and intrastate pipeline companies. The three commissioners are appointed by the Governor with Senate confirmation. The general statutory authority for the PSC is found in W.S. 37-1-101 through W.S. 37-3-306; W.S. 37-6-101 through W.S. 37-6-107; W.S. 37-12-101 through W.S. 37-12-403; and W.S. 37-15-101 through W.S. 37-17-105. Accordingly, the PSC has special expertise in the contribution of coal and other fuels to the energy market, including the sources and quality of federal coal mined in Wyoming.

Homeland Security- The Office of Homeland Security, in accordance with W.S. 19-13-101 through 19-13-414 and W.S. 35-9-151 through W.S. 35-9-159, assists state and local agencies in their efforts to mitigate, prepare for, respond to, and recover from the effects of crisis due to terrorism, natural (fire, flood, earthquake, etc.) or technological (hazardous materials spills, etc.) causes. The Office of Homeland Security has special expertise on confidential nature of critical infrastructure data collected in support of risk, vulnerability, or threat assessments is of vital concern to facility owners, operators, managers, and responders across Wyoming. Additionally, the Office of Homeland Security has special expertise and secured access to information on the importance of coal mining and all of its interdependencies and dependencies on several national critical infrastructure sectors to include, electrical power, rail transportation, road transportation, and diesel fuel.

Department of Education - The general supervision of the public schools is entrusted to the State Superintendent of Public Instruction who is the administrative head and chief executive officer of the Wyoming Department of Education (WDE). Wyo. Const. art. 7 § 14; W.S. 21-2-201. The Superintendent and WDE Staff promulgate and enforce rules and regulations consistent with the Wyoming Constitution and state statutes. See W.S. 21-1-101 through W.S. 21-13-721. The WDE acts as the funding agent for state and federal funds that flow to the Wyoming School Districts. Accordingly, the WDE has special expertise on the impact taxes generated by the coal leasing program have on public education in Wyoming.

Department of Workforce Services- The Wyoming Department of Workforce Services (DWS) is the primary U.S. Department of Labor (DOI) grantee and contractor in Wyoming. W.S. 9-2-2002 through 9-2-2601. DWS is the principle fact-finding agency in the field of labor economics for the State of Wyoming. For example, DWS produces county unemployment rates each month under contract to the Department of Labor's Bureau of Labor Statistics. DWS manages Unemployment Insurance (UI) benefits payments for those who lose their jobs through no fault of their own, and administer UI tax collections from employers. Through Employment Service offices DWS seeks to re-employ UI claimants by matching job seekers to employer job openings. For dislocated workers, those whose skills no longer match the needs of the labor market, DWS provides training opportunities through administration of the Workforce Innovations and Opportunities Act. Accordingly, DWS has special expertise on the coal labor market and the impacts the federal coal program has on the labor force in Wyoming.

Department of Audit- The Department of Audit, authorized by W.S. 9-2-2003, is the independent audit agency for the State of Wyoming. The Department includes the Public Funds Division, the Mineral Audit Division, the Excise Tax Division, the Banking Division, and the Administration Division, which oversees management services and information technology. Specifically, the Mineral Audit Division performs mineral tax and royalty audits to ensure compliance with state and federal laws. In performing the independent mineral audits, the Department works closely with the Department of the Interior, the Office of Natural Resources Revenue, the Wyoming Department of Revenue and the Wyoming Office of State Lands and Investments. Accordingly, the Department of Audit has special expertise on the collection of and compliance with federal and state coal taxes and royalties.

Wyoming State Geologic Survey- The Wyoming State Geologic Survey (WSGS) interprets Wyoming's complex geology. W.S. 9-2-801 through W.S. 9-2-809. WSGS scientists work to gain a better understanding of our

planet's history, geologic wonders, potential hazards and natural resources such as water, minerals and energy. The WSGS gathers key information, provides technical analyses, perform scientific investigations and generate maps using Geographic Information Systems (GIS). WSGS teams cover four core subject areas: 1) energy and mineral resources; 2) water resources, mapping and hazards; 3) information technology and GIS; and communications and public outreach. Accordingly, the WSGS has special expertise on the geologic formations in Wyoming's coal regions, including the location and extent of federal coal in Wyoming.

State Engineer's Office- The State Engineer's Office and State Board of Control provide for the general supervision of the waters of the state, including surface and underground water, and of its appropriation, distribution, and application to beneficial use as provided under Wyoming statutes and the prior appropriation doctrine. See Wyo. Const. art. 1 § 31, art. 8 §§ 1 through 5, and art. 13 § 5; W.S. 41-1-101 through 41-14-103. The State of Wyoming owns all waters in the state. Id. Further, all water produced or used in connection with federal coal mining in Wyoming is regulated and controlled by the State Engineer's Office and the State Board of Control. Accordingly, the State Engineer's Office and the State Board of Control have special expertise regarding the impact coal production has on the appropriation, distribution and use of the waters of the state.

Department of Agriculture -The Wyoming Department of Agriculture (WDA) assists the citizens of Wyoming to live safe and healthy lives, promote and preserve Wyoming's agricultural community, be responsible stewards of Wyoming's natural resources, and achieve integrity in the marketplace. W.S. 11-1-101 through W.S. 11-50-108. It is a duty of the WDA to "foster practicable conservation of state natural resources." W.S. 11-2-202(a)(v). WDA also provides rangeland health technical assistance to evaluate plant communities, soils and water resources in order to sustain healthy grazing and wildlife habitat resources. W.S. 11-2-207. WDA collaborates with private landowners, local governments, other state agencies and federal agencies to provide rangeland health assessments across jurisdictional boundaries and including areas subject to reclamation or renovation projects. Most of the land surrounding ongoing coal mining operations in Wyoming is put to agricultural uses. That same land will likely be reclaimed and returned to agricultural uses. Accordingly, the WDA has special expertise in the condition and health of pre and post mining lands and resources, including the soils, water resources and plant communities that provide healthy grazing and wildlife habitat.

Office of State Lands and Investments- Upon admission to the Union, Congress granted the State of Wyoming certain lands, in surface and mineral, for the benefit of Wyoming institutions, primarily the public schools. Wyo. Act of Admission, 26 Stat. 222, §§ 4 through 14 (July 10, 1890). These lands were granted to and accepted by the State of Wyoming for the specific purpose of income production. The Wyoming Constitution, Article 18, Section 3, and Wyoming Statutes 36-2-101 through 36-2-108, statutes mandate that the Office of State Lands and Investments and the Board of Land Commissioners manage and protect the underlying value of and derive revenue from these trust assets for both short- and long-term returns to the public schools and other designated beneficiaries. The value and marketability of Wyoming's coal assets are directly impacted by the federal coal program. The Office of State Lands and Investments works closely with the Bureau of Land Management's coal team to ensure that Wyoming's trust responsibilities to its citizens are accounted for in the federal coal program. Accordingly, the Office of State Lands and Investments has special expertise in the valuation, marketability and sale of coal in Wyoming.

County Government- In Wyoming, counties serve as a legal arm of the state and shoulder the responsibility to carry out the state's statutory and regulatory goals at the local level. As such, county government operates on the front lines of ensuring Wyoming's communities are both economically vibrant and safe, healthy places to live. Wyoming statute provides that:

ISSUE I.3 - RANGE OF ALTERNATIVES

Comment Number: 00000334 _ Potter _ Carbon County _ 20160519-3

Organization I: County Commissioner

Commenter I: Jay Potter

Comment Excerpt Text:

If today's alternative is zero coal, which is what I really believe that the BLM and the Department of the Interior is after and to keep it in the ground, the opposite end of that should be full access to all the coal within the United States and to do it now.

Comment Number: 0000363_HEIN_20160519-2

Organization I: Institute for Policy Integrity

Comment Excerpt Text:

First, the Interior should formulate a broad change of alternatives for federal coal leasing. These alternatives could include, for example, no new federal coal leasing, leasing using adjusted royalty rates or carbon adders that aim to maximize social welfare by accounting for all quantifiable costs and benefits of the program, and, three, leasing that serves declining domestic coal demand alone.

Organization I: Tri-State Generation and Transmission Association, Inc

Commenter I: Doug Lempke

Comment Excerpt Text:

Tri-State encourages BLM to include alternatives in the PEIS that maximize federal coal use while maintaining the current royalty rate, or even better, proposing ways to reduce it.

Comment Number: 0000752_Lempke_Tri-State_20160623-3

Organization I: Tri-State Generation and Transmission Association, Inc

Commenter I: Doug Lempke

Comment Excerpt Text:

As BLM develops the PEIS, Tri-State strongly encourages you to consider the following:

- o the impacts on the cost of electricity,
- o federal, state and local government dependence on royalty payments,
- o the true cost to mine federal coal, including state and federal royalty payments, all bonus bids, ad valorem property taxes, ad valorem production taxes, sales and use taxes, severance taxes and the AML fees,,
- o new ways to simplify the reporting and administrative burdens for all parties involved,
- o the long term benefits that coal mining can have for the environment, specifically the reinvigoration of wildlife habitats which may be in decline or of poor quality to start with, and
- o the provisions of the mineral leasing act that specifically identify and mandate the development of these resources for the benefit of the American public.

Comment Number: 0001187-1

Commenter I: Peggy Willis

Comment Excerpt Text:

After that review of the science, the financial and public benefits and costs, I would urge the Bureau of Land Management to have an option recommending ending the current policy of subsidizing strip mining coal from our public land.

And I really believe this program is broken, and I urge the BLM to include also an option that would permanently end the new leasing of coal permits on public lands and leave the coal in the ground as many others have said earlier today.

Comment Number: 0001188-1

Commenter I: John Stafford

Comment Excerpt Text:

It also seems desirable for the U.S. government to be acting in consistent purposes across its policies. So if we're involved in the Paris accords, the clean power plant from President Obama, in Washington state there's I-732 and the Alliance for Jobs and Clean Energy pending proposal to affect the price on carbon, again, why would the U.S. government enter into something that works in exact -- at cross purposes to that?

Comment Number: 0002100_OHair_20160613-2

Commenter I: Todd O'Hair

Comment Excerpt Text:

it is important that the scope be set to include a possible reduction in royalty rates, reduction in bonus bid payments and streamlined permitting processes.

Comment Number: 0002240_Hargrove_20160701-1

Commenter I: Bourtai Hargrove

Comment Excerpt Text:

The scope of your programmatic EIS must be comprehensive, and concentrate on the impact that burning the coal you lease will have on the cumulative CO₂ already in the atmosphere. The EIS must quantify the amount of CO₂ that will be added to the atmosphere for each ton of coal which will be burned for every prospective lease of coal on federal land. The EIS must also calculate the effect of burning that coal on the carbon reduction levels the U.S. agreed to during the 2015 U.N. Climate Change Conference (COP 21) in Paris, and on the proposed EPA regulations to reduce carbon pollution from coal-fired power plants.

Comment Excerpt Text:

I urge you to develop and select an alternative in the federal coal leasing Programmatic Environmental Impact Statement to terminate the sale of federal coal entirely.

Comment Number: 0002443_Koontz_20160727_BowieResources-13

Organization I: Bowie Resource Partners, LLC

Commenter I: Gene DiClaudio

Comment Excerpt Text:

Order 3338 states that the PEIS will examine several policies that can only be modified by congressional action. These include potential changes in federal royalty rates and the potential imposition of carbon-related fees or taxes. The PEIS should expressly identify which alternatives and actions it considers will require legislative authorization. In addition, there are a variety of legislative reforms that should further be analyzed. These include:

Bonus Bid Reform for Maintenance Tracts

Bonus bids under competitive leasing are required under the FCLAA, and are intended to: (a) provide a mechanism for choosing among qualified bidders, (b) incentivize diligence in production, and (c) compensate taxpayers for the disposition of federal natural resources. Diligence is independently achieved by the federal diligence regulations and requirements, and taxpayers can be equally or more effectively compensated by payment of federal royalties. Bonus bids were also an effective tool in the 1970s when there were more frequent greenfield coal mine starts, and remain useful for any future greenfield proposals.

As noted by NMA, there is no evidence of systemic error in the current valuation practices and regulations. However, the valuation process is time consuming and demanding on federal staff resources, and is more difficult in the current era of stable-to-declining coal prices. Moreover, bonus bids serve no selection function when there is only one bidder, which is the norm for maintenance tracts. Consequently, the Secretary should evaluate abandoning bonus bids for maintenance tracts, and instead employ an adjusted revenue-neutral royalty schedule for those tracts. Shifting taxpayer compensation to royalties would significantly streamline the leasing process, ensure that taxpayers are more attuned to market conditions, and reduce the administrative burden on the BLM and Office of Natural Resources Revenue.

More Specific Congressional Directives on Leasing

As noted, federal law presently mandates coal leasing and encourages coal exports, but otherwise affords the Secretary broad discretion in the manner, frequency, and scale of leasing. Since federal coal leasing policy is an integral component of federal energy policy, the Secretary should request more precise guidance from Congress on general leasing targets within the proven Lease-by-Application system. In that way the legislative and executive policies toward federal coal leasing can be better harmonized.

Congressional Validation, Adjustment, or Rejection of the SCC

To date the SCC has not undergone notice-and-comment rulemaking, and is deeply problematic at a technical and procedural level. In addition, the discounting and time horizon assumptions in the SCC render the SCC an inter-generational wealth transfer mechanism. This is especially true of any attempt to impose SCC-derived fees or taxes. Finally, the SCC also generates such large value ranges that it is uniquely susceptible to result-driven policy choices, that is, project proponents will always be able to identify values that support denial. Because of these inherent and profound philosophical and policy dimensions, the SCC is poorly suited to the secretive, unilateral Executive processes under which it has been developed to date. Rather, the Secretary (and the

Administration generally) should seek express Congressional authorization and guidance to the extent there is a desire to continue to employ the SCC in federal decision-making. Such authorization, if obtained, would place the Executive on a far sounder democratic and constitutional footing than under current and potentially future practices.

Commenter I: Gene DiClaudio

Comment Excerpt Text:

The Mineral Leasing Act specifies that the Secretary "shall" lease federal coal. 30 U.S.C. 201 (a)(1). Moreover, federal law has repeatedly directed the Secretary of Energy to examine methods to increase the development of the nation's coal reserves and to increase the export of coal. See, e.g., 42 U.S.C. 13571(1); 42 U.S.C. 13367(a). Revisions to the leasing regulations that have the effect of curtailing federal coal production and the export of coal would be inconsistent with these mandates. At a minimum, the scope of the PEIS must include a discussion of how any proposed regulatory changes would advance the federal policies of development of federal coal resources and the export of U.S.-produced coal.

Comment Excerpt Text:

The Coalition opposes the proposed landscape-level view to analyzing what areas should or should not be available for leasing. There is no indication as to how these new boundaries would be drawn or what criteria would be used to define a landscape. The management concerns of the BLM Director may not reflect the management concerns the field offices have refined by their on-the-ground experience and resource management. The landscape boundaries may also be defined by one resource, such as sage-grouse habitat, without consideration of all other resources, such as energy, roads, or other wildlife concerns.

Comment Excerpt Text:

As explained in further detail below, in order to achieve this purpose and need, the PEIS must explore alternatives that will achieve the following overarching objectives:

- Delineating the full scope of GHG emissions associated with federal coal leasing, including upstream and downstream emissions;
- Reducing, mitigating, or eliminating the GHG emissions associated with federal coal leasing to align with the Nation's GHG emission reduction goals;
- Identifying and fully presenting a detailed analysis of the direct adverse environmental impacts associated with federal coal leasing and developing new regulations and policies to insure these impacts are minimized, including

insuring proper reclamation; and

- Reforming the coal leasing price structure to advance GHG reduction objectives, insure meaningful competition, and provide a transparent and fair return to taxpayers.

It is of course too early in the process to set out precisely which reforms will best accomplish these objectives. However, at this stage we anticipate that BLM will need to include the following elements to achieve the PEIS's purpose and need:

- An end to leasing by application and regional coal teams, and development of a national framework for when, where, and how much federal coal, if any, must be considered for leasing;
- A revised lease payment framework that takes into account GHG reduction objectives and provides a transparent and fair return to taxpayers, including a new approach to determining FMV and setting rental and royalty fees;
- A systematic examination of the full life-cycle GHG emissions caused by federal coal leasing;
- A Carbon Budget delineating the extent of GHG emissions that the agency will permit from federally leased coal;
- An inter-agency management approach to ensure compliance with all federal laws;
- Limitations on leasing in areas with environmental conflicts or suitable for renewable energy development;
- Limitations on who may obtain leases based on the extent of reserves and the company's demonstrated capacity to complete appropriate reclamation;
- New lease conditions and bonding requirements that will facilitate proper site reclamation; and
- Regulatory requirements for methane capture and/or offsets.

To encompass these issues, we recommend that the agency identify the following major federal action as the driver of consideration in the PEIS:

The proposed federal action is to provide a complete environmental analysis of, potential alternatives to, and mitigation measures associated with federal coal leasing, as well as an informed basis for restructuring the regulatory and policy framework for federal coal leasing with the objectives of minimizing contributions to Greenhouse Gas emissions and other environmental harms, while maximizing returns to the American public.

Comment Excerpt Text:

Once the impacts are properly characterized and analyzed, the PEIS should consider several approaches to minimize and mitigate GHG emissions associated with federal coal leasing. These approaches should include a set of analytical alternatives of the GHG environmental impacts associated with federal coal leasing:

a. Establishing a "Carbon Budget" for coal leasing

Under this approach, BLM – in coordination with other appropriate agencies – would present an analysis that would determine how much of United States GHG emissions should be permitted to come from federal coal leasing (again, considering full life cycle emissions), taking into account the Nation's GHG reduction objectives and other sources of GHG emissions. Once that Carbon Budget is established, BLM would apply it initially to take account of existing leases. Any remaining Budget would then be allocated to new leasing based on a revised leasing framework, which would incorporate the applicant's ability to achieve GHG emission and other environmental goals. Capping the amount of leasing available, and having coal operators compete for remaining leases, could also create an associated benefit of additional competition for federal coal resources.

Comment Excerpt Text:

The “no action” alternative

The EIS must consider a “no action alternative,” 40 C.F.R. §1502.14(d), whereby BLM would make no changes to the coal leasing regulatory framework. In the PEIS, the agency should detail each of the problems that would remain should the agency choose this approach, including:

- The conflict between federal coal leasing and the Nation’s GHG emission reduction goals;
- The direct environmental harms caused by coal mining on federal lands, and the failure of current reclamation standards to protect against those harms;
- BLM’s failure to obtain FMV for coal resources or to otherwise obtain a full return for taxpayers; and
- The conflicts between the current regulatory scheme and domestic energy security.

Comment Excerpt Text:

While the foregoing illustrates many of the alternatives BLM should analyze and consider in the PEIS, we recognize that BLM is likely to choose only a small subset of consolidated alternatives to carry forward for further consideration. We here offer some initial thoughts on how BLM might approach those alternatives. We do not intend this to be a comprehensive list, or to advocate for any particular alternative at this early stage, but intend these consolidated alternatives to simply aid BLM’s thinking in how to address alternatives as the process moves forward. And in any case, all of these alternative analytical scenarios must include and be based on a PEIS that has clearly set forth the environmental impacts; the adverse environmental effects which cannot be avoided should the proposal be implemented; a sharply defined set of comparative alternatives; the relationship between local short-term uses of man’s environment and the maintenance and enhancement of long-term productivity; and any irreversible and irretrievable commitments of resources should the proposed alternative be implemented. See 42 U.S.C. § 4322.

A. The 21st Century Coal Alternative

This alternative would contain a combination of the reforms BLM determines will best achieve the goals of reducing GHG emissions, protecting the environment, and maximizing returns for American taxpayers. We anticipate that under this alternative BLM would determine to implement a new leasing framework whereby coal would be leased, solely for domestic use, at appropriate prices and times, from appropriate places, on appropriate terms, and in a manner that insures a complete (or almost complete) accounting for GHG emissions through adder or royalty fees, or other mitigation or offset measures, and only to companies with a demonstrated ability to achieve maximum mitigation and reclamation.

The discussion of impacts under this alternative would demonstrate that it has the least detrimental environmental impacts, maximizes revenue, and poses the least risks to domestic energy security.

B. The Taxpayer Return Alternative

This alternative would seek to maximize returns for the public by structuring bonus, rental and royalty rates to provide the highest possible returns to taxpayers over the long term – i.e., a century or more. Because coal prices are currently low relative to other energy sources, this approach may result in a marked reduction in federal coal leasing in the short term. See, e.g. *Coal: Survival of the Fittest* (Citibank May 27, 2015) (discussing anticipated continuing low coal prices). However, BLM would consider whether by requiring higher prices, the agency could achieve a greater return in the long term, while providing greater GHG reductions and environmental protection in the coming decades.

C. The Climate Change Focused Alternative

This alternative would focus principally on the GHG emissions aspects of coal leasing, presumably advocating for highly restricted – or no – leasing to best align with GHG emissions reduction goals. Because there would be far fewer leases for which the agency would need to value the coal, engage in enforcement, or insure proper reclamation, a significantly scaled back scope to public lands coal leasing could make other reforms considerably

easier.

D. The Land Protection Alternative

This alternative would focus on reclamation, and other non-GHG environmental issues, limiting leasing in areas that pose environmental conflicts and insuring that where leasing occurs, operators follow all environmental protection requirements at every stage, including a guarantee that they complete timely and satisfactory reclamation.

E. The Lease Reform Alternative

This alternative would focus on the coal pricing issues, insuring coal leases are properly valued, including incorporating all externalities, especially GHG contribution. It could also include timing and location restrictions that help drive GHG and/or other environmental goals by reducing coal production.

F. The Domestic Security Alternative

This alternative would focus on whether coal leasing is necessary to insure domestic energy needs, and restrict or forbid leasing for export to protect these resources for the American people, as Congress intended.

Comment Excerpt Text:

At the outset, we emphasize that, as regards all physical, chemical, radiological and biological, aesthetic, historic, cultural, economic, and social effects areas, the PEIS must address all relevant impacts, including cumulative and related impacts. See, e.g., 40 C.F.R. § 1508.7 (explaining that cumulative effects include “the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions”). Only through a comprehensive analysis can BLM make an informed judgment about changes in the federal coal leasing regulatory framework. (12)

(11) In order to meaningfully address the impacts of federal coal leasing, BLM must take into account important geographical considerations. To assist with that aspect of the analysis, attached as Appendix A are additional comments focusing on geographic information systems and geospatial analysis and data that should be considered in developing the PEIS.

(12) See, e.g., CEQ, *Considering Cumulative Effects Under the National Environmental Policy Act*, January 1997 (explaining that “cumulative effects must be evaluated along with the direct effects and indirect effects... of each alternative...” and that “...as the proposed action is modified or other alternatives are developed (usually to avoid or minimize adverse effects), additional or different cumulative effects issues may arise”); BLM NEPA Handbook at 61 (stating that cumulative effects analysis “must be able to describe the incremental differences in cumulative effects as a result of the proposed action and alternatives”).

Moreover, impacts must be analyzed broadly and include all relevant “effects on natural resources and the components, structures, and functioning of affected ecosystems,” including “effects on air and water and other natural systems.” 40 C.F.R. § 1508.8(b). BLM should also be guided by its statutory mandate to manage public lands “in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values” 43 U.S.C. § 1701(a)(8) (emphasis added).

To minimize and mitigate these impacts, in the PEIS BLM must also “[r]igorously explore and objectively evaluate all reasonable alternatives” and “[d]evote substantial treatment to each alternative considered in detail.” 40 C.F.R. § 1502.14. Because the alternatives we propose – and those BLM is already considering – are closely tied to the impact area they are designed to address, we present a set of tailored alternatives for each impact area in this section. In the following section we will offer several combined alternatives for BLM to consider carrying forward in the PEIS.

Organization I:Natural Resources Defense Council

Commenter I:Geoffrey Fettus

Comment Excerpt Text:

b. Amending the price structure for coal leasing to account for the significant GHG emissions externalities costs associated with coal

Under this alternative, BLM would analyze incorporation of the life-cycle costs of GHG emissions into the royalty rates charged for access to federally leased coal. For example, the royalties might include an “adder” that would be a flat sum (adjusted over time and keyed to inflation) to reflect these costs.

While BLM might determine it requires a change to its regulations (21), analysis of this alternative would be well within BLM’s broad authority, for the MLA and FLPMA provide the agency with broad discretion to determine appropriate royalty rates.

Finally, BLM should present an analysis of the relevant alternatives associated with where the money raised by such fees should be allocated. Possibilities include:

- paying for carbon mitigation or other efforts to reduce GHG emissions elsewhere – e.g., carbon sequestration;
- assisting coal mine employees displaced by reductions in federal coal leasing; or
- supporting coal reclamation projects in areas where operators have not fulfilled their reclamation obligations.

(22)

21 Although the existing regulation only provides for a 12.5% (for surface mining) floor on royalties, 43 C.F.R. § 3473.32, we recommend BLM amend the regulation to explicitly include the adder for GHG emissions.

22 Although some of these uses may not be within BLM’s present statutory authority, that should not dissuade the agency from giving them serious consideration. See, e.g., 40 C.F.R. § 1502.15(c) (requiring consideration of “reasonable alternatives not within the jurisdiction of the lead agency”).

Comment Excerpt Text:

c. Requiring CO₂ and/or methane capture and sequestration throughout the coal leasing chain

To the extent CO₂ and methane emissions from the coal supply chain can be captured and sequestered, coal leasing’s impacts on GHG emissions, and therefore on climate change, can be mitigated to some extent. BLM should therefore consider analyzing such a sequestration alternative.

Capture during the coal mining process – where most of the fugitive methane emissions occur – is squarely within BLM’s authority. As noted, at present operators have no requirement to capture fugitive methane. BLM should squarely address this problem by considering an approach that would require every coal lease, permit and plan of operations to provide for the capture of all methane releases, or, at bare minimum, to provide strong incentives for methane capture (i.e., penalties for non-capture).

As for downstream emissions, in this alternative BLM should consider structuring its leasing framework to incentivize companies to insure downstream sequestration. For example, BLM might reduce the externality cost included in leasing prices to the extent the applicants can demonstrate that the downstream emissions will be sequestered.

Organization I:Natural Resources Defense Council

Commenter I:Geoffrey Fettus

Comment Excerpt Text:

d. Permitting GHG emission mitigation through offsets elsewhere in the economy

Another alternative to address GHG emissions would be an analysis of permitting applicants to offset life cycle GHG emissions by obtaining GHG emissions reductions outside the coal leasing fuel chain. One potential source for this mitigation would be investments in renewable energy. Another possibility would be carbon capture with biological carbon sinks – i.e., restoration or protection of vegetative communities that naturally absorb significantly quantities of carbon dioxide. BLM should identify federal lands that might serve as significant biological carbon sinks, and make them available for this purpose, and should also consider permitting carbon capture elsewhere, such as through forest or coastal habitat restoration, sustainable land management practices, or other measures. See generally CEQ Climate Guidance at 20.

Comment Excerpt Text:

f. Prohibiting new leasing

Finally, BLM should consider the environmental impacts that would be associated with no longer issuing federal coal leases, which – short of terminating existing leases – would have the greatest impact on GHG emissions reduction. Such an alternative would be eminently reasonable given the state of the science on climate change and the contribution federally leased coal is making to GHG emissions. In short, because immediate and substantial reductions in GHG emissions are critical to reduce or prevent serious impacts from climate change, BLM would be well within its broad discretion to maintain a hiatus on further leasing.

It is also evident that further federal coal leasing will not be necessary to meet the Nation's energy demands. Demand for coal is decreasing, and will continue to decrease, while existing federal coal leases will continue to provide adequate coal supplies for decades. See, e.g., U.S. EIA, *Today in Energy: Clean Power Plan reduces projected coal production in all major U.S. supply regions* (July 8, 2016) (available at <http://www.eia.gov/todayinenergy/detail.cfm?id=26992>)

It also bears emphasizing that the statutory requirement for “maximum economic recovery,” 30 U.S.C. § 201(a)(3)(C), would not be impediment to this or any other alternative under which BLM might prioritize environmental concerns over simply achieving the highest economic returns. To the contrary, Congress was clear that this requirement “does not restrict the authority of the authorized officer to ensure the conservation of the recoverable coal reserves and other resources and to prevent the wasting of coal.” 43 C.F.R. § 3480.0-5(21)(emphasis added).

And regardless of whether BLM were to choose such an alternative, fully analyzing what would happen were leasing to be halted is critical to permit BLM to meaningfully compare the relative GHG reductions that can be reasonably achieved through other alternatives.

Comment Excerpt Text:

A full assessment of the impacts of the federal coal leasing program going forward requires analysis of the amount of development that might occur. See e.g., BLM & DOE, Final Programmatic Environmental Impact Statement (PEIS) for Solar Development in Six Southwestern States (July 2012) at 2-64; Interagency Reference Guide: Reasonably Foreseeable Development Scenarios and Cumulative Effects Analysis (June 2003). Several key factors are relevant to BLM's preparation of reasonably foreseeable development scenarios. The most important factors include: (1) enforceable greenhouse gas reduction targets and policies; (2) other federal and state policies that impact federal coal production; (3) market factors affecting demand for federal coal both domestically and internationally; (4) financial solvency of coal companies; (5) future production costs for federal coal; and (6) the time frame selected for evaluation.

Each alternative that BLM chooses to evaluate in its PEIS should have a reasonably foreseeable development scenario associated with it. A transparent description of the federal coal resource can provide a critical foundation for each development scenario. This accounting should distinguish between federal coal resources already leased and those not yet leased. Economic recoverability will vary in each scenario based on assumptions about available technology, demand, price including royalty rate and greenhouse gas emissions, and other policies and regulations affecting coal production. Such assumptions and choices should be clearly identified. Moreover, the analysis and modeling used to estimate reasonably foreseeable development from the assumptions/ choices should be explained and made publically available. Once a reasonably foreseeable development scenario is determined for each alternative, BLM can then assess the impacts associated with this level of development.

Comment Excerpt Text:

The past, current and reasonable foreseeable impacts from public lands coal mining in Gunnison County are significant. Gunnison County's experience with public lands coal mining is a microcosm of the bigger issue of federal coal leasing, and our local experience with coal mine pollution and climate change impacts is analogous to other rural communities across the west. The federal coal leasing program, which subsidizes the mining and burning of coal, is out of step with priorities to avoid pollution that disrupts our climate and with the president's commitment to better manage public lands. As such, HCCA urges the BLM to consider and adopt an alternative that ends new coal leasing on public lands.

Commenter I:Matt Reed

Other Sections: 6 7.1

Comment Excerpt Text:

Coal Mining and Climate Change are Impacting Gunnison County's Public Lands Gunnison County is home to the Gunnison National Forest, Black Canyon of the Gunnison National Park, and biologically diverse BLM-managed

lands. Ranging in elevation from less than 6,000 feet to mountains over 14,000 feet, it is a rich and varied landscape. Yet both subtle and obvious impacts from climate change are impacting millions of acres of local public lands and straining federal budgets. Warmer winters and hotter summers, the proliferation of the spruce beetle and subsequent die-off of vast swaths of forest, Sudden Aspen Decline, larger and more intense wildfires, and reduced snowpack are just some of the climate change impacts we're seeing on our public lands. In 2005, Colorado's greenhouse emissions were 35 percent higher than they were in 1990. They are projected to grow 81 percent above the 1990 levels by 2020.⁷ Current and proposed federal coal leasing and development contributes to Colorado's greenhouse gas emissions and directly impacts public lands and communities. (7) U.S. Dept. of Agriculture, Spruce Beetle Epidemic and Aspen Decline Management Response Final Environmental Impact Statement (February 2016), at 228.

On June 20, President Obama spoke at Yosemite National Park, declaring that climate change is "the biggest challenge we're going to face in protecting this place and places like it."⁸ He could just have easily been discussing public lands in western Colorado. President Obama condemned those who pay "lip service" to protecting America's natural areas while making climate change worse:

(8) The White House, Remarks by the President at Sentinel Bridge, Yosemite National Park, Office of the Press Secretary (June 20, 2016), available at <https://www.whitehouse.gov/the-press-office/2016/06/20/remarks-president-sentinel-bridge> (last viewed July 28, 2016).

-Make no mistake, climate change is no longer just a threat, it's already a reality. I was talking to some of the rangers here -- here in Yosemite, meadows are drying out. Bird ranges are shifting farther northward. Alpine mammals like pikas are being forced farther upslope to escape higher temperatures. Yosemite's largest glacier, once a mile wide, is now almost gone. We're also seeing longer, more expensive, more dangerous wildfire seasons -- and fires are raging across the West right now. I was just in New Mexico yesterday, which is dealing with a big wildfire, just like folks here in California and four other states -- all while it's still really early in the season.⁹

Comment Excerpt Text:

We suggest considering a modified version of intertract bidding. Rather than hosting a lease sale with multiple tracts up for simultaneous bid, BLM could allow companies to bid on a fixed amount of mining credits. The winning bidders would gain the right to mine a certain amount of coal, as measured in dollars per BTU or dollars per ton. These bidders would then submit applications for the specific tracts of land on which they would like to mine the coal for which they have rights. This process would allow the BLM to better prioritize the fairest return available to taxpayers while allocating credits up to a pre-set carbon, BTU, or tonnage cap. The allocation of credits could also be weighted based on the companies' proven track records of reclamation, financial stability, and worker safety and compensation.

Comment Excerpt Text:

In recent cases, courts have found NEPA violations based on an agency's failure to evaluate a conservation-oriented alternative. See, e.g., *New Mexico v. BLM*, 565 F.3d 683, 710-711 (10th Cir. 2009) (Alternative considering closing Otero Mesa to oil and gas leasing must be considered as part of oil and gas amendment to governing land use plan); *Colorado Environmental Coalition v. Salazar*, 875 F.Supp.2d 1233, 1249-1250 (D.Colo. 2012) (BLM required to consider community alternative protecting Roan Plateau from surface disturbance). Accordingly, the BLM should consider a range of alternatives that includes protecting other resources and values in developing alternatives in the Coal PEIS.

Further, the BLM should fully evaluate a true range of alternatives, rather than setting up alternatives that are at far ends of a spectrum with one "compromise." An agency violates its obligation to consider a reasonable range of alternatives and to take NEPA's hard look at environmental impacts when it only looks at "straw men" for comparison, which the agency has no intention of accepting and are put forth only to lead to the agency's already foregone conclusion. See, e.g., *California v. Block*, 690 F.2d 753 (9th Cir. 1982); *Blue Mountains Diversity Project v. U.S. Forest Service*, 229 F.Supp.2d 1140 (D.Or. 2002); *Oregon Natural Desert Association v. Singleton*, 47 F.Supp.2d 1182 (D.Or. 1998). In the context of the Coal PEIS, there are a variety of issues to be addressed and tools to be considered that merit a range of alternatives that is both broad in terms of options and deep in terms of the level of analysis completed. This will provide the agency with a thorough range of options from which to develop its final PEIS.

Consequently, we recommend that BLM develop alternatives that evaluate the suite of policies that could be used to meet climate goals, including:

- Incorporating a carbon adder into the royalty rate for coal. While measurement and assessment of impacts from upstream emissions (from exploration and production) may be easier to quantify and downstream emissions (from transportation and combustion) may be more challenging because they are more attenuated, a carbon adder may be useful in one or both contexts by offering a straightforward approach and a mechanism to direct funding directly to states and local communities.
- Developing and applying mitigation measures consistent with the mitigation hierarchy, including compensatory mitigation requirements to offset climate impacts.
- Developing a carbon budget and management framework for all fossil fuels developed on federal lands that includes a targeted budget for coal. The budget should inform decisions made by the agency and could be used as a cap to limit future coal sales.
- Incorporating a range of tools to measure carbon emissions and impacts from those emissions, including those discussed above and others that may be under development.

BLM Should Evaluate a Range of Approaches to Meet Other Goals of Reforming the Coal Program.

In addition to a range of alternatives that includes a focus on reducing environmental impacts and methods to meet climate goals, BLM should evaluate a range of alternatives to meet the other goals of the PEIS, including;

- Developing a regional mitigation strategy for the Coal PEIS and/or developing regional mitigation strategies that are focused on high priority areas.
- Amending all affected plans or amending a set of priority plans where ongoing development and risks to communities are highest and setting up an approach for remaining plans.
- Incorporating transition approaches for affected communities that can be a set of common elements or tailored to specific regions or communities, or simply setting out priority areas where transition will be addressed.
 - Evaluating use of royalty rates or mitigation or a combination thereof to address impacts to resources and communities.
 - Eliminating LBA or incorporating LBA into a more proactively managed regional leasing program.
 - Identifying opportunities to incentivize competition, which could include bidding on a set Btu of coal, or determining what role competition can play in other ways.
 - Including a range of tools to ensure a fair return to taxpayers from the federal coal program. At a minimum this means identifying and ensuring fair market value for coal produced. It also includes evaluating the other public benefits that would be gained from contracting the coal program and considering whether and how royalty rates, bonding amounts and reclamation standards should be adjusted.

Organization I: Cloud Peak Energy Inc.

Commenter I: Andrew C. Emrich, P.C.

Private Industry

Other Sections: 8.1

Comment Excerpt Text:

BLM should consider the following facts and specific recommendations during its PEIS review:

- The current administration has targeted America's coal industry through a series of unlawful regulatory and administrative actions. Given the administration's unwillingness to conduct a fair and objective review of the federal coal program, BLM should lift the federal coal leasing moratorium pending its completion of the PEIS. Cloud Peak Energy also requests that BLM disavow the biased White House Coal Report.
- Although the Secretary has directed BLM to undertake a review of the federal coal program through the PEIS, BLM and federal courts have recently and consistently rejected the notion that a significant overhaul of the federal coal leasing program is legally warranted.
- In determining the FMV of federal coal, BLM should consider federal coal lessees' significant financial contributions to the American people, which we believe are unparalleled across any industry in the United States and clearly represent more than a "fair share."
- BLM should retain the current royalty rate and other leasing costs in order to ensure the continued leasing and production of federal coal in accordance with the MLA. Any increase in coal leasing costs would discourage federal coal development, while also reducing federal and state revenues from future coal lease payments.
- BLM should carefully and thoroughly evaluate the impacts of federal coal program reform on state and local communities through meaningful collaboration with coal-producing states concerning socioeconomic impacts related to federal coal mining.
- BLM should implement the recommendations in the IG Report and GAO Report and evaluate their effectiveness prior to undertaking an unnecessary overhaul of the entire federal coal program. In addition, BLM should reconvene the Royalty Policy Committee to undertake a detailed review of the complex royalty and revenue changes contemplated by BLM in its review of the federal coal program.
- BLM should retain the existing LBA framework, while considering ways to streamline the permitting process and reduce the economic burdens on federal coal lessees.
- BLM should not raise the royalty rate on federal coal production. Any increase in the royalty rate would result in the decreased FMV for federal coal leases and decreased lease bonus payments to federal and state governments.
- BLM should acknowledge, as it did in 2011, that it may not legally impose climate change fees or other climate-related fees under the MLA or any other federal statute. Any increase in coal leasing or production costs to advance the administration's political climate objectives would be unlawful.
- BLM should consider the adverse socio-economic impacts that would result from increased costs on federal coal production. Any increase in coal leasing costs would discourage the production of federal coal and thereby diminish the significant benefits to state and local communities dependent on federal coal production.
- BLM should consider the important role of federal coal in meeting America's domestic energy needs, including the benefits of low-cost, reliable electricity, independence from foreign energy sources, and jobs for workers in coal and coal-related industries.

In *Natural Resources Defense Council v. U.S. Forest Service*, the Forest Service Environmental Impact Statement was ruled inadequate for failing to consider the full range of decision alternatives, specifically an analysis of cumulative impacts.⁵⁸ The court stated that an EIS “must include a ‘useful analysis of the cumulative impacts of past, present and future projects’ in sufficient detail to be ‘useful to the decision maker in deciding whether, or how, to alter the program to lessen cumulative impacts.’”⁵⁹ Interior needs to determine the cumulative effect of the coal leasing program, including both existing and expected future leases, on domestic carbon emissions. The best way to evaluate these impacts is in the context of an overall carbon budget for the program. The cumulative impacts assessment should also consider how the program impedes the development of low-carbon energy pathways for countries receiving exported PRB coal.

Interior should evaluate decision alternatives in a manner that reasonably examines a range of climate-consistent scenarios, and should reject alternatives that assume or result in projected carbon emissions above the level set in the carbon budget. Pursuant to the National Environmental Policy Act, environmental impact statements should “include the environmental impacts of the alternatives including the proposed action, any adverse environmental effects which cannot be avoided should the proposal be implemented . . . and any irreversible or irretrievable commitments of resources which would be involved in the proposal should it be implemented.”⁶³ Critically, this evaluation of environmental effects includes the question of whether a given action exceeds the limited available carbon budget for the Powder River Basin. Interior should evaluate climate consistency under the three 450 Scenarios discussed in Part I: climate consistency with CCS deployment in 2020, climate consistency with widespread CCS deployment in 2030, and climate consistency with no CCS deployment through 2040, in addition to any other climate-consistent scenarios.

Interior should investigate decision alternatives that address carbon constraints in a variety of ways: the addition of a carbon adder, changes to royalty and reclamation requirements, or ending leasing by nomination. In addition to the no action reference scenario, this Comment recommends that Interior reject decision alternatives that do not comport with the restrictions of a carbon budget. If a given decision exceeds the 2°C target threshold, then

Interior should reject the decision alternative, and ultimately select an alternative that most closely approximates consistency with the carbon budget and the eventual end of the federal coal program.

Alternative A is the No Action Alternative under which the BLM continues its lease-by-application program. Secretary Jewell has already acknowledged public concerns with the current program, including concerns about global climate change and the impact of coal production and use. The reasonably foreseeable development can be calculated from this no action alternative, which represents developments that would occur over the life of the plan.⁶⁴ Emissions associated with business-as-usual have been compiled by Carbon Tracker, in their analysis of the 2016 Annual Energy Outlook. Under the 2016 Reference Case, annual demand in the Powder River Basin declines to 227 Mt in 2040, and the compounded annual growth rate is - 1.7%. This case exceeds the PRB carbon budget.

[⁶⁴ Bureau of Land Management, BLM Handbook, at III-7. Available at http://www.blm.gov/style/medialib/blm/wo/Information_Resources_Management/policy/blm_handbook.Par.59010.File.dat/H_1624_1.pdf]

Annual Demand (Mt) CAGRs (%)

	2015	2020	2030	2040	2015-20	2020-30	2030-40	2015-40
AEO 2016 Reference Supply	350	339	285	227	-0.6%	-1.7%	-2.2%	-1.7%

Source: Modified Table from Carbon Tracker Report (Referencing IEA, EIA, CTI analysis 2016)

Although the no action alternative is customary in an Environmental Impact Statement, the option is climate-inconsistent and in tension with U.S. law and policy, and it should therefore be rejected.

Alternative B: Proposed Action (Preferred Alternative) Permanently Extending Lease Moratorium

Under this alternative BLM would permanently implement the coal leasing moratorium, allowing all existing leases to naturally sunset without extension. Under this alternative, assuming deployment from CCS, as noted by Carbon Tracker, “the potential production from existing leases is sufficient to meet projected demand in every year through 2040.”⁶⁵ In this scenario, the number of leases are sufficient to meet demand for a range of plausible and high levels of CCS deployment: 450 with CCS deployment in 2020, 450 with widespread CCS deployment in 2030, and 450 with no CCS deployment through 2040.⁶⁶

Alternative C and D: Social Cost of Carbon and Royalty Rate Increases

This alternative would internalize the cost of carbon based on federal social cost of carbon estimates reflecting the “worldwide incremental damage from climatic change brought about by an additional metric ton of CO₂ emissions.”⁶⁷ This price is sensitive to discount rates. A midrange price for the year 2020 is \$46 per ton of CO₂.⁶⁸ Similarly, BLM may consider royalty rates as a means to reform the federal coal program. Increased royalty rates can also include royalty carbon adders, which “directly incorporates a carbon price into the royalty paid on federal coal sales, reflecting its climate costs.”⁶⁹ Interior should analyze these decision alternatives and compare them against the criterion of budget compatibility – whether the reformed alternatives are consistent with federal climate change targets, as illustrated by the 450 Scenario.

2. Just Transition Alternative

The “Just Transition Alternative” is meant to both wind down the federal coal program in order to keep fossil fuels in the ground and to ensure an orderly, effective, and fair transition of workers and communities away from coal to more prosperous and sustainable economies. The “Just Transition Alternative” is defined by the following key components:

1. An end to federal coal leasing: Consistent with authorities and discretion under the Mineral Leasing Act, the Just Transition Alternative imposes a permanent pause on the leasing of federal coal. The primary basis for adopting this permanent pause would be to ensure the protection of the public interest and the interests of the United States. Such justification for an end to leasing is clearly supported by the Mineral Leasing Act.

This pause would apply to all competitive leases (including all leases by application, including emergency leases, as

defined by 43 C.F.R. § 3425.1-4) and lease modifications. We further believe there is ample justification for applying a permanent pause to other forms of non-competitive leasing, such as preference right lease applications and lease exchanges. With regards to lease exchanges, the BLM has clear authority to reject exchanges that are not in the “public interest.” 43 C.F.R. § 3435.4(a); see also 43 C.F.R. § 3436.0-2(b) (related to alluvial valley floor exchanges) and 43 C.F.R. § 2200.0-6 (generally related to exchanges). With regards to preference right lease applications, the BLM has the authority to reject such applications where there does not exist “commercial quantities” of coal. 43 C.F.R. § 3430.5-1(a)(1). Given the dismal state of the coal industry and the overwhelming climate costs that coal imposes on society, it would be dubious at best to claim that any commercial quantities of coal exist where there are preference right lease applications. Accordingly, the BLM has the authority to reject such applications. (20)

Furthermore, to ensure an orderly end to federal coal leasing, the BLM and the Department of the Interior should issue a rule or guidance requiring that as land management planning is undertaken pursuant to 43 C.F.R. § 1610, et seq., that all lands within a resource management area that are not currently leased for coal, be made unavailable for leasing. The authority to impose such direction is set forth at 43 C.F.R. § 3420.1-4(e), which gives the BLM broad discretion to “eliminate additional coal deposits from consideration to protect other resource values.” 43 C.F.R. § 3420.1-4(e)(3).

(20) The only preference right lease applications that exist are in northwestern New Mexico, where Arch Coal, which is currently bankrupt, has the rights to acquire 21,000 acres of leases. Legislation was introduced in the U.S. House of Representatives that would allow the Secretary to retire these preference right lease applications. See HR-1820, available online at <https://www.congress.gov/bill/114th-congress/house-bill/1820/text>. If this legislation is passed, there would be no additional preference right lease applications requiring action. We support this legislation and urge the Secretary of the Interior to encourage its passage in the U.S. Senate and adoption into law.

Putting a permanent pause on leasing will not destroy the U.S. economy or otherwise endanger our energy security. As a recent report looking at leasing in the Powder River Basin found, existing leased reserves in the Powder River Basin are sufficient to meet demand and effectively contribute to limiting temperature increases.

(21) This report is instructive as the Powder River Basin is the largest coal producing region in the United States and imposes the greatest influence on energy supply and demand in the nation. If an end to federal leasing can be justified in the Powder River Basin, it can be justified for federal leasing elsewhere in the U.S.

21 See Exhibit 11, Fulton, M., D. Koplow, R. Capalino, and A. Grant, “Enough Already: Meeting 20C PRB Coal Demand Without Lifting the Federal Moratorium,” Report Prepared for Energy Transition Advisors, Earth Track, and Carbon Tracker Initiative (July 2016), available online at <http://www.carbontracker.org/report/enough-already-2c-powder-river-basin-coal-demand-federal-moratorium/>.

2. Increased royalty rates and rentals: Coal is exacting a tremendous toll on our nation, costing our society billions in climate damages, adverse health impacts from air pollution, and water contamination. Royalty rates from production on existing coal leases and rentals on existing leases must be increased to begin to recoup the costs of these externalities, which are currently shouldered by the public.

Although royalty rates are normally imposed through new leasing, we recommend that the Interior Department and BLM incorporate higher royalty rates into existing leases as existing leases are readjusted pursuant to 43 C.F.R. § 3451.1. To accomplish this, we urge the amendment of 43 C.F.R. § 3473.3-2(a)(1) and (2) to incorporate increased royalty rates for both surface and underground mining. As leases are readjusted, these royalty rates must be applied to existing leases pursuant to 43 C.F.R. § 3451.1(a)(2).

Increasing royalty rates has been recommended by the White House as both a means to generate revenue and address the costs of environmental externalities, including carbon costs. (22)

(22) See Exhibit 12, Executive Office of the President of the United States, “The Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to Taxpayers” (June 2016), available online at https://www.whitehouse.gov/sites/default/files/page/files/20160622_cea_coal_leasing.pdf.

Furthermore, royalty rate reductions should not be approved. Currently, royalty rate reductions are routinely granted as companies claim poverty or difficulty in mining with little apparent scrutiny as to whether the reductions are justified. In Colorado, for example, BLM officials have approved royalty rate reductions to facilitate

methane venting and most recently proposed to approve a retroactive royalty rate reduction for a mine that was not even producing coal. (23) See Exhibits 13 and 14.

Similarly, we urge Interior and BLM to amend 43 C.F.R. § 3473.3-1(a) to raise rental rates for federal coal leases. Currently, rental rates are set at \$3.00 per acre, a figure that has not been adjusted since 1979, if not earlier. This rental rate not only has failed to be adjusted to account for inflation, but fails to account for the fact that some leases may be of small acreage, yet yield significant amounts of coal. Rentals should reflect the value of the lease, which depends on the amount of coal a lease contains. In accordance with 43 C.F.R. § 3473.3-1(a), any increased rental rate must be applied to any readjusted coal lease.

3. Existing leases that are not producing must be canceled: Where a lease is not meeting continued operation requirements under 43 C.F.R. § 3483.1(a)(2), it is subject to cancellation pursuant to 43 C.F.R. § 3452.2. Where a lease is not meeting continued operation requirements, BLM and the Interior Department should make clear that cancellation of the lease must be pursued. To this end, discretionary avenues for avoiding cancellation should be prohibited. Thus, lease suspensions under 43 C.F.R. § 3483.3 and payment of advanced royalties in lieu of continued operation under 43 C.F.R. § 3483.4 should be barred.

The justification for imposing such direction is very clear. Currently, BLM regularly grants lease suspensions and allows payment of royalties in lieu of continued operation with no assessment of whether such actions are appropriate or in the public interest. BLM appears to be under the impression that lease suspensions or advanced royalties are somehow mandated, and that the agency has no choice but to approve company requests. An egregious example of this is with regards to Arch Coal's Carbon Basin Lease in southern Wyoming (No. WYW-139975). Arch acquired this lease with the aim of developing a mine to fuel a proposed coal to liquids facility. However, this coal to liquids facility has never materialized or even shown any promise of materializing. Most recently, the Wyoming Department of Environmental Quality terminated the permit for the proposed facility. (24) Nevertheless, since 2010, Arch has failed to meet continued operation requirements. The BLM has allowed Arch to maintain its lease, however, by routinely allowing the company to pay advanced royalties in lieu of continued operation. (25) These decisions appear to be pro forma in nature, and do not reflect any consideration as to whether it is appropriate or remotely in the public interest to accept advance royalties in lieu of continued operation.

(24) See Exhibit 15, Wyoming Department of Environmental Quality, "Permit Termination, Medicine Bow Fuel and Power Coal to Liquid Project" (June 27, 2016).

(25) See Exhibit 16.

Furthermore, where an existing lease is not producing, yet is part of a producing logical mining unit, BLM and the Interior Department should use their discretion to modify the boundaries of logical mining units to eliminate the non-producing lease and facilitate its cancellation. BLM has such discretion under 43 C.F.R. § 3478.1.

Cancelling leases that are not producing will serve the goal of preventing any potential future development of existing leases and contribute to an orderly end to the federal coal program.

4. Accounting for carbon costs in coal management: It should be made clear, whether through new rules or guidance, that carbon costs must be analyzed, assessed and disclosed as federal coal management decisions are made. Such decisions are most likely to include mining plan modifications issued pursuant to the Mineral Leasing Act, 30 U.S.C. § 207(c), and the Surface Mining Control and Reclamation Act ("SMCRA"), 30 C.F.R. § 746, and lease readjustments. It is imperative that the BLM and Interior maintain close accounting of the carbon emissions and costs resulting from its coal management actions, to ensure full transparency around these emissions and costs, and to meaningfully act to address these emissions and costs. Particularly given that, pursuant to authorities under the Mineral Leasing Act and SMCRA, the Secretary of the Interior has full discretion to disapprove mining plans authorizing the development of leased federal coal, it is imperative that carbon emissions and costs factor into and influence such decisionmaking.

5. Reclamation must be guaranteed: To ensure an orderly end to the federal coal program, full and final reclamation must be guaranteed within a reasonable timeframe. We urge two regulatory changes to ensure this occurs.

First, Interior should amend regulations at 30 C.F.R. §§ 816.100 and 817.100 to provide clarification and specificity around contemporaneous reclamation. Current rules are vague and fail to ensure that reclamation proceeds in a manner that is as “contemporaneously as possible” with mining in accordance with 30 U.S.C. § 1202(e). These regulations should be amended to make clear that the success of contemporaneous reclamation must be measured based on a comparison of Phase III bond release acres, as defined under 30 C.F.R. § 800.40(c)(3), with disturbed acres and ensure that reclamation proceeds at a 1:1 rate, in other words for every acre disturbed, one acre should be fully reclaimed to meet Phase III bond release standards.

Second, just as current BLM rules require diligent development of federal coal, these rules should also require diligent reclamation. To this end, Interior and BLM should consider rule changes to ensure that nonproducing coal leases are fully reclaimed within two years of failing to meet continued operation requirements and set deadlines for the full reclamation of federal coal leases that are no later than 2035. This reclamation deadline should be established by rule and incorporated into lease terms as leases are readjusted.

Finally, Interior should amend self-bonding regulations at 30 C.F.R. § 800.23, and any other regulations, as appropriate, to prohibit self-bonding whenever publicly owned coal is permitted to be mined. This will ensure that, as coal companies continue their decline, that American public resources are fully protected and fully guaranteed to be cleaned up.

6. Prioritizing transition: Above all, the BLM and Interior must make transition away from coal a foremost goal as the federal coal program comes to an end. To do this, the agencies should not only explicitly commit, to the extent possible, their leadership, resources, and expertise to ensure that workers and communities receive the support and assistance they need to transition to more sustainable and prosperous economies. Among the actions that Interior and BLM can and should undertake to ensure transition:

- Work to secure Congressional authorization to direct increased royalty and rental payments toward worker and community support. Under NEPA, agencies are required to rigorously explore and objectively evaluate reasonable alternatives “not within the jurisdiction of the lead agency.” 40 C.F.R. § 1502.14(c). Here, although BLM and Interior may not be able to direct royalties toward transition support, they can recommend that Congress pass legislation that provides such authorization.
- Establishing an Economic Transition Fund, which would be sustained by an increase in reimbursement fees charged by the Interior Department when processing coal-related applications. Under the Federal Land Policy and Management Act (“FLPMA”), Interior has authority to recover reasonable costs associated with its coal management program and to appropriate and spend such monies. Specifically, FLPMA provides the Secretary of the Interior with authority to “require a deposit of any payments intended to reimburse the United States for reasonable costs with respect to applications,” including coal lease application. See 43 U.S.C. § 1734(b). Such payments are “authorized to be appropriated and made available until expended” by FLPMA. Id. Funds from the Economic Transition Fund should be directed toward transition-oriented initiatives.
- Prioritizing support and assistance to help communities transition. In addition to securing funds and making them available, the Department of the Interior can play a key role in helping direct communities to support, steering resources to support conservation and research projects in or near communities, encouraging renewable energy development on public lands. Such leadership could be conveyed through a Secretarial Order that simply makes it an overarching priority of the Interior Department to advance transition

Overall, the Interior Department and BLM must move to keep our publicly owned coal in the ground. However, keeping coal in the ground should not mean that we turn our backs on the workers and communities that have been dependent on coal for so long. Embracing an alternative that ensures “Just Transition,” in other a fair, compassionate, and orderly transition away from coal, is the most effective way to both protect our climate and help our nation effectively move to more sustainable economies and reliable and affordable means of energy production.

A. The PEIS Should Evaluate an Alternative that Ends Federal Coal Leasing Consistent with this country's overarching climate goals, the PEIS should identify as its preferred alternative an end to federal coal leasing, phased in by declining to issue new leases and by not renewing or modifying existing leases. Such an action is both authorized and achievable. BLM has the discretion to end federal coal leasing. The FCLAA provides that the Secretary "is authorized" to identify tracts for leasing and thereafter "shall, in his discretion ... from time to time, offer such lands for leasing" 30 U.S.C. § 201; see also *WildEarth Guardians v. Salazar*, 859 F. Supp. 2d 83, 87 (D.D.C. 2012) ("Under the [FLCAA], the Secretary is permitted to lease public lands for coal mining operations after conducting a competitive bidding process" (emphasis added)). Further, the Secretary has discretion to reject lease applications on the grounds that "leasing of the lands covered by the application, for environmental or other sufficient reasons, would be contrary to the public interest." 43 C.F.R. § 3425.1-8(a)(3). Here, the public interest—as will be reflected in BLM's thorough analysis in the PEIS—overwhelmingly supports an end to federal coal leasing. BLM cannot reject this alternative on grounds that creating an electric generating sector in the U.S. that relies on 100 percent clean energy is infeasible. As explained in a recent paper by Environment America "at least seven detailed studies of clean energy systems – conducted by academics, government agencies and nonprofit organizations– suggest that we have the tools we need to make the transition."³⁰⁰ For many years, scholars explained that the primary barriers achieving a 100 percent clean energy economy were political rather than technological. In 2010, the peer-reviewed journal *Energy Policy* published an article analyzing the feasibility of providing world-wide energy for electric power, transportation, and heating and cooling exclusively from wind, water, and sunlight.³⁰¹ In particular, that paper analyzed current and future energy demand; availability of wind, water and sunlight energy resources; the number of facilities then in use and needed to harness sufficient wind, water, and sunlight energy; and the variability of renewable resources; the economics of massive renewable deployment; and material requirements; and policy implications. The paper concluded that a combination of wind turbines, concentrated solar³⁰⁰ Environment America Research & Policy Center, *WE HAVE THE POWER: 100% RENEWABLE ENERGY FOR A CLEAN, THRIVING AMERICA*, ES-7 (Spring 2016), attached as Ex. 59. ³⁰¹ Mark Z. Jacobson & Mark A. Delucchi, *Providing All Global Energy with Wind, Water, and Solar Power*, 39 *ENERGY POLICY* 1154–1169 (2011), attached as Ex. 60. 78 plants, PV solar plants, rooftop PV solar systems, geothermal plants, hydro-electric power plants, wave devices, and tidal turbines could supply all the energy the world requires by 2030.³⁰² Further, the study concludes that doing so would reduce world power demand by 30 percent, require only 0.59 percent more of the world's land for energy production, and entail similar energy costs. ³⁰³ More recently, the Intergovernmental Panel on Climate Change ("IPCC") and others have explained that in order to achieve the necessary carbon reductions to keep global temperatures within 2 degrees Celsius of pre-industrial times, the global electricity sector must be decarbonized by 2050.³⁰⁴

BLM Should Evaluate an Alternative that Forces Coal Companies to Internalize the Climate Costs of Mining and Combusting Federal Coal In any alternative that allows for continued coal leasing, the PEIS should ensure that the extraordinary costs of mining and burning coal on our global climate are reflected in the price of federal coal by, at a minimum, incorporating into royalties the social costs of carbon and methane. In addition to identifying the value that would accurately reflect those costs, BLM should analyze whether such an alternative would sufficiently discourage federal coal mining to meet U.S. carbon-reduction targets. In April 2016, researches at Harvard University and Vulcan Philanthropies released a paper that utilized the Integrated Planning Model to analyze the market and climate impacts of incorporating a “carbon adder” into federal coal royalties. 305 Their findings indicated that if the Clean Power Plan (“CPP”) is either struck down or otherwise not implemented, incorporating the Interagency Working Group’s social cost of carbon into federal coal royalty rates could achieve roughly three-quarters of the emissions reductions that EPA anticipates under the Clean Power Plan. The analysis also finds that in a scenario where the CPP is upheld by the courts and ultimately implemented, incorporating the social cost of carbon into federal coal royalties would result in a slight up-tick in mining non-federal coal reserves, but this substitution would be tempered by a shift to electricity generation by gas and renewables. 306 Under both a Clean Power Plan and non-Clean Power Plan Scenario, the modeling conducted as part of the study revealed that adding the social cost of carbon into federal coal royalties would increase revenue to the federal government and states even while reducing the total amount of coal mined and 302 Id. at 1154. 303 Id. 304 Lindee Wong, David de Jager, & Pieter van Breevoort, *The Incompatibility of High-Efficient Coal Technology with 2 Degrees Scenarios*, ECOFYS I (April 2016), attached as Ex. 61. 305 Todd Gerarden and James Stock, *FEDERAL COAL PROGRAM REFORM, THE CLEAN POWER PLAN, AND THE INTERACTION OF UPSTREAM AND DOWNSTREAM CLIMATE POLICIES* (April 2016), attached as Ex. 62. 306 Id. at 3. 79 GHGs emitted from the electric sector. 307 Further, as the White House Council of Economic Advisors recognized, even if carbon dioxide emissions from coal combustion are completely internalized through downstream regulation such as the CPP (which remains to be seen), BLM may achieve additional emissions-reductions benefits by requiring coal producers to internalize the climate costs of coal-bed methane emissions that are released during mining.

III. THE PEIS SHOULD EVALUATE A RANGE OF REASONABLE ALTERNATIVES BLM must examine reasonable alternatives that meet the nation’s energy needs while avoiding the extreme social and environmental costs of federal coal leasing. NEPA’s implementing regulations require BLM to “[r]igorously explore and objectively evaluate all reasonable alternatives” to its proposed actions. 40 C.F.R. § 1502.14(a). “The alternatives section is ‘the heart of the environmental impact statement.’” *City of Sausalito v. O’Neill*, 386 F.3d 1186, 1207 (9th Cir. 2004) (quoting 40 C.F.R. § 1502.14). The reasonableness of alternatives is governed by the agency’s statement of the “purpose and need” for the action. See *Wyoming v. U.S. Dep’t of Agric.*, 661 F.3d 1209, 1244 (10th Cir. 2011) (alternatives need not be considered that do not meet purpose and need for project); *Pac. Coast Fed’n of Fishermen’s Associations v. Blank*, 693 F.3d 1084, 1100 (9th Cir. 2012) (same). Here, the purpose and need of the PEIS is to “consider whether and how the [federal coal leasing] may be improved and modernized to foster the orderly development of BLM administered coal on Federal lands in a manner that gives proper consideration to the impact of that development on important stewardship values, while also ensuring a

fair return to the American public.”²⁹⁹ As discussed, those stewardship values include, most prominently for ²⁹⁶ See letter from E. Zukoski, Earthjustice to R. Welch, Colorado State Director, BLM (Feb. 25, 2016) at 1, attached as Ex. 57. ²⁹⁷ Id. at 2-3. ²⁹⁸ See letter from E. Zukoski, Earthjustice to R. Welch, Colorado State Director, BLM (Mar. 16, 2016) at 1, attached as Ex. 58. ²⁹⁹ Secretarial Order No. 3338, at 1. ⁷⁷ purposes of the PEIS, our nation’s commitments to dramatically reduce greenhouse gas emissions. While these comments suggest numerous opportunities to reduce greenhouse gas emissions attributable to burning federal coal, BLM must examine, at a minimum, two overarching alternatives: first, an alternative that ends federal coal leasing; and second, an alternative that requires coal companies to internalize the climate costs of mining and combusting federal coal.

Comment Number: 0020052-12

Organization I: Tri-State Generation and Transmission Association, Inc.

Commenter I: Barbara A. Walz

Comment Excerpt Text:

The idea that access to federal coal should be significantly reduced - or even eliminated - would be disastrous and should not be considered as a reasonable alternative in the PEIS. The "Purpose and Need" of the federal coal program is to satisfy, in part, the requirements of the MLA and MMPA. Curtailment or elimination of federal coal outside the confines of these laws is unwarranted and inappropriate.

Comment Number: 0020052-6

Organization I: Tri-State Generation and Transmission Association, Inc.

Commenter I: Barbara A. Walz

Comment Excerpt Text:

Tri-State encourages BLM to include reasonable alternatives in the PEIS that maximize federal coal use while maintaining the current royalty rate or proposing ways to reduce it. The federal coal program is mature, well established, should be more efficient and should be able to reduce the amount of funding necessary to implement it.

Comment Number: 0020056-13

Organization I: Bowie Resource Partners, LLC

Commenter I: Gene DiClaudio

Comment Excerpt Text:

Order 3338 states that the PEIS will examine several policies that can only be modified by congressional action. These include potential changes in federal royalty rates and the potential imposition of carbon-related fees or taxes. The PEIS should expressly identify which alternatives and actions it considers will require legislative authorization.

From our perspective as guardians of the nation's health, the glaring deficit in the BLM's proposal is the failure to consider ending coal leasing on public lands as a legitimate alternative. Greenhouse gas emissions from coal combustion undermine US climate commitments and threaten the world's ability to stay within a 2C carbon

budget. There is no reason to subject public lands and the US population to further risk when we have enough coal through existing leases to meet our needs as we transition to clean sources of energy.

Commenter I: Brian Ronremoeller

Comment Excerpt Text:

we'd just like to urge BLM to consider the alternative, to end the federal coal leasing program because we can never fully account for all the public health and environmental impacts coal leasing. In Ohio we estimate that about one out of every 100,000 people die from coal-powered pollution in our state. No number above zero is an acceptable number of deaths from coal pollution. No number above zero is an acceptable number of asthma attacks of our children in our state.

Comment Number: 0000869_Kotcon-1

Organization I: Sierra Club

Commenter I: James Kotcon

Comment Excerpt Text:

I am here today to urge that you look very seriously at the no leasing alternative. I realize that from an agency whose mission is to issue leases that's going to be a very heavy lift, and I'd like to give you some reasons why. We have heard a lot about the problems with the leasing program, the need to reform reclamation bonding, the need to end the self-bonding, the need to consider and incorporate the social cost of carbon in the leasing costs, a lot of the adverse impacts on mining communities and so on. And I think you need to consider each of those. EPA asks that you consider both the direct impacts of your alternatives as well as the indirect and cumulative impacts. Much of what we have heard today is testimony from the eastern United States really looks as evidence of the indirect and cumulative impacts of leasing from western states coal. It will be easy to disregard some of this testimony today as not relevant to the western states leasing programs, and I'm urging you to resist that temptation to disregard that and instead look at the impacts on eastern states of the leasing programs in western United States.

For example, about 40 percent of the coal burned in coal-fired power plants in West Virginia is actually western coal. So the air pollution impacts of that western coal, the mercury in the streams, the impacts to fisheries, is an indirect impact of your leasing program, and it's happening in my home State of West Virginia. Please consider that in your analysis.

There are indirect impacts of burning western coals on eastern coal communities, impacts to workers. Right now a number of the major mining companies in West Virginia are bankrupt and don't have the money for reclamation. It is important that you get an estimate of the true cost of coal and that you fully consider those in your analysis.

Impacts to water, soils, vegetation and wildlife are short duration in the whole scheme of things and are already managed by state and federal agencies, including:

- Wyoming DEQ – Land Quality Division, Air Quality Division, Water Quality Division, and Solid & Hazardous Waste Division, Industrial Siting
- Wyoming State Engineers Office – groundwater and surface water use permitting
- BATF – explosives use licensing and inspections
- MSHA – safety and health and inspections
- NRC – nuclear sources related to coal analyzers
- ACOE – any and all wetland impacts
- EPA – drinking water, wastes
- BLM – coal leasing, resource recovery and protection, and inspections
- USFWS – migratory birds of high federal interest

Just to name a few, and BLMs review of addressing impacts to water, soil, vegetation and wildlife, during the PEIS review, are absolutely not necessary.

EPN agrees that the impact on the projected fuel mix and cost of electricity are relevant considerations in a Programmatic EIS on the Federal coal program. EPN urges BLM to ensure that this analysis is comprehensive and not one-sided, as a one-sided evaluation of these issues will undoubtedly be urged by scores of comments driven by a spoken or unspoken desire to eradicate coal from the resource mix in every state and organized electricity market in the country. The BLM must remain cognizant of that fact that emissions from the combustion of coal are comprehensively and strictly regulated through air quality rules set forth by the Environmental Protection Agency (EPA) and state air regulators under the Clean Air Act. These include, without limitation, the Regional Haze Rule and Mercury Air and Toxics Standards, and may one day include the carbon emission limits imposed by the Clean Power Plan.

Commenter I:Ben Pfeiffer

Comment Excerpt Text:

BLM's analysis must include:

- increased illness and mortality due to mining pollution
- climate change from greenhouse gas emissions
- particulates causing air pollution
- loss of biodiversity
- cost to taxpayers of environmental monitoring and cleanup
- decreased property values
- infrastructure damages from mudslides resulting from mountaintop removal
- infrastructure damage from mine blasting
- impacts of acid rain resulting from coal combustion byproducts;
- water pollution; and
- federal, state, and local subsidies to the coal industry.

Comment Number: 0002282_Bradford_20160719-4

Commenter I:David Bradford

Comment Excerpt Text:

Other impacts should also include the impacts of increased cost of electricity if coal mining declines and the cost of generating electricity increases. Currently, coal and natural gas compete for the electricity market share. If less

coal is offered for leasing, what impact will this have on the cost of electricity? If the cost of electricity rises due to decreased availability of coal what impacts will this have on the cost of living and the health and welfare of Americans? These impacts need also to be considered.

Current coal lease requirements on the Grand Mesa, Uncompahgre and Gunnison National Forests provide adequate protections for water resources, wildlife, threatened and endangered species and other land uses. These issues are addressed at the time of lease issuance and I believe are the appropriate level for these evaluations to be made. A national PEIS is not the appropriate place to make these determinations, other than to direct that these items be considered at the project level.

Comment Excerpt Text:

There are several potential options to streamline and speed leasing. First, the PEIS itself can be a valuable tool. An organized and practical discussion of national environmental economic conditions and trends will facilitate tiering by BLM state offices in individual leasing decisions, facilitating discussion of cumulative and indirect impacts and reducing duplication of effort. The PEIS should be expressly designed for tiering, both by BLM in leasing and OSMRE in mine planning.

Similarly, the Secretary should expressly adopt the cumulative impact principles articulated by the D.C. Circuit in their recent decisions *Sierra Club v. FERC*, D.C. Cir. No. 14-1275 (June 28, 2016) and *EarthReports, Inc., v. FERC*, D.C. Cir. No. 15-1127 (July 15, 2016), in which the Court recognized that cumulative impact analyses are to be focused on the same geographic area as the proposed action. The PEIS itself would thus have a broad cumulative impact analysis, but individual leasing decisions should have substantially more focused cumulative impact analyses than those urged by environmental activists.

Third, the PEIS should examine more express and firm deadlines for the various steps in lease processing, including NEPA proceedings. Presently, the only deadlines are various statutory and regulatory minimums. There are very few maximums. Consequently leasing processes can drift for months or years, only coming to a head when the applicant is approaching a supply crisis. Firmer regulatory timelines will not only greatly facilitate planning by the mine operators, they will assist the Department of Interior ("Department") in securing necessary appropriations to adequately staff the BLM and other offices to meet those deadlines. At this stage of scoping Bowie will not propose any specific timelines for any particular steps in leasing, but simply requests that this be an express subject of analysis, discussion, and recommendation in the PEIS.

The PEIS Must Examine How Any Proposed Leasing Reforms are Reconcilable with the Federal Coal Leasing Act Amendments of 1976 ("FCLAA") and the Lessons Learned from the Failed Experiment with Regional Coal Leasing in the Late 1970s and Early 1980s.

Comment Number: 0002443_Koontz_20160727_BowieResources-9

Organization I: Bowie Resource Partners, LLC

Commenter I: Gene DiClaudio

Comment Excerpt Text:

As noted in Order 3338, a current area of controversy is the degree to which the BLM should analyze the effect of leasing decisions on coal combustion downstream. Bowie does not object to the consideration of the impact of federal coal leasing in the aggregate on net coal combustion, but any such analysis must consider the interaction of federal coal leasing with other law and market constraints. The most important of these is EPA's Clean Power Plan ("CPP"). Should the CPP survive judicial review, national coal consumption, and derivatively federal coal production, will be capped. As a result, leasing policy will have little effect on aggregate emissions, and extensive analysis of combustion effects will serve no policy purpose.

Moreover, even if the CPP is overturned, leasing policy is only a small driver of net coal combustion. The combined effect of MATS, CSAPR, regional haze, and NAAQS revisions has been to render fuel costs a continually declining share of consumer operating costs, and to complicate any cause-and-effect relationship between federal coal leasing policy and net coal combustion. As a result, whether the CPP is upheld or not, any PEIS must evaluate net coal combustion effects of various leasing policy proposals with appropriate sensitivity to the highly regulated character of the coal consumer market.

Substitution Analysis and Carbon Budgeting

The third panel centered on substitution analysis and carbon budgeting.

Nathaniel Shoaff (Staff Attorney, Sierra Club) discussed BLM's past substitution analysis and recommendations for approaching substitution in the programmatic review. Shoaff explained that while there is an idea that coal is a global commodity and that consumers will pay to have coal come out of one spot if it does not come out of another; this assumption of "perfect substitution" should be refuted. The Sierra Club takes the position that one cannot make a "reasoned choice among alternatives," as required by the National Environmental Policy Act (NEPA), until the greenhouse gas emission differences are known. This cannot be done without proper substitution analysis. The Sierra Club hopes that through the PEIS, there will be a determination as to whether a federal coal leasing program is consistent with the President's climate objectives and the climate agreements (China, Paris, etc.) that we have already made. All of the emissions from coal production, transportation, and combustion should be quantified in the PEIS; this is a simple calculation. It is harder to analyze how certain policies change the energy market; however, this can and should be done using available tools and models, and is called for in the Secretarial Order itself. The agency should explain its historical views on substitution and why it is changing them, and make its review as transparent and replicable as possible.

Jason Schwartz (Legal Director, Institute for Policy Integrity) discussed how other federal agencies have conducted substitution analysis and provided recommendations for BLM. He suggested that the first place BLM could look was within Interior itself, as its offshore leasing program has an extensive 35 years' worth of experience doing energy substitution analyses. Schwartz explained that before 1982, BLM actually prepared Interior's EIS for offshore leasing, and that today BOEM does much more qualitative and quantitative substitution analysis than BLM does. BLM can learn from its sister agencies'—including BOEM, FERC, the Surface Transportation Board, the U.S. State Department, and EPA—experiences with substitution analyses and should do so by using an economic model that has been used and adopted by other agencies. BOEM's Market Sim, the U.S. Energy Information Administration's NEMS, and ICF International's IPM are all available models that have different benefits and drawbacks. Policy Integrity recommends that environmental impact statements quantify and monetize the full upstream and downstream emission consequences of proposed leasing actions and energy substitute scenarios. This approach is consistent with White House Council on Environmental Quality (CEQ) guidance and is necessary to fulfill NEPA's goals of providing policymakers and the public with information in a way that allows full comparison between alternatives.

Comment Excerpt Text:

Hayes stated that reforming the federal coal program is important for six reasons:

- (1) the federal government's efforts to earn a fair return have a checkered history outlined in many reports and investigations;
- (2) the status quo in terms of federal policy and valuation is not where it needs to be— federal coal is discounted even compared to regional coal sold by states and private actors, much less the national market;
- (3) we have a new appreciation today of key externality costs (and greenhouse gas emissions in particular) that historically have not been accounted for in the program but are now coming to the forefront. The federal government's coal leasing decisions arguably affect 10 percent of the Nation's overall greenhouse gas emissions; the federal government is both a major player and significant cost center for the impacts associated with climate change, like wildfires, droughts, and reduced snowpack;
- (4) we have a new appreciation that the definition of "fair market value" should mean more than the bidder's

market price. The Outer Continental Shelf Lands Act takes a reasonable approach, and we ought to be considering the totality of a resources' value when deciding whether to lease federal natural resources; (5) Congress recognized that there is a cost to providing federal resources to private parties. In 1964, it created the Land and Water Conservation Fund, paid for by oil and gas royalties; and (6) Secretary Jewell has taken a leadership role on reform, with a comprehensive effort underway right now through the Programmatic review.

Commenter I: Jim Lyon

Comment Excerpt Text:

Purpose and need. In order to properly arrive at alternatives that will address the current shortcomings of the federal coal leasing program, it is critical that BLM and DOI set forth the purpose and need of the PEIS so as to reflect the public need to protect wildlife, ensure mining occurs in a manner that is compatible with the spirit and requirements of the law, ensure reclamation occurs, ensure the public is protected and receives fair compensation for the use of its resource, ensure a just transition for communities as coal use declines, and achieve the climate reduction goals needed to meet domestic and international carbon reduction goals. The purpose and need must, therefore, address the following concerns:

- o Whether, where, when and how to lease federal coal to best meet the needs of all Americans.
- o Whether adjustments are needed in order to provide a fair return to the American public.
- o How best to protect wildlife, habitat and other natural resources from the impacts of coal mining.
- o How best to assess the climate impacts of federal coal production and combustion.
- o How to ensure that coal mines operating under current and future leases comply with environmental protection and reclamation requirements
- o Whether the current coal program adequately accounts for externalities including environmental, climate, economic and social impacts.

o The degree to which federal coal should support fulfilling the energy needs of the United States and the role of coal exports.

Comment Excerpt Text:

The Mineral Leasing Act of 1920 (38) (MLA) established a leasing process for all deposits of coal, phosphate, sodium, potassium, oil, and gas on federal land. The goal of Congress in passing the MLA was to encourage better management of federal land and mineral resources. Under the MLA, the two principal methods for leasing coal were public sale by competitive bidding (in areas containing known quantities of coal deposits), (39) and prospecting permits with a right to obtain a preference right lease upon discovery of commercial quantities of coal (in unclaimed and undeveloped areas with no known coal deposits). (40) As is discussed herein, other federal laws impact federal coal mining and leasing decisions. These laws – some of which are administered by other agencies within DOI – must be considered as part of the reform process, particularly issues concerning reclamation, bonding and regulation of surface mining pursuant to the Surface Mining Control and Reclamation Act (SMCRA) administered by OSM. These concerns are addressed below.

(38) 30 U.S.C. §§ 181 et seq. (1920).

(39) *Id.* § 201(a) (1970), amended by scattered sections of 30 U.S.C. §§ 181-352 (1988).

(40) *Id.* § 201(b) (1970), repealed, subject to valid existing rights, by scattered sections of 30 U.S.C. §§ 181-352 (1988).

Congress amended the MLA with the passage of the Federal Coal Leasing Amendments Act (FCLAA) in 1976.

(41) The intent of Congress was to remedy several problems with federal coal leasing and enforcement of the MLA, including:

(41) Pub. L. No. 94-377, 90 Stat. 1013 (codified in scattered sections of 30 U.S.C. §§ 181-352 (1988)); see Harold P. Quinn, Jr., *Lessons from the Coal Law – The Future of Natural Resource Development*, Proceedings of the Rocky Mountain Mineral Law Forty-First Annual Institute (1995); see also Mark Squillace, *The Tragic Story of the Federal Coal Leasing Program*, 27 NAT. RESOURCES J. 3, at 29 (Winter 2013).

Comment Excerpt Text:

While not administered by BLM, the Surface Mining Control and Reclamation Act of 1977 (SMCRA), (133) is critical to addressing chief shortcomings in the mining of federally leased coal. As such, coordination with the Office of Surface Mining and Reclamation and Enforcement (OSM) regarding failures in SMCRA regulation and enforcement must be a central component of BLM's and DOI's effort to reform the federal coal leasing program. Failing to coordinate in this manner will not achieve needed reforms and be a much wasted opportunity. This is particularly true regarding significant failures regarding mine site reclamation and bonding to secure that reclamation.

(133) 30 U.S.C. § 1201 et seq.

Comment Number: 0002454_Hoeft_20160727-3

Commenter I: Bruce Hoeft

Comment Excerpt Text:

We ask that the BLM quantify:

-how much the extraction, processing, transport, and use of coal mined from federal property contributes to climate change, including both carbon dioxide, methane, and particulate releases

-how much coal mining on federal lands constrains the government's ability to comply with carbon-reduction provisions of the UN Climate Change Conference

- how much federal support for coal mining on public lands suppressed the development of alternate energy sources and the industries that would develop and deliver alternatives

- how to ensure that the royalties charged for coal mining on federal property reflect the costs imposed on taxpayers to mediate the impacts of the mining, processing, transport, and burning of that coal

- how to ensure that coal mining protocols on public property compel the mining companies to pay for the damage their operation cause, to both the immediate and global environment; the BLM should identify how effective self-bonding has been as a mechanism to ensure that reclamation liabilities are paid for by those responsible for the damage; simply declaring bankruptcy should not enable companies who bid for coal mining leases to evade liability for the environmental, economic, and health impacts of the mining they do, as well as for damages incurred in the transport and burning of coal

Comment Number: 0002456_Degenfelder_20160728-1

Commenter I: Steve Degenfelder

Comment Excerpt Text:

The Department of Interior must recognize the central role "available" coal leases play in the national security of the United States of America. With over forty percent of the Nation's electricity provided by coal fired power plants, the national security of the country depends on the availability of coal leases as fuel stock for our coal burning electrical generation facilities to delivery of a constant electrical stream to governmental agencies, business and homes in our nation. Computer technology is the primary support mechanism for the United States national security system, space program, military, local law enforcement, along with millions of computers in business and health care which require a constant flow of electrons. These important machines cannot operate

with integrity if their electrical supply is not constant and interruptible which is consistent with electrical supply provided by renewable sources. Renewable sources have not proven they can become part of the electrical baseload without carbon based backup. Unless the EIS concludes the Department can verify, without any doubt, renewable energy sources can be placed into the base load, it must continue a coal leasing program until that time ever occurs. Failure to recognize this fact leaves the EIS open to appeal, which will be won, because you have not considered all the alternatives and cumulative impacts of the decision making process and the EIS was formulated with prejudice.

Should the ROD be delayed, as many NEPA documents seem to be, and the Department determines to continue its leasing moratorium, I hereby request you provide the undersigned with the Code of Federal Regulation (CFR) that allows the Department the authority to disregard the national security of the United States of America in lieu of leasing reform. You should also schedule an appearance before the appropriate Congressional Committee to explain the delayed NEPA document.

Comment Number: 0002456_Degenfelder_20160728-2

Commenter I: Steve Degenfelder

Comment Excerpt Text:

The EIS analysis has to include making the public aware of costs associated with electrical generation. Only comparing operating costs and not including the capital expenditure, federal tax credits and life of project will not depict the true costs. As you know, when all "costs" are considered, electrical generation by renewable sources is uneconomic. This data should be included in the EIS analysis. In addition, the EIS has to contain a review of all scientific views on climate change, not just those on the environmental side who you have established friendships with. That analysis should include data readily available basing climate change primarily on tidal changes in the Pacific Ocean and note that some polar regions have increased ice formation. Without acknowledgement of these facts, the EIS will undoubtedly fail the hard look test required in an appeal before the Interior Board of Land Appeals or an appellate court.

Comment Excerpt Text:

For example, many of the proposals currently advanced by groups in opposition to leasing federal coal are substantially the same as those raised in a 2011 petition for rulemaking calling for the abandonment of the lease-by-application (LBA) method for lease sales and the imposition of "carbon fees." In denying the petition in 2011, BLM explained: how the LBA method is competitive and ensures receipt of fair market value; the pace of leasing occurred at generally the same rate as reserve depletion at existing mines; the National Environmental Policy Act (NEPA) analyses conducted in conjunction for lease sales adequately evaluate GHG emissions; and, imposing a carbon or other externality-based fee would require congressional action authorizing such fees. DOT points to no evidence or rationale that explains why these conclusions are no longer valid. The failure to explain the change in position and abandon the 2011 analysis is arbitrary and capricious.

Commenter I: Kent

Comment Excerpt Text:

The recent land use plan amendments to protect sage grouse and their habitat will also impact the coal mining industry. These amendments have introduced Sagebrush Focal Areas and sterilized large segments of public land to multiple use and natural resource development. Coal is leased on federal land, so it is also affected by all management actions related to sage grouse protection. The amendments impose strict timing, density, and disturbance limitations for general and priority habitat management areas that will impact coal mining. This must be analyzed in the cumulative impact section of this Coal PEIS.

Secretary Jewell issued Order 3338, which directed the BLM to conduct a broad, programmatic review to address the “broad range of issues raised over the course of the past year (and beyond) and the lack of any recent analysis of the Federal coal program.” Id. at 17725.

The rationale for this review is not sufficient and contradicts the long history of sound development that has occurred since the 1986 revisions. There is no new law or development of any existing law that would have triggered this review. There was an extensive statutory and regulatory overhaul of the coal program in the 1970s that brought about the subsequent review in the 1980s, but this is lacking under the current proposed Federal coal program review. The amendments that occurred in 1986 were in response to the approval and implementation of the following statutes and regulations: Federal Coal Leasing Amendments Act of 1976, the Federal Land Policy Management Act of 1976, the Surface Mining Control and Reclamation Act of 1977, and the 1979 regulations implementing these statutes. Environmental Protection in the Federal Coal Leasing Program (Washington, D.C.: U.S. Congress, Office of Technology Assessment, OTA-E-237, May 1984). See 81 Fed. Reg. at 17722. The current proposed review cannot be tied to any similar type of extensive legal overhaul.

Comment Excerpt Text:

The BLM is also concerned about the other environmental impacts of coal mining and whether reclamation is impacted by market conditions. 81 Fed. Reg. at 17724. The BLM is specifically considering whether to raise royalty rates or require an “adder” to be paid to reflect the cost of the harm to the public from “negative externalities” of coal development, to require environmental harms to be mitigated, or to account in the leasing process for whether reclamation responsibilities have been met. Id. at 17727. Under the Surface Mining Control and Reclamation Act of 1977, the Office of Surface Mining Reclamation and Enforcement (OSMRE) and Land Quality Division (LQD) of the Wyoming’s Department of Environmental Quality regulates surface coal mining operations and reclamation activities. 30 U.S.C. §§1211, 1235, 1253; 30 C.F.R. §740.4(b).

The LQD evaluates surface mining permit applications, revisions, and renewals to ensure mining is accomplished in an environmentally sound manner; approves or disapproves the permit applications; and carries out inspections of coal mines to ensure compliance with state's programs. OSMRE and LQD monitor reclamation and reclamation bonding actions. See 30 U.S.C. §1259; 30 C.F.R. §740.4(c)(4). Since 1980, Wyoming's regulatory program has been a partnership effort between the State and OSMRE and has successfully regulated surface coal mining operations and reclamation activities. Any proposed guidance or regulatory changes by BLM that act to control surface coal mining operations and reclamation activities is therefore outside of its jurisdictional authority.

Comment Excerpt Text:

In terms of timing, we believe it is imperative that BLM complete the PEIS, and move forward with revising its regulations and other initiatives necessary to carry out the decisions that will be made at the conclusion of the NEPA process, as soon as practicable. To that end, we urge that particularly with respect to any regulatory or other reforms, such as Resource Management Plan (RMP) amendments, that will require notice and comment, BLM issue its proposed rules or reforms concurrent with issuance of the Final PEIS. This approach is consistent with the process followed by BLM in completing the Solar PEIS. Within three months of completion of the Final Solar PEIS, BLM issued a Record of Decision (ROD) incorporating final amendments to specific Resource Management Plans with solar energy resources. By proceeding in this manner, BLM can put its revised regulatory framework for coal leasing into effect as expeditiously as possible.

While there are numerous important programmatic decisions that must be considered and resolved in the PEIS, BLM must also be careful not to rely on the PEIS process to resolve issues that should be the subject of further, site-specific consideration in the site-specific EISs to be prepared for any future lease sales. Rather, at most the PEIS should provide guidance for how these issues should be considered in site-specific reviews, which must continue to consider the direct environmental impacts associated with the lease under consideration.

For instance, many direct impacts of mining necessitate review at the site-specific lease or mine level. While the PEIS should discuss these impacts at a programmatic level, discussing them in terms of regional or national trends,

the PEIS analysis should not replace the need for much more detailed analysis at the leasing stage as effects can be extremely site specific. Rather, BLM should appropriately tier to the PEIS when considering impacts on a site-specific level.

Comment Excerpt Text:

New concerns arose about FMV for coal leases in the 1980s, particularly with respect to a large lease sale in the PRB. A GAO Report revealed that the agency had received roughly \$100 million less than FMV for the lease. Congress responded by directing formation of a commission – subsequently called the Linowes Commission – to address the FMV issue. Congress also directed a study into whether federal coal leasing was compatible with the Nation’s environmental protection objectives, which resulted in BLM updating its PEIS for the federal coal regulatory scheme.

Once again, coal leasing was halted while these reports were completed, and ultimately the Commission and study recommended that BLM slow the pace of coal leasing, improve procedures to better ensure the government obtains FMV, and more closely consider environmental and other competing resources in making coal leasing decisions. BLM responded by supplementing the PEIS, and then once again modifying the regulatory scheme. And, once again, BLM kept its coal leasing moratorium in place until the revised regulatory scheme was implemented.

Organization I:Natural Resources Defense Council

Commenter I:Geoffrey Fettus

Comment Excerpt Text:

A PEIS is plainly appropriate at this critical juncture for federal coal leasing. One pressing issue that must be addressed in the PEIS has never been the subject of a comprehensive examination under NEPA or any other federal analytical tool – the impact of federal coal leasing on GHG emissions, and the changes necessary to ensure coal leasing supports GHG emission reduction goals. The many developments since the last PEIS update (in the 1980s) also call for the PEIS to comprehensively address both the other environmental issues posed by federal coal leasing, and the coal leasing valuation issues that have come under recent scrutiny. Moreover, as the Secretarial Order and Scoping Notice reflect, in order to properly inform the federal decision-maker, it is vital that these matters all be considered together given that solutions to some issues – such as GHG reductions – may be found in other areas, such as incorporating the social cost of carbon into coal lease pricing.

It is also entirely consistent with NEPA and implementing regulations for a PEIS to be prepared for the entire coal leasing framework, for, as noted, the CEQ regulations call for a single EIS. Indeed, while a single EIS is appropriate where an agency is considering several actions that are either “closely related,” impose “cumulatively significant impacts,” or possess other similarities “such as common timing or geography,” 40 C.F.R. § 1508.25, here all three of these factors support preparation of a single, comprehensive PEIS. See also CEQ Climate Change Guidance at 30 (recognizing a “programmatic NEPA review may also serve as an efficient mechanism to describe Federal agency efforts to adopt sustainable practices for energy efficiency, GHG emissions avoidance or reduction, petroleum product use reduction, and renewable energy use, as well as other sustainability practices”).

Federal coal leasing and production data. Currently, BLM provides geospatial data pertinent to federal coal leasing. However, this data is largely fragmented. Some state BLM offices, particularly Colorado, provide good quality data for federal coal leasing. In other states, if there is BLM data, it is not easy to use. BLM operates LR2000, a database that contains valuable information regarding coal leases, but it is one that only experts can navigate.

BLM should include a synthesized GIS dataset for all federal coal leasing in the country. Additionally, BLM should create datasets of synthesized geospatial information for each state in which federal coal leasing occurs or is proposed. This will help to ensure that communities are fully aware of the extent of federal coal leasing in their respective regions. Within the scope of a programmatic NEPA analysis, BLM must provide, at minimum, maps of the proposed planning area, and indicate which lands are not suitable for development. This GIS data should also include current and pending leases, existing leases that are not producing, and lease bidders and holders. Other information should include:

- Surface ownership and mineral rights, including split estate
- Coal geology and resources on federal lands
- Conservation areas, species habitat and migration routes
- Groundwater and surface water resources
- Coal mining site reclamation operations and the current status of past mined sites
- Coal transportation and end use (for example, coal-fired power plants)
- Coal employment data and regional market information

Organization I: Natural Resources Defense Council

Commenter I: Geoffrey Fettus

Comment Excerpt Text:

In order to ensure that the federal coal PEIS process is transparent, BLM must make the geospatial data accessible to all stakeholders and the public.

Data must be available in a repository with downloadable GIS files, suitable for a variety of GIS platforms (for example: the Esri ArcGIS Online and ArcMap platforms, and the Google Earth Keyhole Markup Language platform).

In addition to the GIS data files, BLM should create an online, interactive data viewer so that non-GIS experts and broader communities can understand the extent of federal coal leasing in their respective regions. The data viewer should be interactive so that people can view more specific characteristics of each lease. These specifications should also be linked to the data repository associated with that particular lease.

For example, while the general repository will provide all of the federal coal leasing geospatial data, the interactive data viewer will allow communities to explore the lease characteristics that are most likely to affect them. This will drastically improve community efforts to make the most effective and efficient decisions regarding resource use. An example of an interactive data viewer can be found on the Colorado Division of Reclamation Mining & Safety website (<http://mining.state.co.us/Reports/Pages/GISData.aspx>). A similar data viewer should be compiled for all federal coal leasing to satisfy the broad scope of a programmatic NEPA analysis.

Comment Excerpt Text:

Evaluating the market and resulting emissions consequences of the coal leasing programs is both required by NEPA and well within BLM's capabilities. 119 In recent months, at least four sophisticated efforts have been made to evaluate the market and emissions consequences of alternative federal coal leasing policies, and concluded that a policy of ending new federal coal lease issuance or modification would have significant effects on mitigating greenhouse gas emissions, while still exceeding both anticipated coal demand for the coming decades, and the time horizon for exceeding 1.5° and 2°C carbon budgets. BLM can and should acknowledge and make use of the sources and methods in these studies to formulate quantitative assessments of the emissions and carbon budget consequences of leasing alternatives (including cessation of leasing, a declining production schedule based on meeting climate targets, and incorporation of a meaningful carbon charge on leased coal production into new or modified lease terms).

(119) See *Ctr. for Biological Diversity v. National Highway Traffic Safety Admin.*, 538 F.3d 1172 (9th Cir. 2008); *Mid States Coalition for Progress v. Comment Excerpt Text:

The BLM should prepare an RFD as part of the Coal PEIS that incorporates sufficient analysis to inform cumulative impact analysis and management decisions. The RFD should follow the elements identified in BLM's guidance for preparing an RFD for oil and gas development. Further, the RFD analysis in the Coal PEIS must not only provide information on the future coal development potential and the amount of coal that will be mined out to at least 2050, but should also look at estimates of the amount of land that will be disturbed by coal mining and the reclamation needs that will be presented by this level of disturbance. There is a need to know disturbance levels and reclamation needs as part of the RFD assessment. The BLM should also update RFDs in existing RMPs to the extent needed.

Commenter 1: Nada Culver

Comment Excerpt Text:

An important issue that BLM must address in the PEIS is the Reasonably Foreseeable Development (RFD) level for federal coal that is likely in the next several decades. RFD is a term that is routinely used when the BLM considers oil and gas development activities, but is also used in other contexts, including for coal and as part of the Solar PEIS. As mentioned in section I above, where we discussed scoping issues, the BLM's NEPA Handbook says that in scoping the BLM should identify "reasonably foreseeable actions." This is essentially direction that the BLM consider coal RFD in the PEIS.

An RFD is essentially a long-term projection of exploration, development, production, and reclamation. Activity that can inform the development of alternatives, analysis of environmental consequences, and selection of a management approach are all affected by the RFD analysis.

In addition, the BLM may need to conduct formal rulemakings to incorporate specific reforms. The BLM can conduct needed NEPA analysis to support the rulemakings and make the ultimate processes more efficient. The BLM should commit to completing these rulemakings, set out a schedule, and prioritize the following rulemakings where the agency determines they are needed to fulfill reforms:

1. Update and expand unsuitability criteria;
2. Update royalty, minimum bid, rental rates and reclamation bonding standards;
3. Incorporate a carbon adder into royalty rates;
4. Develop an updated regional coal leasing approach;
5. Shorten lease review terms;
6. Complete Mine Methane Waste Rule.

Comment Number: 0002488_Sanderson_20160728-13

Organization I: Colorado Mining Association

Commenter I: Stuart Sanderson

Comment Excerpt Text:

To address concerns about fair returns to taxpayers, the BLM will be evaluating whether to raise the royalty rate, limit royalty reductions, identify and require an “adder” to address negative externalities; update the minimum bid and/or establish state-specific minimum bids; raise rental rates to adjust for inflation and/or incorporate lost value of other uses of the land and anticipated externalities of exploratory activities; whether to consider not leasing to companies that have more than 10 years of recoverable reserves coal at the time of lease application; and modification to valuation methodology, among others.

Royalty rates are established under the MLA, as amended (30 U.S.C. 207 (a)); therefore, BLM does not have the authority to raise royalties above 12.5 percent, only Congress does. The assertion made by some stakeholders that current royalty rates do not result in fair return and are lower than the rate established by statute is wildly inaccurate and misrepresents data and fact related to royalty valuation by gerrymandering the metrics used to determine royalties.

BLM must maintain its discretion to reduce royalty rates, because without this discretion it could make extraction of some coal resources uneconomical. BLM has an obligation under the MMPA (30 U.S.C. §21(a)), and FLPMA (43 U.S.C. §1701(a)(12)) to recognize the Nation’s need for domestic sources of minerals. To that end, BLM must be careful that the proposed approaches or combination thereof, comply with the MMPA and FLPMA.

The proposal to evaluate an externality adder is counterproductive. First, the coal industry already pays for climate related impacts through existing regulations. Imposing an adder for other social costs such as loss of recreation will only decrease value of the coal resource by making it costlier to produce, resulting in a decrease in return to taxpayers. Further, the policy to include an adder for practically any conceivable social impact is simply unreasonable, and violates long-standing practice in the management of coal resources. The environmental impacts associated with coal mining are already addressed under a variety of laws, including those cited in these comments.

Comment Number: 0002488_Sanderson_20160728-16

Organization I: Colorado Mining Association

Commenter I: Stuart Sanderson

Other Sections: I

Comment Excerpt Text:

The proposal to exclude operators with at least 10 years of reserves from lease sales is, again, counterproductive because it will reduce competition which critics of the Coal Program complain results in a lack of return to taxpayers. This proposal is also unlawful. Lessee qualifications are established under MLA, as amended and provides:

“That the Secretary of the Interior is authorized to, and upon the petition of any qualified applicant shall, divide any of the coal lands or the deposits of coal, classified and unclassified owned by the United States...” (30 U.S.C. 21(a))

As long as an applicant meets the qualification criteria described in Section I of the MLA, (5) the applicant cannot be arbitrarily excluded from applying or bidding on a lease. Proposed approaches that are unlawful are not implementable. As such, for the reasons, described above, BLM must eliminate these proposed approaches from further detailed analysis.

BLM’s proposal to evaluate valuation methodologies is duplicative. As previously stated, BLM has already begun implementing a number of reforms designed to improve and standardize the valuation process, including the establishment of a Memorandum of Understanding with the Department’s Office of Valuation Services. Moreover, any proposed approach to deal with concerns related to fair market value is no longer necessary given the fact DOI issued new rules governing value and revenue collection on June 30, 2016. Re-addressing these concerns under the PEIS is redundant and unnecessary (See 81 FR 43338).

(5) A citizen of the United States; an association of citizens organized under the laws of the United States or any state thereof; a corporation organized under the laws of the United States; or of any state thereof, including a company or corporation operating a common carrier railroad public body, including municipalities. Other special leasing qualifications include: The aggregate acreage in leases and applications in which you can hold an interest, directly or indirectly, cannot exceed 75,000 acres in any one state and no more than 150,000 acres in the United States; you may not acquire any other mineral leases under the Mineral Leasing Act of 1920, as amended, if you hold or have held a federal coal lease for 10 or more years that has not produced commercial quantities of coal. Other minerals that can be leased under the Mineral Leasing Act of 1920 include oil, natural gas, sodium, potassium, phosphate, sulfur, and gilsonite; as a part of your application for a new coal lease, you must provide a self-certified statement that you are in compliance with all applicable laws and regulations.

CMA recommends BLM eliminate from detailed analyses any proposed approaches and modifications related to valuation procedures, including any approaches or modifications rejected or subject to litigation from the recent review. BLM cannot allow environmental groups that failed at pressing their agenda in another DOI agency, use BLM through the PEIS, as a way to push their agenda through the backdoor.

BLM’s proposal to consider whether landscape scale planning for coal resources is needed, is unnecessary and redundant. Under BLM’s Planning 2.0 initiative, BLM is seeking to amend its land use planning regulations to consider landscape scale planning, this includes landscape scale planning for all resources managed by the BLM, which clearly includes coal. While CMA opposes the changes proposed in the Planning 2.0 initiative, that does not

change the fact that re-evaluating landscape scale planning as part of the Coal Program PEIS is redundant, because no new information would be yielded, unless BLM made actual amendments to resource management plans at a landscape scale.

Comment Number: 0002488_Sanderson_20160728-2

Organization I:Colorado Mining Association

Commenter I:Stuart Sanderson

Comment Excerpt Text:

The commencement of the PEIS was accompanied by a moratorium on issuance of new leases or modifications of existing leases with some exceptions, causing great uncertainty among coal producers. All this presupposes some defect in the current leasing program, a defect which has not been demonstrated to exist. Other recent reviews of the leasing program (GAO and the Department's Office of the Inspector General or OIG) recommended relatively minor updates such as enhancing the appraisal process. Neither contained a call for a wide-ranging comprehensive review and moratorium that extends well into the next Administration. The OIG's conclusions state as follows: "Fortunately, most of the identified issues can be resolved with little or no additional funding or personnel."

Comment Excerpt Text:

These legal and policy concerns embrace numerous laws, including the:

- > Surface Mining Control and Reclamation Act (30 U.S.C. 25 et seq., hereinafter SMCRA)
- > Mining and Minerals Policy Act (30 U.S.C. 21a; hereinafter MMPA);
- > Mineral Leasing Act, as amended (30 U.S.C. 181 et seq., hereinafter MLA);
- > Federal Land Policy and Management Act of 1976 (43 U.S.C 1701 et seq., hereinafter FLPMA);
- > National Environmental Policy Act (42 U.S.C. 4321 et seq., hereinafter NEPA)
- > Data Quality Act (Pub. L. No. 106-554, § 515, 114 Stat. 2763, 2764a-153-154 (2000), hereinafter DQA).

BLM must address the following issues in the NEPA documents associated with this Notice to ensure compliance with these laws.

Comment Number: 0002488_Sanderson_20160728-8

Organization I: Colorado Mining Association

Commenter I: Stuart Sanderson

Comment Excerpt Text:

The Notice indicates that the PEIS will examine where to lease and where not to lease, through BLM's land use planning authority under FLPMA consistent with the recent BLM Planning 2.0 initiative to conduct landscape scale planning. It also will assess whether BLM's unsuitability screening criteria adequately address the questions of where and/or where not to lease for coal production, as well as other potential factors that could be applied during the planning process to provide guidance on the most appropriate locations for coal leasing. (81 FR 17725).

Review of this issue is unnecessary and duplicative. BLM already analyzes during land use planning the availability of certain lands that are open, closed, or limited to mineral leasing. When conducting land use planning BLM is required to conduct NEPA analysis. As such, thorough environmental and impact analyses are required when deciding what lands are available to coal leasing.

Comment Number: 0002488_Sanderson_20160728-9

Organization I: Colorado Mining Association

Commenter I: Stuart Sanderson

Other Sections: I

Comment Excerpt Text:

The question of whether the unsuitability criteria are adequate to determine where and where not to lease is inappropriate because the unsuitability criteria is already established by statute. Neither BLM nor DOI have the authority to revise or change statutory direction; only Congress holds the authority to make changes to the unsuitability criteria. As such, any findings regarding adequacy of the unsuitability criteria during the PEIS review cannot be implemented by BLM or DOI without Congressional action. Therefore, expending resources on something that BLM lacks authority to change is an exercise in futility. Thus, further consideration of whether the unsuitability criteria are adequate must be eliminated from further detailed analysis.

In addition, CMA opposes the approach outlined in BLM's Planning 2.0 initiative, as it violates FLPMA, MMPA, among other issues. CMA incorporates by reference the comments of the American Exploration & Mining Association regarding the flaws and legal shortcomings related to BLM Planning 2.0, and landscape scale planning. (3)

(3) See, AEMA "Comments on Proposed Amendments to Resource Management Planning Regulations (BLM 2.0)," (81 FR 9674). Incorporated by reference. Available at: <https://www.miningamerica.org/wp-content/uploads/2016/07/AEMA-Planning-2-0-comments-final-5-24-16-attachments-included.pdf>.

CMA reminds BLM that any proposed approaches or combination of approaches revising the Coal Program must comply with FLPMA, MMPA, and all other laws governing minerals. Any proposed approaches, revisions or combination thereof that do not comply with law must be eliminated from detailed analysis.

Although Secretarial Order No. 3338 now directs BLM to prepare the nation-wide PEIS, BLM has recently expressed its unwavering position that a significant overhaul of the federal coal program is unnecessary. As an initial matter, neither the MLA, NEPA, or any other statute compels BLM to perform supplemental environmental analysis with respect to the existing coal program or to modify the current program. Even the Secretary admits that BLM has no affirmative or mandatory obligation to conduct programmatic review of the federal coal program. See Secretarial Order No. 3338, Sec. 4 (Jan. 15, 2016) (directing BLM to perform a “[d]iscretionary” programmatic review of the federal coal program). More importantly, in the context of rejecting an administrative petition to overhaul the federal coal program in Wyoming and Montana, and the extensive federal court litigation that followed this decision, BLM has flatly rejected any contemplated overhaul of the federal coal program as both unwarranted and unlawful. The recent attempts by environmental groups to compel BLM’s modification to the federal coal leasing program have been uniformly rejected by BLM and two federal judges in three separate legal decisions.

Comment Excerpt Text:

Other agencies have relied on climate impact assessments when evaluating whether or not a decision is in the public interest. For example, the Department of State decision rejecting the TransCanada Keystone Pipeline (“Keystone XL”) provides additional context for construing the public interest. The determination turned on whether the project served the national interest, and the environmental impact statement for reaching this determination was conducted in a manner consistent with NEPA requirements.³⁰ The decision to reject the pipeline relied on many factors, critically including the fact that approval would undermine U.S. climate change policy:

[30 Department of State, Record of Decision and National Interest Determination: TransCanada Keystone Pipeline, L.P. Application for Presidential Permit. Available at <https://keystonepipeline-xl.state.gov/nid/249254.htm>]

[A] decision to approve this proposed Project would undermine U.S. objectives on climate change; it could call into question internationally the broader efforts of the United States to transition to less-polluting forms of energy and would raise doubts about the U.S. resolve to do so. In turn, this could raise questions for some countries about how aggressively they should combat climate change domestically, and potentially reduce the United States’ ability to advance climate and broader objectives with allies and other partners in various bilateral and multilateral contexts... [A] decision to deny the permit would support U.S. relationships with countries where climate issues are important and encourage actions that combat climate change and benefit the United States.³¹

Comment Excerpt Text:

For example, to accomplish its objective at what it subjectively considers to be "fair," the BLM is proposing to create an "adder" to internalize the environmental costs from coal development. 81 Fed. Reg. at 17726. Congress has not delegated to the BLM any authority to impose an "adder," much less make policy choices and value judgments on what should be included in calculating the environmental adder. See 30 U.S.C. §§ 181 through 207 and 30 U.S.C. §§ 351 through 360. Additionally, the BLM is proposing to by-pass Interior's Royalty Policy Committee and study how it can create out of whole cloth a system for internalizing several environmental costs into the royalty rate imposed on federal coal leases. 81 Fed. Reg. at 17726. Congress has authorized the BLM to impose a royalty rate starting at 12.5%, with exceptions. 30 U.S.C. § 207. That royalty rate is to be applied against the fair market value of the federal coal. Id. §§ 201 and 207. Nothing about that simple formula Congress developed to incentivize the exploration and development of the federal coal asset calls for the BLM to compensate for externalities. Congress has not delegated any authority to the BLM to create policy on what the rate should compensate for and what it should, as a result, penalize or deter. See 30 U.S.C. §§ 181 through 207.

Comment Excerpt Text:

The taxable value of coal in Wyoming is based on the FMV of the product extracted. To reach that value the Wyoming Department of Revenue (WDOR) allows for deduction of many of the expenses currently allowable by the BLM's Coal Evaluation Handbook H-3073-1 (Oct. 2, 2014). The WDOR Property Tax Division values industrial properties in the State and utilizes the income approach in establishing FMV of these properties. This approach is the same as that used by BLM in the Coal Evaluation Handbook. Wyoming has a great deal of experience in the process of valuing property to establish FMV. The Wyoming constitution and statutes require it. See Wyoming Constit., art. 15 § 11(a); W.S. 39-14-103(b)(ii). The BLM must consider its existing guidance and Wyoming's expertise and role in determining fair market value and should engage the WDOR when considering any changes.

The PEIS process is having a disproportionate impact on Wyoming and time is of the essence for Wyoming and Wyoming mine workers. DOI has suggested that this review is temporary and time limited- three years. However, there is no written commitment by the DOI or the BLM to a three-year schedule. It regularly takes a minimum of seven to ten years to complete an Environmental Impact Statement in Wyoming. Interestingly the BLM's Solar Energy Development PEIS- considered a priority of the Obama administration- took more than four

years to complete and the BLM is only now proceeding with updating its rules and regulations. The BLM needs to stop the PEIS, but at a minimum it needs to commit in writing what it has promised repeatedly, that the PEIS will be completed by January 15, 2019 and, completed or not, that the moratorium will expire on that date.

One thing the BLM should do is "[i]dentify and eliminate from detailed study the issues which are not significant[.]" 40 C.F.R. § 1501.7(a)(3). For instance, the BLM is proposing to reevaluate how the coal leasing program imposes a royalty on produced coal, and how the agency values that coal. 81 Fed. Reg. 17723-24, 17726-27. Yet the BLM in 2014 already made changes to its federal coal program leasing process and FMV calculations to address concerns raised by the U.S. Government Accountability Office (GAO) and the U.S. Department of the Interior's Office of Inspector General (OIG). See *infra* 2.3. The BLM developed new protocols and issued policy guidance, a manual, and a handbook to implement the changes. *Id.* And, just this month, the Office of Natural Resources Revenue (ONRR) issued a final rule updating the royalty and production valuation regulations that cover federal coal. 81 Fed. Reg. 43338 (July 1, 2016). In that final rule, the agency determined that the changes it was making to its coal royalty and production valuation regulations were not significant and did not warrant review under NEPA. *Id.* at 43368. Likewise, the BLM should eliminate from its PEIS a study of the royalty rate and coal valuation.

The BLM's request for scoping comments identifies a number of issues that the BLM intends to study. 81 Fed. Reg. at 17725-27. In that notice, the BLM claims authority to administer the federal coal program under the Mineral Leasing Act, 30 U.S.C. §§ 181 through 207, and the Mineral Leasing Act for Acquired Lands, 30 U.S.C. §§ 351 through 360. 81 Fed. Reg. at 17721. However, many of the things the BLM is proposing to study in the PEIS cannot be made into law unless and until Congress changes the Mineral Leasing Acts to give BLM the authority to make those changes.

Comment Excerpt Text:

The way the BLM Wyoming State Office runs the federal coal program in Wyoming shows that the program is not broken. Wyoming dwarfs all other states in federal coal production. 2015 U.S. Energy Information Administration- Sales of Fossil Fuels Produced from Federal and Indian Lands, FY 2003 through FY 2014- Page 1 (Figure 1); (Attachment 3 WY0-00006, 00020). Federal coal produced from the Powder River Basin in Montana and Wyoming accounts for more than 85 percent of all federal coal production, and approximately 40 percent of all coal mined in the U.S. Therefore, the administration's call for revisions to the federal coal program targets coal production in Wyoming, but the administration cannot identify any issues with the way BLM Wyoming manages the program.

The PEIS further states that the BLM will consider ways to compensate for externalities, such as climate change, in an attempt to obtain what is now being called a "fair return." That new term, fair return, does not appear in any statute granting the Secretary authority to administer the federal coal program. Additionally, Congress has never given the Secretary authority to develop a system for internalizing any of the external costs now being analyzed in the PEIS process or to determine what is "fair." This PEIS process appears to be an attempt to bypass Congress and impose by administrative fiat a Carbon Tax.

Comment Excerpt Text:

This Programmatic Environmental Impact Statement (PEIS) states its purpose as environmental stewardship. States like Wyoming, where coal is produced and environmental stewardship is a model for the nation, were not consulted and were caught by surprise. Companies with expertise in mining and reclamation were given no warning. Now, national revenues, energy users across the nation, coal miners and their families are at risk. The justification for this PEIS and the manner it was unveiled are unjustifiable.

Comment Excerpt Text:

The BLM must narrow the scope of issues being addressed in the PEIS or its analysis will get out of control chasing down every little sub- issue that leads to another sub-issue. Wyoming and its citizens are being significantly impacted every day that the moratorium continues to be in place. Therefore, it is imperative that the BLM identify only the relevant, truly significant and appropriate issues that need to be studied and get through the PEIS process in as efficient a pace as possible.

Comment Excerpt Text:

The policy choices that must go into deciding what the royalty rate, rental, bonus, or any other charge imposed on a federal coal lease should compensate for are Congress's to make in the first instance. These issues should not bog down the BLM's PEIS process. Congress has not even authorized or directed the BLM or the DOI to study these issues in order to make recommendations for changing the Mineral Leasing Act, or any other act of Congress. Only after Congress provides direction and authorization through legislation for the BLM to embark on finding ways to address externalities in the federal coal program may BLM create regulations to carry out the policy choices made by Congress. Therefore, the BLM should eliminate from the PEIS process any analysis of how to internalize costs not already covered by the federal coal program.

Comment Excerpt Text:

What is more, the BLM should eliminate from study those things that cannot be made part of a final decision by the agency because the BLM lacks statutory authority to make the regulatory change. Cf. *Effective Use of Programmatic NEPA Reviews*, Council of Environmental Quality, pp. 19-20 (explaining that potentially significant environmental impacts are those that flow from the proposed federal action and that the proposed action drives the issues addressed in the NEPA review); (WY0-00057 to 00058). "A federal agency is a creature of statute and derives its existence, authority and powers from Congress alone. It has no constitutional or common law existence or authority outside that expressly conveyed to it by Congress." *Wyoming v. US. Dep 't of the Interior*, No. 15-cv-043, 2016 WL 3509415, *12 (June 21, 2016) appeal filed, No. 16-8069 (10th Cir.) (citation omitted); (WY0-00130). "Regardless of how serious the problem an administrative agency seeks to address, [] it may not exercise its authority in a manner that is inconsistent with the administrative structure that Congress enacted into law." *Id.* at *3. (citation and quotation omitted); (WY0-00119). Therefore, if the BLM lacks authority to take a particular action it should not amass needless detail on environmental impacts that might flow from that unavailable action.

One benefit of the "stay in your lane" approach is to avoid creating inconsistent, incompatible, or duplicative requirements. Duplicative regulations frustrate and delay development and they incentivize operators to move development activity off of federal lands negatively impacting states that rely heavily on those revenues to fund public projects and services. The BLM must avoid the impact and consequences of straying outside of its lane and the attendant effect of inconsistent, incompatible, and duplicative requirements on state and local governments, tribes, and the U.S. economy, and on air pollutant emissions

Comment Excerpt Text:

For example, the BLM's scoping notice uses language implying that the BLM will consider impacts from all forms of coal development, not just federal coal development and not just the impacts caused by the leasing and mining process. 81 Fed. Reg. at 17726. Congress has not delegated BLM authority to use the federal coal program to compensate for externalities that result from all "coal development." See 30 U.S.C. §§ 181 through 207 and 30 U.S.C. §§ 351 through 360. The BLM should limit the scope of its PEIS analysis to the federal coal leasing process Congress has charged it to administer and not engage in an analysis of matters beyond the scope of its authority. In this vein, the BLM is proposing to study whether the U.S. is receiving a "fair return" on its coal assets. 81 Fed.

Reg. at 17723. The BLM asserts that there is concern that the public is not getting the full value of the coal being leased. *Id.* However, the BLM already made adjustments to its processes that addressed concerns raised by the OIG and GAO. *Id.*; see also *infra* 2.3. Moreover, the ONRR has finalized changes to the royalty and valuation regulations that impact the return on coal. 81 Fed. Reg. at 43338. Therefore, the BLM is proposing to study how to make leasing coal "fair" by charging for the climate change the BLM attributes to coal development and use. 81 Fed. Reg. at 17723. However, nothing about the Mineral Leasing Acts shows an intent from Congress to delegate to the BLM any authority to create a "fair" system based on the environmental concerns raised by BLM. See 30 U.S.C. §§ 181 through 207 and 30 U.S.C. §§ 351 through 360. The Acts direct the BLM to promote coal leasing, they do not contain any provision authorizing the BLM to address climate change. *Id.* Those authorities are found in other acts of Congress and were delegated to states and agencies outside of the U.S. Department of the Interior (DOI) that have the expertise to analyze and manage the issues.

As BLM and Interior prepare the PEIS, the agencies must analyze and assess the impacts of similar and cumulative action consistent with NEPA. Indeed, in accordance with NEPA, the scope of an EIS must include all "[c]umulative" and "[s]imilar" actions. 40 C.F.R. § 1508.25(a)(2) and (3). Cumulative actions are defined as those that "when viewed with other proposed actions have cumulatively significant impacts and should therefore be discussed in the same statement." 40 C.F.R. § 1508.25(a)(2). Similar actions are defined as those that "when viewed with other reasonably foreseeable or proposed agency actions, have similarities that provide a basis for evaluating their environmental consequences together, such as common timing or geography." 40 C.F.R. § 1508.25(a)(3). Pursuant to NEPA regulations, both cumulative and similar actions must be analyzed and assessed together with alternatives and any proposed agency actions in the same EIS.

With regards to cumulative and similar actions, it is imperative that the PEIS, at a minimum, address the following:

i. The impacts of oil and gas development in the western United States

Oil and gas development, particularly the development of federal oil and gas as authorized by the BLM, is not only a cumulative action, but a similar action under NEPA. Oil and gas development, particularly federal oil and gas development, often occurs on or near mines that are producing federal coal. For example, a massive oil and gas project under consideration by the BLM in the Powder River Basin of Wyoming would take place where extensive coal mining is currently occurring. See 80 Fed. Reg. 65,242 (Oct. 26, 2015). At a minimum, oil and gas development occurs extensively throughout the coal producing regions of the western United States, where the vast amount of federal coal is located and mined.

See Attached for Graphic - Federal oil and gas wells in the Uinta Basin of northeastern Utah adjacent to the Bonanza coal-fired power plant. The Bonanza power plant is fueled by the nearby Deserado coal mine in northwestern Colorado, which is comprised almost entirely of federal coal reserves.

Not only does oil and gas development take place in similar geographies and at similar times as coal mining, it poses similar impacts, particularly in terms of air emissions and climate impacts. Indeed, as reports indicate, the onshore and offshore development of federal oil and gas contributes to nearly 10% of all U.S. greenhouse gas emissions. (46) Onshore development of federal oil and gas, which largely occurs in the western United States, often at or near coal mining operations, accounts for nearly 4% of all U.S. greenhouse gas emissions. To this end, climate concerns related to oil and gas development are entirely relevant to addressing the climate impacts of the federal coal program and must be fully analyzed and assessed in the PEIS as similar and/or cumulative actions.

The need to address the impacts of oil and gas development in the PEIS together with the impacts of the federal coal program is critical given that there are a number of reasonably foreseeable proposed oil and gas developments currently under consideration by the BLM, including:

- The Continental Divide-Creston oil and gas project in southern Wyoming, approval of which would open the door for 8,950 new oil and gas wells. See 81 Fed. Reg. 22,628 (April 18, 2016).

- The Monument Butte oil and gas project in northeastern Utah, approval of which would open the door for 5,750 new oil and gas wells. See 81 Fed. Reg. 41,331 (June 24, 2016).
- The Converse County oil and gas project in eastern Wyoming, approval of which would open the door for 5,000 new oil and gas wells. See 79 Fed. Reg. 28,538 (May 16, 2014).
- The Greater Crossbow oil and gas project in northeastern Wyoming, approval of which would open the door for 1,500 oil and gas wells. See 80 Fed. Reg. 65,242 (Oct. 26, 2015).
- Extensive oil and gas leasing in Colorado, Montana, New Mexico, Utah, and Wyoming. As the BLM's own statistics show, millions of acres of these states have been leased over the years, opening the door for extensive oil and gas development. In the remainder of 2016, the BLM is proposing lease 87 parcels in August comprising 89,137 acres in Wyoming, 21 parcels in November comprising 30,197 acres in Wyoming, 91 parcels in October comprising 19,790 acres in Montana, 28 parcels in November comprising 12,344 acres in Utah, 36 parcels in September comprising 13,876 acres in New Mexico, and 37 parcels in November comprising 25,298 acres in Colorado. (47) It is reasonable to believe that the BLM is likely to propose, offer for sale, and issue millions more acres of federal oil and gas leases in the near future. The climate consequences of such leasing actions must be addressed in the PEIS.

(47) See BLM, "Notice of Competitive Oil and Gas Lease Sale" (May 4, 2016), available online at <https://eplanning.blm.gov/epl-front-office/projects/nepa/61292/73465/80674/08list.pdf>; BLM, "Environmental Assessment, November 1, 2016 Competitive Oil and Gas Lease Sale Parcels," EA No. DOI-BLM-WY-D040-2016-0138EA (April 2016), available online at <https://eplanning.blm.gov/epl-front-office/projects/nepa/60579/72678/79780/EAv1.pdf>; BLM, "Notice of Competitive Oil and Gas Lease Sale" (July 2016), available online at http://www.blm.gov/style/medialib/blm/mt/blm_programs/energy/oil_and_gas/leasing/lease_sale_s/2016/oct16_2016.Par.89806.File.dat/10_18_16%20SaleNotice_Map_List_Stips_for%20postin.g.pdf; BLM, "Environmental Assessment, November 2016 Competitive Oil and Gas Lease Sale," EA No. DOI-BLM-UT-G010-2016-033-EA, available online at http://www.blm.gov/style/medialib/blm/mt/blm_programs/energy/oil_and_gas/leasing/lease_sale_s/2016/oct16_2016.Par.89806.File.dat/10_18_16%20SaleNotice_Map_List_Stips_for%20postin.g.pdf; BLM, "Notice of Competitive Oil and Gas Lease Sale" (April 20, 2016), available online at http://www.blm.gov/style/medialib/blm/nm/programs/0/og_sale_notices_and/2016/july_2016.Par.97830.File.dat/July%202016%20OG%20Lease%20Sale%20Notice.pdf; BLM, "November 10, 2016 Oil and Gas Lease Sale" website available at http://www.blm.gov/co/st/en/BLM_Programs/oilandgas/oil_and_gas_lease/2016/november_2016.html.

The climate impacts of the federal coal program cannot be analyzed in a piecemeal fashion that overlooks BLM's twin role in managing onshore oil and gas. Particularly given that the scope of the PEIS will necessarily be national in focus, if not broader, the BLM is compelled under NEPA to ensure these similar actions are fully accounted for.

The need to address the reasonably foreseeable climate impacts of oil and gas development is underscored by the greenhouse gas emissions that are likely to result. As reported, if fully developed, unleased onshore oil and gas reserves stand to release nearly 30 billion metric tons of carbon. (48) See Table below.

See Attached for Table - Carbon Emissions (in billion metric tons) Projected from Unleased Federal Onshore Oil and Gas Reserves(48) See Exhibit 5 at 18

Comment Excerpt Text:

State and Private Coal Development

The PEIS must analyze and assess the impacts of state and private coal development, particularly as such development is often connected to the mining of federal coal.

Under NEPA, the direct, indirect, and cumulative impacts of connected actions must be analyzed in the same

NEPA document as a proposed action. As the Interior Board of Land Appeals (“IBLA”) has held, “connected action must be considered to be a part of the proposed action when determining whether a proposed action will have a significant effect on the human environment.” *Glacier-Two Medicine Alliance, et. al.*, 88 IBLA 133 (1985), 134. The 10th Circuit has explained, “[o]ne of the primary reasons for requiring an agency to evaluate ‘connected actions’ in a single NEPA analysis is to prevent agency from minimizing the potential environmental consequences of a proposed action (and thus short-circuiting NEPA review) by segmenting or isolating an individual action that, by itself, may not have a significant environmental impact.” *Citizens’ Committee to Save our Canyons v. U.S. Forest Service*, 297 F.3d 1012, 1029 (10th Cir. 2002) (citations omitted).

A “connected action” is defined as one that is “closely related” to other actions and is identified based on three factors in NEPA’s implementing regulations. Actions are “connected” if they:

- (i) automatically trigger other actions which may require environmental impact statements.
- (ii) cannot or will not proceed unless other actions are taken previously or simultaneously.
- (iii) are interdependent parts of a larger action and depend on the larger action for their justification.”

40 C.F.R. § 1508.25(a)(1). To determine whether actions are connected, the Tenth Circuit applies the “independent utility test,” which asks whether “each of the two projects would have taken place with or without the other” *Wilderness Workshop v. U.S. Bureau of Land Mgmt.*, 531 F. 3d 1220, 1229 (10th Cir. 2008) (emphasis added) (quoting *Great Basin Mine Watch v. Hankins*, 456 F.3d 955, 969 (9th Cir. 2006); see also *Wetlands Action Network*, 222 F.3d at 1118 (“[W]e have rejected claims that actions were connected when each of the two projects would have taken place with or without the other and thus had independent utility.” (internal quotation marks omitted)); *South Carolina v. O’Leary*, 64 F.3d 892, 899 (4th Cir. 1995) (holding that actions are not “connected” when they are “independent and separable”).

Here, it is often the case that approval of federal coal mining facilitates the mining of state and privately owned coal. In many cases, mines in the western United States consist of an amalgam of privately owned, state owned, and federal coal. Not only that, but approval of federal coal mining can influence the development of state and privately coal on a larger scale. For instance, if cheap Powder River Basin coal continues to be mined and sold, there will be less incentive to develop private and state coal. Conversely, if Powder River Basin coal production declines, would private and state coal production necessarily increase?

See attached for graphic - Twenty Mile Federal Coal Leases

An example of a mine with extensive state, private, and some federal coal reserves. The Foidel Creek (or Twentymile) mine, owned by Peabody Energy, is in northwestern Colorado. The map above shows the location of federal coal leases in green. Outside these leases, the coal is state owned (under the blue lands) or private (under the white lands). (50) Map from BLM, “Environmental Assessment for the Peabody Twentymile Coal, LLC COC54608 Lease Modification” (Oct. 2014), available online at https://eplanning.blm.gov/epl-front-office/projects/nepa/41852/55032/59723/DOI-BLM-CO-N010-2014-044-EA-Public_Comment.pdf.

The PEIS must rigorously analyze the effects that the federal coal program has on the connected action of private and state coal mining, not only as it relates to direct access to state and federal reserves, but also as it relates to economic impacts. Furthermore, where private and state coal mining may not actually be “connected” to the federal coal program, Interior and BLM must continue to address the impacts of this coal mining given that they represent cumulative actions that must be analyzed and assessed as part of the scope of analysis for the PEIS.

Interim Federal Coal Management Measures

We are concerned that as the PEIS process is unfolding, the Interior Department and BLM have be falling short of ensuring that actions are not undertaken that would prejudice the ultimate decision pursuant to 40 C.F.R. § 1506.1(c)(3). In the Secretary’s January 16, 2016 statement regarding coal reform, it was indicated that the BLM would be moving forward in the near-term to provide guidance related to transparency, royalty rate reductions,

and waste mine methane. (51) As we conveyed in an earlier letter, we support this effort. However, we would urge you to add clarity as follows:

- On transparency, BLM state and field offices must be directed to immediately post online pending requests to lease coal, pending applications to reduce royalties, pending lease readjustments, pending lease suspensions and pending proposals to accept advance royalties in lieu of continued operation, and any and all findings that operators are not diligently developing or meeting continued operation requirements. Ensuring that these proposals and findings are made public will be critical for buttressing the integrity that Interior expects to bring to its reform efforts.

- With regards to royalty rate reductions, the BLM must be directed to pause consideration of any pending or new royalty rate reduction requests until completion of the programmatic environmental impact statement. With recent media reports indicating royalty rate reductions may be enriching coal companies at the expense of the public, these reductions are uncalled for in the near-term. (52)

- On waste mine methane, the Interior Department must be directed to pause approval of any coal lease or mining plan that would lead to underground mining activities requiring degasification systems (i.e., systems that vent methane other than normal ventilation air systems) pending completion of BLM regulations meant to address coal mine methane. (53)

(51) See “Fact Sheet: Modernizing the Federal Coal Program,” available at http://www.blm.gov/style/medialib/blm/wo/Communications_Directorate/public_affairs/news_release_attachments.Par.47489.File.dat/Coal%20Reform%20Fact%20Sheet%20Final.pdf.

(52) See Rucker, P., “U.S. taxpayer due to subsidize Koch-controlled coal mine,” Reuters (Jan. 12, 2016), available at <http://www.reuters.com/article/usa-koch-coal-idUSL2NI4W1JJ20160112>.

(53) In 2014, the Bureau of Land Management issued an Advanced Notice of Proposed Rulemaking requesting comments to assist in developing a “program to capture, use, or destroy waste mine methane that is released into the mine environment and the atmosphere as a direct consequence of underground mining operations[.]” 79 Fed. Reg. 23,923 (April 29, 2014). The agency has yet to initiate a rulemaking, however.

See attached for graphic - Methane Venting Above the West Elk Coal Mine in Colorado. (54)

Comment Excerpt Text:

Given all this, we urge the Department of the Interior and the BLM to ensure that as the PEIS is developed, that the purpose and need for the review and the proposed actions is to put an end to the federal coal program and lead our nation away from coal toward cleaner, mores sustainable forms of energy. A purpose and need is required for an EIS pursuant to 40 C.F.R. § 1502.13. We strongly urge the Interior Department to make clear that, given the collapse of the coal industry, the need to combat climate change, and mounting support for keeping coal in the ground, the purpose and need for the PEIS is to ensure an orderly transition away from coal and an end to the leasing and future mining of all publicly owned coal reserves.

Such a purpose and need is entirely within the scope of the Interior Secretary’s discretion and duties under the U.S. Mineral Leasing Act. As the Act makes clear, the Secretary is “authorized,” but not compelled to lease coal. 30 U.S.C. § 201(a)(1). It is telling that not only is the Secretary not only is not required to lease coal, but also is authorized to lease coal “as [s]he finds appropriate and in the public interest[.]” Id. Further, the Secretary is even authorized to “disapprove” of plans to allowing the mining of leased federal coal. 30 U.S.C. § 207(c). Taken together, there is overwhelming authority and discretion for the Interior Department and the BLM to begin to say “no” to more federal coal leasing and production and “yes” to a brighter future that is not ruined by fossil fuels and driving our world deeper into climate debt.

Given the public’s immense interest in limiting, if not reversing, the impacts of climate change and preventing

trillions in potential climate damages, there is ample reason for the Interior Department and the BLM to use their discretion to make the goal of the PEIS and any future reforms to be to end the federal coal program. (19) (19) It is further telling that the BLM is not simply authorized, but actually compelled, to reject coal lease applications if “leasing of the lands covered by the application, for environmental or other sufficient reasons, would be contrary to the public interest.” 43 C.F.R. § 3425.1-8(a)(3). This applies to leasing by application, which is the only way the BLM currently offers leases for competitive sale. Similarly, a lease modification, which is a form of non-competitive leasing, cannot be issued if it is not “in the interest of the United States.” 30 U.S.C. § 203(a)(2)(A).

We do not suggest that the Interior Department and BLM simply shut down all publicly owned coal mining overnight. Rather, we urge the Interior Department and the BLM to consider, consistent with the National Environmental Policy Act (“NEPA”), 42 U.S.C. § 4332(C)(iii), a range of alternatives to determine the most effective and orderly means of ending the federal coal program. At a minimum, we urge the detailed consideration, analysis, and assessment of the following alternative, which we describe as the “Just Transition Alternative”:

Comment Excerpt Text:

The climate impacts of all Interior Department fossil fuel management. Additionally, if Interior and the BLM are to properly analyze and assess the climate impacts of federal coal management, the climate impacts of all Interior Department overseen fossil fuel development must be taken into account. This includes, but is not limited to, the impacts of offshore oil and gas development, oil shale, and tar sands development. As reports indicate, the potential climate impacts of offshore oil and gas, oil shale, and tar sands stand to be tremendous, with more than 222.14 billion metric tons of carbon projected, nearly as much as the total carbon emissions that could be released if all unleased federal coal reserves are developed. (49) See Exhibit 5 at 18

See Attached for Table - Carbon Emissions (in billion metric tons) From Other Interior Department-overseen Fossil Fuel Development

Similar to onshore oil and gas development, the Interior Department and BLM’s management of offshore oil and gas, oil shale, and tar sands are both cumulative and similar in nature, and therefore must be a part of the scope of the analysis for the PEIS. Indeed, if the climate impacts of the federal coal program are to be completely understood, they must be analyzed together with the impacts of other fossil fuel management programs that are under the control and authority of the Department of the Interior.

Greater Transparency Must be Achieved

Finally, we urge the BLM and the Interior Department to live up to its commitment to making federal coal management more transparent and accessible to the American public. Currently, information related to federal coal management is not readily available, is difficult to track down in a consistent manner, and is not affirmatively made available to the public through the internet.

WildEarth Guardians experienced this firsthand recently. In 2015, we sought to prepare maps presenting information related to federal coal leases in the United States. (55) In embarking upon this project, we found many shortcomings in the way the BLM manages data regarding coal leases.

(55) This series of interactive maps is available at

http://www.wildearthguardians.org/site/PageServer?pagename=priorities_climate_energy_coal_public_land_interactive_map#.V5qVxyMrlIdY.

For example:

-BLM does not maintain consistent GIS data for coal leases in the United States. Although some state offices maintain shapefiles showing accurate lease boundaries, most state offices do not appear to maintain such data. (56) The most reliable form of geographic data is accessible through BLM's LR2000 database. However, this data is not easily transferrable to spreadsheets or databases and does not easily translate into precise geospatial presentation. It seems reasonable to expect BLM to maintain consistent, reliable, accurate, and accessible GIS data regarding coal leases. (56) The Colorado State Office has very accessible, accurate, and up-to-date coal lease GIS data available on its website,

http://www.blm.gov/co/st/en/BLM_Programs/geographical_sciences/gis/GeospatialData.html.

-Information related to coal management actions is not made available online. Information regarding readjustments, lease suspension reviews, royalty rate reductions, etc. is not regularly posted online and made available to the public. Furthermore, even though these actions are subject to NEPA, they are not made readily available to the public, even on BLM's NEPA logs. Certainly, the BLM often provides no notice to the public that these decisions are being contemplated and/or undertaken.

-LR2000 is useful (albeit not user-friendly), but it would be more useful if BLM would provide consistent and more detailed entries for coal lease cases. We found that LR2000 entries for coal leases varied by state, with some states providing greater detail and others not so much. If LR2000 is meant as a clearinghouse for public information related to federal coal leases, it could be improved considerably to ensure consistent and more useful data is available. LR2000, if it is to be utilized as a public database of federal coal information, should also include information regarding mining plan and mining plan modification approvals for federal coal leases. This would take coordination with OSMRE and the Secretary, but would provide more robust information regarding the status of current leases.

-Production data for individual federal coal leases has not been made available. It is unclear why this is the case. For members of the public wishing to determine whether a specific coal lease is producing and if so, how much coal it produces, such data is not available. BLM and Interior should strive to make this data available to provide greater transparency around federal coal production.

BLM and Interior should strive to ensure that records related to federal coal management are made available online so that the public can be more informed and engaged in the management of their coal resources. As it stands, federal coal management often occurs in a black box, making it very difficult to foster public trust and acceptance of BLM and Interior management actions.

a. OSMRE Must be Involved in the PEIS Process and Federal Coal Reform Efforts

We take issue with the apparent exclusion of the Office of Surface Mining Reclamation and Enforcement ("OSMRE") from the PETS process. While Secretarial Order 3338 states that it does not "apply to any action of the Office of Surface Mining Reclamation and Enforcement" (Order 3338 § 1), this statement does not appear to preclude or otherwise prevent OSMRE's involvement in the PETS and the broader effort to reform the federal coal program. In fact, this statement appears to speak to the applicability of the coal leasing moratorium set forth under the Order, which clearly does not affect actions undertaken by OSMRE. That OSMRE and its management authorities should be implicated in the development of the PETS seems entirely consistent with the Order, which directs that a PETS be prepared to, "analyz[e] potential leasing and management reforms to the current Federal coal program." Order 3338 § 1. As the Order acknowledges, OSMRE's coal management responsibilities are considered part of the "Federal Coal Program." Order 3338 § 2(a).

In fact, OSMRE (as well as the Secretary) has extensive authorities and responsibilities related to the management of publicly owned coal that are highly relevant, if not indispensable, to the purpose of the PETS. These authorities

and responsibilities include reviewing and taking action on mining plans and mining plan modifications for the mining of leased federal coal pursuant to 30 C.F.R. § 746, ensuring state-issued permits authorizing the mining of leased federal coal are consistent with non-delegable federal laws pursuant to 30 C.F.R. § 745, and exercising oversight of state permitting of the mining of leased federal coal pursuant to 30 C.F.R. § 740. These duties are entirely germane to the core issues that will be addressed in the PETS, including the climate impacts of the federal coal program, other impacts of the federal coal program, socio-economic considerations, exports, and energy needs.

For example, the PETS could and should address how OSMRE can best measure, assess, and address the climate impacts of continued federal coal production when reviewing and taking action on mining plans and mining plan modifications. Especially given that OSMRE and the Secretary have been directly admonished by federal courts for ignoring the climate impacts of coal mining decisions, such a move seems imminently wise. (26) To this end, it would make sense to consider changes to 30 C.F.R. § 746 (or other provisions of 30 C.F.R. § 740, et seq.) to ensure that, even after publicly owned coal has been leased, that reforms are integrated into OSMRE and Secretarial reviews and decisionmaking regarding the mining of leased federal coal. Ultimately, it just makes sense to ensure OSMRE's role in the management of federal coal is taken into account to ensure the most effective reforms are implemented.

(26) The Department of the Interior and OSMRE have recently lost and/or conceded on at least lawsuits challenging their failure to comply with the National Environmental Policy Act when reviewing and taking action on mining plan modifications in accordance with 30 C.F.R. § 746. See *WildEarth Guardians v. OSMRE*, 104 F.Supp. 3d 1208 (D. Colo. 2015), *WildEarth Guardians v. OSMRE*, Nos. CV14-13-BLG-SPW, CV14-103-BLG-SPW, 2016 WL 259285 (D. Mont. Jan. 21, 2016), and *Federal Defendants' Motion for Voluntary Remand and Memorandum in Support, WildEarth Guardians v. OSMRE*, Civ. No. 1:14-cv-00112-RJ-CG, filed July 18, 2016. The latter motion is attached to these comments as Exhibit 17.

Furthermore, although the Secretary has the authority to disapprove of mining plans, there are currently no explicit criteria to guide the Secretary in making such decisions. We would urge the Interior Department to consider changes to 30 C.F.R. § 746 that would require the Secretary to make, at a minimum, a finding that mining leased federal coal is in the public interest for environmental or other sufficient reasons. This "public interest" standard is similar to what the BLM considers when determining whether leasing is appropriate. Because at times, after a lease is issued, new information or circumstances may arise calling into question any "public interest" determination made at the leasing stage, it would make sense to ensure that, even after a lease is issued, the mining of the leased federal coal remains firmly within the public interest.

I. Department of the Interior (DOI) Previously Rejected Motivations for the Moratorium and Should Not Change Course Based on Third Party Conjectures

In moving forward with the moratorium and preparation of the PEIS, DOI is apparently fully embracing the flawed reasoning it had rejected out of hand just a few years earlier. In the PEIS scoping meetings and in the media, various anti-development organizations have resurrected these claims by deploying a combination of incomplete, misleading data and misinformation to produce a fictional narrative about the revenue and other economic returns to the public through bonus bids, royalties and surface rental fees. The Secretarial Order rests upon the uncritical acceptance of these contrived "fair market value" concerns by allowing them to serve as proxies for substituting climate-centric for market-based policies in the management of the nation's largest energy resource.

For example, many of the proposals currently advanced by groups in opposition to leasing federal coal are substantially the same as those raised in a 2011 petition for rulemaking calling for the abandonment of the lease-by-application (LBA) method for lease sales and the imposition of "carbon fees." In denying the petition in 2011,

BLM explained: how the LBA method is competitive and ensures receipt of fair market value; the pace of leasing occurred at generally the same rate as reserve depletion at existing mines; the National Environmental Policy Act (NEPA) analyses conducted in conjunction for lease sales adequately evaluate GHG emissions; and, imposing a carbon or other externality-based fee exceeds BLM's delegated authority under the Mineral Leasing Act (MLA) and the Federal Land Policy Management Act (FLPMA) and would require congressional action. DOI points to no evidence or rationale that explains why these factual and legal conclusions are no longer valid. DOI's change in position from its well-considered and legally sound 2011 decision is arbitrary and capricious.

Similarly, DOI seems to now blithely accept the "keep it in the ground" organizations' characterization of two key government reports as the rationale for the moratorium. These two reports on coal leasing, one conducted by the DOI Inspector General (IG) and the other by the General Accountability Office (GAO) however, did not identify systemic weaknesses in the current leasing system. Specifically, GAO did not repudiate its 2010 finding that the LBA method can achieve the objectives of ensuring fair return to the public. When the IG testified before Congress, she confirmed in response to questions that taxpayers are receiving a fair return from the federal coal program, and in many cases receiving more than fair market value. In fact, in the months after the reports were released, DOI informed members of the U.S. Senate that neither report identified concerns meriting a moratorium on federal coal leasing. While each report identified some inconsistencies in the application of guidance or documentation for decisions, BLM has since addressed those concerns. To date, the agency has published an updated Coal Evaluation manual and handbook as well as seven instruction memoranda to its field offices in response to the modest suggestions by the IG and GAO.

Comment Excerpt Text:

While the applicant states in the EA on page 48 that the ADEM NPDES permit "provides strict water quality restrictions that control the quality of water that will be allowed to be discharged into the nearby streams," ADEM's NPDES permits actually allow for rain event exemptions on pollutant limitations, essentially permitting coal mines to discharge sediment and heavy metals-laden water over spillways or through pipes into receiving streams during rain events. These unfortunate exemptions circumvent the intent of the Clean Water Act, and place downstream waters and species in harm's way at times when pollutant limitations are needed most. ADEM's coal mining NPDES permits are designed to allow massive quantities of sediment to discharge into receiving waters during rain events. The idea touted on page 48 that sediment basins are adequate to trap sediment in runoff from coal mines cannot be trusted. There is a lot of talk in the EA about all the regulations and plans in place to protect the environment, but the reality on the ground is: strip mines in Alabama are overseen by lax regulations and minimal regulatory oversight.

A misleading representation of the NPDES compliance history of the applicant at its Narley Mine was provided as a justification for the lease in this EA. Such misinformation should not be taken lightly, and should be ample fodder for revocation of this lease. The EA states on page 48: "Best Coal, Inc. has not experienced a non-compliance discharge from any of its basins associated with the NPDES Permit AL0075752 since March 15, 2011." Upon a quick Black Warrior Riverkeeper review of NPDES Permit AL0075752 monthly discharge monitoring reports publicly available on ADEM's eFile database, we found this statement to be patently false. From March 15, 2011 to January 2012, Narley Mine had 217 violations of its NPDES permit – by exceeding limitations for toxicity and selenium.

On page 48 the following was stated: "In addition, there are no issues or concerns brought forth relating to the past mining operations in the area according to their past compliance records." Additionally on page 35 the following was stated: "Best Coal had tested the Narley Mine overburden and interburden to determine whether

acid or other toxic-forming substances were present in amounts that might pollute water resources. The results indicated that toxicity issues with respect to the materials tested were minimal. The three overburden cores contained small amounts of acid-forming shale zones near one or more of the coal beds to be mined. The volume of this toxic material was small compared to the total volume of overburden. Excavation of the overburden would not necessarily mix the spoil thoroughly. Therefore, there is a possibility that pods of toxic shale might be positioned within the backfill where they could have some localized environmental effect. However, considering the volumes involved, that effect would be limited to a few patches of sparse vegetation, which could be mitigated with an application of agricultural lime.” Taking these two items into consideration, it is of note that some of the NPDES permit violations at the Narley Mine were with respect to toxicity failures in their discharges. It is clear that the applicant’s representation of operations at Narley Mine differ from the facts on the ground.

The stretch of the Locust Fork near Narley Mine No. 3 is classified as federal Critical Habitat under the Endangered Species Act for six species of freshwater mussels: Alabama moccasinshell (*Medionidus acutissimus*) [Threatened], Dark pigtoe (*Pleurobema furvum*) [Endangered], Orange-nacre mucket (*Hamiota perovalis*) [Threatened], Ovate clubshell (*Pleurobema perovatum*) [Endangered], Triangular kidneyshell (*Ptychobranhus greenii*) [Endangered], and Upland combshell (*Epioblasma metastrata*) [Endangered]. It is also known habitat for the following rare species: Black Warrior waterdog (*Necturus alabamensis*) [Candidate], Cahaba shiner (*Notropis cahabae*) [Endangered], Flattened musk turtle (*Sternotherus depressus*) [Threatened], and Plicate rocksnail (*Leptoxis plicata*) [Endangered]. Amazingly, Table 4 in the EA erroneously states about the Cahaba Shiner: “this species is only found in the main channel of the Cahaba River.” Actually, the most robust population of the Cahaba shiner lives within the Locust Fork near this mine site. With such a clear mistake, it is hard to imagine that a Section 7 Consultation meaningfully took place, even though the U.S. Fish & Wildlife Service informed the BLM on 6/27/13 that Best Coal’s contractor met consultation requirements. Unfortunately, without a serious cumulative impacts review, these species well-being and the habitat and water quality impacts from coal mining were not seriously considered through this process. The habitat assessment performed by MEC simply focused on the immediate area of the mine – an area already impacted by multiple activities over the years, but failed to survey areas immediately downstream that will be impacted by polluted runoff from the mine during operation, during reclamation activities, and well into the future beyond post-reclamation closure. Alabama is the number one state in the U.S. for aquatic biodiversity, and the Locust Fork is a key priority watershed for rare species habitat, reintroductions, and recovery. If the BLM’s federal coal EA process were adequate, the importance of the Locust Fork, its water quality, its aquatic habitat, and its inhabitants would not have been glossed over as it was here.

Along with preparation of the EIS, the Secretary of Interior has imposed a de-facto moratorium on coal leasing pending completion of this review.

Part of the stated justification for these actions is reports resulting from review by the Government Accounting

Office (GAO) and the DOI-Office of Inspector General (OIG) of the current coal program. Given, however, that the referenced reports stated that the current leasing program is sound and contributes significant benefits to the taxpayers, that the reports offered only modest recommendations for program improvements, and that in 2014 the BLM already developed new protocols, policy guidance, and a manual and handbook to implement the GAO/OIG recommendations, there is a reasonable basis to question the need and motivation for both the EIS and the leasing moratorium. It must also be noted that the proposed regulatory changes illegally conflict with and attempt to supercede existing law and regulation under SMCRA (30 U.S.C. 25), FLPMA (30 U.S.C. 1701), MLA (30 U.S.C. 181), MMPA (30 U.S.C. 21a), NEPA (40 U.S.C. 4321, and DQA (Pub. L. No. 106-554, 515).

Multiple levels of broad-scope National Environmental Policy Act (NEPA) review should also be eliminated (currently required at the leasing stage - BLM, mine permitting stage - OSMRE, and the utility permitting stage - Various agencies). Separate analyses of the impacts of each action would be more realistic and appropriate (limit "related and connected" actions).

Comment Number: 0002507_Nettleton_20160801-5

Commenter I: Jerry Nettleton

Comment Excerpt Text:

How, When, and Where to Lease - The BLM already has an established and robust land use planning process, which addresses current economic, land-use, and environmental considerations. The process includes an evaluation of fair market value, consideration of special and restricted land use designations, and a full NEPA review process. The proposed re-evaluation of unsuitability criteria is inappropriate and illegal since the existing criteria were established by Congress, and the DOI does not have the authority to re-visit or change them. Similarly, any proposed regulatory changes which supersede or conflict with established authority under FLPMA, MLA, or MMPA, exceed the DOI's authority and purview and would be inappropriate and illegal. It must be noted that issues with the federal coal leasing process that have been identified over time, have been addressed through changes in BLM guidelines and procedures, most notably and recently in 2014. The concerns noted and identified with the timing and scope of leasing activity have either already been addressed or are irrelevant and impractical given current and anticipated future conditions in the coal industry, and the realities of mine location and potential future development.

Commenter I: Jerry Nettleton

Other Sections: 6

Comment Excerpt Text:

Climate Impacts - Due to pressure from environmental interest groups, consideration of potential climate impacts is being mandated at every stage of the process, including coal leasing, mine permit approvals, and required approvals for powerplant construction and operation. This approach results in multiple redundant reviews, does not accurately characterize direct or indirect impacts from those actions preceding combustion of coal in a powerplant, and results in significant unnecessary costs and delays. Under the current BLM leasing process and practices, potential climate impacts are required to be evaluated and analyzed in the NEPA documents prepared for each leasing action. While this requirement is duplicative of subsequent environmental reviews, it adequately addresses and satisfies the requirement to evaluate these potential impacts. The suggestion that potential climate impacts should be evaluated on a broader scale relative to identification of potential lease offerings creates a

situation where the linkage between action and potential impacts is even further removed and speculative, is adding one more layer to an already duplicative and redundant review process, and is therefore inappropriate and unjustified.

Commenter I: Gregory Cowan

Comment Excerpt Text:

Wyoming's counties need to be meaningfully engaged throughout the Coal PEIS process.

Coordination and cooperation between local government and the BLM are based on the understanding that concerns and expertise are best conveyed, and therefore decisions made more robust and durable, when the BLM and local governments engage in dialogue. This is because the federal agency decision maker is in a position to be more responsive and flexible to the concerns of local government during rule development. Simply put, coordination and cooperation provide the context necessary to help the BLM make the right decision the first time, and doing so with the buy-in of the local communities most affected by that decision.

During the PEIS process, the BLM should consider including joint fact finding on issues of high relevance specific to areas of local government expertise (socioeconomics, custom and cultural attributes, travel management, etc.). Wyoming's counties should also be looked to by the BLM to help with issue identification; arranging for the collection and/or assembly of necessary resource, environmental, social, economic, and institutional data; analyzing data; identifying alternatives, evaluating alternatives and estimating the effects of implementing each alternative; and carrying out any other tasks necessary for the development of the environmental analysis and documentation.

Changed Circumstances Warrant Renewed Programmatic Review of the Federal Coal Leasing Program Because the federal coal program “is a coherent plan of national scope, and its adoption surely has significant environmental consequences,” NEPA requires BLM to prepare a programmatic environmental impact statement for the Program as a whole. *Kleppe v. Sierra Club*, 427 U.S. 390, 400 (1976) (recognizing need for programmatic EIS for federal coal leasing program). BLM’s most recent full programmatic environmental review for the program was in 1979—37 years ago—at a time when the federal government’s policy was to increase reliance on coal and the threat of climate change had not yet been fully realized or understood. 10 The fundamental reversal of these factors requires BLM to renew its programmatic analysis. 10 See Bureau of Land Mgmt., Final Environmental Statement: Federal Coal Management Program (Apr. 1979) (“1979 PEIS”). 9 BLM committed to update its 1979 PEIS “when conditions change sufficiently to require new analyses of [national and interregional] impacts.” 11 In commencing that update now, BLM complies with a key requirement of NEPA to supplement a past EIS when there are “significant new circumstances or information relevant to environmental concerns and bearing on the proposed action or its impacts.” 40 C.F.R. § 1502.9(c)(1)(ii).

Organization I: Tri-State Generation and Transmission Association, Inc.

Commenter I: Barbara A. Walz

Comment Excerpt Text:

The development and production of federal coal must comply with strict environmental regulations and is historically more regulated than other coal sources. If the federal royalty rates are increased, production will shift to privately held coal reserves and reduce overall oversight of coal produced nationally (not to mention it will also reduce the revenue currently received by the public from the development of this resource).

The federal coal program is directed and governed by numerous federal statutory and regulatory programs already. The following key laws establish the primary authorities, responsibilities, and requirements for developing federal coal resources:

- Mineral Leasing Act of 1920
- National Historic Preservation Act of 1966 (NHPA)
- National Environmental Policy Act of 1969
- Mining and Minerals Policy Act of 1970 (MMPA)
- Clean Air Act of 1970 (CAA)
- Clean Water Act of 1972 (CWA)
- Endangered Species Act of 1973 (ESA)
- Colorado Surface Coal Mining Reclamation Act of 1973
- Federal Land Policy and Management Act of 1976 (FLPMA)
- Federal Coal Leasing Amendments Act of 1976 (FCLAA)
- Surface Mining Control and Reclamation Act of 1977
- Federal Mine Safety and Health Act of 1977

Comment Excerpt Text:

The Secretary enjoys considerable discretion in the management of coal leasing. However, this discretion is not unlimited. The Mineral Leasing Act specifies that the Secretary shall "lease federal coal. 30 U.S.C. § 201(a)(1). Moreover, federal law has repeatedly directed the Secretary of Energy to examine methods to increase the development of the nation's coal reserves and to increase the export of coal. See, e.g., 42 U.S.C. § 13571(1); 42 U.S.C. § 13367(a). Revisions to the leasing regulations that have the effect of curtailing federal coal production and the export of coal would be inconsistent with these mandates. At a minimum, the scope of the PEIS must include a discussion of how any proposed regulatory changes would advance the federal policies of development of federal coal resources and the export of U.S.-produced coal.

Comment Excerpt Text:

Similarly, the Secretary should expressly adopt the cumulative impact principles articulated by the D.C. Circuit in their recent decisions *Sierra Club v. FERC*, D.C. Cir. No. 14-1275 (June 28, 2016) and *EarthReports, Inc., v. FERC*, D.C. Cir. No. 15-1127 (July 15, 2016), in which the Court recognized that cumulative impact analyses are to be focused on the same geographic area as the proposed action. The PEIS itself would thus have a broad cumulative impact analysis, but individual leasing decisions should have substantially more focused cumulative impact analyses than those urged by environmental activists.

Comment Excerpt Text:

The WMA is compelled to address the release of the President's Council of Economic Advisors, "Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to Taxpayers". We find the release and content of this study very inappropriate, because it was issued prior to the closing of the scoping comment period for the Programmatic Environmental Impact Statement (PEIS) for evaluating the federal coal leasing program. The PEIS is a National Environmental Policy Act (NEPA) activity and is intended to be the vehicle to be used to analyze environmental impacts of federal agency actions. The President's Council report offers biased analyses in response to the same questions posed in the Notice of Intent for the PEIS. The report presumes to be the preferred position of the federal administration, since it was issued by the Office of the President. The issuance of the President's study makes a mockery of the NEPA process in general and the PEIS for coal leasing in particular. The existence of the study and the obvious bias against coal production in the Powder River Basin of Wyoming leads us to question whether the integrity of the NEPA process has been violated. The potential legal impact of this presumptuous document calls to question whether the PEIS should be withdrawn and the Secretary's moratorium on federal coal leasing be suspended. This administration is obviously incapable of and cannot be trusted to conduct a fair and impartial environment analysis. As part of the scoping process the BLM must consider whether Secretarial Order No. 3338, "Discretionary Programmatic Environmental Impact Statement to Modernize the Federal Coal Program" should be withdrawn, and the scoping report should explain and justify the resulting decision. WMA is in general agreement with several United States Senators who have voiced objection to the report, and includes their letter for the record in these comments (Attachment 1).

Comment Excerpt Text:

Well, what about environmental impacts? What about CO2 emissions? Are they skyrocketing? Well, according to the Environmental Protection Agency, their data shows that CO2 emissions for 2014 were about equal to the mid-1990s. That was a downward trend. What about methane? Those levels are lower than the 1990s. As the Congressman is fond of saying, if you want to develop a resource the right way, the most environmentally responsible way, then no one does it better than we do here in American. And that includes our coal industry. Yet despite those facts, the administration insists on pushing forward with rules and regulations, like the [indiscernible] power plan, which some economists estimated will cost a whopping \$366 to \$479 billion from 2017 to 2031, and would result in a decrease in CO2 emissions by 2030 of less than 1 percent of current level emissions. So, if you can't make a compelling case that the coal industry is unfairly benefiting from a public resource, and you can't demonstrate that the industry is the cause of some large-scale environmental crisis, then why push forward with these efforts? It's because coal does not have a role to play in this administration's misguided energy vision. In 2008, the President famously advocated an energy policy in which he said, "if someone wants to build a coal-fired power plant, they can. It's just it will bankrupt them". And there is absolutely no ambiguity in that statement whatsoever.

Opponents of coal mining allege there are serious flaws in the Federal Coal Leasing Program. This is unsubstantiated. Reports from 2013 by the Government Accountability Office in the Department of Interior and Inspector General contain minor recommendations for improvements to the Federal Coal Program. Neither report recommended wholesale revisions to the program, nor do they address in any way royalty rates. BLM has already acted on the reports' recommendations to improve the management of the Federal Coal Program. To date, the agency has published an updated Coal Evaluation Manual and Handbook, as well as seven instruction memorandum to its field offices in response to the suggestions by the IG and the GAO. We

believe large-scale changes in the program are unnecessary and may serve to harm the industry and result in less revenue to the American taxpayer.

Second, reconsider how to balance multiple uses. The nation has relied on fossil fuel sources extracted from public land since its founding. In the Federal Lands Policy Management Act requires that the BLM balance extractive uses against other public, public land uses. It's clear that coal mining doesn't simply compete with other uses. Coal [indiscernible] be stabilized and degrade, making other uses impossible. Given the long-term impacts of carbon dioxide, the effects of mining public coal today will affect public lands for centuries, damaging recreational opportunities, water supplies, wildfire resilient, and even other extractive uses, such as timber and grazing. If a disparity exists between the high, long-term cost of coal usage and the low, short-term windfalls from sale, then the BLM must consider this disparity when making its decisions.

Comment Excerpt Text:

The review of the federal coal leasing systems must evaluate BLM authority and opportunities, as well as actions of other agencies and Congress could take, to help ensure a just transition for workers and communities to a clean energy economy. Such actions should include robust investment in community economic development, protection of worker livelihoods, and development of new tax revenue sources for local economies. A combination of factors is forging a new reality where lower gas prices, rising coal costs, and the competitive cost of renewable energy sources are driving a shift to clean energy. The new energy technologies coming on-line will create hundreds of thousands of new jobs and will continue to do so in communities across the country. But, as our nation makes this transition, some workers and communities may be impacted. Coal mines, coal-fired power plants, coal transportation infrastructure, coal handling facilities and their associated supply and maintenance industries are often the lifeblood of small towns, providing significant employment and contributing to their communities' tax base. Moving toward clean energy could result in fewer jobs at a local level and a reduction in the tax stream going to local governments in these communities. Therefore, we must consider what authority and opportunities the federal government possesses, having succeeded in capturing a fair return for extracted coal, to ensure that some portion of that increased return is put to use ensuring a just transition for workers, communities and regional economies occurs.

Many blamed President Obama for the decline of coal. This is patently false. The decline of coal began in 1963 with the passage of the Clean Air Act. In 1970 the Act was amended and strengthened. It was weakened in 1977, and strengthened again in 1990. The six "criteria pollutants" in the 1970 Clean Air Amendment Act are: sulfur oxides, particulates, carbon monoxide, hydrocarbons, nitrogen oxides, and photochemical oxidants. All of these compounds are found in coal and/or petroleum products in varying amounts.

Comment Excerpt Text:

Cigarette smoke contains 69 known carcinogens. Coal-fired power plant emissions contain 67 known carcinogens or neurotoxins (U.S.EPA, 1998)—many of the same ones found in cigarette smoke. Cigarette smoke and power-plant emissions both contain

- Fine particulate matter (PM2.5)
- Carbon monoxide
- Ozone precursors
- Volatile Organic Compounds (VOCs), such as benzene, toluene, and formaldehyde;
- Acid gases, such as hydrogen chloride and hydrogen fluoride;
- Dioxins and furans;
- Lead, arsenic, and other toxic heavy metals;
- Mercury;
- Polycyclic Aromatic Hydrocarbons (PAH); and
- Thorium, Uranium, Polonium and other radioactive metals

The harm to public health that second-hand cigarette smoke and fossil fuel emissions pose is remarkably similar. The difference is primarily quantitative, not qualitative. A typical life-long smoker will shorten his life by ten years. The American Lung Association reports that the typical urban dweller in the United States is exposed to enough airborne fine particulate matter to shorten his life by one-to-three years. (Pope, C.A. III, 2000.) Nearly all of that exposure is due to pollution from the burning of fossil fuels. This shortened life span of a typical urban dweller is not just the effect of his exposure to fine particulate pollution. Exposure to other components of air pollution caused by burning fossil fuels--such as ozone and Hazardous Air Pollutants (HAPs)--further shortens his life.

Comment Excerpt Text:

Fossil fuel emissions permeate entire air sheds of most urbanized regions of the country. The largest single source of fossil fuel emissions is coal-fired power plants. To escape fossil fuel pollution, one would have to find a region without coal-fired power plants or concentrated automobile traffic. Air quality maps show that most regional air sheds in the United States are moderately or heavily polluted—almost entirely the result of burning fossil fuels

Comment Number: 0002326_Moench_20160724_UtahPhysicHealthyEnviron-68

Organization I:Utah Physicians for a Healthy Environment

Commenter I:Malin Moench

Comment Excerpt Text:

Across the U.S., high concentrations of PM2.5 and ozone usually occur together because the sources are largely the same—coal-fired power plants and heavy vehicular traffic. There are, however, regional variations. In the Mountain West, the summer forest fire season and winter temperature inversions in mountain valleys also contribute to high concentrations of PM2.5. In the Ohio Valley, where coal-fired power plants are heavily relied on to produce electricity, concentrations of PM2.5 are higher than most of the rest of the country year round. This reflects the fact that burning coal as fuel generates 33 times as much fine soot (the main component of PM2.5) as burning oil or gas, on a per-Btu basis.

Comment Excerpt Text:

Clean air standards have yet to catch up to the science. Up to now, the approach that Federal and state governments have taken to regulating fossil fuel emissions has been based on an assumption that the harm from these pollutants at concentration levels commonly experienced is minor, and is a small price to pay for a healthy economy. This reflects a precept that was once central to the science of toxicology--that “the poison is in the dose.”

This precept assumes that most poisons, including those in ambient air, are harmless below a certain threshold concentration, and the public policy task is to find that threshold and keep the poisonous substance below it. This precept, however, has been shown to be false by a wealth of more recent studies that show that the principal fossil fuel pollutants (lead, mercury, fine particulates, and ozone) harm human health at every level of concentration.

In a major survey of recent research the World Health Organization concluded (World Health Organization Report, 2004):

The potential for serious consequences of exposure to high levels of ambient air pollution was made clear in the mid-20th century, when cities in Europe and the United States experienced episodes of air pollution, such as the infamous London Fog of 1952 and Donora Smog of 1948, that resulted in large numbers of excess deaths and hospital admissions. Subsequent clean air legislation and other regulatory actions led to the reduction of ambient air pollution in many regions of the world, and particularly in the wealthy developed countries of North America and Europe. New epidemiological studies, however, conducted over the last decade, using sensitive designs and methods of analysis, have identified adverse health effects caused by combustion-derived air pollution even at the low ambient concentrations that now generally prevail in cities in North America and western Europe (Health Effects Institute 2001).

If fact, many studies show that these pollutants not only cause significant damage at very low concentrations, but that the damage is proportionally the greatest (on a parts per billion basis) at the lowest concentrations. Just as the first five cigarettes have been found to do more damage to the lung, per cigarette smoked, than the next 15, the relationship between concentrations of such pollutants as fine particulates and their impact on health shows a similar non-linear curve, i.e. further reductions in atmospheric levels have even more public health benefit when levels are comparatively low than when they are high. (Peters, A., 2009.)

The U.S. Center for Disease Control ranks toxic heavy metals as the number one environmental health threat to children.(22) Recent research on the effects of lead pollution, for example, invalidates the notion that exposure to lead is safe below a particular threshold concentration.

(22) ATSDRA/EPA Priority List for 2005: Top Hazardous Substances. Agency for Toxic Substances and Disease Registry, U.S. Department of Health and Human Services, www.atsdr.cdc.gov/clist.html.

Human activity has increased the concentration of lead in the environment more than 1,000-fold over the past three centuries. This reflects the fact that lead does not break down, so its concentration in the environment continually increases. <http://www.atsdr.cdc.gov/PHS/PHS.asp?id=92&tid=22>. A typical coal-fired power plant without pollution controls emits 114 pounds of lead each year.

<http://www.ucsusa.org/cleanenergy/coalswind/c02c.html#.VG4Z3YvF-H4>. Lead pollution from power plants enters the by several pathways. It begins as vapor, is deposited in the soil, leaches into streams, lakes, and aquifers, and ends up in drinking water and food supplies.

Lead is a powerful neurotoxin. At levels that currently prevail in developed countries, it causes substantial harm to public health. In the United States, for example, until very recently the Center for Disease Control defined an "" lead blood level (the level assumed to require additional pollution controls and/or medical intervention) as 10.0 micrograms per deciliter. www.cdc.gov/mmwr/preview/mmwrhtml/mm5420a5.htm.

Recent research indicates that the 10.0 µg/dL tolerance level of lead exposure is too high by a factor of 50.

Acknowledging the findings of more recent research, the CDC conceded in 2012 that there is no level of lead in blood serum that is small enough to be considered "safe." At that time, the CDC cut its tolerance level for blood-level lead from 10.0 µg/dL to 5.0 µg/dL (rather than zero) without a clear explanation of the basis for the new tolerance level. See www.cdc.gov/mmwr/preview/mmwrhtml/mm6213a3.htm. Even CDC's current tolerance level of 5.0 µg/dL is 25 times too high, according to the most recent research.(23)

(23) It is important to note that the EPA's current National Ambient Air Quality Standard (NAAQS) for lead [0.15 µg/m³] was adopted in 2008. Because it has yet to be reconciled with the current research, the EPA's NAAQS for lead pollution that is now in effect still reflects the CDC's now-abandoned (and exceedingly lax) blood-lead tolerance level of 10.0 µg/dL.

Comment Excerpt Text:

Aggressive new regulatory initiatives in the consumer market have further sensitized coal consumers to the precise characteristics of their coal. The Mercury Air Toxics Standards ("MATS") Rule, Cross-State Air Pollution Rule ("CSAPR"), regional haze regulations, and ongoing revisions to Sulfur Dioxide, Nitrogen Oxide, Ozone, and Particulate National Ambient Air Quality Standards ("NAAQS") have prompted numerous older generating unit retirements, but they have also spurred extremely expensive and sophisticated new pollution controls on surviving units. These pollution controls in turn often require very precise management of influent airstream quality, emphasizing the need for consistent and precise fuel characteristics. It is simply not possible for utilities and other consumers to haphazardly swap out fuel suppliers - or for fuel suppliers to haphazardly substitute coals - and maintain the high degree of environmental performance mandated by current regulations. Notably, this often means that a coal mining company must have several lease tracts simultaneously at its disposal, so that it can appropriately blend coals from different sources or seams to manage the naturally occurring variation in coal qualities and deliver a consistent product.

Substantial air emissions arise from every stage of coal fuel cycle that have impacts on wildlife: from coal mining to transportation to combustion. These emissions significantly impact air quality at local, regional, and global scales. The harms caused by these emissions on the climate, the environment, and human health are widely documented. (94)

(94) See, e.g., Center for Health, Environment & Justice, *The Health Impacts of Mountaintop Removal Mining*, available at http://www.chej.org/wp-content/uploads/MTR_Mining_Final_April_18_2013.pdf; Synapse Energy Economics, Inc., *The Hidden Costs of Electricity: Comparing the Hidden Costs of Power Generation Fuels (Hidden Costs)*, available at

<http://www.civilsocietyinstitute.org/media/pdfs/091912%20Hidden%20Costs%20of%20Electricity%20report%20FINAL2.pdf>.

Air pollution from coal mining comes from the engines driving mining equipment, from mine construction and development activities, (95) and from the transportation of coal away from the mine pit. (96) As discussed in more detail below, coal mining emits greenhouse gases (GHGs) via the release of such gases in coal deposits, the release of carbon sequestered in plant matter, and exhaust from the many engines used. (97) Fugitive emissions are a major source of air pollution from coal mining. (98) The air pollutants released by surface coal mines include:

- Carbon Dioxide (CO₂). Carbon dioxide is released in great quantities from the burning of fossil fuels and is an

important GHG. A 2012 EPA inventory of industry-reported emissions shows that coal mines nationwide release the equivalent of nearly 28 million metric tons of carbon dioxide annually, as much as 8 coal-fired power plants. (99)

- Methane. Methane is the naturally occurring product of the decay of organic matter as coal deposits are formed. Methane is a GHG with more than 25 times the heat-trapping effect of carbon dioxide over a hundred year period. (100)

- Nitrogen dioxide (NO₂). A poisonous gas that reacts with sunlight to form ozone, nitrogen dioxide forms from blasting at surface coal mines, which creates poisonous orange clouds. According to a petition filed by environmental groups, in Wyoming alone, the amount of nitrogen dioxide released by strip mining equals the amount normally released by 1.12 million passenger vehicles. (101)

- Particulate matter (PM). During the coal mining process, PM originates from: use of haul roads; wind erosion of overburden, exposed areas, and coal piles; bulldozing; blasting a drilling; draglines; loading and dumping overburden and coal; conveyors and transfers; and transportation of coal on conveyors, trains, and trucks. (102) In the U.S., coal mines release more than 17,000 tons of PM annually, including more than 10,000 tons of PM less than 2.5 microns in diameter, the most dangerous form of particulates. (103)

- Volatile organic compounds (VOCs). VOCs are gases that react with sunlight to form ground-level ozone, the key ingredient of smog. Coal mines nationwide release more than 1,790 tons of VOCs every year. (104)

(95) Fugitive dust emissions are increased by the removal of vegetative cover, hauling and stockpiling of topsoil, construction of haul roads, excavation and blasting of coal seams and overburden, displacement of overburden, and hauling of coal. Storage and handling of coal generates dust at rates which can be 3 kilograms (kg) per metric ton of coal mined, with the ambient dust concentration ranging from 10 to 300 micrograms per cubic meter (above the background level) at the mine site. Multilateral Investment Guarantee Agency, World Bank Group, Coal Mining and Production, available at <http://www.miga.org/documents/CoalMiningandProduction.pdf>.

(96) Synapse Energy Economics, Hidden Costs, *supra*.

(97) *Id.*

(98) Fugitive emissions are unintended emissions of any type (including carbon dioxide and methane) that arise during the production of coal. Fugitive emissions are released from the coal and surrounding rock strata when previously trapped methane and carbon dioxide gas are released into the atmosphere as coal seams are mined. Air Quality Impacts

The PEIS must evaluate the impacts of coal leasing on local and regional air quality. BLM's own regulations require that the agency manage federal lands according to federal and state air quality standards. (25) The Mineral Leasing Act also mandates that the agency insert in each coal lease provisions that require compliance with the Clean Air Act (as well as the Clean Water Act). 30 U.S.C. § 201. The PEIS should include a discussion of current local and regional air quality conditions and modeling of future compliance under various leasing scenarios. Pollutants which require specific attention include PM10 and PM2.5, as well as NOx and ozone.

(25) See 43 C.F.R. § 2920.7(b)(3) (requiring that BLM "land use authorizations shall contain terms and conditions which shall . . . [r]equire compliance with air . . . quality standards established pursuant to applicable Federal or State law") (emphasis added); see also 43 U.S.C. § 1712(c)(8) ("In the development and revision of land use plans, the Secretary shall . . . provide for compliance with applicable pollution control laws, including State and Federal air, water, noise, or other pollution standards or implementation plans.").

In a related issue, the PEIS should disclose and discuss Air Quality Related Values (AQRVs) as established by land managers. Although AQRVs lack the legal force of criteria pollutant emission limits, for example, they are not without legal significance. The PEIS should provide discussion and analysis of AQRVs and how they factor in the air quality permitting process for federal coal leases.

Air Quality Impacts: During blasting operations, coal mines emit significant amounts of toxic air pollution, contributing to regional haze and higher ozone levels. Coal haul trucks are surrounded in a cloud of air pollution that is carried by the wind to neighboring lands. B LM's planning documents must ensure compliance with Clean Air Act standards for nitrogen oxides and particulate matter, but the mines have violated these standards. Coal mines must also mitigate dust under their state SMCRA permits. Mitigation measures to reduce air quality impacts must be addressed in the PEIS.

Once coal is mined and washed, it must be transported to power plants via truck, ship, barge or train. Railroad engines and trucks together release over 600,000 tons of nitrogen oxide and 50,000 tons of particulate matter into the air every year in the process of hauling coal, largely through diesel exhaust.¹⁶¹ Coal trains and trucks also release coal dust into the air, exposing nearby communities to dust inhalation. There are essentially six potential local environmental effects of concern related to coal transportation: (1) emission of particulate matter in the form of coal dust; (2) emission of particulate matter in the form of diesel locomotive exhaust; (3) production of noise and vibration by train movement; (4) congestion and collisions along roadways and rail lines; (5) train derailments; and (6) fires due to spontaneous combustion of coal.¹⁶²

Comment Excerpt Text:

The "external costs" of electricity generation from coal are the burdens to society that are not included in the electricity's monetary price. Estimates of the external costs of electricity generation from coal suggest that 95% of the external cost consists of the adverse health effects on the population.¹⁶³ When coal is burned, it produces air-borne pollutants of sulfur dioxide, particulate matter (PM), nitrogen oxides, mercury, arsenic, chromium,

nickel, and other heavy metals, acid gases, hydrocarbons, and dozens of other substances known to be hazardous to human health.¹⁶⁴ It also contributes to smog through the release of oxides of nitrogen, which react with volatile organic compounds (VOCs) in the presence of sunlight to produce ground level ozone, the primary ingredient in smog. In 2011, the World Health Organization compiled air quality data from 1,100 cities in 91 countries and found that residents living in many urban areas are exposed to persistently elevated levels of fine particle pollution, partly due to coal-fired power plants, as well as the burning of coal for cooking and heating.¹⁶⁵

A 2007 article published in the medical journal, *The Lancet*, summarizes the burden of the health effects of generating electricity from coal and lignite (a type of coal). It estimated that for every TWh (Terrawatt-hour) of electricity produced from coal in Europe, there are 24.5 deaths, 225 serious illnesses including hospital admissions, congestive heart failure and chronic bronchitis, and 13,288 minor illnesses.¹⁶⁶ When lignite, the most polluting form of coal, is used, each TWh of electricity produced results in 32.6 deaths, 298 serious illnesses, and 17,676 minor illnesses.¹⁶⁷ To give these data perspective, consider the fact that nearly half of the 4,160 TWh of electricity generated in the United States in 2007 came from coal-fired power plants.¹⁶⁸ If these estimates are applied to the U.S., as many as 50,000 deaths per year may be attributable to burning coal.¹⁶⁹

The major health effects linked to coal combustion emissions damage the respiratory, cardiovascular, and nervous systems and contribute to four of the top five leading causes of death in the United States: heart disease, cancer, stroke, and chronic lower respiratory diseases.¹⁷⁰ Although it is difficult to ascertain the proportion of this disease burden that is attributable to coal pollutants, even very modest contributions to these major causes of death are likely to have large effects at the population level, given high incidence rates.

U.S. coal emissions from combustion overseas, namely in Asia, returns to the U.S. in the form of particulate matter, ozone and mercury deposition. Multiple studies have shown that, depending on the season and meteorological conditions, a significant portion of particulate pollution in California originates in Asia, as well the precursors for ozone, the ozone itself, and gaseous mercury.²³⁷ Indeed, a University of California at Berkeley study found that 29% of particulate matter pollution in the San Francisco Bay area originated from fossil fuel use in China.²³⁸ Another study found that the majority of particulate pollution in Lake Tahoe originated in Asia.²³⁹ Coal's pollution footprint is extremely large, spanning thousands of miles across oceans and continents. The health impacts stemming from this pollution are significant and should be addressed in any environmental review of the federal coal program.

Ports are also a significant source of coal dust. When a train arrives at a coal export terminal, it may dump its coal into an open air storage pile or holding silo. Alternatively, a train arriving at a port terminal may wait for days in a train yard at the port before its coal is unloaded. These waiting train cars and open-air coal piles are significant sources of coal dust particulate matter at export terminals because typical wind speeds and wind gusts prevalent in near-coastal areas cause coal particles from the storage piles and from the uncovered tops of waiting coal cars to be released into the air.²²⁸ Unloading the coal from rail cars into storage piles at the port facility and storing the coal in these piles emits coal dust into the air, soil, and water nearby. In addition, coal dust is carried off the storage piles as runoff when the piles are exposed to rain.²²⁹ This runoff can impact both surface water and underlying groundwater. When a ship is ready for loading, conveyor belts transport the coal from the train

car, silo, or coal pile, and dump the coal onto the ship, releasing additional coal dust into the air and water.

Coal dust, once emitted, can have multiple impacts on humans and the environment. Fugitive coal dust that is 10 micrometers or less in diameter is classified as PM10, and fugitive coal dust that is 2.5 micrometers or less in diameter is classified as PM2.5. PM10 can travel up to 30 miles, and PM2.5 can travel 500 miles.²³⁰ Both PM10 and PM2.5 are extremely harmful to human health. The particles can travel deep into the lungs and into the bloodstream, causing premature death in people with heart or lung disease, heart attacks, decreased lung function, and increased respiratory effects, including irritation of the airways, aggravated asthma, coughing, and breathing difficulties.²³¹ Groups that are most at risk due to PM10 and PM2.5 exposure include children, older adults, low-income communities, and individuals with asthma or preexisting heart and lung disease. Inorganic arsenic found in coal dust deposited in soil near coal export terminals is a human carcinogen.²³² Human exposure to inorganic arsenic by inhalation has been strongly associated with lung cancer, and ingestion has been linked to skin, bladder, liver, and lung cancers.²³³ Chronic inhalation has been associated with irritation of the skin and mucous membranes, as well as effects in the brain and nervous system. Gastrointestinal effects, anemia, peripheral neuropathy, skin lesions, hyperpigmentation, and liver or kidney damage have resulted from chronic oral exposure to elevated levels of inorganic arsenic.²³⁴

In addition to coal dust, the trains and ships used to transport coal emit diesel exhaust. Diesel exhaust contains significant sources of harmful air pollutants including particulate matter (PM/PM2.5), volatile organic compounds (VOCs), toxic compounds known as air toxics, carbon monoxide (CO), nitrogen oxides (NOx) and, in the case of ships, sulfur oxides (SOx), and contributes to elevated ozone levels.²³⁵ This pollution causes poor air quality, reduced visibility, water and soil contamination, and ecosystem damage. Health effects associated with exposure to this pollution include premature mortality, increased hospital admissions, heart and lung diseases, asthma, reduced lung function, and increased cancer risk.²³⁶

In addition to analyzing and permitting coal mine development activities, Wyoming also analyzes and permits coal combustion and other facilities that process or consume coal. These facilities are required to obtain air quality permits and demonstrate that their air emissions will comply with all applicable emission standards, including the health and welfare standards. These facilities include major sources such as power plants (see Basin Electric's DEQ/AQD Permit Application Analysis NSR-AP-3546 and Permit CT-4631), activated carbon production facilities (see Atlas Carbon's DEQ/AQD Permit Application Analysis A0000253 and Permit P0014996), and coal drying and briquetting facilities (see White Energy Coal's DEQ/AQD Permit Application Analysis AP-14387 and Permit CT-14387), and others. (WY0-03211 to 03286; WY0-03288 to 03330 and WY0-03332 to 03372) The BLM's analysis in the PEIS must recognize Wyoming's air quality primacy and consider the regulatory control

and permitting expertise of the DEQ, AQD related to coal mine development, combustion, and processing activities.

Comment Excerpt Text:

When considering the environmental impact of mining coal, BLM must consider and evaluate current emission trends. See M. J. Bradley & Associates, *Benchmarking Air Emissions of the 100 Largest Electric Power Producers in the United States* (2016). (WY0-03374 to 03447). For example, from 1990 to 2014 emissions of nitrogen oxides have fallen 51% from 25.5 million tons to 12.4 million tons and sulfur dioxide emissions have fallen 78% from 23 million tons to 5 million tons. EPA Air Emission Trends (1974- 2014); [20] and Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2014, Chapter 2- Trends (WY0-03449 to 03482). Methane emissions from the mining sector have demonstrated a decreasing trend from 1990 to 2014. Emissions were reduced 29% from 96.5 million metric tons of CO₂ equivalent emissions to 68.1 million metric tons. Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2014, Executive Summary; [21] (WY0-03484 to 03510). Considering the critical role played by the abundant supply of federal coal mining in Wyoming to meet national energy needs, the BLM must consider the ability of our nation to continue to meet our environmental requirements (i.e., sulfur, mercury, etc.) if coal from the PRB and elsewhere in Wyoming is reduced or eliminated. Wyoming coal has less sulfur than eastern coals, making it attractive to utilities for meeting Clean Air Act requirements.

Comment Excerpt Text:

The PEIS must consider all air pollutant impacts from coal transport on downstream communities. Coal transport by rail also causes significant air quality and health impacts through coal train exhaust, which includes diesel particulate matter (DPM), and criteria pollutants including NO_x, SO₂, PM₁₀, PM_{2.5} and CO. Trains emit these pollutants while in motion and idling. 189 Communities and workers in close proximity to rail tracks, coal terminals, and shipping lanes are at highest risk for DPM exposure. DPM is associated with “acute short term symptoms such as headache, dizziness, light headedness, nausea, coughing, difficulty breathing, tightness of chest, and irritation of eyes, nose and throat. Long-term exposure can result in increased probability of heart attacks, lung cancer, worsening of asthma, and infant mortality. 190 Health risk assessments of rail terminals and ports have found significant cancer risks associated with DPM up to two miles from coal terminals. 191 The PEIS should quantify health impacts along the entire coal transportation corridor. In addition, the PEIS should analyze air emissions from coal export and shipping activities. For instance, air modeling for a proposed state of the art covered coal export at the Port of Morrow in Oregon showed major exceedances of particulate matter and NAAQs for NO_x. 192 Storing coal in communities also generates large amounts of PM. 193 It is also well known that coal export can increase acid rain and mercury deposition in the Pacific Ocean and Western US from Asia. 194 These impacts should also be analyzed. In evaluating the significance of air quality impacts due to coal storage and transportation, the analysis should not base its conclusions solely on National Ambient Air Quality Standards (“NAAQS”) because harms may occur at pollutant concentrations below the NAAQS standards. For example, epidemiological studies have shown associations between SO₂ 188 Pastor, Manuel Jr., et al., *Waiting to Inhale? The Demographics of Toxic Air Release Facilities in 21st Century California*, 85 *SOCIAL SCIENCE QUARTERLY*, no. 2, June, 2004. 189 Comments of Phyllis Fox, *Environmental Health and Safety Impacts of the Proposed Oakland Bulk and Oversized Terminal*, September 21, 2015, at 19 (Ex. 35). 190 *Id.* 191 *Id.* 192 See, e.g., AMI International, *AIR QUALITY MODELING FOR THE PROPOSED ENCLOSED COAL EXPORT FACILITY AT THE PORT OF MORROW* (2012), http://media.oregonlive.com/environment_impact/other/AERMOD_Modeling_Morrow_vfin.pdf (last visited July 28, 2016), attached as Ex. 38. 193 See *id.* 194 Comments of Phyllis Fox, *Environmental Health and Safety Impacts of the Proposed Oakland Bulk and Oversized Terminal*, September 21, 2015, at 7 (Ex. 35). 54 concentrations and emergency room visits and hospital admissions down to the 50 ppb level even though the NAAQS for SO₂ is 85 ppb. 195 Moreover, NAAQS does not account for the fact that some pollutants have higher localized impacts—pollutants like SO₂ concentrate locally. The PEIS should analyze the significance of the health impacts of the program associated with air emissions on downstream communities.

Comment Excerpt Text:

Aggressive new regulatory initiatives in the consumer market have further sensitized coal consumers to the precise characteristics of their coal. The Mercury Air Toxics Standards (“MATS”) Rule, Cross-State Air Pollution Rule (“CSAPR”), regional haze regulations, and ongoing revisions to Sulfur Dioxide, Nitrogen Oxide, Ozone, and Particulate National Ambient Air Quality Standards (“NAAQS”) have prompted numerous older generating unit retirements, but they have also spurred extremely expensive and sophisticated new pollution controls on surviving units. These pollution controls in turn often require very precise management of influent airstream quality, emphasizing the need for consistent and precise fuel characteristics. It is simply not possible for utilities and other consumers to haphazardly swap out fuel suppliers or for fuel suppliers to haphazardly substitute coals - and maintain the high degree of environmental performance mandated by current regulations. Notably, this often means that a coal mining company must have several lease tracts simultaneously at its disposal, so that it can appropriately blend coals from different sources or seams to manage the naturally occurring variation in coal qualities and deliver a consistent product.

Comment Excerpt Text:

I am proud to deliver high BTU coal. And it's for all of us. One thing that was brought up earlier, we talked about the pollution here in Grand Junction. We did this several years ago in Denver over the coal-fired power plants. And they ended up converting those coal-fired power plants. The percentage of pollution that all those coal-fired power plants had in Denver was four percent. Likesomebody mentioned that we -- the guys that drove here today, produced more pollution than all these coal-fired power plants.

Commenter I: Ann Thomas

Other Sections: I

Comment Excerpt Text:

On a broader scale, I believe it is important to transition to a more sustainable trajectory of energy production. According to the Center for Climate and Energy Solutions, coal burning produced 24.5 percent of greenhouse gas emissions in the US in 2012 and the US is the second largest producer and consumer of coal.

Comment Number: 00000360_ Gilgen_20160519-2

Commenter I: Gilgen

Comment Excerpt Text:

The fossil fuel industry and our political leaders that seek the votes of those employed therein contend that the science of climate change is not settled. However, the evidence suggests otherwise, the climate scientists of NOAA and NASA, the EPA, the scientists at the National Academy of Scientists, the scientists that advise the US military and the insurance industry. In fact, every science organization and scientific union in the world has issued policy statements confirming their conviction that the threat of climate change is real, ominous, and is the consequence of burning fossil fuels.

Comment Number: 00000366 _ Brady _20160519-2

Organization I: Emery County

Commenter I: Keith Brady

Comment Excerpt Text:

a key rationale seems for the moratorium -- however, seems to address climate change, which used to be global warming, but since that didn't work out, the moniker has changed. And while I'm not a climate change denier, in truth the climate does change season by season, year by year. And to say that science has settled makes a mockery of science. Science should always be subject to scrutiny.

Comment Number: 0000066 _ Keowa _20160517-1

Organization I: Powder River Basin Resource Council

Commenter I: Duane Keown

Comment Excerpt Text:

Wyoming leads all states and most nations for its coal contribution to increasing CO₂. No state except for Wyoming has ever produced more than 200 million tons of coal in a year. Best peak for Wyoming was in 2008 when it produced 462 million tons of coal. It was shipped out of this state. In less abstract terms, in 100 ton coal cars, that's 46,000 miles of coal or enough coal to reach around the earth nearly two times at the equator. Most of the 462 million tons of coal, Wyoming coal of 2008 is now in the atmosphere as CO₂. Where is Wyoming in relation to cooling the temperature? 41 percent of U.S. coal comes from the federal land, and 75 percent of it comes from just Wyoming.

Comment Number: 0000082 _ Marshal _20160517-6

Organization I: Cloud Peak Energy

Commenter I: Colin Marshall

Comment Excerpt Text:

Unfortunately, the current thinking about climate change in the U.S. has evolved to the point where stopping coal production appears to be the number one objective. The climate scientists know that eliminating U.S. coal will not fix climate change, and as Secretary Jewell said last week, "The keep in the ground movement is naive."

Comment Number: 0000090 _ Nichols _WildEarthGuard _20160517-1

Organization I: Wild Earth Guardians

Commenter I: Jeremy Nichols

Comment Excerpt Text:

I want to express our honest belief that we do feel that the result of this reform effort needs to be more coal being kept in the ground. We are facing a climate crisis, a global climate crisis right now. We have an enormous challenge just to keep global temperatures in check. We're in the all-hands-on-deck era right now, and keeping as much fossil fuel in the ground as possible is key to eliminating greenhouse gas emissions and safeguarding our climate. I also want to be honest, though, that I firmly believe that keeping coal in the ground shouldn't mean that

people are just kicked down the street and communities are left hanging. I believe that this reform effort presents a once-in-a-generation opportunity to chart a just transition.

Comment Number: 0000094_Gerrits_20160517-1
Organization I: Powder River Basin Resource Council
Commenter I: Christy Gerrits
Comment Excerpt Text:

Last week the level of CO₂ in the atmosphere rose to 407.5 parts per million. The historic average or the historic high was 208 -- 80 parts per million. This 407.5 parts per million is the highest level measured in over 800,000 years. Coal-fired electric power plants were responsible for a quarter of the CO₂ emitted by the U.S.

Comment Number: 0000098_Strayer_20160517.txt-1
Commenter I: Bob Strayer
Comment Excerpt Text:

But this is a time of transition, and I think it's a cruel deceit on the part of politicians whether it's at the state or on the federal level to mislead people into thinking that things are not going to be changing -- changing and specifically in the energy we use in this country and primarily I'm talking about coal. It's one of the dirtiest sources of pollution that we use for energy. There's no question about that. And 95 percent of the scientists in the world plus are convinced that the climate is changing, is warming. And the increase in CO₂ is a major cause in that, and that's coming from human use of carbon fuels.

Comment Number: 0000099_Wilbert_20160517-1
Commenter I: Kim Wilbert
Comment Excerpt Text:

First, the new program must address the tremendous costs of coal mining on federal lands in terms of climate change.

Comment Number: 0000099_Wilbert_20160517-5
Commenter I: Kim Wilbert
Comment Excerpt Text:

The burning of federally owned coal is a huge contributor to the ever-rising carbon dioxide of atmosphere. The tremendous future costs of dealing with climate change must be accounted for when the taxpayers of this country sell their coal.

Comment Number: 0000274_Nolting_20160515-1
Commenter I: Sharon Nolting
Other Sections: I
Comment Excerpt Text:

In January, an article in Climate Progress stated that "the combustion of coal from federal lands accounts for more than 57 percent of all emissions from fossil fuel production on federal lands." An even more recent study by Greenpeace found that almost 80% of the coal produced by the 3 leading coal companies is taken from our public lands. There is a serious contradiction in your administration's climate policy here which I am hoping your review will make clear so that policy can be changed to align with what must be our highest priority: reducing greenhouse gas emissions to fight climate change.

Commenter I: Cantwell

Comment Excerpt Text:

Third, reconsider how to balance multiple uses over time. The U.S. has relied on fuels extracted from public

lands since its founding. The Federal Land Policy and Management Act requires the BLM to balance extractive uses against other uses of public lands. As part of that responsibility, the BLM must take into account the long-term needs of future generations. What has become clear is that coal mining doesn't merely compete as one use among others. Coal combustion without carbon sequestration ultimately destabilizes and degrades the conditions that make those other uses possible. Given the long atmospheric lifetime of carbon dioxide, the effects of mining a ton of public coal today may rebound on public lands for centuries, damaging opportunities for recreation, water supply, wildfire resilience, and even other extractive uses like grazing and timber. A huge disparity exists between the high, long-term costs of burning the public's coal and the low, short-term return for selling it. The BLM needs to address this disparity.

In 1974 we were concerned about global cooling. Now global warming. Has an honest effort been made to look at the data and conclude that these changes are a natural occurrence

Comment Number: 0000611_Leahy_NMWF-2

Organization I: New Mexico Wildlife Federation

Commenter I: Todd Leahy

Comment Excerpt Text:

First, rely on independent, peer-reviewed science. We strongly believe that the nation cannot continue to lease coal without taking into account that it is the most significant source of greenhouse gas emissions. The current Programmatic Environmental Impact Statement (PEIS) under which federal coal is leased predates the first congressional hearings on climate change and the creation of the intergovernmental Panel on Climate Change. Every one of our hottest years on record has occurred in the last 20 years. A scientific consensus has developed around the reality of global warming. The BLM must ground its new PEIS in this new reality.

Comment Number: 0000620-3

Organization I: University of Illinois

Commenter I: Gerald C. Nelson

Comment Excerpt Text:

Both my own research and my professional assessment of the scientific literature on the effects of climate change lead me to the conclusion that climate change poses an existential threat to the human species. Life on our planet will survive as it has for several billion years, but we could be the first species to be responsible for its own extinction. To reduce the probability of this happening, we must act quickly to slow and eventually stop the net addition of greenhouse gasses (GHGs), particularly carbon dioxide, to the atmosphere. Coal, along with the other fossil fuels, represents stored sunlight. Unfortunately, with current practices, converting that ancient energy into useful energy today requires adding more GHGs to the air at a time when we need to be ending this practice. Until commercially viable technology is developed to reduce carbon pollution from coal burning, we need to expeditiously phase out the use of coal for energy generation.

Comment Number: 0000626-1

Commenter I: Michael Clark

Comment Excerpt Text:

Coal Leasing and Climate Considerations - Coal built our country and is a key foundation for our success and prosperity. A rational energy policy should be based on a true, "all of the above" approach. In fact, this approach is essential if we are to meet our projected future energy needs. Much of the current focus is on addressing climate considerations, but this must be balanced with the critical need to maintain reliable energy generation and distribution systems and provide affordable power for our households and businesses. Any impact analysis should include an alternative which takes this critical balance into consideration.

Comment Excerpt Text:

According to the international disaster database (Emergency Events Database EM-DAT), climate-related deaths are down 98 percent over the past 80 years. In 2013, there were 21,122 such deaths worldwide compared to a high of 3.7 million in 1931, when world population was less than a third of its current size. Why is the climate killing less people? Because while fossil-fuel use has only a mild warming impact, it has an enormous protecting impact. Nature doesn't give us a stable, safe climate that we make dangerous. It gives us an ever-changing, dangerous climate that we need to make safe. And the driver behind sturdy buildings, affordable heating and air-conditioning, drought relief and everything else that keeps us safe from climate is cheap, plentiful, reliable energy, overwhelmingly from coal and other fossil fuels.

Comment Number: 0000750_Atwood_20160623-4

Comment Excerpt Text:

Deniers often site scientific facts from millions of years ago. Such ancient facts are irrelevant since modern man did not walk the planet until 200,000 years ago. In the 400,000 years prior to the Industrial Revolution, CO2 levels cycled between 180 and 290ppm, and in the two+ centuries since, we quickly crossed that threshold, now exceeding 400ppm. During those 400,000 years, the most rapid change in CO2 levels - EVER!! - was a 90ppm change that required 15,000 years. Since 1930, the CO2 level has increased 100ppm ... like a skyrocket! ... a rate 175 times FASTER than the FASTEST change in those previous 400,000 years! Again ... what required 15,000 years THEN, took only 85 years NOW! These fuels have clearly been a monumental factor in this dilemma. The well-being of seven billion people is at risk.

Organization I: House of Representatives

Commenter I: Joe Fitzgibbon

Comment Excerpt Text:

We are already in Washington state seeing devastating impacts from just the early onset of climate change. Ocean acidification is having severe impacts on our shellfish growers in some of the most economically depressed parts of our state as more of what's traditionally fallen as precipitation has fallen as snow is now falling as rain. We are seeing less ability to store water for irrigation of our crops in Eastern Washington, less ability to store water for hydropower purposes, and of course, the last two summers we've seen the most devastating wildfires in our state's history.

So the impacts of climate change are already taking place in Washington. We contribute less than 2 percent of the total United States greenhouse gas emissions here in Washington, but we're suffering the impact nonetheless. There's only so much that we in our state can do to reduce our fossil fuel emissions, but we're already doing what we -- we're doing much of what we can as we shift towards greater reliance on electric vehicles, on public transportation, on renewable energy, but the fossil fuels being burned from coal produced on federal lands are -- vastly outweigh anything we can do in Washington state to reduce our own contributions to climate change.

I don't think you should think of climate as one of those factors to be traded off against others. We know the mathematics, the physics of climate. We know the carbon budget that we must live within in order to preserve human civilization as we know it. Those numbers are embodied in the human framework on climate change and in the Paris treaty, and I think we can treat that as a hard constraint as an imperative so that whatever you decide on coal leasing needs to operate and keep us within that carbon budget.

Comment Excerpt Text:

The EPA is wrongly asserting that CO₂ is dangerous gas that falls under their purview. The attached chart of global temperatures and CO₂ levels over 600 million years shows that the EPA contention (that human caused CO₂ increases are causing higher global temperatures) is false. This chart is important in that it is the only one I found that shows results from several CO₂ studies, and unusual in that it shows visually the relationship between temperature and CO₂ over the full 600 million years for which there is evidence available.

The chart, produced by the editors at New Scientist for their May 16, 2007 issue, in an article titled Climate Myths... shows conclusively that there is no relationship between CO₂ and global temperatures. The chart shows that CO₂ has been as high as 7,000 ppm in the past (17 times current levels of 400 ppm) without any effect on the temperature range of 4 degrees. The chart shows long periods of time where CO₂ and temperature move together (as in the current time period), and long periods where they move in opposite directions, showing no correlation at all. All the studies I looked at that do show a correlation depend on the stopped watch phenomenon (being right 2 seconds in each 24 hour period), or a careful selection of the time period.

As is obvious from the attached chart, the 100 million year Ice Age (from 350 million years ago - 250 million years ago) probably caused a world-wide plant die-off, which lead to the spike in CO₂ levels from 300 ppm (250 million years ago) to over 4,000 ppm (200 million years ago). Thus the chart tells us that the only relationship

between CO₂ and temperatures is that very low temperatures can cause an ice age, which can cause a biosphere die off, which can cause higher CO₂ levels when the biosphere no longer absorbs the CO₂ generated by volcanoes.

What's especially interesting is that the chart shows that the 50 million year spike in CO₂ from 300 ppm to 4,000 ppm corresponds with the global temperature dropping 4 degrees. Exactly the opposite of what the EPA and NASA claim is happening now. As is also obvious from the chart, the current warming period started 20 million years ago, well before humans.

Comment Number: 0002110_Reagor_20160626_att-3

Commenter I: Paul Reagor

Comment Excerpt Text:

Not only is CO₂ not having any effect on global temperatures, but it is, in fact, a beneficial plant food. Plant studies show that the earth's biosphere needs a CO₂ level of 900 - 1,200 ppm (depending on the species). This is obvious when you consider that most plant species can trace their genetic roots back 100 - 200 million years when the CO₂ content of the atmosphere was at that level or higher.

Many studies, from 1986 on show all plants do better at higher CO₂ levels. Many large European growers have been placing their new greenhouses next to power plants so they use the CO₂ from the power plant to enhance plant growth. As any greenhouse man knows, a proper level of CO₂ (900 - 1,200 ppm) increases plant growth by 50%. There is now a whole industry devoted to providing CO₂ generators to greenhouses.

Comment Number: 0002110_Reagor_20160626_att-4

Commenter I: Paul Reagor

Comment Excerpt Text:

as any physicist can tell you, a greenhouse gas that has a density of 1 in 2,500 (400 ppm = 1/2,500) can not have a measurable temperature effect on the surrounding gas. The experiments that show CO₂ raising the temperature by 6 degrees depend on 100% pure CO₂. When converted to actual densities, the effect is 6/2,500 or .0024 degrees, too small to measure.

Comment Number: 0002111_Ross_20160623-1

Your organization seems to ignore the climate impacts from coal production in relation to meeting national and international climate commitments.

At least 80 percent of global coal reserves and 90 percent of U.S. coal reserves must remain in the ground to have a 50 percent chance of avoiding catastrophic levels of global warming. Unleased federal coal contains up to 212 billion tons of potential greenhouse gas emissions, which is 43 percent of the potential emissions of all remaining federal fossil fuels, including oil and gas. With more than 57 percent of fossil fuel emissions from federal areas coming from the combustion of federal coal, there is no place for the federal coal program in a carbon-constrained world.

The federal government has a duty to mitigate climate impacts from downstream GHG emissions associated with the coal leasing program

There are at least four potential non-statutory sources of the federal government's affirmative duty to mitigate greenhouse gas emissions and associated climate impacts from federal coal: the principles of international law and the requirements set forth under the United Nations Framework Convention on Climate Change; the public trust doctrine; the federal common law of public nuisance; and private nuisance under state common law.

Although it is plausible that none of these sources would result in an affirmative court decision holding the government liable for a breach of its duty, that shortfall does not negate the existence of the duty itself. The statutes and regulations that govern Interior's management of public lands provide other, and potentially even

more forceful, sources for a duty to mitigate upstream and downstream greenhouse gas emissions and associated climate change impacts arising from the federal coal leasing program. Pursuant to the Federal Land Policy and Management Act (FLPMA), the Mineral Leasing Act (MLA) and NEPA, BLM has a duty to analyze and implement mitigation measures for the adverse environmental, social and public health impacts attributable to its management of fossil fuels on public lands.

Comment Number: 0002158_Burger_SabineCenter_9132016-3

Organization I: Sabine Center for Climate Change Law

Commenter I: Michael Burger

Other Sections: 2 8.10

Comment Excerpt Text:

Federal statutes, regulations and policy provide Interior and BLM with ample authority to adopt a fee as a form of compensatory mitigation

BLM has recognized that compensatory mitigation for unavoidable or residual climate change impacts arising from agency decisions is fully consistent with its mission and its multiple use mandate and that it possesses the discretion to require it, and has clarified that doing so is in fact the agency's policy. A climate change impacts fee for downstream GHG emissions fits within the agency's NEPA obligations and its compensatory mitigation policy. The climate change impacts at issue in this paper are those that occur as a result of GHG emissions both at the coal mine and downstream, when the extracted coal is transported and eventually combusted for its end use. These downstream GHG emissions are considered "indirect effects" under NEPA, and the climate change impacts associated with those emissions are unavoidable or "residual" impacts. In undertaking the Programmatic EIS, Interior has recognized that NEPA requires it to analyze downstream emissions – a conclusion that comports with the current trajectory of courts' interpretations of NEPA. Under NEPA, then, the agency must also identify and assess appropriate mitigation measures for these emissions, including compensatory mitigation measures. The mitigation measures discussed in the Programmatic EIS should follow the "mitigation hierarchy," and should include both a "net zero" emissions offset program as well as a climate change impacts fee. A climate change impacts fee would be consistent with recent directives, including the Presidential Memorandum Mitigating Impacts on Natural Resources from Development and Encouraging Related Private Investment; Secretarial Order 3330, Improving Mitigation Policies and Practices of the Department of the Interior; and "Landscape-Scale Mitigation Policy," a new chapter in its Departmental Manual, which effectively operationalizes Order 3330. The sum total of the White House and Interior guidance is that BLM can and should assess and potentially implement mitigation measures, which might operate through any number of mechanisms, including lease stipulations and chargeable fees, among other things. The mitigation measure should first seek to avoid GHG emissions and their climate impacts; second, seek to minimize emissions and impacts; and third, compensate for unavoidable impacts, as through a climate change impacts fee.

Comment Number: 0002158_Burger_SabineCenter_9132016-6

Comment Excerpt Text:

The federal government has the discretion to mitigate climate impacts from downstream GHG emissions associated with the coal leasing program

Even if the duty to mitigate is of uncertain scope or enforceability, FLPMA, the MLA and NEPA all confer a definite discretion to mitigate climate change impacts. The multiple use mandate and unnecessary and undue degradation prohibition of FLPMA, the public interest requirements of the MLA and the ambitious goals and

specific analytical requirements of NEPA individually and taken together grant the agencies broad discretion to mitigate foreseeable impacts, and to require compensation for impacts that cannot be avoided or minimized.

Comment Number: 0002158_Burger_SabineCenter_9132016-7

Organization I: Sabine Center for Climate Change Law

Commenter I: Michael Burger

Comment Excerpt Text:

The duties imposed on and remedies available against lessors under tort and property law offer a persuasive rationale for assigning a climate change impacts fee to federal coal

Climate change impacts from the coal leasing program's downstream GHG emissions will occur in locations, and to persons, both proximate to and remote from a given leased parcel. These impacted locations will include the leased parcel, other public lands and resources under BLM's jurisdiction, other federal lands and resources under Interior's jurisdiction, and private and public property within and outside the United States. Impacts to federal lands—including the leased parcel and off-site lands—and even to the public fisc, more broadly writ, are compensable under the general principles of property law. For instance, it is a general principle of property law that tenants are required to restore leased property to its former condition, or else be subject to termination and/or damages. And although there may not be a hornbook principle along these lines to cite to, it makes profound sense that a lessor has within its authority the ability to protect its other properties, or to require compensation for impacts to them, from activities it permits on its land. Moreover, the federal government, as lessor to coal mining companies, could, in principle, be held liable for damages for the climate change impacts associated with downstream GHG emissions. Section 379A of the Restatement (Second) of Torts and Section 18(4) of the Restatement (Second) of Property maintain similar standards for lessor liability for remote nuisances or personal injuries attributable to lessees' activities. Because the federal government is consenting to the coal mining, and because the federal government is at this time well aware that coal leasing either involves an unreasonable risk or else contributes to the identifiable nuisance of climate change impacts, these principles of lessor liability put the government on the theoretical hook for damages.

Climate disruption is already scorching India, where the temperature reached 123.8 F in April, killing hundreds and destroying crops in at least 13 states. Climate disruption is fueling the massive Alberta wildfire that forced 90,000 people to evacuate their homes and is now spreading into Saskatchewan. In Africa 36 million people are on the verge of famine, due to climate-change escalated drought, while in Australia 93 percent of the Great Barrier Reef has suffered heat-related coral bleaching and death. Climate disruption is accelerating the sixth great extinction of life on earth, an extinction which if it continues at the present rate, will eliminate half the plants and animals on our planet by the end of the century. We are facing the greatest threat to survival humans have ever faced. "Because CO2 stays in the atmosphere for over a century, the only thing that matters in limiting temperature is cumulative emissions, the total concentration of greenhouse gases we dump into the atmosphere" warns Kevin Anderson, climate advisor to the British government and former director of the Tyndall Energy Program. What would it take, Anderson asks, to target 2 degrees C realistically? "No carbon tax is going to do that. We won't get there through innovation or new technology, even if we spend a trillion a year for the next few years. The only conceivable way to produce that level of reductions," says Anderson, "is a full-scale, all-hands-on deck mobilization, what William James called 'the moral equivalent of war.'"

Any evaluation of the effects of coal mining on climate impacts needs to be based on accurate and factual information and analysis. While there seems to be some evidence of a warming trend, that evidence also seems to be within the natural variability that exists for the earth. Much of the climate impact “science” is theoretical and based on computer modeling. Any climate science needs to be accepted, proven science.

As noted in the Notice in the Federal Register, the coal produced on Federal lands, while comprising 41% of all coal produced in the U.S. produced only 10% of the U.S. Green House Emissions. In addition, the coal produced in the North Fork Valley of western Colorado is among the cleanest coal. It is reputed to be cleaner than natural gas.

Coal mining on federal lands accounts for an estimated 14% of U.S. CO₂ emissions. This is a very large number compared to the emissions of any individual facility or project. The approximately 160 billion tons of coal that remain to be potentially mined in the Powder River Basin, and the 272 billion tons of CO₂ which burning that coal would emit, are also very large numbers. According to the declaration by climate scientist Mike MacCracken in High Country, this amount, by itself, would equal 1/2 of the world's remaining carbon budget if the global warming is to be kept below 2 degrees Celsius. This is the amount of coal (and associated CO₂ emissions) that falls within this updated programmatic EIS. It is no longer possible to deflect an assessment of the BLS coal leasing program on the earth's climate. This PEIS must undertake that assessment.

The disruptive effect that global warming is having on this cycle is summarized by the Bureau of Land Management and the National Forest Service. Rising temperatures associated with global warming have already altered the characteristics of a broad range of plant and animal species (80% of species from 143 studies). These changes include reduced species density, northward or range shifts, altered timing of organism growth and reproduction, and reductions in the diversity of species' gene pools.

There has been a rapid expansion of invasive species. This can be attributed primarily to the direct and indirect effects of climate change, including elevated CO₂ and N deposition. Changes in past and present land uses, such as intense grazing, have also contributed. Consequently, approximately 20% of the sagebrush ecosystem's native flora and fauna are considered imperiled, and the remaining components of the sagebrush-based ecosystem are in decline. (Miller and Tausch, 2000, pp. 15–30).

Comment Excerpt Text:

As discussed in more detail below, global warming is dramatically increasing the frequency and intensity of fire in the Great Basin. Increased wildfires in shrublands in the Great Basin that have been converted to cheatgrass have now transformed rangelands that were carbon sinks into carbon sources on a large scale (Bradley et al., 2006). The combined effects of increased burn area and overgrazing mean that, by the end of the century, almost 59% of sagebrush-bunchgrass communities throughout the western U.S. could be replaced by communities of annual grasses and noxious weeds, or juniper and pinyon pines. The consequences for mule deer, pronghorn and other species that depend on the sagebrush ecosystem will be devastating. (Glick, 2006). The consequences for the Great Basin's soils will be equally grim. Juniper, pinyon, annual grasses, and noxious weeds do little to prevent fluvial erosion, and do not facilitate infiltration of moisture into soil and ground water recharge. The decline in the sagebrush-bunchgrass ecosystem in the Great Basin will expose those soils to erosion by wind, rain, and

flood. Although overgrazing, road building, and urban construction all contributing to demise of the sagebrush ecosystem, global warming is the main forcing mechanism, largely through its facilitation of fire. (Humboldt-Toiyabe Report, . 9).

Comment Excerpt Text:

Among earth scientists there is nearly complete consensus that accumulating greenhouse gas emissions have the planet on a long-run path to an ever hotter atmosphere and ocean, and ever greater climate disruption. The debate about this survives only at the political level. It is kept alive primarily by commercial interests who are aware of the implications of climate science, but would be disadvantaged if this country to deal with them seriously. As rangeland scientist Dr. Thad Box observes, the controversy between scientists and climate change critics over whether human-induced changes simply exacerbate “natural” climatic cycles or drive the major changes is irrelevant. The countermeasures required in either case are the same, and the diverts society from making the responses that it must in order to survive.

Comment Excerpt Text:

Changes in temperature and precipitation associated with climate change are causing widespread deforestation across the globe. (Bonan, et al., 2008.) Deforestation, in turn, is responsible for 20% of the “greenhouse effect.” In the Great Basin, climate change is expected to continue to produce hotter, drier conditions at high elevations, drought-weakened trees, broader insect infestations, more frequent and more intense wildfires, and impaired forest ecosystems. White Pine and Aspen are in special peril. [http://www.deq.utah.gov/BRAC Climate/docs/Final Report/Sec-A-I SCIENCE REPORT.pdf](http://www.deq.utah.gov/BRAC%20Climate/docs/Final%20Report/Sec-A-I%20SCIENCE%20REPORT.pdf).

Of particular concern are the greatly expanded burn acreage caused by a warming climate and the effects of extreme wildfire events on ecosystems. It is estimated that increases in temperature will cause annual mean area burned in the western United States to increase by 54% by the 2050s relative to the present-day. The forests of the Pacific Northwest and Rocky Mountains will experience the greatest increases--78% and 175% respectively. The increase in the area burned is expected to cause a near doubling of wildfire carbonaceous aerosol emissions by mid-century. (Spraklen et al., DOI:10.1029.) In 2004, researchers at the U.S. Forest Service’s Pacific Wildland Fire Lab looked at past fires in the West to create a statistical model of how future climate change may affect

wildfires. They found that by the year 2100, the area annually burned in Montana, New Mexico, Washington, Utah, and Wyoming could be five times greater than at present. (McKenzie, et al., 2004, pp. 890-902.)

Comment Excerpt Text:

Current trends suggest that the fastest and most wide spread mass extinction of species in the Earth's history is very likely underway. In the tropics alone, we may now be losing 27,000 species per year to extinction. http://www.pbs.org/wgbh/evolution/library/03/2/1_032_04.html. By the year 2050, it is estimated that 15–37% of land plants and animals will become extinct as a result of climate change. (Thomas, C. et al., 2004.) Many species will die because they will not be able to migrate to places where the climate remains suitable. Others will die because suitable habitat will no longer exist. <http://www.nature.com/nature/links/040108/040108-1.html>. When viewed on an evolutionary time scale, the current pace of climate change is essentially instantaneous. For example, studies of the fossil record indicate that for tree species to adapt to the current pace of climate change, they would have to migrate to suitable habitats ten times faster than most species were able to respond to climates shifts in the past two million years. Few tree species have this ability. (Davis and Shaw, 2001.) Species mortality has serious consequences. In plant communities, reduced diversity leads to lower productivity, less nutrient retention in ecosystems and ecosystem instability. An average plot containing one plant species is less than half as productive as an average plot containing 24–32 species. As plant diversity is lost, leaching of nutrients from the soil increases, reducing its fertility. (Tilman, D., 2000).

A. Impaired Respiratory Function from Increased Ground-Level Ozone.

The chemical reaction that forms ozone is, in part, heat driven. Hotter temperatures will create higher ozone concentrations. The incidence of forest fires is also heat driven. Forest fires are a major source of ground-level ozone. As forest fires become more frequent and intense, exposures to ground-level ozone will increase. The significance of forest fires as sources of ozone can be appreciated by considering that smoke plumes from forest fires in Alaska have been shown to significantly increase ground-level ozone concentrations as far away as Europe. (Real E., et al., 2007).

Ozone creates a positive feedback mechanism for global warming because ozone itself is a greenhouse gas. In yet another feedback mechanism, higher ozone concentrations retard the growth of trees, which reduces the ability of forests to absorb CO₂.

The American Lung Association estimates that at least one-third of Utah is vulnerable to the impacts of air pollution. Of a population of 2.8 million, more than 1 million are under 19 or over 64. About 230,000 have asthma, and nearly 494,000 have cardiovascular disease. The effect of ground-level ozone pollution on the delicate lining of the lungs is analogous to the effects of sunburn on the skin. It aggravates respiratory diseases like asthma, and impairs lung function in the population generally.

Until recently, high concentrations of ground-level ozone in the Mountain West had been observed only in the summer in population centers, as auto and industrial emissions reacted in the presence of sunlight and heat. Now high concentrations of ground-level ozone are appearing in the Mountain West's remote areas as well, especially in areas where oil and gas producers have recently drilled thousands of wells. Oil and gas drilling, as presently practiced, releases large quantities of ozone precursors, such as nitrogen oxide (NO_x), volatile organic compounds (VOCs), and formaldehyde. <http://rd.usu.edu/files/uploads/ubos2011-12finalreport.pdf>. Recently, for the first time, concentrated ozone has appeared in the winter in the remote energy development areas of Wyoming and Colorado and Utah's Uinta Basin.

Utah's Uinta Basin covers nearly 6 million acres. In winter, emissions from energy production collect in the lower atmosphere where they are transformed into ozone by interacting with sunlight and snow. Air pollution monitors installed in the Uinta Basin measured ozone concentrations exceeding federal health standards more than 68 times in the first three months of 2010. <http://www.nytimes.com/gwire/2010/10/01/01greenwire-air-quality-concerns-may-dictate-uintah-basins-30342.html?pagewanted=all>. Maximum 8-hour average ozone concentrations at the Ouray air monitoring station during 2013 reached 142 ppb. This exceeds federal air quality standards by 89%. <http://www.deq.utah.gov/envrpt/Planning/s12.htm>. For long periods of time, ground-level ozone concentrations in the Uinta Basin now exceed those of Los Angeles County, where the nation's highest ozone concentrations traditionally occur.(36)

(36) The Uinta Basin's average ozone concentration for 2010-2011 was 116.5 ppb (based on the NAAQS-created measurement of the fourth-highest value averaged over the two years). In comparison, Los Angeles County averaged 108 ppb over the same two years.

http://www.blm.gov/pgdata/etc/medialib/blm/ut/lands_and_minerals/oil_and_gas/november_2011.Par.75557.File.dat/Email%20July%2015%202011%20Garbett%20-%20SUWA%20Comments%20Nov%202011.

Atmospheric currents are capable of transporting ozone and particulate matter thousands of miles away from their original sources. Ozone is showing up now in high concentrations in the air over the middle of the Atlantic Ocean. This raises the prospect that the rapidly growing supply of ozone precursors in the Uinta Basin, combined with the higher temperatures that global warming will bring, will increase ground-level ozone both there and in adjacent regions, such as the mountain valleys of the heavily populated Wasatch Front.

Another source of ozone adjacent to the Wasatch Front is the ultraviolet light that reflects off of the surface of the Great Salt Lake and interacts with the chemical soup produced by the refinery emissions and the vehicle exhaust emitted near the shore of the lake. This adds to the concentration of ozone along the Wasatch Front, and makes the Wasatch Front all the more vulnerable to the ozone-promoting effects of global warming.

A recent study of ozone by Utah's Division of Air Quality reports annual concentrations of ozone in the Salt Lake City of 0.079 ppb, violating the National Ambient Air Quality Standard of 70 ppb (based on the 4th highest annual 8-hour maximum). Furthermore, the study shows, ozone is expanding far beyond the areas traditionally affected by photochemical reaction. It reports ozone levels virtually as high in the parks of Southern Utah as in the urbanized North. [http://www.airquality.utah.gov/Public-Interest/Current-Issues/Ozone/2012 Utah Ozone Study.pdf](http://www.airquality.utah.gov/Public-Interest/Current-Issues/Ozone/2012%20Utah%20Ozone%20Study.pdf). Utah's air quality is already being affected by events and policies in other parts of the world, this trend will intensify.

A recent, landmark study led by Brigham Young University's Arden Pope has enhanced our understanding of the impact of ozone on public health. It clearly demonstrates that ozone exposure increases rates of respiratory death. Along the Wasatch Front, the study concludes, exposure to ground-level ozone increases the rate of respiratory death by about 25%. Other studies establish that ground-level ozone negatively impacts lung function across all segments of the population, including young, healthy adults, even at levels below current national air quality standards.

As described earlier, hotter temperatures and reduced precipitation expected in the Great Basin as a result of climate change is likely to result in widespread loss of native vegetation in the already water-stressed Great Basin. This can be expected to expand the sources of dust, or particulate matter pollution, to which Utah residents are exposed. Earlier this spring, for example, a storm moving in from the Great Basin filled the atmosphere with enough dust to send levels of fine particulates in northern Utah ten times higher than the EPA maximum limit. Kinds of particulate exposure that are likely to increase as a result of global warming, and the additional threats that they pose to the health of Utah's residents, are discussed below.

Soils in the Western United States also harbor significant concentrations of microorganisms like coccidiomycosis, the fungal spores that cause Valley Fever. Valley Fever is a disease with flu-like symptoms that is difficult to diagnose, and is sometimes fatal. It is spread by inhaling windblown coccidiomycosis spores, known by the inhabitants of the Southwest as "Death Dust." Valley Fever has quadrupled in the last ten years in the Southwest. The American Academy of Microbiology estimates that 200,000 people per year contract the disease, which is fatal in about one in 1,000 cases. People who are immunosuppressed, women who are pregnant, and diabetics, are particularly susceptible to serious courses of this disease.

Hotter temperatures associated with global warming will give the cocci a survival advantage over other microorganisms. More frequent and intense dust storms are the perfect delivery system for increasing this infectious disease among residents of the Western U.S. Dale Griffin, a USGS microbiologist, says that one gram of desert soil can contain as many as one billion microorganisms. Fungi can travel long distances because the spore "housing" acts like a cocoon, protecting the fungus from environmental stresses. More than 140 different organisms have been identified as "hitchhiking on to dust particulates." These include SARS, meningitis, influenza and foot and mouth disease. <http://wwwp.dailyclimate.org/tdc-newsroom/valley-fever/Valley-Fever-blowin2019-on-a-hotter-wind>.

Climate change, through weather extremes, pollution, habitat fragmentation and destruction, and widespread extinction of species, is reducing the viability of world's ecosystems. If allowed to continue, the collapse of these ecosystems is likely to be a major contributor to future pandemics of infectious disease.

the contributions that the coal leasing program makes to U.S. Greenhouse Gas emissions (GHG) are significant. Extraction of coal from federal lands should be ended as quickly as possible as a measurable contribution to reducing our national release of GHGs in an effort to avoid the most terrible and irreversible effects of global warming and climate disruption.

Reforming the coal leasing program is insufficient.(8) Any amount of increased revenue to the federal government will be minuscule compared to the costs of adaptation and response to climate disruption.(9) This year (2016) the mainland U.S. has already suffered six (6) severe climate-weather events which each caused economic losses of \$1 Billion or more(10) – thus a single severe event may cause losses that must be replaced that equals the current annual revenue of the Coal Leasing Program. This situation will only worsen. The best we can do is to stop the release of GHG as rapidly and effectively as possible in an effort to avoid the worst.

The cost of droughts and flooding and resulting infrastructure damage and crop losses together with forest fire fighting costs(11) are greater than the annual revenue for the program even if adaptation to sea level rise is not included. If sea level rise is included(12) the Secretary could start by noting “More than \$40 billion of National Park Service assets, including infrastructure and historic and cultural resources, are at high risk of damage from sea-level rise caused by climate change.”(13)

The Secretary must fully consider and act upon what science is telling us – that we have become a world of melting ice and rising sea levels. Look at the projections on sea level rise and the loss of large parts of New York City, Boston, Miami, New Orleans, Galveston, and our eastern barrier islands. Burning coal increases atmospheric energy and ocean temperatures which increases the strength of land falling hurricanes. We are suffering longer deeper droughts, massive forest fires, widespread flooding and deadly heat waves.

While these localized threats are extremely important to address, we ask the agencies to consider coal’s global impacts: climate change. According to CHGE, coal generates 4/5 of utility sector greenhouse gases even though it comprises less than half of the nation’s electricity (4). Soot absorbs solar radiation, further warming the atmosphere. Coal mines themselves emit methane (5).

Because of climate change, we are already seeing impacts to the environment and public health. We are witnessing stronger hurricanes and more frequent floods (6). After heavy rain events and intense storms there are increases in asthma and clusters of illnesses (7). Heat waves affect vulnerable populations such as the elderly. Droughts contribute to food insecurity. These wide-ranging climate impacts must be considered as the agency evaluates the federal coal program. Finally, the government should not incentivize the use of coal through subsidies and loopholes. In 2007, the level of federal government subsidies for electricity and mining activities was estimated by the Environmental Law Institute to be \$5.37 billion or 0.27¢/kWh (8).

(6) <http://www.chgeharvard.org/resource/explore-true-costs-coal>

According to a large body of scientific research, holding temperature rise to “well below 2°C” requires that the vast majority of global and US fossil fuels stay in the ground. (4) Effectively, this means that fossil fuel emissions must be phased out globally within the next few decades. (5) The global carbon budget — the remaining amount of carbon that can be released to the atmosphere before we lose any reasonable chance of holding global temperature increase well below 2°C — is extremely limited and is rapidly being consumed by continued fossil fuel use. (6) The United States alone has enough recoverable fossil fuels, split about evenly between federal and nonfederal resources, that if extracted and burned, would exceed the global carbon budget for a 1.5°C limit, and would consume nearly the entire global budget for a 2°C limit. (7) The unleased federal coal resource alone is estimated at 212 GtCO_{2e}, or almost two-thirds of the remaining global carbon budget for a reasonable probability of limiting warming to 1.5°C. (8)

Comment Excerpt Text:

As western mountain communities, we represent nearly 200,000 permanent residents and millions of annual visitors. Coal extraction and use as a fuel source poses a number of costs currently unaccounted for in federal coal program. Onsite, these costs include air pollution from exploration, development, and transportation to and from the mine site; fugitive methane emissions; habitat disruption; noise pollution; and water contamination. From the perspective of our mountain communities, the coal’s contribution to climate changes poses the greatest cost. Economic, public health, and environmental damages from catastrophic wildfire, floods and reduced snowpack are some of the threats we face.

Failing to account for coal’s contribution to these costs in federal coal leases shifts them onto taxpayers -- and in our case, at a time when our towns are shouldering the financial burden of climate impacts and proactive adaptation. In the face of climate change, it is time to modernize the federal coal program to accurately account for its costs to communities, taxpayers and the environment while supporting a transition to a more sustainable and resilient economy.

Substitution Analysis and Carbon Budgeting

The third panel centered on substitution analysis and carbon budgeting.

Nathaniel Shoaff (Staff Attorney, Sierra Club) discussed BLM's past substitution analysis and recommendations for approaching substitution in the programmatic review. Shoaff explained that while there is an idea that coal is a global commodity and that consumers will pay to have coal come out of one spot if it does not come out of another; this assumption of "perfect substitution" should be refuted. The Sierra Club takes the position that one cannot make a "reasoned choice among alternatives," as required by the National Environmental Policy Act (NEPA), until the greenhouse gas emission differences are known. This cannot be done without proper substitution analysis. The Sierra Club hopes that through the PEIS, there will be a determination as to whether a federal coal leasing program is consistent with the President's climate objectives and the climate agreements (China, Paris, etc.) that we have already made. All of the emissions from coal production, transportation, and combustion should be quantified in the PEIS; this is a simple calculation. It is harder to analyze how certain policies change the energy market; however, this can and should be done using available tools and models, and is called for in the Secretarial Order itself. The agency should explain its historical views on substitution and why it is changing them, and make its review as transparent and replicable as possible. Jason Schwartz (Legal Director, Institute for Policy Integrity) discussed how other federal agencies have conducted substitution analysis and provided recommendations for BLM. He suggested that the first place BLM could look was within Interior itself, as its offshore leasing program has an extensive 35 years' worth of experience doing energy substitution analyses. Schwartz explained that before 1982, BLM actually prepared Interior's EIS for offshore leasing, and that today BOEM does much more qualitative and quantitative substitution analysis than BLM does. BLM can learn from its sister agencies'—including BOEM, FERC, the Surface Transportation Board, the U.S. State Department, and EPA—experiences with substitution analyses and should do so by using an economic model that has been used and adopted by other agencies. BOEM's Market Sim, the U.S. Energy Information Administration's NEMS, and ICF International's IPM are all available models that have different benefits and drawbacks. Policy Integrity recommends that environmental impact statements quantify and monetize the full upstream and downstream emission consequences of proposed leasing actions and energy substitute scenarios. This approach is consistent with White House Council on Environmental Quality (CEQ) guidance and is necessary to fulfill NEPA's goals of providing policymakers and the public with information in a way that allows full comparison between alternatives.

Comment Excerpt Text:

A recent study has concluded that introduction of higher royalty rates would reduce carbon dioxide emissions of coal even with demand side policies, like the Clean Power Plan, in place. (127) This would be in part due to the induction of substitution of lower carbon emitting fuel and energy sources for coal. (128) The study finds significant reductions in CO₂ emissions with the imposition of royalty rates that internalized carbon pollution costs by reflecting the social cost of carbon in the royalty rate. (129) While scenarios vary depending on demand side policy, with strong CPP implementation a carbon adder to royalty rates as low as 20% of the SCC could further lower carbon emissions by between 59 and 25 million metric tons in 2020 and by 39 and 10 million metric tons in 2030 depending on CPP implementation schemes. (130) The reason for the larger near term increase in emissions reductions is that the increased costs of coal will speed near term investment in lower carbon fuel sources including renewables. (131) The effects of a royalty rate increase without the CPP is also quite substantial. If the CPP is not implemented, a royalty rate at or equal to 100% of the SCC would result in carbon emission reduction equal to 70% of those that would have been achieved by the CPP as currently designed. Comment Excerpt Text:

Federal coal program must be consistent with federal carbon reduction policy and goals, like the Administration's Climate Action Plan, and properly internalize the costs of carbon pollution to industry. The Obama Administrations has put forth a bold climate initiative aimed to aggressively reduce greenhouse gas emissions to levels that scientists tell us we must by aiming for carbon pollution reductions of between 26-28% by 2025. In December of last year, the U.S. made international commitments to achieving worldwide reductions that will limit warming to below 2 degrees Celsius with an aspirational goal of not exceeding warming of 1.5. degrees Celsius. Two degrees Celsius is the level of warming scientists have told policy makers is the amount of warming the earth can likely occur without triggering the most calamitous impacts of climate change. 1.5 degrees is considered a safer and more prudent level, especially for lower lying areas, but harder to achieve. The federal coal program must be reformed so as to in sync with these goals. The Federal coal program can no longer be divorced from the nation's climate policy. To align the federal coal leasing program with climate goals, BLM and DOI should:

- o Properly account for the carbon pollution impacts from coal mining by looking at the cradle to grave emissions from coal.
- o Manage the federal coal program to strategically reduce the production of coal to help achieve reduction of associated greenhouse gas emissions by 26-28% below 2005 levels by 2025 through five-year leasing plans.

- o Develop quarterly estimates of all greenhouse gas emissions associated with the extraction, transport, and consumption of federal coal to serve as basis for future decisions regarding the federal coal program and report the carbon emissions and impacts for all agency leasing decisions.

- o Fully analyze the true life-cycle impacts of greenhouse gas emissions from federal coal leasing and development. Protocols should be established to consider upstream and downstream impacts for methane and carbon including monetizing the impacts using the EPA's social cost of methane and the Interagency Working Group's social cost of carbon methodologies.

- o Include stipulations in every lease, permit and plan of operations to require mines to capture or offset methane releases.
- o Ending substitution analyses that do not add up.

- o Once the costs of carbon pollution from coal mining have been assessed, incorporate these costs into coal royalty rates so as to internalize the carbon pollution costs to the lessee companies.

Comment Excerpt Text:

It is virtually undisputed that carbon pollution from the extraction, use and combustion of fossil fuels is causing warming global temperatures leading to accelerating climate change. In 2014, the Intergovernmental Panel on Climate Change (IPCC) released its Fifth Assessment Report, stating that “[w]arming of the climate system is unequivocal,” and that “[h]uman influence on the climate system is clear.” (105) “[M]ore than half of the observed increase in global average surface temperature from 1951 to 2010 was caused by the anthropogenic increase in [greenhouse gas (“GHG”)] concentrations.” (106) Furthermore, between 1970 and 2010, “CO₂ emissions from fossil fuel combustion and industrial processes contributed about 78% to the total GHG emission increase.” (107) As detailed below, the potential impacts from climate change are immense and threaten wildlife and communities globally. Of fossil fuels, coal accounts for the greatest amount of carbon pollution from its extraction and use. In the United States, a significant amount of those coal emissions can be traced to federally leased coal.

(105) Intergovernmental Panel on Climate Change, *Climate Change 2014: Synthesis Report (IPCC Report)* (Nov. 2014) at 2, 4, available at http://ar5-syr.ipcc.ch/ipcc/resources/pdf/IPCC_SynthesisReport.pdf.

(106) *Id.* at 48.

(107) *Id.* at 4.

The costs of these emissions are immense: increased droughts, floods, forest fires, coastal erosion, threats to water supplies and many other impacts. Currently, these costs are not being accounted for in leasing decisions or being borne by the coal companies responsible for them.

The single greatest cause of increasing global temperatures is emissions resulting from the combustion of fossil fuels such as coal. (108) Coal is one of the dirtiest fossil fuels in terms of contributing to the GHGs that are causing climate change. Scientists estimate that in order for worldwide emissions to stay below a level that will push the earth above 2 degrees Celsius of warming – a threshold world leaders have agreed is too dangerous to cross – 95% of U.S. coal reserves will have to remain undeveloped. (109) In Paris, world leaders agreed to aspire to keep warming below a safer target of 1.5 degrees Celsius. To achieve these needed reductions, the President has made clear that he intends to lower U.S. emissions by up to 28% by 2025. (110) On August 3, 2015, the Environmental Protection Agency finalized a rule – the Clean Power Plan – intended to reduce the emissions of GHGs from the power sector, primarily by demanding reductions in coal consumption. (111) While these rules are being challenged in court, it is almost certain federal policies will continue to move our power sector away from coal.

Climate change is also affecting many areas directly impacted by federally leased coal mining. According to the U.S. National Climate Assessment, climate change impacts the Great Plains region, including the Powder River Basin area, by causing “more frequent and more intense droughts, severe rainfall events, and heat waves.” (116) As acknowledged by a recent Draft Environmental Impact Statement on the proposed and now rejected Tongue River Railroad, Montana has already “experienced a warming trend in the past five decades, and annual average maximum temperatures have increased by 1.4°F.” (117) This trend is expected to continue:

Across Montana, hot summer temperatures (those at the 90th percentile) could rise by 4.8 to 5.0°F in moderate and high GHG concentration scenarios from 2025 to 2050, relative to the 1950 to 2005 period. Cold winter temperatures (those at the 10th percentile) are projected to increase by 3.8 to 4.5°F in moderate and high GHG concentration scenarios over 2025 to 2050, relative to the 1950 to 2005 period. Energy development on public lands, particularly the coal program, is responsible for as much as 21% of all America's greenhouse gas emissions in 2012 originated from coal, oil and gas extracted from public lands. (124) As the Secretary's order notes, the federal coal program accounts for a substantial share of those emissions – 10% of total US greenhouse gas emissions according to the order.

(124) Ecoshift Consulting et al., *The Potential Greenhouse Gas Emissions from U.S. Federal Fossil Fuels* (August 2015) at 7, available at <http://www.ecoshiftconsulting.com/wp-content/uploads/Potential-Greenhouse-Gas-Emissions-U-S-Federal-Fossil-Fuels.pdf>, citing Stratus Consulting, *Greenhouse Gas Emissions from Fossil Energy Extracted from Federal Lands and Waters* (2014), available at <http://wilderness.org/sites/default/files/FINAL%20STRATUS%20REPORT.pdf>.

BLM has only recently begun to disclose the amount of carbon pollution associated with its coal leasing decisions and take steps toward analyzing the consequences of those emissions. It is important for the American people to have an understanding of how their resources are contributing to climate change and how the managers of those resources, the federal government, are working to reduce the impact on the climate over time.

Comment Excerpt Text:

Coal reform is vital to combating climate change. Government-owned coal harvested in one region of the U.S., the Powder River Basin, accounts for 10% of all U.S. greenhouse gas emissions, and 24% of greenhouse gas emissions is from coal. That's a lot! The impacts of climate change will be one of the greatest challenges facing our youth, and accounting for carbon emissions would be a first step in mitigating coal's harmful effects.

Further, one of the issues to address in the proposed Federal coal program review is climate impacts of Federal coal production, transportation, and combustion; how to mitigate, account for, and address these impacts through the coal program; and ensure that there is no unnecessary and undue degradation of public lands from these impacts. 81 Fed. Reg. at 17725. The BLM has no authority over air quality or the emissions of hazardous air pollutants. The U.S. Environmental Protection Agency (EPA) is the governing agency authorized to establish National Ambient Air Quality Standards to protect public health and public welfare and to regulate emissions of hazardous air pollutants. 42 U.S.C. §7401 et seq. The states are also provided with authority over air quality if they have developed approved state implementation plans (SIP). 42 U.S.C. §7410. The State of Wyoming's regional haze SIP was partially approved by the EPA in 2014, with the EPA promulgating a Federal plan to fill in any missing gaps. 79 Fed. Reg. 5032 (Jan. 30, 2014). The recently adopted Clean Power Plan, 80 Fed. Reg. 64662 (Oct. 23, 2015), also addresses concerns about climate change and reducing carbon pollution from power plants. The EPA and the State of Wyoming have provided sufficient protection over air quality and any further restrictions by BLM is unwarranted and without authority.

Direct Impacts Associated With Climate Change

Finally, the PEIS must examine the impacts from climate change to the ecosystems in which federal coal leasing occurs. Secretarial Order No. 3226 recognizes BLM's responsibility to identify changes that may result from climate change and directs bureaus to "consider and analyze potential climate change impacts" in "long range planning" and/or when making "major decisions affecting DOI resources." (27)

(27) This order was replaced by Secretarial Order No. 3289, Amendment No. 1, Feb. 22, 2010. However, the text of the relevant portion is unchanged and the new order specifically recognizes that that portion of Order No. 3226 remains in effect.

From 2003 to 2007, the 11 western states warmed 70% more than the rest of the world as a whole. Nowhere is this impact felt more than in water supplies — the warming has led to decreases in snowpack, reduced snowfall, shifts in precipitation from snow to rain, earlier snowmelt, increased peak spring flows, and decreased summer flows. These dynamics are also making the West increasingly vulnerable to future wildfires, which are weighing more and more on federal, state and local budgets in mountain communities and towns across the West. For example,

- Climate models based on a 2.4C warming show a 17% reduction in runoff in the Colorado River Basin, which leads to a 40% reduction in basin storage.
- The Sierra Nevada Range in California may experience a 99% loss of its April 1st baseline snowpack, and other western mountain ranges will suffer reduced late-season snowpacks by the end of the century.

See Paying The Costs of Climate Change: How Closing Coal Loopholes Can Supply Western Communities With Much-Needed Revenue To Fight Wildfires, Prepare For Droughts, and Adapt To A Changing Climate (Mountain Pact 2015) at 2.

Climate change can increase the vulnerability of resources and ecosystems, making them more susceptible to environmental damage. For example, a proposed coal lease might require water from a stream that has diminishing quantities of available water because of decreased snow pack in the mountains. The PEIS should evaluate these impacts and provide direction for their consideration in site-specific EISs.

CEQ has also issued draft Guidance on how agencies should incorporate the impacts of GHG and climate change into their EIS analyses, as well as Guidance on cumulative impact analyses. See CEQ Revised Draft Guidance on the Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in NEPA Reviews (Dec. 2014) (Climate Change Guidance); CEQ Guidance on Cumulative Impacts (1997) (Cumulative Impacts Guidance). As the Climate Change Guidance explains, although "[c]limate change is a particularly complex challenge given its global nature and inherent interrelationships among its sources, causation, mechanisms of action, and impacts," it is a "fundamental environmental issue, and the relation of Federal actions to it falls squarely within NEPA's focus.

Id. at 2 (emphasis added). As the Guidance explains, “analyzing the proposed action’s climate impacts and the effects of climate change relevant to the proposed action’s environmental outcomes can provide useful information to decisionmakers and the public and should be very similar to considering the impacts of other environmental stressors under NEPA.” Id. This is consistent with CEQ’s Cumulative Impacts Guidance, which calls on agencies to consider impacts on the “global atmosphere.” Cumulative Impacts Guidance at 15; see also id. at 13 (describing “release of greenhouse gases” as a cumulative effect to be considered in NEPA analyses).

Comment Excerpt Text:

[M]any agency NEPA analyses to date have concluded that GHG emissions from an individual agency action will have small, if any, potential climate change effects. Government action occurs incrementally, program-by-program and step-by-step, and climate impacts are not attributable to any single action, but are exacerbated by a series of smaller decisions, including decisions made by the government. Therefore, the statement that emissions from a government action or approval represent only a small fraction of global emissions is more a statement about the nature of the climate change challenge, and is not an appropriate basis for deciding whether to consider climate impacts under NEPA. Moreover, these comparisons are not an appropriate method for characterizing the potential impacts associated with a proposed action and its alternatives and mitigations. This approach does not reveal anything beyond the nature of the climate change challenge itself: the fact that diverse individual sources of emissions each make relatively small additions to global atmospheric GHG concentrations that collectively have huge impact.

As stated in the Scoping Notice, the PEIS will “examine how best to measure and assess the climate impacts of continued Federal coal production, transportation, and combustion,” as well as “whether and how to mitigate, account for, or otherwise address those impacts through the structure and management of the coal program.” 81 Fed. Reg. 17,725. Among the approaches BLM is already considering to address climate change goals are:

- changing the methodology used to determine which areas and how much coal is available for leasing, such as:
- establishing a coal leasing budget tied to U.S. GHG emission reduction goals

- creating a new regional lease planning process to make affirmative leasing decisions
- developing a land-scape level approach to identify areas for leasing;
- raising royalty rates with an “adder” to incorporate GHG externalities from all stages of the coal process, including the social cost of carbon and methane; and
- requiring mitigation for climate and environmental harms from coal production.

i. Climate Change Impacts

As the Interior Department recognizes in the Secretarial Order and Scoping Notice, federally leased coal’s contribution to anthropogenic climate change is one of the central issues that must be addressed in the PEIS. Federal coal fuels power plants across the country, and increasingly around the world, and coal-fired power plants are a leading emitter of carbon dioxide. Coal mining also accounts for approximately 15% of methane emissions – which at present operators are not required to address. (7) These Greenhouse Gas (GHG) emissions contribute to climate change, the single biggest threat facing our world and nation today.

(7) In 2014, BLM issued an Advanced Notice of Proposed Rulemaking to assess ways its regulations could be amended to allow the capture, use, sale, or destruction of waste mine methane from Federal coal leases. 79 Fed. Reg. 23,923 (Apr. 29, 2014). While this rulemaking was abandoned, the Secretary’s announcement in January 2016 committed to issuing guidance that would facilitate the capture of waste mine methane. We encourage BLM to complete this necessary and appropriate effort to issue guidance outside the PEIS process, but to be sure, emissions of waste mine methane must still be included within the scope of issues to be analyzed in the PEIS.

Comment Excerpt Text:

Coal Mining and Climate Change are Impacting Gunnison County’s Public Lands Gunnison County is home to the Gunnison National Forest, Black Canyon of the Gunnison National Park, and biologically diverse BLM-managed lands. Ranging in elevation from less than 6,000 feet to mountains over 14,000 feet, it is a rich and varied landscape. Yet both subtle and obvious impacts from climate change are impacting millions of acres of local public lands and straining federal budgets. Warmer winters and hotter summers, the proliferation of the spruce beetle and subsequent die-off of vast swaths of forest, Sudden Aspen Decline, larger and more intense wildfires, and reduced snowpack are just some of the climate change impacts we’re seeing on our public lands. In 2005, Colorado’s greenhouse emissions were 35 percent higher than they were in 1990. They are projected to grow 81 percent above the 1990 levels by 2020.7 Current and proposed federal coal leasing and development contributes to Colorado’s greenhouse gas emissions and directly impacts public lands and communities. (7) U.S. Dept. of Agriculture, Spruce Beetle Epidemic and Aspen Decline Management Response Final Environmental Impact Statement (February 2016), at 228.

On June 20, President Obama spoke at Yosemite National Park, declaring that climate change is “the biggest challenge we’re going to face in protecting this place and places like it.”⁸ He could just have easily been discussing public lands in western Colorado. President Obama condemned those who pay “lip service” to protecting

America's natural areas while making climate change worse:

(8) The White House, Remarks by the President at Sentinel Bridge, Yosemite National Park, Office of the Press Secretary (June 20, 2016), available at <https://www.whitehouse.gov/the-press-office/2016/06/20/remarks-president-sentinel-bridge> (last viewed July 28, 2016).

-Make no mistake, climate change is no longer just a threat, it's already a reality. I was talking to some of the rangers here -- here in Yosemite, meadows are drying out. Bird ranges are shifting farther northward. Alpine mammals like pikas are being forced farther upslope to escape higher temperatures. Yosemite's largest glacier, once a mile wide, is now almost gone. We're also seeing longer, more expensive, more dangerous wildfire seasons -- and fires are raging across the West right now. I was just in New Mexico yesterday, which is dealing with a big wildfire, just like folks here in California and four other states -- all while it's still really early in the season.⁹

Comment Excerpt Text:

In the western United States, higher temperatures and lower precipitation are expected to lead to drought conditions that will exacerbate forest stressors, especially fire and insect disturbance. The majority of land in Gunnison County is managed by the U.S. Forest Service as part of the Gunnison National Forest, which is administered jointly with the Grand Mesa and Uncompahgre National Forests. Over the course of only a decade on the Grand Mesa, Uncompahgre and Gunnison (GMUG) National Forests, approximately 223,000 acres of spruce forest have been affected by spruce beetle and 229,000 acres of aspen by Sudden Aspen Decline (SAD).¹³ These disturbances are occurring because of and in the context of a changing climate. Higher summer temperatures can foster spruce beetle outbreaks by allowing beetles to reproduce every year rather than every two years. Anticipated more frequent drought conditions make stands more vulnerable to insect and disease. And wildfire behavior in recently dead spruce-fir and areas with heavy fuel loadings can create more unpredictable fire behavior that is more hazardous to manage.¹⁴

Impacts to Public Lands: Climate change is causing and will continue to cause specific impacts to public lands and resources. Although public lands provide a variety of public benefits, one recent Forest Service attempt at quantification estimates the public land ecosystem services at risk from climate change at between \$14.5 and \$36.1 billion annually.²⁷ In addition to the general loss of public land resources, irreplaceable species and aesthetic and recreational treasures are at risk of permanent destruction. High temperatures are causing loss of glaciers in Glacier National Park; the Park’s glaciers are expected to disappear entirely by 2030, with ensuing warming of stream temperatures and adverse effects to aquatic ecosystems.²⁸ With effects of warming more pronounced at higher latitudes, tundra ecosystems on Alaska public lands face serious declines, with potentially serious additional climate feedbacks from melting permafrost.²⁹ In Florida, the Everglades face severe ecosystem disruption from already-occurring saltwater incursion.³⁰ Sea level rise will further damage freshwater ecosystems and the endangered species that rely on them.

Comment Excerpt Text:

Impacts to Biodiversity and Ecosystems: Across the United States ecosystems and biodiversity, including those on public lands, are directly under siege from climate change—leading to the loss of iconic species and landscapes, negative effects on food chains, disrupted migrations, and the degradation of whole ecosystems.³¹ Specifically, scientific evidence shows that climate change is already causing changes in distribution, phenology, physiology, genetics, species interactions, ecosystem services, demographic rates, and population viability: many animals and plants are moving poleward and upward in elevation, shifting their timing of breeding and migration, and experiencing population declines and extirpations.³² Because climate change is occurring at an unprecedented pace with multiple synergistic impacts, climate change is predicted to result in catastrophic species losses during this century. For example, the IPCC concluded that 20% to 30% of plant and animal species will face an increased risk of extinction if global average temperature rise exceeds 1.5°C to 2.5°C relative to 1980-1999, with an increased risk of extinction for up to 70% of species worldwide if global average temperature exceeds 3.5°C relative to 1980-1999.³³

As greenhouse gas emissions and the resulting harms from climate change grow, the Fish and Wildlife Service and National Marine Fisheries Service are increasingly recognizing climate change as a significant threat to listed species. The Services determined that climate change is a threat (and a listing factor) in the listing rules for the vast majority of species listed as threatened and endangered in recent years. Our analysis of listing rules found

that climate change was determined to be a threat for 96% and 91% of all species listed in 2012 and 2013, respectively.

In recent years, several species have been listed primarily because of climate change threats resulting from continued greenhouse gas emissions, including the polar bear in 2008, the bearded seal and ringed seal in 2012, and 20 coral species in 2014. The best-available science has concluded that the survival and recovery of these climate-vulnerable species depends on a return to lower atmospheric CO₂ concentrations than the present level of 400 ppm. As such, the massive greenhouse gas emissions stemming from the federal coal program are clearly not consistent with the survival and recovery of these species.

Loggerhead sea turtles: Other marine species are also at risk from numerous consequences of GHG emissions and ensuing ocean temperature increase, sea level rise, disruption of ocean currents, and extreme weather events. The 2011 listing rule for the loggerhead sea turtle found climate change and sea level rise to be a significant threat to multiple distinct population segments of the loggerhead sea turtle, including the North and South Pacific populations.³⁴ The Services found that “Similar to other areas of the world, climate change and sea level rise have the potential to impact loggerheads in the North Pacific Ocean.”³⁵ This includes beach erosion and loss from rising sea levels, skewed hatchling sex ratios from rising beach incubation temperatures, and abrupt disruption of ocean currents used for natural dispersal during the complex life cycle (Hawkes et al., 2009; Poloczanska et al., 2009). Scientific reviews of the impacts of climate change on sea turtles confirm that climate change poses significant threats to the loggerhead (Fuentes et al. 2009, Hawkes et al. 2009, Witt et al. 2010). Hawkes et al. (2009) concluded that “[o]verall, climate change could supersede current documented threats posed to marine turtle populations” including bycatch, habitat destruction, and pollution (p.146). Fuentes et al. (2010) highlighted that sea turtles will be affected simultaneously by changes in multiple climatic processes which will create amplifying effects, especially in combination with other threats. Furthermore, many researchers have cautioned that sea turtles are especially vulnerable to climate change because they are slow to recover from disturbances due to their life history characteristics. The best available science on the impacts of observed and projected climate change on loggerhead sea turtles, reviewed below, clearly indicates that climate change—including sea level rise, increasing sand temperatures, increasing storm activity, rising ocean temperatures and changes in circulation pattern, and ocean acidification—is a significant threat to the survival of the species. (34) Fish and Wildlife Service, Determination of Nine Distinct Population Segments of Loggerhead Sea Turtles and Endangered or Threatened, 76 Fed. Reg. 58,868, 58,909 (Sept. 22, 2011). (35) Id.

Monarch Butterfly: The Monarch butterfly, due to its narrow thermal requirements and specific microhabitat requirements, is also at exceptional risk due to climate change:³⁶

The monarch is threatened by several other factors including global climate change, severe weather events, pesticides, and the spread of invasive species. Unfavorable weather conditions have been identified as a primary factor contributing to the recent drastic declines in monarch populations. Weather that is too hot or too cold at critical times in monarch development can cause massive mortality of caterpillars and adults. A single winter storm event in Mexican overwintering habitat in 2002 killed an estimated 450-500 million monarchs. This high death toll from a single storm event is particularly staggering given that the entire monarch population now numbers only about 35 million butterflies. Because of their narrow thermal tolerance and specific microhabitat requirements, climate change threatens monarchs in their summer and winter ranges. The threat from climate change in the monarch's overwintering habitat in Mexico is so dire that monarchs may no longer occur in the Monarch Butterfly Biosphere Reserve by the end of the century due to climatic changes. The monarch's summer breeding habitat in the United States is also predicted to become too hot in many areas for monarch's to be able to successfully reproduce.³⁷

Impacts to water resources: "Water resources across large areas of the country are at serious risk from climate change, with effects on water supplies, water quality, and adverse effects from extreme events such as floods and droughts. Even areas of the country where an increase in water flow is projected could face water resource problems from the supply and water quality problems associated with temperature increases and precipitation variability, as well as the increased risk of serious adverse effects from extreme events, such as floods and drought. The severity of risks and impacts is likely to increase over time with accumulating greenhouse gas concentrations and associated temperature increases."²²

Impacts from sea level rise: "The most serious potential adverse effects are the increased risk of storm surge and flooding in coastal areas from sea level rise and more intense storms. Observed sea level rise is already increasing the risk of storm surge and flooding in some coastal areas. The conclusion in the assessment literature that there is the potential for hurricanes to become more intense (and even some evidence that Atlantic hurricanes have already become more intense) reinforces the judgment that coastal communities are now endangered by human-induced climate change, and may face substantially greater risk in the future. Even if there is a low probability of raising the destructive power of hurricanes, this threat is enough to support a finding that coastal communities are endangered by greenhouse gas air pollution. In addition, coastal areas face other adverse impacts from sea level rise such as land loss due to inundation, erosion, wetland submergence, and habitat loss. The increased risk associated with these adverse impacts also endangers public welfare, with an increasing risk of greater adverse impacts in the future."²³

Colorado River listed fishes (Colorado pikeminnow, bonytail chub, humpback chub, and razorback sucker): Anthropogenic climate change is profoundly impacting the Colorado River in ways that are altering temperature, streamflow, and the hydrologic cycle. As detailed below, changes observed to date include rising temperatures, earlier snowmelt and streamflow, decreasing snowpack, and declining runoff and streamflow. Modeling studies project that these changes will only worsen, including continued declines in streamflow and intensification of drought. Climate change is likely to have significant effects on the endangered fish and the Colorado River ecosystem.³⁸

Impacts from Algal Blooms: Toxic algal blooms are a public health menace and they have an obvious and distinct relationship with global warming.³⁹ Many types of algae release toxic compounds, or harbor other deadly bacteria, that can have a wide range of health consequences, especially neurotoxicity, and can even be fatal if swallowed.⁴⁰ The public health threat is enhanced because the toxicity of the blooms is not always proportional to their visibility.⁴¹ In fact, the blooms can be dilute and inconspicuous and still highly toxic to wildlife and human health.⁴²

(39) U.S. Environmental Protection Agency, Impacts of Climate Change on the Occurrence of Harmful Algal Blooms, EPA Office of Water 820-S-13-001 (May 2013), found at <https://www.epa.gov/sites/production/files/documents/climatehabs.pdf>.

(41) Id.

(42) Id.

Algae feed on nutrients like nitrogen and phosphorus whose presence in water may be the result of reckless agricultural practices, inadequate regulations, and leaky sewage systems.⁴³ But warmer temperatures ignite the process.⁴⁴ In fact, climate change promotes the growth and dominance of harmful algal blooms through a cascade of multiple mechanisms, including: warmer water temperatures, changes in rainfall patterns, increases in the acidity of ocean waters, and sea level rise.⁴⁵

(43) U.S. Environmental Protection Agency, Nutrient Pollution Sources and Solutions, EPA Office of Water (January 2016), found at <https://www.epa.gov/nutrientpollution/sources-and-solutions>.

(44) See generally EPA, Impacts of Climate Change.

(45) See Id.

Algae need carbon dioxide to survive. Higher levels of carbon dioxide in the air and water accelerate algae growth, especially toxic blue-green algae which can float to the water's surface, depriving other marine life of oxygen and sunlight.⁴⁶ When global warming unleashes heavy rainfall and flooding more nitrogen/phosphorus

pollution from farms and sewage seeps into waterways, serving up the nutrient banquet for the algae to thrive on.⁴⁷ Where global warming leads to drought, the salinity of fresh water bodies is increased.⁴⁸ This can cause marine algae to invade freshwater ecosystems. In the southwestern and south central United States, toxic marine algae have been killing fish in freshwater lakes since 2000.⁴⁹

(46) See Id.

(47) See Id.

(48) See Id.

(49) See Anderson, Estimated Annual Economic Impacts, at 24.

Warmer temperatures inhibit mixing of water layers, allowing stagnation of warmer layers near the surface, promoting thicker and faster algae growth.⁵⁰ Algal blooms actually increase water surface temperatures by absorbing more sunlight, creating a feed-back spiral of more blooms, absorbing more sunlight, warming the water further, and promoting more blooms.⁵¹

(50) See generally EPA, Impacts of Climate Change.

(51) See Id.

Warmer temperatures reduce the viscosity of water, increasing the speed at which small aquatic organisms can vertically migrate.⁵² This makes it easier for the small, toxic, cyanobacteria to float to the surface to form the dangerous blooms.⁵³

(52) See Id.

(53) See Id.

While algal blooms are not new, there has been a worldwide increase in their frequency, severity and geographic distribution, in concert with the rise in global temperatures.⁵⁴ Significant outbreaks have occurred in the last few years in Ohio, Florida, New York, and Utah. Last year, a mass of record breaking warm water triggered a bloom that extended from southern California to Alaska, damaging the entire marine food web throughout the West Coast, especially the crab industry.⁵⁵ The bloom was 40 miles wide and 650 ft deep in some places.⁵⁶ Marine scientists said last year's toxic algal bloom was "unprecedented" and "diagnostic of what we can expect more of in the future."⁵⁷ The EPA notes that these blooms are now a serious environmental problem plaguing all 50 states, not just those on the coasts.⁵⁸

The blooms also have a significant economic impact. In 2000, the Woods Hole Oceanographic Institution estimated that the annual economic cost to the US economy at that time was about \$450 million dollars.⁵⁹ That figure would be markedly increased today.

Impacts to oceans: Oceans have absorbed the vast bulk of warming to date, and will continue to suffer increasingly severe impacts on temperature, acidity, circulation, and marine ecosystems from climate change.⁶⁰ A recent survey of science regarding climate change impacts to the world's oceans finds that:

Marine ecosystems are centrally important to the biology of the planet, yet a comprehensive understanding of how anthropogenic climate change is affecting them has been poorly developed. Recent studies indicate that rapidly rising greenhouse gas concentrations are driving ocean systems toward conditions not seen for millions of years, with an associated risk of fundamental and irreversible ecological transformation. The impacts of anthropogenic climate change so far include decreased ocean productivity, altered food web dynamics, reduced abundance of habitat-forming species, shifting species distributions, and a greater incidence of disease. Although there is considerable uncertainty about the spatial and temporal details, climate change is clearly and fundamentally altering ocean ecosystems. Further change will continue to create enormous challenges and costs for societies worldwide, particularly those in developing countries.⁶¹

Comment Excerpt Text:

The IPCC's Fifth Assessment Report on Climate Change Impacts, Adaptation, and Vulnerability similarly summarizes the state of scientific research on foreseeable impacts to marine systems and reaches the following conclusions:

Due to projected climate change by the mid 21st century and beyond, global marine-species redistribution and marine-biodiversity reduction in sensitive regions will challenge the sustained provision of fisheries productivity and other ecosystem services (high confidence). Spatial shifts of marine species due to projected warming will cause high-latitude invasions and high local-extinction rates in the tropics and semi-enclosed seas (medium confidence). Species richness and fisheries catch potential are projected to increase, on average, at mid and high latitudes (high confidence) and decrease at tropical latitudes (medium confidence). . . . The progressive expansion of oxygen minimum zones and anoxic "dead zones" is projected to further constrain fish habitat. Open-ocean net primary production is projected to redistribute and, by 2100, fall globally under all RCP scenarios. Climate change adds to the threats of over-fishing and other nonclimatic stressors, thus complicating marine management regimes (high confidence).

For medium- to high-emission scenarios (RCP 4.5, 6.0, and 8.5), ocean acidification poses substantial risks to marine ecosystems, especially polar ecosystems and coral reefs, associated with impacts on the physiology, behavior, and population dynamics of individual species from phytoplankton to animals (medium to high confidence). Highly calcified mollusks, echinoderms, and reef-building corals are more sensitive than crustaceans (high confidence) and fishes (low confidence), with potentially detrimental consequences for fisheries and livelihoods. . . . Ocean acidification acts together with other global changes (e.g. warming, decreasing oxygen levels) and with local changes (e.g. pollution, eutrophication) (high confidence). Simultaneous drivers, such as warming and ocean acidification, can lead to interactive, complex, and amplified impacts for species and ecosystems.⁶²

The Third National Climate Assessment likewise has identified five significant ways in which climate change will adversely affect U.S. oceans and marine resources:

1. The rise in ocean temperature over the last century will persist into the future, with continued large impacts on climate, ocean circulation, chemistry, and ecosystems.
2. The ocean currently absorbs about a quarter of human-caused carbon dioxide emissions to the atmosphere, leading to ocean acidification that will alter marine ecosystems in dramatic yet uncertain ways.
3. Significant habitat loss will continue to occur due to climate change for many species and areas, including Arctic and coral reef ecosystems, while habitat in other areas and for other species will expand. These changes will consequently alter the distribution, abundance, and productivity of many marine species.
4. Rising sea surface temperatures have been linked with increasing levels and ranges of diseases in humans and marine life, including corals, abalones, oysters, fishes, and marine mammals.
5. Climate changes that result in conditions substantially different from recent history may significantly increase costs to businesses as well as disrupt public access and enjoyment of ocean areas.⁶³

Impacts from Ocean Acidification: The ocean's absorption of anthropogenic CO₂ has already resulted in more than a 30% increase in the acidity of ocean surface waters, at a rate likely faster than anything experienced in the past 300 million years, and ocean acidity could increase by 150% to 200% by the end of the century if CO₂ emissions continue unabated.⁶⁴ Ocean acidification negatively affects a wide range of marine species by hindering the ability of calcifying marine creatures to build protective shells and skeletons and by disrupting metabolism and critical biological function.⁶⁵ The adverse effects of ocean acidification are already being observed in wild populations, including reduced coral calcification rates,⁶⁶ reduced shell weights of foraminifera in the Southern Ocean,⁶⁷ and mass die-offs of larval Pacific oysters in the Pacific Northwest.⁶⁸

Coral reef ecosystems, which are estimated to harbor one-third of marine species and which support the livelihoods of a half billion people, are particularly threatened by ocean acidification. Some corals are already experiencing reduced calcification.⁶⁹ Due to the synergistic impacts of ocean acidification, mass bleaching, and other stresses, reefs are projected to experience "rapid and terminal" declines worldwide at atmospheric CO₂

concentrations of 450ppm.⁷⁰ Prominent coral scientists have called for reducing atmospheric CO₂ to less than 350 ppm to protect coral reefs from collapse.⁷¹

Numerous U.S. and international scientific and policy bodies have identified ocean acidification as an urgent threat to ocean ecosystems, food security, and society.⁷² The United Nations Environment Program concluded that ocean acidification's impact on marine organisms poses a threat to food security and the billions of people that rely on a marine-based diet.⁷³ Moreover, a recent study estimated that the damage our oceans will face from emissions-related problems will amount to \$428 billion a year by 2050 and nearly \$2 trillion per year by the century's end.⁷⁴

Immediate and aggressive greenhouse gas emissions reductions are necessary to keep warming below a 1.5° or 2°C rise above pre-industrial levels. Put simply, there is only a finite amount of CO₂ that can be released into the atmosphere without rendering the goal of meeting the 1.5°C target virtually impossible. A slightly larger amount could be burned before meeting a 2°C limit became an impossibility. Globally, fossil fuel reserves, if all were extracted and burned, would release enough CO₂ to exceed this limit several times over.⁹¹

Comment Excerpt Text:

The science is clear that the vast majority of the world’s fossil fuels must remain in the ground in order to maintain any reasonable hope of limiting global warming to 1.5° or even 2°C above pre-industrial levels. Global fossil fuel reserves and resources far exceed the carbon budgets needed to stay below a 1.5° or 2°C temperature target.⁹⁹

(99) Analyses by the Carbon Tracker Initiative estimated that 80% of proven fossil fuel reserves must be kept in the ground to have a reasonable probability (75-80%) of staying below even 2°C. This estimate includes only the fossil fuel reserves that are considered currently economically recoverable with a high probability of being extracted. See Carbon Tracker Initiative at 2, 6.

Comment Excerpt Text:

Even the lowest of these estimates (2,900 GtCO₂) is more than three times greater than the most generous carbon budget nominally consistent with a 2°C temperature limit (~900 GtCO₂), while the largest (50,092 GtCO₂) is over 160 times greater than the remaining budget for a 66% probability of not exceeding a 1.5°C limit (<300 GtCO₂).

As stated by one study, “the disparity between what resources and reserves exist and what can be emitted while avoiding a temperature rise greater than the agreed 2C limit is therefore stark.”¹⁰⁵ Another recent report on global carbon reserves found that:

The reserves of coal, oil and natural gas outlined in this report contain enough carbon to rocket the planet far beyond the 2 C limit. Warming from fossil fuels puts other carbon sinks at risk. As permafrost melts and peat bogs dry, they emit enormous quantities of carbon dioxide, furthering a chain reaction where the release of carbon results in a warmer world, which in turn releases more carbon.¹⁰⁶

The unleased federal coal resource alone is estimated at 212 GtCO₂e, or almost two-thirds of the remaining global carbon budget for a reasonable probability of limiting warming to 1.5°C.¹⁰⁷

In the United States, coal is the largest and most carbon dioxide-intensive conventional fossil fuel resource.¹⁰⁸ The Department of Interior’s fossil fuel leasing program contributes about one-quarter of all US fossil fuel emissions, with 14% of US emissions coming from the federal coal program,¹⁰⁹ which comprises approximately 41% of total US coal production.¹¹⁰ Coal mining, particularly underground mining, also contributes substantial additional methane emissions, with vastly higher radiative forcing potential than carbon dioxide.¹¹¹

Mitigation pathways for holding temperature rise well below 2°C mandate a rapid phase-out of coal emissions.¹¹² For example, a recent study estimates that 95% of US coal reserves, including both federal and non-federal coal, must remain unburned to preserve a reasonable probability of remaining below 2°C.¹¹³ Coal mining, transport, combustion, disposal, and cleanup also have significant external costs on public health and the environment that must be taken into consideration in the PEIS.¹¹⁴

A near-term phase-out of federal coal is also critical because new leasing locks in investment and high-carbon infrastructure for mining, transport, and coal combustion, all of which is inconsistent with the pressing need to end fossil fuel emissions.¹¹⁵ A rapid end to federal coal extraction would send an important signal internationally and domestically to markets, utilities, investors and other nations that the United States is committed to upholding its climate obligation to limit temperature rise to well below 2°C.

Climate change health effects

Pollution from the life-cycle of coal is one of the leading causes of climate change.¹⁹⁶ Climate change itself is a significant threat to human health and well-being.¹⁹⁷ The health impacts of climate change include harms from increasing heat stress and other extreme weather events, increases in air pollution, the spread of vector-borne diseases, food insecurity and under-nutrition, changing exposure to toxic chemicals, displacement, and stress to mental health and well-being.¹⁹⁸ Although everyone is vulnerable to health impacts from climate change, certain groups are particularly vulnerable to climate change-related health harms such as children, the elderly, low-income communities, some communities of color, immigrant groups, and persons with disabilities and preexisting medical conditions.¹⁹⁹ The 2015 Lancet Commission on Health and Climate Change highlighted that climate change is causing a global medical emergency, concluding that “the implications of climate change for a global population of 9 billion people threatens to undermine the last half century of gains in development and global health.”²⁰⁰

Climate change-driven health impacts are already occurring in the United States, particularly due to morbidity and mortality from extreme weather events which are increasing in frequency and intensity.²⁰¹ Heat is already

the leading cause of weather-related deaths in the United States, and extreme heat is projected to lead to increases in future mortality on the order of thousands to tens of thousands of additional premature deaths per year across the United States by the end of this century.²⁰² Extreme precipitation events have become more common in the United States, contributing to increases in severe flooding events in some regions.²⁰³ Floods are the second deadliest of all weather-related hazards in the United States and can lead to drowning, contaminated drinking water leading to disease outbreaks, and mold-related illnesses.²⁰⁴

Air pollution components, specifically ozone, air particulates, and allergens, are expected to increase with climate change. 74 Fed. Reg. 66496 §IV.B.1(b). Climate-driven increases in ozone will cause more premature deaths, hospital visits, lost school days, and acute respiratory symptoms.²⁰⁵ Projected climate-related increases in ground-level ozone concentrations in 2020 could lead to an average of 2.8 million more occurrences of acute respiratory symptoms, 944,000 more missed school days, and over 5,000 more hospitalizations for respiratory-related problems.²⁰⁶ In 2020, the continental U.S. could pay an average of \$5.4 billion (2008\$) in health impact costs associated with the climate penalty on ozone, with California experiencing the greatest estimated impacts averaged at \$729 million.²⁰⁷

Risks from infectious diseases are also increasing as climate change alters the geographic and seasonal distribution of vector-borne diseases.²⁰⁸ Climate change favors the spread of some pathogen-carrying vectors. Lyme disease is the most common vector-borne disease in the United States, with 25,000–30,000 cases reported to the CDC per year, with the highest incidence among children between ages 5 and 9.²⁰⁹ The risk of human exposure to Lyme disease is expected to increase as ticks carrying Lyme disease and other pathogens become active earlier in the season and expand northward in response to warming temperatures.²¹⁰ Rising temperatures and changes in rainfall have already contributed to the maintenance of West Nile virus in parts of the United States, and climate change is expected to increase suitable conditions for the mosquitoes that transmit West Nile virus, increasing human exposure risk to the disease.²¹¹

As highlighted by the Third National Climate Assessment, fighting climate change by reducing greenhouse gas pollution provides critical “opportunities to improve human health and well-being across many sectors,” including a wide array of important health co-benefits.²¹²

The impacts of coal combustion can also be described in economic terms, and several papers have attempted to estimate the cost of using coal by assigning value to the environmental and public health damage caused during each stage of coal’s extraction, transportation, combustion, and disposal. One such study estimated that the external costs of coal-fired electricity in the U.S. add an extra 17.8 cents to each kWh of electricity produced; an amount that would triple its cost to consumers.²¹³ Another U.S. report by Machol et al. estimates 45 cents per kWh as the cost of the health burden and environmental damages from coal combustion.²¹⁴ In 2011, the US EPA estimated the benefits and costs of the Clean Air Act, a law which regulates emissions of sulfur dioxide, oxides of nitrogen, carbon monoxide, and particulate matter in the United States. The EPA calculated that the ratio of health care cost savings to compliance costs was 25:1 in 2010.²¹⁵ This means that for every dollar spent complying with the Clean Air Act, twenty-five dollars were saved in health care costs due to lower disease burden, including a reduction in premature deaths, and cases of bronchitis, asthma, and myocardial infarction.²¹⁶ (196) Intergovernmental Panel on Climate Change Fifth Assessment Report Chapter 7, Energy Systems. pg 554. The Department of Interior's fossil fuel leasing program contributes about one-quarter of all US fossil fuel emissions, with approximately 14% of US emissions coming from the federal coal program. See Climate Accountability Institute. 2015.116 Based on EIA, USGS, and BLM data, the best available estimate of the entire unleased federal coal resource is 212 GtCO₂e, or almost two-thirds of the entire remaining global carbon budget for maintaining a reasonable probability of limiting warming to 1.5°C.117 The PEIS must not only quantify the contribution of the federal coal leasing program to greenhouse gas emissions and global carbon budgets, but also the foreseeable results of the various alternatives on near- and medium-term national and global emissions. The fact that emissions rates are influenced by multiple factors (including market, policy, and regulatory factors) does

not obscure the fact that a variety of models exist and can be used to evaluate the emissions consequences of leasing policy under a variety of scenarios (including business as usual, implementation of the Clean Power Plan, and predicted coal demand in a scenario that achieves 450 ppm CO₂ climate targets).

As an initial matter, it is important to note that the role of the federal coal program in coal supply, infrastructure, consumption, is larger than its (considerable) share of U.S. coal production. As the Institute for Energy Economics and Financial Analysis has noted;

The availability of cheap coal from the PRB has not only provided the industry with a price advantage that has allowed much deeper market penetration throughout the years—from 5 percent in 1982 to nearly 48 percent today—but it has also had significant implications for the nation’s energy policy. For the past 30 years, the U.S. government has effectively selected coal as its primary energy source to power the nation’s electric grid. In addition to its market penetration, analysts have concluded that coal’s dominance has effectively prevented the development of public-private partnership policies and programs to improve energy diversity in the United States. | 18

In other words, the expectation of a continued policy below-market federal coal leasing, particularly from the Powder River Basin, encourages investment in coal mining, coal export schemes, and, in particular, continued infrastructure investment and lock-in coal transportation, export, and electricity generation, based on the assumption that the BLM’s leasing policies will continue to provide a plentiful supply of cheap, reliable, relatively low-sulfur sub-bituminous coal from the Powder River Basin. As the IEEFA noted, “Given that the United States owns almost all the coal in the [Powder River Basin] region, the U.S. government holds an effective monopoly of western coal. As a result, government policies—or more precisely those of the DOI—are extremely influential and shape annual coal production levels and the market price of coal.”

Comment Excerpt Text:

We also note that while the PEIS is fundamentally directed at the coal leasing and development program, our concerns about climate change relate to all fossil fuels that are produced from the federal mineral estate—oil, natural gas, and coal, as well as oil shale and tar sands. Thus, this Section of our comments applies to climate change issues that are created from fossil fuel extraction on the federal mineral estate, not just coal production. While the immediate opportunity—and indeed the carbon necessity—starts with the climate change impacts of coal, the analysis should not end there and oil, natural gas, oil shale and tar sands should also be included in a Department-wide analysis as soon as possible.

Comment Excerpt Text:

The BLM is clearly required to measure, evaluate and fully consider the GHG emissions and climate change impacts of the federal coal program in the PEIS based on a number of policies of the BLM and other agencies, and even the President. NEPA also requires the BLM to fully consider climate change issues in the PEIS. This must include both upstream and downstream emissions, including those from coal combustion at power plants. This analysis must inform BLM's requirements to avoid, minimize and compensate for these impacts consistent with this country's climate change commitments, specifically the requirement to reduce emissions by 26 to 28 percent below 2005 levels by 2025. This analysis and decision-making should seek to achieve a no more than 2 degrees C temperature increase, which will require the U.S. to reduce emissions an average of 70 to 80 percent below 2000 levels by 2050. The PEIS should put in place requirements to achieve these commitments.

Comment Excerpt Text:

It is also critical that the BLM assess climate change impacts from a global perspective, not just a local or even national perspective. The PEIS is national in scope—this is a perfect time to look at the overall impacts of GHG emissions and not claim individual impacts are too small.

Comment Excerpt Text:

Related to the issue of ensuring there is a global and life-cycle analysis of GHG impacts on climate change is the question of “perfect substitution” by other coal from other sources for federal coal that is not mined. Some claim that “perfect substitution” will occur if there is less federal coal mined, and therefore any climate change and other benefits of the reduction in federal coal supply will be nullified. This argument has no basis. Much (85 percent) of the federal coal is mined in the Powder River Basin in Wyoming and Montana. This coal is notable for being low cost and having low sulfur content relative to other sources of coal in the U.S. What this means is that if Powder River Basin coal is not produced, the costs of other coal will make these sources less economically attractive than the Powder River Basin coal. In addition, it will not have the low sulfur (reduced air pollution) benefits of the Powder River Basin coal. That is, there will not be a basis for “perfect substitution.”

Comment Excerpt Text:

The second critical step in analyzing climate change issues in the PEIS after determining the amount of GHG that are emitted is to evaluate the climate change impacts of those emissions. This can be done by utilizing the Social

Cost of Carbon (and companion EPA Social Cost of Methane) protocol. The BLM should use this method for climate change impact assessment in the PEIS. But in addition, due to some shortcomings in the SCC method, the BLM must also evaluate qualitative, non-monetary impacts that are caused by climate change, such as from earlier snowmelts in our western mountains that are changing water supplies. This analysis should be done from a global perspective because as recognized in the CEQ Climate Change NEPA Guidance, “diverse individual sources of emissions each make relatively small additions to global atmospheric GHG concentrations that collectively have huge impact.” That said, local impacts also need to be considered especially since the BLM has traditionally published the local monetary benefits of the coal program in its NEPA analyses. BLM should not assume that federal coal that is not produced will simply be replaced by production from other sources (so-called “perfect substitution”) thus eliminating any climate change benefits —this unfounded myth is not based on empirical evidence or sound economic theory, and it has been rejected in several reports.

Comment Excerpt Text:

There are three critical needs relative to BLM decision-making and climate change, including for the federal coal program. First, the agency must provide an accurate and comprehensive assessment of the amount of GHG produced by its fossil fuel program activities. Second, it must ensure a fair and comprehensive assessment of the impacts of these GHG emissions. It is critical that two GHG in particular receive treatment in these analyses: carbon dioxide (CO₂) and methane (CH₄), both of which are emitted at significant levels as a result of the federal coal leasing and development program. Third, it must commit to avoiding, minimizing and offsetting impacts through compensatory mitigation.

Making the case for the need to consider climate change in NEPA documents, the Council on Environmental Quality (CEQ) issued its revised draft Climate Change NEPA Guidance in December, 2014. (20) It provides direction to all agencies on when and how to consider the effects of GHG emissions and climate change in the evaluation of federal actions. The guidance states that, “[i]t is essential . . . that federal agencies not rely on boilerplate text to avoid meaningful analysis, including consideration of alternatives or mitigation.” The CEQ draft guidance provides detailed reasons and instruction on how climate change and GHG NEPA analyses can be effectively accomplished. Any “boilerplate” claims that GHG and climate change analyses are impossible are rejected.

S.O. 3330 (Improving Mitigation Policies and Practices of the Department of the Interior) as well as the report to the Secretary of the Interior from the Energy and Climate Change Task Force, (21) and the BLM’s current mitigation guidance (IM No. 2013-142 and Draft Manual Section 1794), all also direct the BLM to incorporate

mitigation strategies into planning and to address climate change. S.O. 3330 notes that a key reason for issuing the new policy is to “focus on mitigation efforts that improve the resilience of our Nation’s resources in the face of climate change.” More recent guidance in the form of the Presidential Memorandum: Mitigating Impacts on Natural Resources from Development and Encouraging Related Private Investment (2015) and the Department of the Interior’s Landscape-Scape Mitigation Manual (2015) also emphasize the importance of mitigation in BLM planning and decision-making and how it can and should apply in the context of addressing impacts from climate change. Again, the BLM must have an accounting for the amount of GHG emissions and climate change impacts from its coal program in order to mitigate for those impacts.

Perfect substitution of other coal for federal coal that is not mined is an unfounded myth and should not be used to avoid evaluating climate change impacts in the PEIS. This theory is not based on empirical evidence and it is not supported by economic theory. In addition, there have been several recent papers that bring into question the perfect substitution theory by the White House Council of Economic Advisors, Vulcan Philanthropy, Stockholm Environment Institute, and the Carbon Tracker Initiative. The existing regulatory regime provides ample opportunity for complete and thorough consideration of the environmental impacts, including global climate change, associated with coal leasing and production. The current project-specific analysis allows for a more complete review of environmental impacts, which accounts for localized impacts that would be difficult to assess at a programmatic level. BLM should not engage in a speculative, nation-wide review of global climate change impacts of coal leasing that is divorced from actual leasing decisions.

Instead, to the extent BLM continues to analyze climate change impacts as part of its leasing decisions, that analysis should take place within the context of the existing regulatory and environmental review process. Such a limited and site-specific analysis would best serve the purpose of NEPA, which seeks to promote informed

decision-making by considering reasonably foreseeable impacts within the control of the agency. See *Dep't of Transp. v. Public Citizen*, 541 U.S. 752, 770 (2004).

Comment Excerpt Text:

BLM asserts that the PEIS will “examine the climate change impacts of the coal program in the context of the Nation’s climate objectives . . .” 81 Fed. Reg. at 17725. Nowhere in the MLA does Congress authorize BLM to impose a climate-related fee on the production of federal coal reserves. BLM has expressly rejected any form of “carbon tax” as unlawful. Attachment 5, BLM Petition Denial, at 7 (Jan. 28, 2011).

Further, an increase in royalties or other leasing costs to account for climate impacts would prevent coal from being produced economically. Any climate change fee imposed solely on the coal industry would unfairly disadvantage federal coal as compared to alternative electrical generation fuels, such as natural gas and renewables. These additional costs would prevent BLM from achieving maximum economic recovery of federal coal—a clear statutory mandate under the MLA—while at the same time punishing electricity consumers by artificially suppressing competition between fuel sources.

Comment Excerpt Text:

The production models analyzed by Carbon Tracker, which inform our recommendations for modernizing the federal coal program, are inherently conservative on the basis of two factors.⁸ First, the 2°C target used by the IEA is an uppermost-limit for temperature warming but does not represent a “safe” threshold. For this reason, technical experts to the United Nations Framework Convention on Climate Change (“UNFCCC”) have cautioned keeping temperature warming well below 2°C in order to significantly reduce the risks of climate change, and Parties to the UNFCCC adopted this goal under the Paris Agreement.⁹ Second, the IEA 450 Scenario only assigns a 50% probability of successfully staying below the 2°C threshold and assumes a relatively rapid deployment of CCS technology by 2020.¹⁰

[⁸ The calculated balance of the global carbon budget and the implication for fossil fuel use varies across studies. A recent article in the scientific journal *Nature* applies a global carbon budget to identify the fraction of U.S. coal reserves that are unburnable before 2050 under a 2°C scenario, concluding that 95% of U.S. reserves cannot be combusted. The *Nature* analysis models the optimal global use of oil, natural gas and coal with the constraint of a 2°C emissions trajectory. Coal is heavily disfavored in relation to oil and gas, especially in the United States, due both to coal’s carbon intensity and the wide availability of lower-cost, lower-carbon electricity sources. Even with CCS technology widely deployed from 2025 forward, the study concludes that 92% of U.S. coal reserves remain unburnable. See Christopher McGlade & Paul Eakins, *The geographic distribution of fossil fuels unused when limiting global warming to 2 °C*, 215 *Nature* 187 (January 8, 2015) at 189.]

[⁹ For a discussion on the relative risks of temperature targets, see: United Nations Framework Convention on Climate Change Secretariat, *Report on the structured expert dialogue on the 2013-2015 review* (2015). Available at <http://unfccc.int/resource/docs/2015/sb/eng/inf01.pdf>. The Paris Agreement on climate change identifies the need for greater temperature ambition. The Agreement aims to hold “the increase in the global average temperature to well below 2°C above pre-industrial levels” with “efforts to limit the temperature increase to

1.5°C above pre-industrial levels” (emphasis added). Paris Agreement, Article 2 (Dec. 13, 2015), in UNFCCC, Report of the Conference of the Parties on its Twenty- First Session, Addendum, at 21, UN Doc. FCCC/CP/2015/10/Add.1 (Jan. 29, 2016) (hereinafter, “Paris Agreement”).]

[10 Forecasting the rapid deployment of carbon capture and storage projects is characterized by uncertainty. CCS projects are not utilized at scale and only 15 large-scale projects currently operate. See Global CCS Institute, “Large Scale CCS Projects,”<https://www.globalccsinstitute.com/projects/large-scale-ccs-projects>.]

In addition to health effects, the federal coal program exacerbates the climate problem, which impairs the public interest. Emissions associated with the program comprise a large share of U.S. greenhouse gas emissions. The collective emissions from existing production under the federal coal program are responsible for 11% of American greenhouse gas emissions,²⁵ and the United States has already leased more coal than it can afford to burn in a manner that is consistent with meeting climate goals. The climate change impacts of the federal coal program disrupt ecosystems on federal lands, including national parks, monuments, and reserves, through the effects of climate change. A technical climate change report prepared for BLM identified potential climate impacts on BLM lands, which include increased risk of extreme temperatures, water scarcity and drought, and frequency of wildfires.²⁶ These risks extend beyond publicly-owned lands to encompass all areas of the United States.

The National Environmental Policy Act provides a framework for how Interior can interpret its relative contribution to climate change and the corresponding risk to the public interest through cumulative impacts.²⁷ The Council on Environmental Quality (“CEQ”) draft guidance for greenhouse gas emissions states that agencies should consider the “potential effects of a proposed action on climate change as indicated by its GHG emissions.”²⁸ The draft guidance also accounts for indirect effects of agency actions, defined as effects that are caused by the action and are “later in time or farther removed in distance, but are still reasonably foreseeable.”²⁹ Up until now, BLM has inadequately evaluated the climate change impacts of its coal leasing program by failing to address indirect and cumulative impacts. The programmatic review provides an opportunity to correct this shortcoming.

Comment Excerpt Text:

Any eventual decisions to grant new leases should be made with reference to what coal is unburnable under the 2°C energy pathway. Doing so requires reference to production at currently producing mines, planned production from privately owned reserves, and the application of CCS technology, in addition to broader energy market conditions. If a given policy is consistent with the 2°C climate budget it is considered “climate consistent.”⁷

[7 The Intergovernmental Panel on Climate Change Fifth Assessment Report assigns a remaining carbon budget of 1,000 metric GtCO₂ when using a greater than 66% probability of keeping the temperature increase below 2°C. This budget is relaxed to 1,300 GtCO₂ when using a 50% probability of success. The Fifth Assessment Report of the Intergovernmental Panel on Climate Change summarizes the characteristics of this 1,000 GtCO₂ budget. “Multi-model results show that limiting total human-induced warming (account for both CO₂ and other human influences on climate) to less than 2°C relative to the period 1861-1880 with a probability of >66% would require total CO₂ emissions from all anthropogenic sources since 1870 to be limited to about 2900 GtCO₂ when accounting for non-CO₂ forcing... About 1900 [1650 to 2150] GtCO₂ were emitted by 2011, leaving about 1000 GtCO₂ to be consistent with this temperature goal. Estimated total fossil carbon reserves exceed this remaining amount by a factor of 4 to 7, with resources much larger still” (emphasis added). Intergovernmental Panel on Climate Change, *Climate Change 2014: Synthesis Report. Contribution of Working Groups I, II and III to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change* [Core Writing Team, R.K. Pachauri and L.A. Meyer (eds.)]. As part of the BLM's development of a PEIS to review the federal coal program, it must adequately and comprehensively evaluate the real and likely negative impacts to local, state, and the U.S. economy if investments

in and deployment of CO₂ emission reduction strategies related to coal mine production and coal consumption are not addressed in a manner similar to that applied to traditional air pollutants. BLM must provide a comprehensive evaluation of the ongoing advancement of clean coal technologies at a global scale if it is to adequately evaluate environmental impacts of federal coal use. The BLM must also evaluate the negative impacts to local, state, and the U.S. economy of stranding the more than \$111 billion made in emission reduction investments to address emissions of particulate matter, sulfur dioxides, nitrogen oxides and other pollutants. See Energy Ventures Analysis, Inc., Capital Investments in Emission Control Retrofits in the U.S. Coal-fired Generating Fleet through the Years- 2016 Update (Jan. 26, 2016); (WY0-03863 to 03869).

The BLM should also evaluate the influence of various coal market conditions, value propositions, coal market price conditions, and climate policies in those markets. See ICF International 2016, Millennium Bulk Terminals-Longview, SEPA EIS, SEPA Greenhouse Gas Emissions Technical Report, April, Scope of Analysis at § 2.2.2.1; (WY0-01490 to 01498)

Technology is always improving and since coal may not be mined and used until years after the lease has been awarded, there is no way of accurately predicting what those emissions levels may be since the coal may be utilized in a technology that is not commercial today or for something other than energy production. For those reasons, if the BLM factors GHGs into the leasing process, they should only consider those directly tied to the extraction process.

As BLM and Interior prepare the PEIS, the agencies must analyze and assess the impacts of similar and cumulative action consistent with NEPA. Indeed, in accordance with NEPA, the scope of an EIS must include all “[c]umulative” and “[s]imilar” actions. 40 C.F.R. § 1508.25(a)(2) and (3). Cumulative actions are defined as those that “when viewed with other proposed actions have cumulatively significant impacts and should therefore be discussed in the same statement.” 40 C.F.R. § 1508.25(a)(2). Similar actions are defined as those that “when viewed with other reasonably foreseeable or proposed agency actions, have similarities that provide a basis for evaluating their environmental consequences together, such as common timing or geography.” 40 C.F.R. § 1508.25(a)(3). Pursuant to NEPA regulations, both cumulative and similar actions must be analyzed and assessed together with alternatives and any proposed agency actions in the same EIS.

With regards to cumulative and similar actions, it is imperative that the PEIS, at a minimum, address the following:

i. The impacts of oil and gas development in the western United States

Oil and gas development, particularly the development of federal oil and gas as authorized by the BLM, is not only a cumulative action, but a similar action under NEPA. Oil and gas development, particularly federal oil and gas development, often occurs on or near mines that are producing federal coal. For example, a massive oil and gas project under consideration by the BLM in the Powder River Basin of Wyoming would take place where extensive coal mining is currently occurring. See 80 Fed. Reg. 65,242 (Oct. 26, 2015). At a minimum, oil and gas development occurs extensively throughout the coal producing regions of the western United States, where the vast amount of federal coal is located and mined.

See Attached for Graphic - Federal oil and gas wells in the Uinta Basin of northeastern Utah adjacent to the Bonanza coal-fired power plant. The Bonanza power plant is fueled by the nearby Deserado coal mine in northwestern Colorado, which is comprised almost entirely of federal coal reserves.

Not only does oil and gas development take place in similar geographies and at similar times as coal mining, it poses similar impacts, particularly in terms of air emissions and climate impacts. Indeed, as reports indicate, the onshore and offshore development of federal oil and gas contributes to nearly 10% of all U.S. greenhouse gas emissions. (46) Onshore development of federal oil and gas, which largely occurs in the western United States, often at or near coal mining operations, accounts for nearly 4% of all U.S. greenhouse gas emissions. To this end, climate concerns related to oil and gas development are entirely relevant to addressing the climate impacts of the federal coal program and must be fully analyzed and assessed in the PEIS as similar and/or cumulative actions. The need to address the impacts of oil and gas development in the PEIS together with the impacts of the federal coal program is critical given that there are a number of reasonably foreseeable proposed oil and gas developments currently under consideration by the BLM, including:

- The Continental Divide-Creston oil and gas project in southern Wyoming, approval of which would open the door for 8,950 new oil and gas wells. See 81 Fed. Reg. 22,628 (April 18, 2016).
- The Monument Butte oil and gas project in northeastern Utah, approval of which would open the door for 5,750 new oil and gas wells. See 81 Fed. Reg. 41,331 (June 24, 2016).
- The Converse County oil and gas project in eastern Wyoming, approval of which would open the door for 5,000 new oil and gas wells. See 79 Fed. Reg. 28,538 (May 16, 2014).
- The Greater Crossbow oil and gas project in northeastern Wyoming, approval of which would open the door for 1,500 oil and gas wells. See 80 Fed. Reg. 65,242 (Oct. 26, 2015).
- Extensive oil and gas leasing in Colorado, Montana, New Mexico, Utah, and Wyoming. As the BLM's own statistics show, millions of acres of these states have been leased over the years, opening the door for extensive oil and gas development. In the remainder of 2016, the BLM is proposing lease 87 parcels in August comprising 89,137 acres in Wyoming, 21 parcels in November comprising 30,197 acres in Wyoming, 91 parcels in October comprising 19,790 acres in Montana, 28 parcels in November comprising 12,344 acres in Utah, 36 parcels in September comprising 13,876 acres in New Mexico, and 37 parcels in November comprising 25,298 acres in Colorado. (47) It is reasonable to believe that the BLM is likely to propose, offer for sale, and issue millions more acres of federal oil and gas leases in the near future. The climate consequences of such leasing actions must be addressed in the PEIS.

The climate impacts of the federal coal program cannot be analyzed in a piecemeal fashion that overlooks BLM's twin role in managing onshore oil and gas. Particularly given that the scope of the PEIS will necessarily be national in focus, if not broader, the BLM is compelled under NEPA to ensure these similar actions are fully accounted for.

The need to address the reasonably foreseeable climate impacts of oil and gas development is underscored by the greenhouse gas emissions that are likely to result. As reported, if fully developed, unleashed onshore oil and gas

reserves stand to release nearly 30 billion metric tons of carbon. (48) See Table below.
See Attached for Table - Carbon Emissions (in billion metric tons) Projected from Unleased Federal Onshore Oil and Gas Reserves(48) See Exhibit 5 at 18

Comment Excerpt Text:

The climate impacts of all Interior Department fossil fuel management
Additionally, if Interior and the BLM are to properly analyze and assess the climate impacts of federal coal management, the climate impacts of all Interior Department overseen fossil fuel development must be taken into account. This includes, but is not limited to, the impacts of offshore oil and gas development, oil shale, and tar sands development. As reports indicate, the potential climate impacts of offshore oil and gas, oil shale, and tar sands stand to be tremendous, with more than 222.14 billion metric tons of carbon projected, nearly as much as the total carbon emissions that could be released if all unleased federal coal reserves are developed. (49) See Exhibit 5 at 18

See Attached for Table - Carbon Emissions (in billion metric tons) From Other Interior Department-overseen Fossil Fuel Development

Similar to onshore oil and gas development, the Interior Department and BLM's management of offshore oil and gas, oil shale, and tar sands are both cumulative and similar in nature, and therefore must be a part of the scope of the analysis for the PEIS. Indeed, if the climate impacts of the federal coal program are to be completely understood, they must be analyzed together with the impacts of other fossil fuel management programs that are under the control and authority of the Department of the Interior.

Coal Leasing and Climate Considerations - Coal built our country and is a key foundation for our success and prosperity. A rational energy policy should be based on a true, "all of the above" approach. In fact, this approach is essential if we are to meet our projected future energy needs. Much of the current focus is on addressing climate considerations, but this must be balanced with the critical need to maintain reliable energy generation and distribution systems and provide affordable power for our households and businesses. Any impact analysis should include an alternative which takes this critical balance into consideration.

Climate Impacts - Due to pressure from environmental interest groups, consideration of potential climate impacts is being mandated at every stage of the process, including coal leasing, mine permit approvals, and required approvals for powerplant construction and operation. This approach results in multiple redundant reviews, does not accurately characterize direct or indirect impacts from those actions preceding combustion of coal in a powerplant, and results in significant unnecessary costs and delays. Under the current BLM leasing process and practices, potential climate impacts are required to be evaluated and analyzed in the NEPA documents prepared for each leasing action. While this requirement is duplicative of subsequent environmental reviews, it adequately

addresses and satisfies the requirement is duplicative of subsequent environmental reviews, it adequately addresses and satisfies the requirement to evaluate these potential impacts. The suggestion that potential climate impacts should be evaluated on a broader scale relative to identification of potential lease offerings creates a situation where the linkage between action and potential impacts is even further removed and speculative, is adding one more layer to an already duplicative and redundant review process, and is therefore inappropriate and unjustified.

The PEIS Should Evaluate Climate Change Impacts of the Federal Coal Program We applaud the Secretary of the Interior for ordering BLM to take its first comprehensive look at the climate impacts of leasing and burning federally owned coal. In the PEIS process, the BLM must finally acknowledge – for the first time in its history – that its federal coal program perpetuates and exacerbates climate change. Such an analysis is the only responsible approach to addressing climate impacts of mining and burning hundreds of millions of tons of taxpayer-owned coal every year, and it is the only approach that honors Secretary Jewell’s call for “an honest and open conversation” with the American people about the federal coal program. 21 As the White House Council of Economic Advisors acknowledged, coal combustion and the impacts of coal combustion are indirect impacts of federal coal leasing. 22 Indeed, “[f]ederal coal was used to generate about 14 percent of the Nation’s electricity in 2015.”23 For the past several years, while the much of the Obama Administration has developed significant and forward-thinking policies aimed at curbing greenhouse gas emissions in order to stave off the worst effects of climate change, the Department of Interior and BLM have continued to lease billions of tons of federally owned and managed coal while telling the public and decision-makers that doing so has no impact on the climate. The Department, in particular BLM and OSMRE, have based this idea—that although burning coal may harm the climate, their decisions to approve more coal mining do not—on a discredited assumption that courts have referred to as “perfect substitution.” The idea behind BLM’s perfect substitution theory, which defies even the most basic understanding of the way in which energy markets work, is that if the Department were to reject any particular coal lease, coal from other mines would perfectly substitute for one-hundred percent of that coal in the marketplace—that is, coal-fired power plants would simply buy the same amount of coal at the same price from other mines. Another significant and consistent flaw in BLM NEPA reviews for proposals to mine federal coal is that many of these reviews continue to state that the individual mining proposal would only minimally contribute to state, national, and global carbon dioxide (CO2) emissions, even though the White House’s Council on Environmental Quality (CEQ) – which promulgates NEPA regulations that other agencies are required to follow– explicitly advised against this approach in 2014. For example, in June 2016, in evaluating climate impacts of a proposed expansion at Spring Creek Mine, OSMRE quantified direct and indirect GHG emissions from 21 Sec’y Sally Jewell, Speech at the Center for International Strategic Studies (March 17, 2015), available at <https://www.doi.gov/news/pressreleases/secretary-jewell-offers-vision-for-balanced-prosperous-energy-future> (last visited July 20, 2016). 22 See White House Fair Return Report, at 28 (describing environmental externalities of leasing federal coal, including coal combustion impacts). 23 Secretarial Order 3338, at 2. 13 coal production and combustion and compared those to Montana and national emission totals. 24 This, however, is precisely the kind of limited analysis that CEQ specifically directed agencies not to do: [T]he statement that emissions from a

government action or approval represent only a small fraction of global emissions is more a statement about the nature of the climate change challenge, and is not an appropriate basis for deciding whether to consider climate impacts under NEPA. Moreover, these comparisons are not an appropriate method for characterizing the potential impacts associated with a proposed action and its alternatives and mitigations. This approach does not reveal anything beyond the nature of the climate change challenge itself: the fact that diverse individual sources of emissions each make relatively small additions to global atmospheric GHG concentrations that collectively have huge impact.

BLM must reject, once and for all, this unnecessarily limited approach to understanding the climate impacts of its decisions and the unsupported, incorrect, and damaging assumption of perfect substitution. In order to adequately understand the impacts of the federal coal leasing program as a whole—and to take the hard look at those impacts that NEPA requires—BLM must analyze the extent to which continued expansion and long-term operation of the program affects the mix of resources used to generate electricity and how the concomitant greenhouse gas emissions differ among alternatives. As described below, there are multiple energy market models that would allow BLM to quantify how alternative proposals (such as a “no new leasing” alternative and an alternative that captures externalities of climate damage into royalty rates) would affect demand for coal, natural gas, and renewables used to generate electricity. Once BLM quantifies the different levels of climate pollution associated with various alternatives, it must do more than simply use the volume of greenhouse gas emissions as a proxy for the effect of those BLM emissions. In particular, BLM must analyze whether the continued leasing of federal coal is consistent with our national GHG emission reduction goals and international climate commitments, and BLM must use the social cost of carbon and social cost of methane as tools to understand the severity of climate impacts without merely relying on the volume of GHG emissions as proxy for their effect. 24 Office of Surface Mining Reclamation and Enforcement, Spring Creek Mine EA, 4-17 (June 2, 2016), available at <http://www.wrcc.osmre.gov/initiatives/SpringcreekMineLBAI/documents/EA0616.pdf> (last visited June 26, 2016). 25 Council on Environmental Quality, Revised Draft Guidance on the Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in NEPA Reviews, at 9 (2014), available at: https://www.whitehouse.gov/sites/default/files/docs/nepa_revised_draft_ghg_guidance_searchable.pdf (last visited July 1, 2016) (hereafter “CEQ Draft Climate Guidance”) (emphasis added). 14

Comment Excerpt Text:

. BLM Must Acknowledge that the Federal Coal Program Exacerbates Climate Change. Federal agencies that make regulatory decisions that affect the amount of coal that can be produced from public lands have an obligation under NEPA to accurately analyze and disclose the environmental impacts of those decisions. With regard to assessments of climate impacts, agencies must quantify the amount of GHG emissions that will occur as a result of the agency’s action. But that does not mean merely tallying up the direct emissions of carbon dioxide and methane emissions emitted during mining and adding them to the carbon dioxide emissions emitted from burning the coal once it is mined. In order to make an accurate assessment of GHG emissions, agencies must first thoroughly examine coal markets and the extent to which the market will respond to the agency’s decision. The nature and extent of the market’s response to 15 a single regulatory decision can lead to complex questions that require rigorous economic evaluation—agencies may not simply assume a given market response, as BLM has

done repeatedly in the past. We support the Secretary of the Interior's commitment in the Secretarial Order announcing this PEIS process to studying this precise issue, and her recognition that many commentators have noted the tension between producing very large quantities of federal coal while pursuing policies to reduce U.S. GHG emissions. Specifically, the Secretary's order directs the agency to address: [H]ow the administration, availability, and pricing of Federal coal affect regional and national economies (including job impacts), and energy markets in general, including the pricing and viability of other coal resources (both domestic and foreign) and other energy sources. The impact of possible program alternatives on the projected fuel mix and cost of electricity in the United States should also be examined. BLM's March 30, 2016 Notice of Intent repeats the Secretary's direction, with an explicit commitment to study this issue, explaining that the PEIS "will broadly examine" these issues.

Comment Excerpt Text:

In the PEIS, BLM must disavow perfect substitution both to disclose the cumulative impacts of the federal coal leasing program, and to comport with the legal principle that when agencies change their minds on key issues they explain why the reversal is not arbitrary and capricious. NEPA regulations define a "cumulative impact" as one that "results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time." 40 C.F.R. § 1508.7. As recently articulated by the D.C. Circuit Court, "[o]ne of the core tenets of reasoned decision-making is that 'an agency [when] changing its course . . . is obligated to supply a reasoned analysis for the change.'" *Sierra Club v. Salazar*, No. 10-1513 (RBW), 2016 WL 1436645, at *22 (D.D.C. Apr. 11, 2016) (quoting *Republic Airline Inc. v. U.S. Dep't of Transp.*, 669 F.3d 296, 299 (D.C. Cir. 2012)). See also *W. Deptford Energy, LLC v. FERC*, 766 F.3d 10, 17 (D.C. Cir. 2014) (noting that agencies "cannot depart from [prior] rulings without provid[ing] a reasoned analysis indicating that prior policies and standards are being deliberately changed, not casually ignored"); *Wis. Valley Improvement v. FERC*, 236 F.3d 738, 748 (D.C. Cir. 2001) (stating that "an agency acts arbitrarily and capriciously when it abruptly departs from a position it previously held without satisfactorily explaining its reason for doing so"). 26 Secretarial Order 3338, Discretionary Programmatic Environmental Impact Statement to Modernize the Federal Coal Program, at 8 (Jan. 15, 2016) (emphasis added). 27 Notice of Intent, 81 Fed. Reg. at 17,226. 16 In disavowing the myth of perfect substitution, BLM has an unfortunate and long history to refute. Although BLM routinely quantifies the amount of carbon dioxide that would result from mining and burning the coal made available by individual BLM leasing decisions, and often provides a general overview of climate change, in nearly every environmental impact statement and environmental assessment this administration has prepared under NEPA evaluating the climate impact of various coal leasing proposals, the Department has dismissed the notion that its decisions opening up more federal coal have any impact on the total amount of coal mined and burned, and thus on the amount of carbon dioxide emitted from the electric sector. As documented below, this assumption can be found in the environmental analyses for the largest surface mine approvals in the history of the program, comparatively tiny mines in Washington, underground mines in Colorado and Montana, and analyses from as early as 2008 and as recent as last month. The following examples are an illustrative, but by no means exhaustive, list of NEPA review documents in which BLM, OSMRE, and/or the U.S. Forest Service, which is part of the Department of Agriculture, have relied on perfect substitution to help justify its decision to authorize new or expanded coal leases. • West Antelope, proposal to lease 400 million tons of coal (2008): "It is not likely that selection of the No Action Alternative would result in a decrease of U.S. CO₂ emissions attributable to coal-burning power plants in the long term. There are multiple other sources of coal that, while not having the cost, environmental, or safety advantages, could supply the demand for coal beyond the time that the Antelope Mine completes recovery of the coal in its existing leases."²⁸ • Belle Ayr and Caballo, proposal to lease 230 million tons of coal

(2009): “It is not likely that selection of the No Action alternatives would result in a decrease of U.S. CO₂ emissions attributable to coal-burning power plants in the longer term because there are multiple other sources of coal that, while not having the cost, environmental, or safety advantages, could supply the demand for coal beyond the time that the Belle Ayr, Coal Creek Caballo, and Cordero Rojo Mines complete recovery of the coal in their existing leases.”²⁹ 28 Bureau of Land Management, West Antelope II FEIS, at 4-109, (2008), available at http://www.blm.gov/wy/st/en/info/NEPA/documents/cfo/West_Antelope_II.html (last visited June 26, 2016). 29 Bureau of Land Management, South Gillette Area Coal Lease Applications FEIS, at 4-120-121 (2009), available at <http://www.blm.gov/publish/content/wy/en/info/NEPA/documents/hpd/SouthGillette.html> (last visited June 26, 2016). 17 • Wright Area coal mines, proposal to lease 2 billion tons of coal (2010): “It is not likely that selection of No Action alternatives would result in a decrease of U.S. CO₂ emissions . . . because there are multiple other sources of coal that . . . could supply the demand.”³⁰ • Colorado Roadless Rule, proposal to open to leasing 347 million tons of coal (2012): “[C]oal is increasingly a global commodity and any reductions in coal production associated with a roadless rule likely would be by coal from another source.”³¹ • John Henry Mine, proposal to develop 740,000 tons of coal (2014): “The end users of coal, in particular the cement manufacturing plant located in Richmond, British Columbia, will show no net increase in CO₂ emissions as [the mine’s] coal will displace coal from other sources.”³² • Bull Mountain Mine, proposal to develop 100 million tons of coal (2015): “The No Action Alternative would not likely result in a decrease of CO₂ emissions attributable to coal-burning power plants in the long term. There are multiple other sources of coal that could supply the demand for coal beyond the time that the Bull Mountains Mine No. 1 completes recovery of all coal proposed for mining. Without continued coal export from the Bull Mountains Mine No. 1 after the remaining 35 million tons is mined, it is reasonable to expect that power plant(s) would obtain coal from alternative sources on the spot market and coal combustion emissions would be comparable to the Proposed Action, depending on the coal quality and associated efficiency. Negligible impacts to climate change are expected under the No Action Alternative.”³³ • Spring Creek Mine, proposal to develop 84 million tons of coal (2016): “In addition, there is no certainty that GHG emissions at power plants would actually be reduced if the federal coal associated with the Proposed Action was not mined, given that the power 30 Bureau of Land Management, Wright Area FEIS, at 4-141 (2010), available at <http://www.blm.gov/wy/st/en/info/NEPA/documents/hpd/Wright-Coal.html> (last visited June 26, 2016). 31 U.S. Forest Service, Colorado Roadless Rule FEIS, at 138-139 (2012), available at <http://www.fs.usda.gov/roadmain/roadless/coloradoroadlessrules/finalruledocuments> (last visited June 26, 2016). 32 Office of Surface Mining Reclamation and Enforcement, John Henry Mine EA, at 23, (2014), available at http://www.wrcc.osmre.gov/initiatives/johnHenryMine/JHM_EA.pdf (last visited June 26, 2016). 33 Office of Surface Mining Reclamation and Enforcement, Bull Mountain No. 1 Mine EA, at 4- 24, (Jan. 2015), available at <http://www.wrcc.osmre.gov/initiatives/bullMountainsMine/BullMountainsMineEA.pdf> (last visited June 26, 2016). 18 plants supplied by [Spring Creek Coal Mine] have alternative sources for coal, and the [Mine] also has non-federal coal reserves that could be mined.”³⁴ In stark contrast to this long-standing practice of BLM and other agencies, the only times that federal courts have ruled on an agency’s use of perfect substitution, they have rejected the theory. In *Mid States Coal. for Progress v. Surface Transp. Bd.*, the Surface Transportation Board approved a new railroad line that would have provided a shorter route to deliver Powder River Basin coal to power plants in the Midwest. 345 F.3d 520, 532, 550 (8th Cir. 2003). The Surface Transportation Board argued that the rail line would not cause an increase in the use of Powder River Basin coal, since the project would merely provide a shorter and straighter route to power plants for coal mines that already served those plants through existing railways. *Id.* at 549. The Eighth Circuit rejected the unsupported notion that demand would remain unaffected in the face of a proposal that increased the availability and decreased the price of approximately 100 million tons of coal per year coal: [T]he proposition that the demand for coal will be unaffected by an increase in availability and a decrease in price . . . is illogical at best. The increased availability of inexpensive coal will at the very least make coal a more attractive option to future entrants into the utilities market when compared with other potential fuel sources, such as nuclear power, solar power, or natural gas. . . . [The railroad] will most certainly affect the nation’s long-term demand for coal. *Id.* (emphasis added). More recently, the U.S. District Court for the District of Colorado rejected the Forest Service’s reliance on perfect substitution when analyzing the impact of making available approximately 347 million tons of coal in Colorado.

High Country Conservation Advocates v. U.S. Forest Serv., 52 F.Supp. 3d 1174, 1197-98 (D.Colo. 2014). The Forest Service argued that “if the coal does not come out of the ground in the North Fork consumers will simply pay to have the same amount of coal pulled out of the ground from somewhere else—overall [greenhouse gas] emissions from combustion will be identical under either scenario.” Id. The High Country court rejected the Forest Service’s conclusion, explaining that the increased supply made possible by the Forest Service’s decision would “impact the demand for coal relative to other fuel sources” and that “[t]his reasonably foreseeable effect must be analyzed.” Id. at 1198. Significantly, every time agencies have actually analyzed the impact of coal-related proposals by modeling the market impacts, they have concluded that proposals to facilitate coal mining on public lands will result in increased carbon dioxide emissions. 34 Office of Surface Mining Reclamation and Enforcement, Spring Creek Mine EA, at 4-17 (June 2, 2016), available at <http://www.wrcc.osmre.gov/initiatives/SpringcreekMineLBA1/documents/EA0616.pdf> (last visited June 26, 2016).

19 Earlier this year, the Washington Department of Ecology analyzed the impacts of the proposed Millennium Bulk coal export terminal. As part of its analysis, Ecology used the ICF Integrated Planning Model to analyze impacts of the proposal. Ecology studied relevant factors, including how changes in supply can affect coal price. Ultimately, Ecology concluded that the proposal could affect the delivered coal price and thus total coal consumption, recognizing that: “[a]s delivered coal prices change, the demand for coal changes in the opposite direction.”³⁵ Similarly, following the High Country decision, the Forest Service used the ICF Integrated Planning Model to analyze the market and environmental impacts of the proposal to allow access to approximately 170 million tons of coal in otherwise protected areas of Colorado. In November 2015, the Forest Service released its Supplemental DEIS, which concluded that “[c]hanges in gross production and consumption of coal from the North Fork Coal Mining Area are expected to have an effect on production and consumption of other fuel sources, including alternative supplies of coal, natural gas, and other energy supplies such as renewables, especially in later years of the analysis.”³⁶ The Forest Service explained that opening up approximately 170 million tons of coal would cause “the mixture of fuels [to] shift[,]” including increases in production and consumption of underground coal, and decreases in production and consumption of substitute fuel sources such as surface coal, natural gas, and renewable energy. Moreover, the Forest Service concluded based on its Integrated Planning Model runs that this relatively modest proposal, in terms of volume of coal when compared to the federal coal leasing program, would displace approximately 40,000 gigawatt hours of renewable energy from the U.S. electricity grid.³⁵ Washington Department of Ecology, Millennium Coal Export Terminal Draft EIS, SEPA Market Assessment Technical Report, at 4-11 (2016). ICF conducted a literature review to identify a specific demand elasticity, and supplied the following studies when asked to identify the documents it relied upon: Office of Air and Radiation, U.S. Environmental Protection Agency, TECHNICAL SUPPORT DOCUMENT FOR EPA’S MULTI-POLLUTANT ANALYSIS ELECTRICITY DEMAND RESPONSE TO CHANGES IN PRICE IN EPA’S POWER SECTOR MODEL (2005), available at <http://www.epa.gov/airmarket/progsregs/cair/docs/DemandResponse.pdf>; James Espey & Molly Espey, Turning on the Lights: A Meta-Analysis of Residential Electricity Demand Elasticities, 36 J. OF AGRIC. & APPLIED ., no. 1, 2004, at 65, available at <https://ideas.repec.org/a/ags/joaec/42897.html>; R. Laffery, et al., Office of Markets, Tariffs and Rates, Federal Energy Regulatory Commission, DEMAND RESPONSIVENESS IN ELECTRICITY MARKETS (2001); Mark Bernstein & James Griffin, The RAND Corporation, REGIONAL DIFFERENCES IN THE PRICE-ELASTICITY OF DEMAND FOR ENERGY (2005), available at http://www.rand.org/content/dam/rand/pubs/technical_reports/2005/RAND_TR292.pdf; Nathan Joo, Matt Lee-Ashley, & Michael Madowitz, Center for American Progress, 5 THINGS YOU SHOULD KNOW ABOUT POWDER RIVER BASIN COAL EXPORTS (2014), available at <http://cdn.americanprogress.org/wp-content/uploads/2014/08/PowderRiver-factsheet.pdf> (From The structural break and elasticity of coal demand in China: empirical findings from 1980-2006); U.S. Energy Information Administration, U.S. Department of Energy, FUEL COMPETITION IN POWER GENERATION AND ELASTICITIES OF SUBSTITUTION (2012), available at <http://www.eia.gov/analysis/studies/fuelelasticities/pdf/eia-fuelelasticities.pdf>.³⁶ U.S. Forest Service, Colorado Roadless Rule SDEIS, at 80 (Nov. 2015) (emphasis added).²⁰ over the life of the proposal, and result in a net increase of 130 million tons of CO₂ over the life of the proposal.³⁷ In sum, the PEIS must disclose the volume of

GHGs likely to occur as a result of each alternative, by acknowledging and disclosing the substitution of effects of other energy sources.

Comment Excerpt Text:

Health effects associated with climate change: Because coal-fired power plants account for so much of U.S. carbon dioxide emissions, coal is a major contributor to the health impacts of climate change. Determination of the climate threats needs to be quantified by the PEIS to evaluate the ultimate cumulative impact of additional leasing on federal land. For example, more frequent heat waves will lead to a rise in heat exhaustion and heat stroke, potentially resulting in death, especially among elderly and poor urban dwellers. Rising temperatures are expanding the ranges for disease-carriers like mosquitoes and ticks in some cases causing epidemics of Lyme disease. Drought causes detrimental effects on food supply resulting in crop failure, higher prices and worsening nutrition. The increased frequency of intense precipitation events contributes to flooding, water contamination and the spread of infectious and mosquito-borne diseases. Drought, declining food supplies and rising sea levels increase the migration of affected populations and increase armed conflict and global instability.

Comment Excerpt Text:

As coal is burned, CO₂ is released. CO₂ is a gas that disperses all over the globe. As it circulates around, it combines with water or water vapor to create a mild acid. Slowly but inexorably our oceans are becoming more acidic as a result. Ocean acidification is a huge problem for the economy of Washington State. It affects one of our major industries, one that earns an estimated \$270 million a year for the state coffers every year, the shellfish industry. Acidic water affects oysters and, even more important, shell-forming marine plankton which is critical in basic marine food chains. These effects start in the higher latitudes and gradually move toward the equator. The burning of coal in Asia will affect ocean acidification all over the world, especially having an impact on ecosystems such as coral reefs, an important support system for fish stocks

Last May, the White House released a report called the National Security Implications of the Changing Climate, which included findings from DHS, DOD, and other Federal agencies. This report makes clear that climate change poses an immediate and far-reaching threat to America's safety and stability. The Pentagon refers to climate change as a threat multiplier because it aggravates existing stressors, such as poverty, poor farming conditions and political instability, which in turn provides environments where terrorist activity thrives. This results in the need for more frequent defense missions. This increased scale and intricacy costs human lives and taxpayer dollars. Domestically the IC and DOD recognizes that climate change poses serious threats to our coastal communities and military bases, two essential aspects of our economy and food security, like agriculture and water; and to our critical national energy and transportation infrastructure.

Even though the coal industry has seen a significant decline over the last decade, we can't ignore the reality of the United States is the fourth largest source of coal exports in the world. Of those exports, the majority of our coal is headed to Asia. Joby Warrick in a Washington Post article put it most aptly: "Each shipment highlights what critics describe as a hypocrisy, underlining U.S. climate policy: While boasting of pollution cuts at home, the United States is facilitating the sale of large quantities of government-owned coal abroad." To make it abundantly clear, continuing the mining and export of government owned coal is making a statement to the world where our priorities lie and most importantly it goes against President Obama's Climate Action Plan. By the Bureau of Land Management not taking into account the effects of coal exports on global warming, you are undermining global efforts to address climate change. In yesterday's USA Today article on the West Virginia floods, it stated that climate change may have added to this disaster. According to the National Climate Assessment, the part of the U.S. that includes West Virginia has seen a 71 percent increase in extreme precipitation since 1958. We are exporting our pollution and that pollution is not only still contributing to global climate change, but its local effects are impacting poor and vulnerable populations. Now is the time to take a serious stance on climate change and protect the most vulnerable.

Comment Excerpt Text:

a significant amount of coal is being extracted from our public lands. This means that a significant amount of carbon dioxide, mercury, lead and other toxic materials are being spewed into the atmosphere at a cost of about \$300 billion estimated. That's far more than the \$68 billion that was shown up there as income generated from the extraction of coal. Today the carbon dioxide levels are 460 parts per million. That's up from 180 parts per million. The ice is melting. Greenland's ice caps, glaciers are melting. Antarctica's glaciers are melting. Alpine's glaciers are melting. And according to James Hanson, the current rate of melting, sea level rise expected to go up or rise by 12 feet by the end of this century. That's 12 feet by the end of this century. It's estimated that 2 billion people are going to be displaced by the sea level rises. That's far more extensive in terms of the losses there than the short term gains by the extraction of fossil fuels. The oceans are dying. The carbon dioxide levels have caused the oceans to warm and acidify. This acidification is ruining our reefs, which are an ecological indicator of the tropical rain forest in terms of its reduction of ecosystems, and at the same time that plankton is being destroyed in the oceans as well. Plankton, by the way, is a source of 70 percent of our oxygen that we breathe. In addition to this, this warming is causing the melting of permafrost and we see methane being released. Methane levels have been recorded at that exceeding 3,000 parts per billion. That's the highest rate of methane that has been recorded. Methane is 80 times more potent than greenhouse gas than carbon dioxide is, according to Michael Mann in his book "Dire Predictions." For the sake of future generations, we must transition from fossil fuels to renewable sources of energy. For the sake of our eternity of Earth's ecosystems that support human life on this planet, we must transition from fossil fuels to renewable energy sources.

Comment Excerpt Text:

The Interior should also use the social cost of carbon and the social cost of methane to quantify the climate impacts of proposed alternatives. These tools are critical to evaluating the overall return of the Federal Coal Program to all citizens and taxpayers. The Interior should also analyze the optimal term for any new and modified coal leases by assessing the social cost of carbon and social cost of methane and using potential adders to the royalty rate. Both NYU Policy Integrity and Vulcan Group have conducted analysis on increasing royalty rates to account for some of these costs. We found that using an upstream social cost methane adder, which would be equivalent to only a dollar per ton of coal would add up to \$2 billion in royalty revenue over four years in just four western states, Wyoming, Colorado, Montana, and Utah. Vulcan found that using an adder instead of 20 percent for the social cost of carbon would add nearly 3 billion in royalty receipts by 2025, with those benefits extending all the way to 2050. In other words, by increasing royalty rates to recoup some of the social and environmental cost of production, the Interior can increase revenue for states and the Federal Government while also reducing greenhouse gas emissions.

Comment Excerpt Text:

If the administration wants to impose new taxes on coal mined on federal lands, it must seek legislation authorizing such new taxes from Congress. The Secretary has no statutory authority to impose a "social cost of carbon" via royalty or leasing rates. She cannot impose a climate change tax. If she wishes the federal coal program to "reflect the administration's climate objectives", she must obtain Congress' authorization to do so.

Comment Number: 0000620-1

Organization I: University of Illinois

Commenter I: Gerald C. Nelson

Comment Excerpt Text:

As an economist, I strongly favor relying on market based mechanisms to simplify the leasing program and increase its transparency. In particular, the application of the royalty rate to the gross market price, a statistic that is readily and widely available, would make the program much more transparent. However, without further modification, this approach does not take into account the negative effects of additional carbon pollution from coal burning. A simple modification would be to add the social cost of carbon to the gross market price and apply the royalty rate to the combined amounts.

The US court system has recognized the harmful effects of carbon pollution and directed the government to take these effects into account. For example, the United States District Court for the District of Colorado in 2014

specifically required the use of the social cost of carbon (SCC) in a cost-benefit analysis underpinning the approval of federal coal leases. This information should become a key part of revisions to the leasing program to address the PEIS focus on fair return, a topic to which I now turn

The review of federal coal and its contributions to climate change comes at a pivotal moment and the Department of the Interior must ensure that the environmental consequences of carbon are accurately reflected in the cost of coal.

Comment Number: 0001161-1

Commenter I: Mark Hennon

Comment Excerpt Text:

There are many reasons to keep coal in the ground, but let's focus on methane pollution, which big coal has done its best to hide. Coal mining dumps millions of tons of climate-destroying methane gas into the air. Most of it goes unmeasured because big coal is not exactly scrupulous about self-reporting the extent of its own sins.

Comment Number: 0001161-2

Commenter I: Mark Hennon

Comment Excerpt Text:

Methane pollution heats us up far more than carbon dioxide. Methane from just one coal train causes significant global warming. A standard coal train of 120 cars carries 120 tons of coal for each car for a total of 14,400 tons of coal.

Based on the latest science, the methane pollution from that coal is equal to at least 6,400 tons of carbon dioxide. That's 6,400 tons of pollution for every 14,400 tons of coal, 44 percent of the weight of each coal train.

Commenter I: Ruby

Comment Excerpt Text:

I want to suggest that you should include as one of the elements in the price calculation the social costs of carbon. When the coal is extracted and burned, it does, of course, release carbon dioxide into the air, and that's what we price.

The social cost of carbon for a given year is an estimate in dollars, but the present discounted value of the damage caused by one metric ton increase in CO₂ emissions into the atmosphere for that year were equivalently the benefits of reducing CO₂ emissions by the same amount in that year.

The social cost of carbon is intended to provide a comprehensive measure of the monetized value of the net damages from global climate change that results from an additional unit of CO₂, including but not limited to changes in the net agricultural productivity use, energy use, human health effects, property damages from increased blood risk.

Federal agencies use the social cost of carbon to value the CO₂ emission's impacts on various regulations, including emission and fuel economy standards for vehicles, emission standards for industrial manufacturing power plants, solid waste incineration, and appliance energy efficient standards and I believe it should be used in writing this EIS.

The amount of CO₂ released per ton of coal will depend on the actual use of coal and the way it is burned or consumed. This will vary by lease and can be more or less depending, for example, on the efficiency of the power plant. But for the most part, it will be sufficient to assume that it is burned in the national average coal-fired power plant unless there is a dedicated contract for purchase of the coal for the entire lease period.

The U.S. federal government's interagency working group on the social cost of carbon has developed a methodology for estimating the social cost of carbon, and has applied that methodology to produce estimates that government agencies can use in regulatory impact analyses under Executive Order 12866.

Ensuring that carbon costs (including the costs of methane) are accounted for in each and every leasing and

mining plan approval that may move forward as the programmatic environmental impact statement is completed. As you have acknowledged, the moratorium on new leasing does not affect a number of pending leases and does not affect the Interior Department's review and approval of mining plans authorizing the extraction of leased federal coal. To ensure the Department and the American public are informed of the actual costs and benefits of near-term coal approvals and to comply with the National Environmental Policy Act, interior must, at a minimum, ensure that the social cost of carbon emissions due to coal mining, transportation, and combustion are analyzed and considered. This is already being done in the context of a proposal to open roadless forest to coal leasing in western Colorado

In March of 2015, we released a report examining the legal and economic issues associated with putting a carbon charge on federal coal;(1) A modified version of this report will be a forthcoming article in Environmental Law Reporter. (<http://www.rff.org/files/sharepoint/WorkImages/Download/RFF-DP-15-13.pdf>).

(1) Krupnick et al. 2015. Putting a Carbon Charge on Federal Coal: Legal and Economic Issues. RFF DP 15-13. Washington, DC: Resources for the Future.

Our legal analysis concluded the following:

- BLM appears to have the statutory and regulatory authority to institute such a charge, with the clearest place to do so being through a modification to the royalty rate.
- A carbon charge sufficiently large enough to dramatically curtail federal coal leasing could face legal risk by violating the “dual mandate” to balance environmental goals and federal revenue generation.
- The optimal solution would be an economy-wide carbon charge on all fossil fuels, irrespective of federal, state, or private ownership.

Comment Excerpt Text:

The lack of competitiveness in the federal coal leasing market may limit the effectiveness of any carbon charge. Since most leases are granted in bids with only one bidder, bidders may simply reduce their bid by some amount

of the carbon charge. Protections against such actions may be gained through evaluation of BLM's internal fair market valuation processes to ensure that climate costs are considered in those processes.

- The Administration's Interagency Working Group on the Social Cost of Carbon has released estimates for the social cost of carbon for agencies to consider in their programs.

- At the midrange SCC estimate (\$46/ton CO₂), the corresponding carbon charge would be over \$90/ton of coal, which far exceeds the average mine-mouth price of coal from the Powder River Basin (recently selling at around \$9.35/ton).

Comment Excerpt Text:

Ken Gillingham discussed coal mined from federal lands and the royalties charged for that extraction. He noted that 42% of thermal coal sold in the U.S. is "federal coal" and that such coal had out-competed other sources on price for decades. Gillingham then explained several of the reasons that the Department of Interior is reviewing its coal leasing program and planning to issue a programmatic environmental impact statement to update that program: royalties charged for coal are 1/6th its market price and many times below the Social Cost of Carbon (in contrast to other fossil fuels, for which royalties are closer to what charging the SCC would yield); 90% of auctions have a single bidder because they are generally for continuations rather than new leases; and most bids for those leases are near the (confidential) minimum bid. Gillingham then noted that charging royalties equal to the SCC would effectively keep federal coal in the ground and suggested that charging 20% of the SCC—because royalties are split with states—could provide a revenue stream for programs that ease the pain of a transition away from coal.

A carbon tax (and dividend) may actually be passed before these regulations are revised again (even though in the present situation it seems unlikely). When passed, coal companies will be hard pressed to make the tax and produce, particularly under their present technologies. We want to emphasize the importance of encouraging/subsidizing innovation by the coal industry to reduce their GHG emissions. A quote from the coal

industry stated that they should be allowed to continue without restrictions because the onus is on renewables to innovate future power sources. Under a carbon tax scenario, coal producers will be increasingly pressed to produce under less profitable scenarios. BLM can encourage industry to face the implications of mining oblivious to the damage and look for innovation before it costs them big time. Potentially, there is something that we have not considered in these comments that can help inspire industry to face forward rather than entrench in the past. We encourage BLM to include those ideas or take them to the local offices for dissemination.

Only by ignoring its enormous health and environmental impacts can coal-fired power be considered a "low-cost" energy source, the use of which promotes economic efficiency and job creation. Failing to reflect all of the cost of a product in the product's sale price misallocates resources. If society, through a tax or a regulation, shifts a dollar of spending away from a product that is less valuable to society to a product that is more valuable to society (on a unit basis) it creates more jobs than it "kills." This principle is taught in Economics 101 in every accredited undergraduate course in the country, and is undisputed. Applied in the context of using fossil fuel to provide electricity, a kilowatt/hour obtained from coal is actually worth from one-half to one-one tenth as much to society as a kilowatt/hour obtained from a non-polluting source, depending on how many of its external costs are accounted for.

Comment Number: 0002326_Moench_20160724_UtahPhysicHealthyEnviron-55

Commenter I: Malin Moench

Comment Excerpt Text:

The EPA estimates that the health care costs imposed on society as a whole from burning a ton of coal (which it labels the Social Costs of Carbon) would be \$43 in 2020 (\$36 on a present value basis at 3%).⁽³²⁾ An alternative Social Cost of Carbon estimate based on middle-of-the-road assumptions is \$62 in 2020 (\$55 on a present value basis at 2%). (Johnson, L., et al., 2012.) The average price of a short ton of coal delivered to the electric power industry in 2012 was \$45.77. The future value of \$45.77 in 2020 at 2.3% interest is \$52.46. These Social Cost of Carbon estimates indicate that the average price of coal in 2020 would need to increase by from 82% to 105% if it were to cover its social costs. It should be borne in mind that these are only a partial estimate of coal's external costs. They do not include the most economically significant ones, such as the long-term reduction in labor productivity described above

Comment Excerpt Text:

Over its life cycle, coal generates a waste stream that carries multiple hazards for human health and the environment. These costs are not imposed on the coal industry, but on the rest of society. The Harvard study estimates that the life-cycle effects of coal and the waste stream generated are costing the American public from one-third to over one-half of a trillion dollars annually. The costs of substituting energy efficiency and renewable forms of energy for the output of existing coal-fired power plants are a small fraction of the costs of not doing so, when the life-cycle costs of coal are taken in to account.

The Harvard study monetized costs imposed on the public health system by NO_x, SO₂, PM_{2.5}, and mercury emissions; fatalities of members of the public due to rail accidents during coal transport; the added public health burden in Appalachia incurred by coal mining; government subsidies; and the lost value of mined land after it has been abandoned. The estimate is conservative in that it does not account for damages outside of Appalachia, nor does it account for unquantifiable costs, such as the cost to a family of losing a wage earner due to black lung disease. It notes that many of these external costs of coal are cumulative. (Epstein, et al, 2011.)

The Harvard study conservatively estimates that if the external costs of coal were accounted for, they would double or triple its price. If electricity produced from burning coal were priced to cover its social costs (which amount to \$345.3 to \$523.3 billion annually), it would add a tax of from 17.7 to 26.9 cents to the current average retail price of electric power (11 cents per kilowatt hour).

Comment Excerpt Text:

If the current moratorium on new Federal coal leases is not made permanent, the next best option is for the BLM to require that the price of Federally leased coal cover the Social Cost of Carbon before the sale can go forward. Currently, there is no consistent approach that State and local BLM offices follow when they draft Environmental Impact accompanying fossil fuel lease applications. Some offices make reference to carbon pollution and climate disruption and even include some efforts to estimate these externalities. Others offices mention these externalities in the abstract, but argue that the social cost of carbon cannot be objectively determined, or they view the potential climate effects of a particular lease proposal on a global scale and dismiss them as de minimis or unquantifiable as a percentage of the entire globe's warming.

There is a critical need for the Secretary of the Interior to require an organized and consistent approach to the issue of carbon pollution and climate disruption and how it relates to a particular fossil fuel lease, whether a coal, conventional oil, or shale gas lease is involved. The new approach should make it clear that carbon pollution and climate disruption are external costs of burning fossil fuel, that there are objective standards and methods for determining a reasonable range of what those costs are on a per-ton basis, and that the percentage of total global warming that might be caused by a particular proposed lease is not normally a meaningful criterion to apply in an Environmental Impact Statement. Rather, above a certain threshold, estimating a carbon contribution and climate impact of a fossil fuel lease is meaningful when estimated on a per-ton, or per-Btu basis

The crippling drought in California is just one example of what economists call the “external cost,” or “social cost,” of continuing to rely on carbon to power our nation. It is a “social cost” because neither the producer nor the consumer of carbon pays it directly—society as a whole pays it. The cost of the intensifying drought that is virtually certain to grip the Southwest and the Central Plains before this century is out is not reflected in the Social Cost of Carbon estimates developed by the EPA or the Harvard Medical School described earlier. This provides another reason for treating those estimates as lower-bound estimates.

The value of avoiding the various forms of harm that burning coal causes to the health of the public is best appreciated by the major efforts to estimate the Social Cost of Carbon. In its Notice of Proposed Rulemaking, the EPA estimated that its Clean Power Plan would reduce CO₂ and other pollutant emissions (SO₂, NO_x, PM_{2.5}) by 30% with respect to 2005 levels. The EPA estimates that this co-benefit of CO₂ reduction would save from \$48 to \$84 billion in health-related costs (primarily, the economic value of lives saved). The EPA estimated the cost of complying with the Clean Power Plan would be between \$7.3 and \$8.8 billion in the year 2030. This, it estimated, would raise electricity prices by 3%. The EPA estimated that the ratio of benefit to cost for the Clean Power Plan ranges from 7:1 to 12:1.⁽¹⁵⁾

(15) See Notice of Proposed Rulemaking, Carbon Pollution Emission Guidelines for Existing Stationary Sources: Electric Utility Generating Units, June 18, 2014, 79 FR 13726, section X.A.

¹⁶See <http://www.nrdc.org/air/pollution-standards/>.

These estimates of the effect of the Clean Power Plan on CO₂ and related emissions, however, are much too low because they are based on stale data and because they look at only part of the benefits of carbon reduction. The most recent data relied on by the EPA is for the year 2010. The Natural Resources Defense Council has gathered data for the years since 2010 and updated the EPA estimate. The new data reflects both a sharp drop in the demand for electric power and a sharp drop in the cost of utility-scale wind and solar power. The NRDC has input the new data into the same Integrated Planning Model that the EPA used to generate its initial cost

estimates. The updated model's estimate of reduced CO₂ and related emissions for 2030 is 30% with respect to 2012 levels, not 2005 levels, as was case with the EPA's original estimate.

The updated model's estimate is that complying with the Clean Power Plan will save from \$28 to \$63 billion in health related costs in 2030, due to reduced emissions of ozone precursors and fine particulates. When environmental benefits are added to these health benefits, the savings range from \$64 to \$99 billion in 2030. The NRDC update also estimates that the Clean Power Plan would reduce the annual costs to electric power consumers by between \$6.4 and \$9.4 billion in the year 2030.¹⁶ That translates to an expected reduction in consumer's electric bills of 3% in 2030.

An alternative estimate of the social cost of carbon is found in a study by the faculty of Harvard Medical School. Published in 2011, it compiled an estimate of the social costs incurred in the United States annually by using coal to generate power. It is more comprehensive than the EPA's Social Cost of Carbon estimate because it considers the costs incurred at each stage of the life cycle of coal—extraction, transport, processing, and combustion. It does not, however, consider future losses in labor productivity.

Comment Excerpt Text:

The CEQ expressly warns agencies that their NEPA duties are not satisfied by recitations in EISs or EAs that emissions resulting from a government action or approval represent only a small fraction of global emissions and therefore require no further analysis. Instead, agencies are to follow a principle of proportionality in which the extent of analysis of GHG emissions is commensurate with the quantity of proposed GHG emissions.

NEPA requires Federal agencies to consider the direct, indirect and cumulative impacts of proposed actions. See, 40 C.F.R. §§ 1508.7, .8. NEPA also requires consideration of “connected actions.” The CEQ defines “connected actions” as those that automatically trigger other actions which may require an EIS, actions that cannot or will not proceed unless other actions are also taken, or actions that are interdependent parts of a larger action. Based on these broad, long-standing definitions CEQ now believes that Federal agencies must discuss climate change and GHG emissions in an EIS or EA if the effects are significant, including a discussion of emissions from other activities that have a reasonably close causal relationship with the proposed action and are either “upstream” or “downstream” from the proposed action.

Comment Excerpt Text:

Campbell County is concerned about potential changes to the federal coal leasing program that will rely on criteria that is simply incapable of measurement and subjective in nature. For example, raising the royalty rate to "reflect the cost of harm to the public from negative externalities from coal development" and "include the social cost of mining imposed by fixed cost non-internalized externalities, such as loss of recreational or other values". (See, Vol. 81, No. 61 Federal Register, pg. 17726, March 30, 2016.) A stated goal of a revision, if any, to the federal coal leasing program is to increase transparency. The use of such nebulous, unquantifiable and subjective "costs" and criteria for valuing coal does not contribute to the stated goal of increased transparency.

We recommend that BLM use the federal SCC and other available tools to assign a cost value to both direct and indirect GHG emissions—or a benefit value to avoided GHG emissions—that will occur as a result of existing leases and all future leasing scenarios under consideration (including the downstream emissions described in Section 1 of these comments). (16) This information should be used to evaluate different coal production scenarios.

(16) The SCC is a tool developed by the federal government to estimate the costs of GHG emissions that are either released or avoided as a result of agency rulemakings. It provides a comprehensive estimate of climate change damages, including changes in net agricultural productivity, human health, property damages from increased flood risk, and changes in energy system costs. For more details, see EPA, *The Social Cost of Carbon*, <https://www3.epa.gov/climatechange/EPAactivities/economics/scc.html>. There is also a peer reviewed methodology that can be used to calculate the social costs of methane and nitrous oxide, which has been used by EPA in prior rulemakings. See Marten et al., *Incremental CH₄ and N₂O Mitigation Benefits Consistent with the US Government's SC-CO₂ estimates*, 15 *CLIMATE POLICY* 272 (2015); EPA, *REGULATORY IMPACT ANALYSIS OF THE PROPOSED EMISSION STANDARDS FOR NEW AND MODIFIED SOURCES IN THE OIL AND NATURAL GAS SECTOR*, 4-14 (2015); EPA, *REGULATORY IMPACT ANALYSIS FOR THE PROPOSED REVISIONS TO THE EMISSION GUIDELINES FOR EXISTING SOURCES AND SUPPLEMENTAL PROPOSED NEW SOURCE PERFORMANCE STANDARDS IN THE MUNICIPAL SOLID WASTE LANDFILLS SECTOR*, 4-10–4-14 (2015).

We also recommend that BLM use this information to inform its decisions about rental fees and royalty rates. According to Secretarial Order 3338, two of the primary goals of the PEIS are to ensure that the American public receives fair market value (or a "fair return") from the sale of the coal, and to assess whether the program "adequately accounts for externalities related to Federal coal production, including environmental and social impacts." (19) GHG emissions are one of the externalities that should be accounted for when determining whether the American public is receiving fair market value from the sale of the coal. Many other commenters, including the White House and members of Congress, have agreed that climate impacts and other externalities of

the federal coal program should be incorporated into the assessment of the market value of federal coal. (20)

An analysis of a range of price alternatives would be consistent with the purposes of NEPA. In particular, BLM should consider a range of carbon price alternatives that correspond with the different SCC estimates at the 5% average, 3% average, 2.5% average, and 3% 95th percentile average, and evaluate the effect of these different pricing scenarios on coal production, revenue, and environmental impacts (including GHG emissions). This information should be used to frame and assess the range of alternative leasing scenarios that are under consideration, and to compare these to a “no leasing” alternative. One critical question will be how higher rental fees or royalties would affect lifecycle GHG emissions from federal coal.(21)

(21) According to one study, the introduction of higher royalties, phased-in over a ten year period, would reduce overall Co2 emissions, even with the Clean Power Plan in place; ramping down coal production could achieve a similar emissions benefit, but with diminished revenue implications. The SCC estimates must be made consistent with OMB Circular A-4. As noted by leading researchers, the IWG SCC value is calculated differently than other measures of social benefits and costs. (11) Among other issues, it uses a lower discount rate than recommended by OMB Circular A-4 and values global benefits rather than solely

U.S. domestic benefits. By introducing an SCC value with a different denomination in both the social cost and social benefit calculation, it muddies the results even more and renders comparison among regulatory options and among regulations even more difficult. Use of the social cost of carbon unfairly imposes “global” climate costs on “domestic” producers of coal which will increase electricity prices for U.S. manufacturing. The Obama Administration has directed agencies to monetize a regulation’s direct or indirect effect of reducing emissions of carbon dioxide (CO₂). Federal agencies have estimated the potential benefits of rules using the social cost of carbon (SCC) and the social cost of methane (SCM). An important glaring problem with the SCC or the SCM is that it indirectly imposes global carbon costs on coal producers, which will increase electricity costs on domestic manufacturers, which damages the industry’s ability to compete with foreign competitors. No other country in the world imposes global carbon costs onto industry.

U.S. Government Accountability Office report highlights severe uncertainties in SCC values. The U.S. Government Accountability Office’s (GAO) report entitled, “Development of Social Cost of Carbon Estimates” (8) highlights that the SCC cost estimates have great economic and scientific uncertainty. (8) U.S. Government Accountability Office, Development of the Social Cost of Carbon Estimates, July, 2014, <http://www.gao.gov/products/GAO-14-663>
On page 12 it states, “The Technical Support Document (TSD) states that reported domestic effects should be calculated using a range of values from 7 to 23 percent of the global measure of the social cost of carbon, although it cautions that these values are approximate, provisional, and highly speculative due to limited evidence.” The quote illustrates that when applying the SCC on domestic industry, 77-93 percent of the estimated climate benefits will flow to entities outside of the U.S.! In other words, the TSD guarantees that domestic application of the SCC will harm the U.S. economy, to the benefit of others around the world. Taking such action is clearly inconsistent with the purpose of the U.S. government and every federal agency. The TSD inappropriately ignores longstanding guidance from OMB to analyze only domestic cost-benefits. If BLM wishes to apply the SCC, it must revise downward the range of benefits by 77-93 percent.
On page 14 it states, “The TSD states that the working group decided to calculate estimates for several discount rates (2.5, 3, and 5 percent) because the academic literature shows that the social cost of carbon is highly

sensitive to the discount rate chosen, and because no consensus exists on the appropriate rate.” Clearly this means that the social cost of carbon is not based on reasonable economic analysis to accurately reflect the cost of capital. The TSD inappropriately ignores longstanding guidance from OMB under Circular A-4 to analyze cost benefits using a 7 percent discount rate.

On page 17 it states, “Some of the participating agencies have incorporated discussions of these limitations into regulatory impact analyses using social cost of carbon estimates. For example, in a 2012 rule setting pollution standards for certain power plants, EPA noted that the social cost of carbon estimates are subject to limitations and uncertainties.” (9)

4. The social cost of carbon value is unrealistically high.

The SCC for 2016 is \$36 per metric ton (in \$2007), while other carbon trading prices are far lower. Some of those include: RGGI’s auction clearing price at \$4.53 per metric ton (on June 1); California’s cap and trade price at \$12.71 per metric ton (on July 13); and the EU ETS price at \$5.29 per metric ton (on July 14). And, throughout the overwhelming majority of the world, the price is even lower. These stated real-time carbon market prices raise serious questions about the validity and appropriateness of the SCC.

Comment Excerpt Text:

Before BLM applies any SCC estimate in its programmatic environmental impact statement, BLM must correct the methodological flaws that commenters have raised about the IWG’s SCC estimate. SCC estimates fail to comply with guidance for developing influential policy-relevant information under the Information Quality Act (IQA).

Further, SCC estimates are the product of an opaque process and any pretensions to their supposed accuracy (and therefore usefulness in policymaking) are unsupported. The models and all of their assumptions with inputs used for the SCC estimates and the subsequent analyses were not subject to peer review, as required under OMB Circular A-4. The SCC estimate from integrated assessment modeling is a highly uncertain academic exercise that does not offer a reasonably acceptable range of accuracy for use in policymaking.

According to the Financial Post, equations “that connect CO₂ emissions to temperature change depend on a parameter called equilibrium climate sensitivity (ECS), which is the amount of warming in degrees Celsius from doubling the amount of CO₂ in the air, after the atmosphere and oceans have fully adjusted. The equations that connect temperature change to economic impacts make up what is called the damage function. The IWG made updates to the damage functions that boosted the costs, but it did not change the ECS even though the ECS has dropped in recent years. The higher the ECS, the longer it takes the climate to adjust to higher greenhouse gas levels. Under a high-ECS case the damages occur much farther in the future and need to be discounted more heavily. But the IWG does not take this into account; instead it allows high-ECS and low-ECS scenarios to occur on the same time scales, biasing the SCC upwards.” (10)

(10) “What’s the right price for carbon? Take a guess (everyone else is),” Financial Post,

•Royalty rates cannot sustain increases. Increasing rates based on carbon created during the combustion process would create a double taxation scenario, especially with the newly formed carbon limits proposed under the EPA's Clean Power Plan. It is evident from the long list of coal companies going out of business the royalty rates are currently too high for companies to be profitable.

Comment Number: 0002443_Koontz_20160727_BowieResources-12

Organization I: Bowie Resource Partners, LLC

Commenter I: Gene DiClaudio

Comment Excerpt Text:

Bowie recognizes that the Secretary is constrained by Administration policy to use the Federal Social Cost of Carbon ("SCC") in rulemaking proceedings, despite the fact that the SCC is technically unsound, was not developed through notice-and-comment rulemaking, and sharply diverges from OMB guidelines regarding critical elements such as discount rates. Nevertheless, the Secretary does have discretion to set policy for project-level decisions, including leasing decisions, and should categorically reject the SCC in those contexts. Not only was the SCC not developed for project-level decisions, but the SCC cannot provide useful information at the project level. This is because at the project level, the incremental SCC impact of the proposed action in relation to the no-action alternative or other project alternatives will generally be indeterminable. For example, for local effects, e.g., the impact of a lease on a stream, the no action or project alternatives will have identifiable different impacts. But for global impacts of the type attempted to be measured by the SCC, one cannot know the effect of, for example, the no action alternative, without knowing how the various actors will respond. Even if coal lease application A is denied, there will be no effect on net SCC calculations unless there is a coordinated policy to deny other similarly-situated coal leasing, and such broad policy determinations are inherently beyond the scope of project-level analyses.

In addition, as the BLM and OSMRE have recognized in recent project level NEPA analyses, the SCC by itself provides an incomplete and biased accounting of the impacts of a decision. There is presently no corresponding "Social Benefit of Carbon" metric. While short term tax, employment, and economic activity measures account for some of the benefits of coal production, they are by no means a complete accounting in the same manner and at the same horizon and scale as attempted by the SCC. Consequently, the SCC is not useful at the project level and the PEIS and any resulting regulatory or policy changes should make that clear.

Organization I: Institute for Policy Integrity

Commenter I: Jayni Foley Hein

Comment Excerpt Text:

Peter Howard (Economics Director, Institute for Policy Integrity) discussed royalty reform scenarios that would account for upstream methane and transportation costs. Policy Integrity's analysis found that internalizing the upstream methane externally costs, alone, would lead to a \$1 per metric ton charge on federal surface-mined coal in the Powder River Basin (or a shift from a 12.5% royalty rate to an 18.7% royalty rate), and approximately a \$10 per metric ton charge for federal underground coal. Using the 18.7% royalty rate for federal coal produced in the Powder River Basin from 2009 to 2014 would have provided about \$1 billion in additional

revenue, not accounting for the externality benefits. These values were derived using the Social Cost of Methane, and represent lower bound estimates of production externality costs, as some externalities cannot easily be quantified (such as water use and pollution). Transportation of coal accounts for 40 percent of all train traffic in the United States. Howard stated that if Interior accounted for both methane and transportation costs, it would lead to an 82% royalty based on Wyoming mine mouth prices. This work is additive and complementary to the work of Vulcan Philanthropies, discussed below, which focuses on downstream combustion emissions.

Organization I: Institute for Policy Integrity

Commenter I: Jayni Foley Hein

Comment Excerpt Text:

Spencer Reeder (Senior Program Officer, Vulcan Philanthropies) and Professor James Stock (Harold Hitchens Burbank Professor of Political Economy, Faculty of Arts and Sciences, and faculty member, Harvard Kennedy School) discussed modeling several federal coal program reform scenarios with a focus on their interaction with the Clean Power Plan. Their work considered reforms that increased coal royalties, including royalty increases linked to the monetized externality value of the combustion of the coal as estimated by the Social Cost of Carbon. In addition, they discussed reforms that would place quantity caps on coal from federal lands. Reeder discussed the White House Council of Economic Advisers' (CEA) recent report, which discussed fair market value, environmental externalities, and how Interior can maximize royalty revenue (coming up with an estimated value of \$3 billion or more in additional annual payments from royalty reform). Reeder stressed that, despite the coal industry currently having bankruptcy issues, their underlying mine assets are valuable (once the burden of overextended debt is lifted) and now is the time to look at reforming the coal leasing program because there have been market failures. Reeder also stated that an economy-wide carbon price would be a proper solution, but that does not yet exist, nor does the Clean Power Plan because of the current stay by the Supreme Court. Reeder noted that when discussing the appropriate royalty rate for federal coal, calculations are often based on a below-market price, as Haggerty's work has shown. It is better to think of it in absolute terms (and in dollars per ton of coal), as the CEA report does. The Vulcan study looked at the effect of different carbon adder scenarios and their effect on energy sector greenhouse gas emissions, including substitution effects, and revenue. Using a 20% Social Cost of Carbon adder results in a dramatic increase in revenue accompanying a decline in production. The CEA report looked at maximizing revenue, and they came up with an adder equivalent to about 30% of the Social Cost of Carbon. Reeder stressed that the revenues from this adder can be used to address the broader economic transition away from coal, and the affected states have the opportunity to direct their share of the increased funds to affected communities without federal legislation. Reeder also stressed that this is new territory and we are confronting a new problem of how to deal with addressing climate change externality costs, consistent with Hein's remarks.

Professor James Stock discussed the modeling conducted for the Vulcan study, using the ICF Integrated Planning Model (IPM), which is the same model EPA used for the Clean Power Plan regulatory impact analysis. Stock described how the analysis examined scenarios with the Clean Power Plan in place, and without it. For example, without any Clean Power Plan, using a royalty rate equivalent to 100% of the Social Cost of Carbon would provide three-quarters of the emissions reductions that the Clean Power Plan would provide if it were fully implemented as EPA envisions. If the Clean Power Plan is in place, the effect is smaller and it would be double-counting to use a full Social Cost of Carbon adder. In the study, as the royalty rate increases, there is some substitution of federal coal for non-federal eastern coal, but the price for eastern coal also goes up, making natural gas and solar more attractive. So there is a "self-limiting" feature; as the adder approaches about 20% of the Social Cost of Carbon, there is less substitution of eastern coal for federal. Internalizing some of the externality cost of coal through royalty reform takes some of the compliance burden off the Clean Power Plan.

The effect on wholesale electricity prices, in a mass-based Clean Power Plan scenario with royalty reform, actually decreases the price of electricity.

Stock summarized in four points: (1) while good government reforms are important and we should come up with a pricing basis that is fair, accurate, and prevents gaming by companies, that is not enough. Interior must adjust for the externality value of burning the coal mined on federal lands if it wants to govern to protect the interest of future generations; (2) an optimal Social Cost of Carbon adder that avoids double-counting depends on the implementation details of the Clean Power Plan (under a mass-based Clean Power Plan, about 20% of the Social Cost of Carbon may be appropriate; if the Clean Power Plan is weaker, then a larger adder would be appropriate); (3) small increases in the coal royalty rate will yield small climate effects and larger increases will yield greater climate benefits while still increasing revenue; and (4) making changes through royalty rate reform, as opposed to conducting no new leasing indefinitely, will provide revenue to states (and the federal government) that will need assistance transitioning away from coal.

Comment Excerpt Text:

BLM should also work to qualitatively monetize the impacts of these GHG emissions using the EPA's social cost of methane and the Interagency Working Group's social cost of carbon methodologies, as well as the USGS carbon database. Relying on these data, BLM should develop quarterly estimates of all GHG emissions associated with the extraction, transport, and consumption of federal coal to serve as basis for informing future decisions regarding the federal coal regulatory scheme, and report the carbon emissions and impacts for all agency leasing decisions.

Finally, fugitive methane is the biggest other contributor to the GHG emissions (after burning of coal for electricity generation), and coal mining accounts for approximately 15% of United States methane emissions. Methane is formed in coal as the coal is created over time from various plant remains, and is retained by the coalbed and surrounding strata as long as it remains under pressure. When coal mining occurs, the trapped methane is released from both the coal seams and surrounding strata.

To address this other potent contributor to climate change. BLM must develop a method to account for the methane emissions associated with mining, and incorporate those emissions into its calculations of the full life-cycle emissions associated with federal coal leasing.

Coal Mining and Climate Change are Impacting Gunnison County's Public Lands Gunnison County is home to the Gunnison National Forest, Black Canyon of the Gunnison National Park, and biologically diverse BLM-managed

lands. Ranging in elevation from less than 6,000 feet to mountains over 14,000 feet, it is a rich and varied landscape. Yet both subtle and obvious impacts from climate change are impacting millions of acres of local public lands and straining federal budgets. Warmer winters and hotter summers, the proliferation of the spruce beetle and subsequent die-off of vast swaths of forest, Sudden Aspen Decline, larger and more intense wildfires, and reduced snowpack are just some of the climate change impacts we're seeing on our public lands. In 2005, Colorado's greenhouse emissions were 35 percent higher than they were in 1990. They are projected to grow 81 percent above the 1990 levels by 2020.⁷ Current and proposed federal coal leasing and development contributes to Colorado's greenhouse gas emissions and directly impacts public lands and communities. (7) U.S. Dept. of Agriculture, Spruce Beetle Epidemic and Aspen Decline Management Response Final Environmental Impact Statement (February 2016), at 228.

On June 20, President Obama spoke at Yosemite National Park, declaring that climate change is "the biggest challenge we're going to face in protecting this place and places like it."⁸ He could just have easily been discussing public lands in western Colorado. President Obama condemned those who pay "lip service" to protecting America's natural areas while making climate change worse:

(8) The White House, Remarks by the President at Sentinel Bridge, Yosemite National Park, Office of the Press Secretary (June 20, 2016), available at <https://www.whitehouse.gov/the-press-office/2016/06/20/remarks-president-sentinel-bridge> (last viewed July 28, 2016).

-Make no mistake, climate change is no longer just a threat, it's already a reality. I was talking to some of the rangers here -- here in Yosemite, meadows are drying out. Bird ranges are shifting farther northward. Alpine mammals like pikas are being forced farther upslope to escape higher temperatures. Yosemite's largest glacier, once a mile wide, is now almost gone. We're also seeing longer, more expensive, more dangerous wildfire seasons -- and fires are raging across the West right now. I was just in New Mexico yesterday, which is dealing with a big wildfire, just like folks here in California and four other states -- all while it's still really early in the season.⁹

The West Elk mine is Colorado's worst methane polluter, spewing more methane into the atmosphere than the state's largest oil and gas operator.⁵ But a proposed mine expansion deeper into sensitive National Forest lands would push emissions much, much higher, not to mention carve up a biologically rich, forested landscape with roads, wells and other infrastructure.⁶ It doesn't make environmental sense, it doesn't make economic sense, and it shouldn't be allowed to occur on public lands. Gunnison County's healthy, intact public lands and the economic opportunities they provide shouldn't be sacrificed to support a failing coal mine that is being heavily subsidized by U.S. taxpayers.

Meaningful consideration of greenhouse gas emissions is clearly within the scope of required NEPA review³. As the Ninth Circuit has held, in the context of fuel economy standard rules:

The impact of greenhouse gas emissions on climate change is precisely the kind of cumulative impacts analysis that NEPA requires agencies to conduct. Any given rule setting a CAFE standard might have an “individually minor” effect on the environment, but these rules are “collectively significant actions taking place over a period of time” (quoting 40 C.F.R. § 1508.7)⁴.

Whether or not any given lease sale is “individually minor” (a questionable assertion, given that single sales such as the Wright Area sales can implicate 2 billion tons of coal), it is beyond dispute that the federal coal program as a whole implicates a significant chunk of national and global greenhouse gas emissions – at current rates approximately 14% of U.S. fossil fuel emissions,⁵ 10% of U.S. total GHG emissions,⁶ and 1.6% of total global GHG emissions.⁷ The courts have ruled that agency consideration indirect GHG emissions resulting from agency policy, regulatory, and leasing decisions cannot ignore the impact of decisions regarding coal supply.⁸

Two recent studies estimated that global oil, gas, and coal resources considered currently economically recoverable contain potential greenhouse gas emissions estimated at 2,900 GtCO₂ (100) and 4196 GtCO₂ (101) respectively. Other sources estimate even greater global fossil fuel reserves at 3,677 to 7,120 GtCO₂.¹⁰² When considering all fossil fuel resources (defined as those recoverable over all time with both current and future technology irrespective of current economic conditions), potential combustion emissions have been estimated at nearly 11,000 GtCO₂ (103) upwards to 31,353 and 50,092 GtCO₂.¹⁰⁴

The Social Cost of Carbon (SCC) is a leading tool for quantifying the climate impacts of proposed federal actions. The SCC is an estimate, in dollars, of the long term damage caused by a one ton increase in carbon dioxide (CO₂) emissions in a given year; or viewed another way, the benefits of reducing CO₂ emissions by that amount in a given year. The SCC is intended to be a comprehensive estimate of climate change damages that includes, among other costs, the changes in net agricultural productivity, risks to human health, and property damages from increased flood risks. The method was initially designed for application in rulemakings, but the courts have recognized its applicability to NEPA analyses. (25)

There is at least one court case supporting the use of the SCC protocol. In *High Country Conservation Advocates v. U.S. Forest Serv.*, 52 F. Supp. 3d 1174 (D. Colo. 2014), a case involving coal mining EISs, the court rejected claims that it was too speculative to estimate coal combustion emissions when the SCC method was available to the agency and had been recognized earlier by the agency. This was particularly true because the agency presented the benefits of the project in a monetary form. By refusing to quantify the climate change costs of the project, the agency effectively zeroed out the costs of greenhouse gasses. Presenting only a project’s economic upsides while omitting a projection of the project’s costs was arbitrary and capricious and violated NEPA.

However, the SCC has some limitations. The method is recognized as an underestimate of the total likely damages associated with a proposed action. (28)

(28) EPA concluded, “The models used to develop SC-CO₂ estimates, known as integrated assessment models, do not currently include all of the important physical, ecological, and economic impacts of climate change recognized in the climate change literature because of a lack of precise information on the nature of damages and because the science incorporated into these models naturally lags behind the most recent research. Nonetheless, the SC-CO₂ is a useful measure to assess the benefits of CO₂ reductions.”

One alternative method identified by the National Academies of Science is an interactive risk management assessment. In a risk management assessment the BLM would consider means to reduce or respond to GHG emissions such as through mitigation, adaptation, geo-engineering, or an improved knowledge base. Many responses are possible for estimating risk reduction potential. Such a method should seek to pursue the most feasible options, pursue options with the lowest costs and good cost effectiveness, put in place options with proven effectiveness, ensure equity and fairness, and be robust to the uncertainties surrounding climate change. The approximate costs would then serve as the basis for determining the risk cost of a proposed action. (29)

The second critical step in analyzing climate change issues in the PEIS after determining the amount of GHG that are emitted is to evaluate the climate change impacts of those emissions. This can be done by utilizing the Social Cost of Carbon (and companion EPA Social Cost of Methane) protocol. The BLM should use this method for climate change impact assessment in the PEIS. But in addition, due to some shortcomings in the SCC method, the BLM must also evaluate qualitative, non-monetary impacts that are caused by climate change, such as from earlier snowmelts in our western mountains that are changing water supplies. This analysis should be done from a global perspective because as recognized in the CEQ Climate Change NEPA Guidance, "diverse individual sources of emissions each make relatively small additions to global atmospheric GHG concentrations that collectively have huge impact." That said, local impacts also need to be considered especially since the BLM has traditionally published the local monetary benefits of the coal program in its NEPA analyses. BLM should not assume that federal coal that is not produced will simply be replaced by production from other sources (so-called "perfect substitution") thus eliminating any climate change benefits —this unfounded myth is not based on empirical evidence or sound economic theory, and it has been rejected in several reports.

Comment Excerpt Text:

Another approach to managing the carbon emissions associated with the Federal Coal Program is by addressing the costs borne by society due to federal coal leasing and production through economic tools designed to ensure that taxpayers receive a fair return. Referred to by some as a carbon adder, such an approach increases the price paid to the federal government for the use of federal coal to reflect some or all of its climate costs (i.e., climate externality). (52) Some have argued that such an adder could be incorporated into the existing bonus bid, rents,

or royalty paid on federal coal sales because it offers the administratively simplest and most efficient strategy, and because of the potential for states and communities impacted by reductions in coal mining to receive a portion revenue generated by the adder even as coal production declines. (53) An adder could be set at a price to address emissions associated with lifecycle emissions of federal coal or just the direct (upstream) emissions of from coal mining. (54) Fully incorporating the lifecycle costs would potentially result in a very large price increase, but could be phased in. (55) Another approach would be for DOI to initially apply an upstream (direct) carbon adder for all fossil production, including coal, as part of the royalty rate. In a forthcoming paper, we will demonstrate in more detail how this approach has myriad benefits, including market flexibility so that least cost options will be made, clearly under the purview of DOI and BLM, more straightforward and transparent than a lifecycle cost, increases taxpayer fairness by beginning to internalize externalities and increasing state and federal revenue, is complimentary to leasing reform. Lastly, “The statutory case for a BLM coal pricing initiative appears to be stronger than the case against it since BLM is required to consider the environment when making multiple use decisions for public land. BLM’s leasing statutes also appear to afford the agency a significant amount of discretion to set the financial terms of coal leases.” (56)

The SCC was developed through a rigorous multi-agency process based on generally accepted research methods and years of peer-reviewed scientific and economic studies. In 2010, an interagency working group was convened by the Council of Economic Advisers and the Office of Management and Budget to design an SCC modeling exercise and develop estimates for use in rulemakings. The interagency group was comprised of scientific and economic experts from the White House and federal agencies, including: Council on Environmental Quality, National Economic Council, Office of Energy and Climate Change, and Office of Science and Technology Policy, EPA, and the Departments of Agriculture, Commerce, Energy, Transportation, and Treasury. The interagency group identified a variety of assumptions, which EPA then used to estimate the SCC using three integrated assessment models, which each combine climate processes, economic growth, and interactions between the two in a single modeling framework.

This method has undergone careful peer review from a number of agencies and has been subject to updates and revisions, and considerable public comment. For example, see the Office of Management and Budget's (OMB) SCC site, which presents the OMB response to the public comments received through its solicitation for comments on use of SCC estimates in Federal regulatory analyses. (26) In this response, OMB announced plans to obtain expert, independent advice from the National Academies of Sciences, Engineering, and Medicine on how to approach future updates to the estimates. This panel is concluding its review but published an interim review generally reaffirming the methods used to develop the SCC for use in evaluating proposed federal actions. (27)

The carbon budget analysis serves as the basis for setting these targets, and would be used to inform decision making by the agency as part of a carbon management system. It could also be used when evaluating new policies, in NEPA processes or to dictate actual leasing decisions. While a carbon budget should be developed for all energy resources on federal lands, we believe that applying this concept to the coal leasing program is a logical starting point presented by the PEIS. The coal budget (measured in terms of CO₂e) will provide a target for the agency to stay below when making leasing decisions. The agency could consider how each new lease impacts the budget and, while a more robust system could be used to construct a firm limit or “hard cap” in the future, we recommend the budget be used to develop “soft targets” to guide decisions in the near term. Thus, we envision the coal budget playing an integral role in the agency’s determination of what, where and how much coal will be made available for lease.

BLM should develop a carbon budget and carbon management system for fossil fuels on public lands modeled after the analysis done by The Wilderness Society. Using the carbon budget, BLM should create a coal budget that will be used as a soft target and decision making tool. The budgets and carbon management system should play an integral role in the leasing process as proposed in Section IV.H. When considering new leases BLM should measure and manage toward the budget as well as requiring compensatory mitigation for the GHG emissions and climate change impacts new leases would cause.

The most straightforward route would be to implement a carbon adder for upstream (or direct) emissions – those occurring during the mining and production phase. Recent research estimates those costs would be roughly \$2 for surface federal coal and \$6 for underground federal coal. Without a more comprehensive carbon pricing program – like a national carbon tax, and given the widely recognized externalities associated with coal use, choosing not to price coal emissions from federal production via an upstream adder (or another similar approach) would represent a glaring misstep in meeting the nation’s climate commitments.

The Social Cost of Carbon (SCC) is a well---established and frequently utilized approach for capturing the externalities of emissions. A recent paper by Resources for the Future (Krupnick et al 2015) shows that the BLM has the regulatory and statutory authority to implement a price on carbon. Thus, including a carbon price (or ‘adder’) based on the SCC and coal emissions would be a practical step to account for carbon costs.

This lack of authority extends to any attempt by the Department of the Interior to utilize the social cost of carbon, or similar analytical tools, to further burden coal leasing on public lands through indirect taxation or mitigation. In other words, BLM has no authority to discourage coal mining at the leasing stage based on downstream effects, such as greenhouse gas emissions from transportation and combustion, using the social cost of carbon or any other similar analytical method. Even BLM has previously recognized that the imposition of climate-related costs “is outside the scope of [the Federal Land Policy and Management Act] and the MLA.” See Attachment 5, BLM Petition Denial (Jan. 28, 2011) (“Carbon and any other fees dedicated to raising monies to fund other initiatives would require legislation allowing that authority to the BLM.”).

Commenter I:Andrew C. Emrich, P.C.

Comment Excerpt Text:

The federal coal leasing program is governed by the MLA, which embodies fundamental principles of maximum economic recovery and diligent development of federal coal reserves. In evaluating climate change impacts related to the federal coal program, BLM’s analysis must be informed by the MLA, which indisputably favors mineral development. BLM’s climate change analysis, including the social cost of carbon, cannot be used as a justification to increase costs associated with coal leasing or otherwise attempt to discourage coal leasing and development on public lands. The social cost of carbon is not only an inaccurate and inappropriate tool to measure climate change impacts, but it is also wholly inconsistent with the MLA’s mandate to encourage the development of federal coal reserves.

Alternative C and D: Social Cost of Carbon and Royalty Rate Increases

This alternative would internalize the cost of carbon based on federal social cost of carbon estimates reflecting the “worldwide incremental damage from climatic change brought about by an additional metric ton of CO₂ emissions.”⁶⁷ This price is sensitive to discount rates. A midrange price for the year 2020 is \$46 per ton of CO₂.⁶⁸ Similarly, BLM may consider royalty rates as a means to reform the federal coal program. Increased royalty rates can also include royalty carbon adders, which “directly incorporates a carbon price into the royalty paid on federal coal sales, reflecting its climate costs.”⁶⁹ Interior should analyze these decision alternatives and compare them against the criterion of budget compatibility – whether the reformed alternatives are consistent with federal climate change targets, as illustrated by the 450 Scenario.

Comment Excerpt Text:

Neither NEPA nor the Council on Environmental Quality regulations specifically requires quantitative consideration of the economic impacts of climate change or use of the SCC. Climate Integrated Assessment Models (IAMs) which are a mechanism for conducting an SCC estimate are imperfect and provide a rough estimation at best - “the actual economic impacts associated with an additional metric ton of GHG emissions are unknown.” Therefore, an SCC based upon IAMs is “largely speculative.” *Id.* at p. 65; (WY0-01785). In reviewing a challenge to the Wright Area FEIS, the Court upheld the agencies' qualitative disclosure rather than quantitative analysis of the effects of GHG emissions. *WildEarth Guardians*, 120 F. Supp. 3d at 1269-1273;

(WY0-01391 to 01396). Distinguishing the coal leases analyzed in the Wright Area FEIS from a coal lease at the mouth of a power plant, the Court recognized that "the mined coal would be entering the free marketplace, thus diminishing the agencies' abilities to foresee the effect of coal combustion." *Id.* at 1272-73 (distinguishing Wright Area FEIS challenge from *High Country Conserv. Advocates v. USFS*, 52 F. Supp. 3d 1174 (D. Colo. 2014)); (WY0-01394 to 01395). It accepted the agencies' rationale that "information regarding the precise impact on global warming was not then available and that 'given the current state of science, it is not yet possible to associate specific actions with the specific climate impacts.'" *WildEarth Guardians*, 120 F. Supp. 3d at 1272; (WY0-01395).

Because of the highly speculative nature of a SCC analysis, the BLM should avoid conducting one as part of the PEIS. If the BLM persists, it must consider that the overall trend in GHG emissions is trending down. See *Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2014, Recent Trends in U.S. Greenhouse Gas Emissions and Sinks* at §2.1. (WY0-01792 to 01813). Overall, net emissions in 2014 were 8.6 percent below 2005 levels as shown in Figure 3.4.1 below.

Comment Excerpt Text:

we want to emphasize that the move to reform the federal coal program comes as a critical moment in our nation's energy history. In the past several years, the federal coal program, which has sought to maximize economic return for the United States of America, has faced the new reality that more coal mining is not yielding the economic benefits intended when the program was first enacted. As our understanding of the costs of climate change have evolved, it is now clear that the federal coal program is not producing an economic return, but rather costing society tremendously.

One vivid illustration of this is with regards to the climate costs of publicly owned coal production. As reports have found, every ton of carbon released into the atmosphere imposes a cost to society in the form of economic damages. The U.S. Environmental Protection Agency ("EPA") has explained this "social cost of carbon" concept as follows:

The [social cost of carbon] SC-CO₂ is an estimate of the economic damages associated with a small increase in carbon dioxide (CO₂) emissions, conventionally one metric ton, in a given year. This dollar figure also represents the value of damages avoided for a small emission reduction (i.e., the benefit of a CO₂ reduction). (1) EPA, "The Social Cost of Carbon," website available at

<https://www3.epa.gov/climatechange/EPAactivities/economics/scc.html>.

Although a U.S. Interagency Working Group consisting of the White House Council on Environmental Quality, U.S. Department of Agriculture, the EPA, the Department of Energy, and others reports that the current cost of carbon emissions may be as high as \$105 per metric ton of carbon dioxide released, peer-reviewed studies actually indicate the cost is as high as \$220 per metric ton. (2) Agencies have lately been using a mid-range value of \$37 per metric tons of carbon dioxide.

(2) According to the Interagency Working Group, the 2015 cost of carbon based on the 95th percentile value across three models at a 3% discount rate was \$105 per metric ton of carbon dioxide. See Exhibit 1, Interagency Working Group on Social Cost of Carbon, "Technical Support Document: Technical Update of the Social Cost of Carbon for Regulatory Impact Analysis Under Executive Order 12866" (July 2015), available online at <https://www.whitehouse.gov/sites/default/files/omb/inforeg/scc-tsd-final-july-2015.pdf>. However, recent studies have determined that current estimates for the social cost of carbon should be as much as \$220 per ton. See Exhibit 2, Moore, C.F. and B.D. Delvane, "Temperature impacts on economic growth warrant stringent mitigation policy," *Nature Climate Change* (January 12, 2015).

Based on recent reports that federal coal production is responsible for 765,241,950 metric tons of carbon dioxide, this would put the total climate cost of the federal coal program at up to \$168,353,229,000 based on a \$220 per metric ton social cost of carbon value. (3) Even based on a \$105 per metric ton of carbon value, the

costs of the federal coal program would be as much as \$80,350,404,750. These are staggering expense. Especially considering the Department of the Interior has estimated the total economic benefits from all oil, gas, and coal production overseen by the BLM may be as high as only \$64.50 billion, the net costs of the federal coal program alone are obvious and far overshadows any economic benefits. (4)

(3) According to a recent report for The Wilderness Society, total carbon dioxide emissions related to federal coal production are estimated to be 765,241,950 metric tons annually. See Exhibit 3, Stratus Consulting, "Greenhouse Gas Emissions from Fossil Energy Extracted From Federal Lands and Waters: an Update," Final Report Prepared for The Wilderness Society (Dec. 23, 2014) at 10, available online at <http://wilderness.org/sites/default/files/Stratus-Report.pdf>.

(4) In the Department of the Interior's most recent Economic Report for FY 2015, the agency estimates a total economic contribution from all coal, oil, and gas production overseen by the BLM to amount to \$64.5 billion. See U.S. Department of the Interior, "Economic Report, FY 2015" (June 17, 2016) at 22, available online at https://www.doi.gov/sites/doi.gov/files/uploads/fy2015_doi_econ_report_2016-06-17.pdf. This number is based on the direct economic benefits of all oil, gas, and coal production overseen by the BLM, which are estimated to be \$29.5 billion, and the "value added" benefits, which are vaguely defined and amount to \$36.64 billion. The report does not disaggregate between coal, oil, and gas benefits, but rather presents an aggregate figure for all fossil fuel production overseen by the BLM.

The costs of the federal coal program are underscored by methane emissions associated with federal coal production. As recent reports have found, among federal fossil fuel development, federal coal production is the largest source of methane pollution, releasing 13,080 metric tons annually. (5) According to recent studies, the social cost of methane as of 2015 was as high as \$3,000 per metric ton. (6) This puts the cost of methane emissions associated with federal coal production at \$39,240,000, further highlighting how costly the climate consequences of the federal coal program are to our society.

(5) See Exhibit 3 at 10. Contrast this figure with total methane emissions from onshore natural gas production, which at 12,358 metric tons is the second largest source of methane from federal fossil fuel production.

(6) See Exhibit 4, EPA, "Regulatory Impact Analysis of the Proposed Emission Standards for New and Modified Sources in the Oil and Natural Gas Sector" (Aug. 2015) at 4-14, available online at https://www3.epa.gov/airquality/oilandgas/pdfs/og_prop_ria_081815.pdf.

Put another way, the annual climate costs of just the federal coal program far outweigh the benefits of all fossil fuel production overseen by the BLM. Taking into account all carbon dioxide and methane emissions associated with federal coal production, the costs are 2.5 times greater than all economic benefits. See Attached for Figure I - Benefits of BLM Oil, Gas, and Coal Production and High and Low Carbon Cost Estimates Associated with Federal Coal Production.

Another way to look at this is to assess the climate costs that society stands to bear from future coal production. According to estimates, 231.92 billion metric tons of carbon stands to be unleashed if all remaining leased and unleased federal coal reserves are mined and consumed. (7) Based just on carbon cost estimates for 2015, these emissions stand to produce as much as \$51.03 trillion in damages, more than 17 times the total budget of the United States of America. However, because these emissions are likely to occur later in time, when carbon costs are more pronounced, these estimates represent very conservative amounts. Nevertheless, they remain illustrative of the need for reforms to ensure the United States, and indeed the world, are not forced to shoulder these costs.

(7) See Exhibit 5, Eco-Shift Consulting, "The Potential Greenhouse Gas Emissions from U.S. Federal Fossil Fuels," Report Prepared for Center for Biological Diversity and Friends of the Earth (Aug. 2015), available at <http://www.ecoshiftconsulting.com/wp-content/uploads/Potential-Greenhouse-Gas-Emissions-U-S-Federal-Fossil-Fuels.pdf>. See Attached for Table I - Projected Carbon Emissions and Costs Related from Unleased and Leased Federal Coal Reserves

Even under the more conservative, mid-range value of \$37 per metric ton of carbon dioxide, the total carbon emissions from unleashed federal coal reserves stands to be more than \$7.8 trillion. No matter how you slice it, the liabilities of future coal development are nearly unfathomable and certainly cannot be something the BLM and Interior Department should expect future generations to shoulder.

These climate costs are not theoretical. As the Interior Department itself has acknowledged, the cost of climate change to the resources it manages is and stands to be enormous, including:

- More than \$40 billion in National Park resources and infrastructure at risk because of climate change; (8)
- Devastating impacts to western water supplies, including decreased precipitation in the American southwest, decreased runoff, and decreased streamflow; (9)
- Loss of imperiled and iconic American wildlife, including polar bear, caribou, salmon, and moose; (10) and
- Greater difficulty in reclaiming land disturbed by energy and mineral extraction and other human activities on public lands. (11)

2. Just Transition Alternative

The “Just Transition Alternative” is meant to both wind down the federal coal program in order to keep fossil fuels in the ground and to ensure an orderly, effective, and fair transition of workers and communities away from coal to more prosperous and sustainable economies. The “Just Transition Alternative” is defined by the following key components:

1. An end to federal coal leasing: Consistent with authorities and discretion under the Mineral Leasing Act, the Just Transition Alternative imposes a permanent pause on the leasing of federal coal. The primary basis for adopting this permanent pause would be to ensure the protection of the public interest and the interests of the United States. Such justification for an end to leasing is clearly supported by the Mineral Leasing Act.

This pause would apply to all competitive leases (including all leases by application, including emergency leases, as defined by 43 C.F.R. § 3425.1-4) and lease modifications. We further believe there is ample justification for applying a permanent pause to other forms of non-competitive leasing, such as preference right lease applications and lease exchanges. With regards to lease exchanges, the BLM has clear authority to reject exchanges that are not in the “public interest.” 43 C.F.R. § 3435.4(a); see also 43 C.F.R. § 3436.0-2(b) (related to alluvial valley floor exchanges) and 43 C.F.R. § 2200.0-6 (generally related to exchanges). With regards to preference right lease applications, the BLM has the authority to reject such applications where there does not exist “commercial quantities” of coal. 43 C.F.R. § 3430.5-1(a)(1). Given the dismal state of the coal industry and the overwhelming climate costs that coal imposes on society, it would be dubious at best to claim that any commercial quantities of coal exist where there are preference right lease applications. Accordingly, the BLM has the authority to reject such applications. (20)

Furthermore, to ensure an orderly end to federal coal leasing, the BLM and the Department of the Interior

should issue a rule or guidance requiring that as land management planning is undertaken pursuant to 43 C.F.R. § 1610, et seq., that all lands within a resource management area that are not currently leased for coal, be made unavailable for leasing. The authority to impose such direction is set forth at 43 C.F.R. § 3420.1-4(e), which gives the BLM broad discretion to “eliminate additional coal deposits from consideration to protect other resource values.” 43 C.F.R. § 3420.1-4(e)(3).

(20) The only preference right lease applications that exist are in northwestern New Mexico, where Arch Coal, which is currently bankrupt, has the rights to acquire 21,000 acres of leases. Legislation was introduced in the U.S. House of Representatives that would allow the Secretary to retire these preference right lease applications. See HR-1820, available online at <https://www.congress.gov/bill/114th-congress/house-bill/1820/text>. If this legislation is passed, there would be no additional preference right lease applications requiring action. We support this legislation and urge the Secretary of the Interior to encourage its passage in the U.S. Senate and adoption into law.

Putting a permanent pause on leasing will not destroy the U.S. economy or otherwise endanger our energy security. As a recent report looking at leasing in the Powder River Basin found, existing leased reserves in the Powder River Basin are sufficient to meet demand and effectively contribute to limiting temperature increases.

(21) This report is instructive as the Powder River Basin is the largest coal producing region in the United States and imposes the greatest influence on energy supply and demand in the nation. If an end to federal leasing can be justified in the Powder River Basin, it can be justified for federal leasing elsewhere in the U.S.

21 See Exhibit 11, Fulton, M., D. Koplow, R. Capalino, and A. Grant, “Enough Already: Meeting 20C PRB Coal Demand Without Lifting the Federal Moratorium,” Report Prepared for Energy Transition Advisors, Earth Track, and Carbon Tracker Initiative (July 2016), available online at <http://www.carbontracker.org/report/enough-already-2c-powder-river-basin-coal-demand-federal-moratorium/>.

2. Increased royalty rates and rentals: Coal is exacting a tremendous toll on our nation, costing our society billions in climate damages, adverse health impacts from air pollution, and water contamination. Royalty rates from production on existing coal leases and rentals on existing leases must be increased to begin to recoup the costs of these externalities, which are currently shouldered by the public.

Although royalty rates are normally imposed through new leasing, we recommend that the Interior Department and BLM incorporate higher royalty rates into existing leases as existing leases are readjusted pursuant to 43 C.F.R. § 3451.1. To accomplish this, we urge the amendment of 43 C.F.R. § 3473.3-2(a)(1) and (2) to incorporate increased royalty rates for both surface and underground mining. As leases are readjusted, these royalty rates must be applied to existing leases pursuant to 43 C.F.R. § 3451.1(a)(2).

Increasing royalty rates has been recommended by the White House as both a means to generate revenue and address the costs of environmental externalities, including carbon costs. (22)

(22) See Exhibit 12, Executive Office of the President of the United States, “The Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to Taxpayers” (June 2016), available online at https://www.whitehouse.gov/sites/default/files/page/files/20160622_cea_coal_leasing.pdf.

Furthermore, royalty rate reductions should not be approved. Currently, royalty rate reductions are routinely granted as companies claim poverty or difficulty in mining with little apparent scrutiny as to whether the reductions are justified. In Colorado, for example, BLM officials have approved royalty rate reductions to facilitate methane venting and most recently proposed to approve a retroactive royalty rate reduction for a mine that was not even producing coal. (23) See Exhibits 13 and 14.

Similarly, we urge Interior and BLM to amend 43 C.F.R. § 3473.3-1(a) to raise rental rates for federal coal leases. Currently, rental rates are set at \$3.00 per acre, a figure that has not been adjusted since 1979, if not earlier. This rental rate not only has failed to be adjusted to account for inflation, but fails to account for the fact that some leases may be of small acreage, yet yield significant amounts of coal. Rentals should reflect the value of the lease, which depends on the amount of coal a lease contains. In accordance with 43 C.F.R. § 3473.3-1(a), any increased rental rate must be applied to any readjusted coal lease.

3. Existing leases that are not producing must be canceled: Where a lease is not meeting continued operation requirements under 43 C.F.R. § 3483.1(a)(2), it is subject to cancellation pursuant to 43 C.F.R. § 3452.2. Where a lease is not meeting continued operation requirements, BLM and the Interior Department should make clear that

cancellation of the lease must be pursued. To this end, discretionary avenues for avoiding cancellation should be prohibited. Thus, lease suspensions under 43 C.F.R. § 3483.3 and payment of advanced royalties in lieu of continued operation under 43 C.F.R. § 3483.4 should be barred.

The justification for imposing such direction is very clear. Currently, BLM regularly grants lease suspensions and allows payment of royalties in lieu of continued operation with no assessment of whether such actions are appropriate or in the public interest. BLM appears to be under the impression that lease suspensions or advanced royalties are somehow mandated, and that the agency has no choice but to approve company requests. An egregious example of this is with regards to Arch Coal's Carbon Basin Lease in southern Wyoming (No. WYW-139975). Arch acquired this lease with the aim of developing a mine to fuel a proposed coal to liquids facility. However, this coal to liquids facility has never materialized or even shown any promise of materializing. Most recently, the Wyoming Department of Environmental Quality terminated the permit for the proposed facility. (24) Nevertheless, since 2010, Arch has failed to meet continued operation requirements. The BLM has allowed Arch to maintain its lease, however, by routinely allowing the company to pay advanced royalties in lieu of continued operation. (25) These decisions appear to be pro forma in nature, and do not reflect any consideration as to whether it is appropriate or remotely in the public interest to accept advance royalties in lieu of continued operation.

(24) See Exhibit 15, Wyoming Department of Environmental Quality, "Permit Termination, Medicine Bow Fuel and Power Coal to Liquid Project" (June 27, 2016).

(25) See Exhibit 16.

Furthermore, where an existing lease is not producing, yet is part of a producing logical mining unit, BLM and the Interior Department should use their discretion to modify the boundaries of logical mining units to eliminate the non-producing lease and facilitate its cancellation. BLM has such discretion under 43 C.F.R. § 3478.1.

Cancelling leases that are not producing will serve the goal of preventing any potential future development of existing leases and contribute to an orderly end to the federal coal program.

4. Accounting for carbon costs in coal management: It should be made clear, whether through new rules or guidance, that carbon costs must be analyzed, assessed and disclosed as federal coal management decisions are made. Such decisions are most likely to include mining plan modifications issued pursuant to the Mineral Leasing Act, 30 U.S.C. § 207(c), and the Surface Mining Control and Reclamation Act ("SMCRA"), 30 C.F.R. § 746, and lease readjustments. It is imperative that the BLM and Interior maintain close accounting of the carbon emissions and costs resulting from its coal management actions, to ensure full transparency around these emissions and costs, and to meaningfully act to address these emissions and costs. Particularly given that, pursuant to authorities under the Mineral Leasing Act and SMCRA, the Secretary of the Interior has full discretion to disapprove mining plans authorizing the development of leased federal coal, it is imperative that carbon emissions and costs factor into and influence such decisionmaking.

5. Reclamation must be guaranteed: To ensure an orderly end to the federal coal program, full and final reclamation must be guaranteed within a reasonable timeframe. We urge two regulatory changes to ensure this occurs.

First, Interior should amend regulations at 30 C.F.R. §§ 816.100 and 817.100 to provide clarification and specificity around contemporaneous reclamation. Current rules are vague and fail to ensure that reclamation proceeds in a manner that is as "contemporaneously as possible" with mining in accordance with 30 U.S.C. § 1202(e). These regulations should be amended to make clear that the success of contemporaneous reclamation must be measured based on a comparison of Phase III bond release acres, as defined under 30 C.F.R. § 800.40(c)(3), with disturbed acres and ensure that reclamation proceeds at a 1:1 rate, in other words for every acre disturbed, one acre should be fully reclaimed to meet Phase III bond release standards.

Second, just as current BLM rules require diligent development of federal coal, these rules should also require diligent reclamation. To this end, Interior and BLM should consider rule changes to ensure that nonproducing coal leases are fully reclaimed within two years of failing to meet continued operation requirements and set deadlines for the full reclamation of federal coal leases that are no later than 2035. This reclamation deadline

should be established by rule and incorporated into lease terms as leases are readjusted.

Finally, Interior should amend self-bonding regulations at 30 C.F.R. § 800.23, and any other regulations, as appropriate, to prohibit self-bonding whenever publicly owned coal is permitted to be mined. This will ensure that, as coal companies continue their decline, that American public resources are fully protected and fully guaranteed to be cleaned up.

6. Prioritizing transition: Above all, the BLM and Interior must make transition away from coal a foremost goal as the federal coal program comes to an end. To do this, the agencies should not only explicitly commit, to the extent possible, their leadership, resources, and expertise to ensure that workers and communities receive the support and assistance they need to transition to more sustainable and prosperous economies. Among the actions that Interior and BLM can and should undertake to ensure transition:

- Work to secure Congressional authorization to direct increased royalty and rental payments toward worker and community support. Under NEPA, agencies are required to rigorously explore and objectively evaluate reasonable alternatives “not within the jurisdiction of the lead agency.” 40 C.F.R. § 1502.14(c). Here, although BLM and Interior may not be able to direct royalties toward transition support, they can recommend that Congress pass legislation that provides such authorization.

- Establishing an Economic Transition Fund, which would be sustained by an increase in reimbursement fees charged by the Interior Department when processing coal-related applications. Under the Federal Land Policy and Management Act (“FLPMA”), Interior has authority to recover reasonable costs associated with its coal management program and to appropriate and spend such monies. Specifically, FLPMA provides the Secretary of the Interior with authority to “require a deposit of any payments intended to reimburse the United States for reasonable costs with respect to applications,” including coal lease application. See 43 U.S.C. § 1734(b). Such payments are “authorized to be appropriated and made available until expended” by FLPMA. Id. Funds from the Economic Transition Fund should be directed toward transition-oriented initiatives.

- Prioritizing support and assistance to help communities transition. In addition to securing funds and making them available, the Department of the Interior can play a key role in helping direct communities to support, steering resources to support conservation and research projects in or near communities, encouraging renewable energy development on public lands. Such leadership could be conveyed through a Secretarial Order that simply makes it an overarching priority of the Interior Department to advance transition

Overall, the Interior Department and BLM must move to keep our publicly owned coal in the ground. However, keeping coal in the ground should not mean that we turn our backs on the workers and communities that have been dependent on coal for so long. Embracing an alternative that ensures “Just Transition,” in other a fair, compassionate, and orderly transition away from coal, is the most effective way to both protect our climate and help our nation effectively move to more sustainable economies and reliable and affordable means of energy production.

b. Social Cost of Carbon Must be Analyzed

The PEIS must fully analyze and assess the climate impacts of coal reforms using the social cost of carbon protocol.

The social cost of carbon protocol for assessing climate impacts is a method for “estimat[ing] the economic damages associated with a small increase in carbon dioxide (CO₂) emissions, conventionally one metric ton, in a given year [and] represents the value of damages avoided for a small emission reduction (i.e. the benefit of a CO₂ reduction).” (27) As explained above, the protocol was developed by a working group consisting of several federal agencies, including the U.S. Department of Agriculture, EPA, CEQ, and others, with the primary aim of implementing Executive Order 12866, which requires that the costs of proposed regulations be taken into

account.

(27) EPA, “Fact Sheet: Social Cost of Carbon” (Nov. 2013) at 1, available online at <http://www.epa.gov/climatechange/Downloads/EPAactivities/scc-fact-sheet.pdf>.

In 2009, an Interagency Working Group was formed to develop the protocol and issued final estimates of carbon costs in 2010. (28) These estimates were then revised in 2013 by the Interagency Working Group, which at the time consisted of 13 agencies. (29) This report and the social cost of carbon estimates were again revised in 2015. (30)

(28) Interagency Working Group on Social Cost of Carbon, “Technical Support Document: Social Cost of Carbon for Regulatory Impact Analysis Under Executive Order 12866” (Feb. 2010), available online at <https://www.whitehouse.gov/sites/default/files/omb/inforeg/for-agencies/Social-Cost-of-Carbon-for-RIA.pdf>.

(29) Interagency Working Group on Social Cost of Carbon, “Technical Support Document: Technical Update of the Social Cost of Carbon for Regulatory Impact Analysis Under Executive Order 12866” (May 2013), available online at https://www.whitehouse.gov/sites/default/files/omb/inforeg/social_cost_of_carbon_for_ria_2013_update.pdf.

(30) See Exhibit I.

Depending on the discount rate and the year during which the carbon emissions are produced, the Interagency Working Group estimates the cost of carbon emissions, and therefore the benefits of reducing carbon emissions, to range from \$11 to \$220 per metric ton of carbon dioxide. See Chart Below. In its most recent update to the Social Cost of Carbon Technical Support Document, the White House’s central estimate was reported to be \$36 per metric ton. (31) In July 2014, the U.S. Government Accountability Office (“GAO”) confirmed that the Interagency Working Group’s estimates were based on sound procedures and methodology. (32)

(31) Exhibit 18, White House, “Estimating the Benefits from Carbon Dioxide Emissions Reductions,” website available at <https://www.whitehouse.gov/blog/2015/07/02/estimating-benefits-carbon-dioxide-emissions-reductions>.

(32) Exhibit 19, GAO, “Regulatory Impact Analysis, Development of Social Cost of Carbon Estimates,” GAO-14-663 (July 2014), available online at <http://www.gao.gov/assets/670/665016.pdf>.

See Attached for Table - Revised Social Cost of CO₂, 2010-2050 (in 2007 dollars per metric ton of CO₂)

Although it appears that Interior and BLM must analyze and assess carbon costs consistent with Executive Order 12866, agencies within the Interior Department, including the BLM, have already been utilizing the social cost of carbon protocol in the context of analyzing the impacts of fossil fuel development under NEPA.

In recent Environmental Assessments for oil and gas leasing in Montana, the agency estimated “the annual SCC [social cost of carbon] associated with potential development on lease sale parcels.” (33) In conducting its analysis, the BLM used a “3 percent average discount rate and year 2020 values,” presuming social costs of carbon to be \$46 per metric ton. (34) Based on its estimate of greenhouse gas emissions, the agency estimated total carbon costs to be “\$38,499 (in 2011 dollars).” (35) In Idaho, the BLM also utilized the social cost of carbon protocol to analyze and assess the costs of oil and gas leasing. Using a 3% average discount rate and year 2020 values, the agency estimated the cost of carbon to be \$51 per ton of annual CO₂e increase. (36) Based on this estimate, the agency estimated that the total carbon cost of developing 25 wells on five lease parcels to be \$3,689,442 annually. (37)

(33) Exhibit 20, BLM, “Environmental Assessment for October 21, 2014 Oil and Gas lease Sale,” DOI-BLM-MT-0010-2014-0011-EA (May 19, 2014) at 76, available online at

(34) Id.

(35) Id.

(36) Exhibit 21, BLM, “Little Willow Creek Protective Oil and Gas Leasing,” EA No. DOI-BLM-ID-B010-2014-0036-EA (February 10, 2015) at 81, available online at https://www.blm.gov/epl-front-office/projects/nepa/39064/55133/59825/DOI-BLM-ID-B010-2014-0036-EA_UPDATED_02272015.pdf.

(37) Id. at 83.

To be certain, the social cost of carbon protocol presents a conservative estimate of economic damages associated with the environmental impacts climate change. As the EPA has noted, the protocol “does not currently include all important [climate change] damages.” (38) As explained:

(38) EPA, “Fact Sheet: Social Cost of Carbon” (Nov. 2013) at 1, available online at <http://www.epa.gov/climatechange/Downloads/EPAactivities/scc-fact-sheet.pdf>.

The models used to develop [social cost of carbon] estimates do not currently include all of the important physical, ecological, and economic impacts of climate change recognized in the climate change literature because of a lack of precise information on the nature of damages and because the science incorporated into these models naturally lags behind the most recent research. In fact, more recent studies have reported significantly higher carbon costs. For instance, a report published this month found that current estimates for the social cost of carbon should be increased six times for a mid-range value of \$220 per ton. (40) In spite of uncertainty and likely underestimation of carbon costs, nevertheless, “the SCC is a useful measure to assess the benefits of CO₂ reductions,” and thus a useful measure to assess the costs of CO₂ increases. (41)

(41) EPA, “Fact Sheet: Social Cost of Carbon” (Nov. 2013) at 1, available online at <http://www.epa.gov/climatechange/Downloads/EPAactivities/scc-fact-sheet.pdf>.

That the economic impacts of climate change, as reflected by an assessment of social cost of carbon, should be a significant consideration in agency decisionmaking, is emphasized by a recent White House report, which warned that delaying carbon reductions would yield significant economic costs. (42) As the report states:

(42) Exhibit 22, Executive Office of the President of the United States, “The Cost of Delaying Action to Stem Climate Change” (July 2014), available online at

https://www.whitehouse.gov/sites/default/files/docs/the_cost_of_delaying_action_to_stem_climate_change.pdf.

[D]elaying action to limit the effects of climate change is costly. Because CO₂ accumulates in the atmosphere, delaying action increases CO₂ concentrations. Thus, if a policy delay leads to higher ultimate CO₂ concentrations, that delay produces persistent economic damages that arise from higher temperatures and higher CO₂ concentrations. Alternatively, if a delayed policy still aims to hit a given climate target, such as limiting CO₂ concentration to given level, then that delay means that the policy, when implemented, must be more stringent and thus more costly in subsequent years. In either case, delay is costly. (43) The requirement to analyze the social cost of carbon is supported by the general requirements of NEPA and by federal case law.

To this end, courts have ordered agencies to assess the social cost of carbon pollution, even before a federal protocol for such analysis was adopted. In 2008, the U.S. Court of Appeals for the Ninth Circuit ordered the National Highway Traffic Safety Administration to include a monetized benefit for carbon emissions reductions in an Environmental Assessment prepared under NEPA. *Center for Biological Diversity v. National Highway Traffic Safety Administration*, 538 F.3d 1172, 1203 (9th Cir. 2008). The Highway Traffic Safety Administration had proposed a rule setting corporate average fuel economy standards for light trucks. A number of states and public interest groups challenged the rule for, among other things, failing to monetize the benefits that would accrue from a decision that led to lower carbon dioxide emissions. The Administration had monetized the employment and sales impacts of the proposed action. *Id.* at 1199. The agency argued, however, that valuing the costs of carbon emissions was too uncertain. *Id.* at 1200. The court found this argument to be arbitrary and capricious. *Id.* The court noted that while estimates of the value of carbon emissions reductions occupied a wide range of values, the correct value was certainly not zero. *Id.* It further noted that other benefits, while also uncertain, were monetized by the agency. *Id.* at 1202.

More recently, a federal court has done likewise for a federally approved coal lease. That court began its analysis by recognizing that a monetary cost-benefit analysis is not universally required by NEPA. See *High Country Conservation Advocates v. U.S. Forest Service*, 52 F.Supp.3d 1174 (D. Colo. 2014), citing 40 C.F.R. § 1502.23. However, when an agency prepares a cost-benefit analysis, “it cannot be misleading.” *Id.* at 1182 (citations omitted). In that case, the NEPA analysis included a quantification of benefits of the project. However, the quantification of the social cost of carbon, although included in earlier analyses, was omitted in the final NEPA analysis. *Id.* at 1196. The agencies then relied on the stated benefits of the project to justify project approval. This, the court explained, was arbitrary and capricious. *Id.* Such approval was based on a NEPA analysis with misleading economic assumptions, an approach long disallowed by courts throughout the country. *Id.*

A recent op-ed in the New York Times from Michael Greenstone, the former chief economist for the President's Council of Economic Advisers, confirms that it is appropriate and acceptable to calculate the social cost of carbon when reviewing whether to approve fossil fuel extraction. (44)

(44) Exhibit 23, Greenstone, M., "There's a Formula for Deciding When to Extract Fossil Fuels," New York Times (Dec. 1, 2015), available online at http://www.nytimes.com/2015/12/02/upshot/theres-a-formula-for-deciding-when-to-extract-fossil-fuels.html?_r=0.

BLM must Ensure that Reforms to the Federal Coal Program Are Consistent With United States' Climate Goals

The historic December 2016 Paris Agreement on climate was achieved in large part because of the strong leadership shown by the United States. The domestic measures to address carbon pollution, such as the Clean Power Plan and passenger-vehicle fuel- efficiency standards, gave the global community confidence that the United States was not only pressing for international action on climate change, but also leading by example at home. The Paris Agreement was not expected to enter into force for several years, but thanks in part to the continued leadership of the United States, it appears the momentum is continuing and the Agreement will enter into force later this year.

To avoid the worst impacts of climate change, including impacts within the United States on federally managed lands, the U.S. government needs to identify additional policy measures to reduce emissions. Recent estimates of U.S. emissions under current policies – including the Clean Power Plan – indicate the United States needs take additional actions to achieve its Paris commitment of reducing emissions in 2025 by 26-28 percent below 2005 levels.[1] It is incumbent upon all federal agencies to assess the impact of major policy decisions on GHG emissions and weigh them in light of the U.S. climate goals and international leadership on climate. The importance of extending these considerations to BLM's review of the federal coal program was reinforced when input at Interior's public listening sessions identified that ensuring consistency of the federal coal program with the United States' (and the world's) climate goals was one of three key areas of concern to address.

Carbon costs must be accounted for and disclosed in coal management: As your Interior Department continues to make coal management decisions, such as approving mining plans or lease readjustments, your Interior Department must account for and disclose the carbon costs of its actions using, at a minimum, social cost of carbon figures. Such analysis and transparency is key to ensuring the American public is effectively apprised of the climate consequences of the federal coal program, even as it winds down and ultimately ends.

4. BLM Must Use the Social Cost of Carbon and Social Cost of Methane to Evaluate Climate Impacts of Considered Alternatives in the PEIS. Beyond quantifying the volume of carbon dioxide and methane emissions that result from the federal coal program, and comparing those emissions totals among alternatives, BLM must also use the social cost of carbon and social cost of methane to evaluate the impact, and not just the volume, of carbon pollution. These social-cost tools are based on sound science; have already been used by federal agencies, including BLM, to evaluate the impacts of agency policy 59 U.S. Environmental Protection Agency, Fact Sheet, Overview of the Clean Power Plan, available at <https://www.epa.gov/cleanpowerplan/fact-sheet-overview-clean-power-plan> (last visited July 27, 2016). 60 White House Fact Sheet, U.S.-China Joint Announcement on Climate Change and Clean Energy Cooperation (Nov. 11, 2014), attached as Ex. 71, available at <https://www.whitehouse.gov/the-press-office/2014/11/11/us-china-joint-announcement-climate-change> (last visited July 27, 2016). 61 See White House Fact Sheet, U.S. Reports its 2025 Emissions Target to the UNFCCC (March 31, 2015), available at <https://www.whitehouse.gov/the-press-office/2015/03/31/fact-sheet-us-reports-its-2025-emissions-target-unfccc> (last visited July 28, 2016); United States, UNFCC submission supra note 11. 62 Doug Vine, Center for Climate and Energy Solutions, Achieving the United States' Intended Nationally Determined Contribution (July 2016), available at <http://www.c2es.org/docUploads/achieving-us-indc-07-2016-update.pdf> (last visited July 27, 2016). 27 proposals; and help put climate impacts into a context that is easily understood by both the public and decision-makers. Federal agencies evaluating climate impacts of their proposals have frequently claimed that science has not developed the tools to analyze climate impacts of individual proposals. This is not

accurate. The social cost of carbon and social cost of methane are two reliable tools that are available and should be utilized by BLM in the PEIS process. Under NEPA's implementing regulations, where "information relevant to reasonably foreseeable significant adverse impacts cannot be obtained because the overall costs of obtaining it are exorbitant or the means to obtain it are not known," NEPA regulations direct agencies to evaluate a project's impacts "based upon theoretical approaches or research methods generally accepted in the scientific community." 40 C.F.R. § 1502.22(b)(4). The social cost of carbon and social cost of methane are based on generally accepted research methods and years of peer-reviewed scientific and economic studies. They are the best tools now available for agencies to use in analyzing the climate impacts of proposed federal actions. a. Background: The Social Cost of Carbon and Social Cost of Methane The social cost of carbon was created by an interagency working group ("IWG") in 2010 that consisted of scientific and economic experts from a dozen federal agencies and offices, including EPA, and the Departments of Agriculture, Commerce, Energy, Transportation, and the Treasury. 63 The working group's primary goal was to help federal agencies engaged in rulemaking to quantify the economic benefit of federal actions that reduce CO₂ emissions. The result of their efforts was the social cost of carbon – a schedule of estimates of the global economic harm caused by each ton of CO₂ emissions in a given year, expressed as \$/ton. 64 These values encompass damages from decreased agricultural productivity as a result of drought, human health effects, and property damage from increased flooding, among other factors. 65 The IWG updated the social cost of carbon in 2013.⁶⁶ Like the social cost of carbon, the social cost of methane estimates the global economic cost of adding one additional ton of methane to the atmosphere (the social cost of carbon does 63 Interagency Working Group on Social Cost of Carbon, Technical Support Document: Social Cost of Carbon, at 2-3 (Feb. 10, 2010), available at <http://www.epa.gov/otaq/climate/regulations/scc-tds.pdf> (last visited July 27, 2016). 64 U.S. Environmental Protection Agency, Fact Sheet: Social Cost of Carbon (Nov. 2013), available at <http://www.epa.gov/climatechange/Downloads/EPAactivities/scc-fact-sheet.pdf> (last visited July 27, 2016). 65 Interagency Working Group, Technical Update of the Social Cost of Carbon, at 2 (May 2013), available at http://www.whitehouse.gov/sites/default/files/omb/inforeg/social_cost_of_carbon_for_ria_2013_update.pdf (last visited July 27, 2016). 66 *Id.* 28 the same thing, but for carbon dioxide). In August 2015, EPA used the Marten et al. social cost of methane estimate in the Regulatory Impact Analysis for the proposed New Source Performance Standard for methane from oil and gas production. 67 This study estimates that methane emissions in 2015 result in global economic damages that range from \$490 to \$3,000/ton, depending on the discount rate used. 68 EPA explained why using Marten et al. (2014) is a sound, justifiable methodology. Following the agency's protocol, EPA transparently disclosed the social cost estimates under four different discount rates, just as the IWG does for the social cost of carbon. 69 Although it was initially developed to help agencies craft regulatory impact assessments of proposed rules, the social cost of carbon need not and should not be limited to this application. 70 The social cost of carbon and social cost of methane are particularly useful with regard to coal leasing because it allows decision makers to understand the impact of projects "that have small, or 'marginal,' impacts on cumulative global emissions."⁷¹ As CEQ has confirmed, statements that a particular agency decision will result in only a small fraction of global GHG concentrations should not be used to avoid analyzing the impact of those emissions. 72 Such statements, according to CEQ, reflect the nature of climate change rather than the impact of any particular project. 73 Using the social cost of carbon in NEPA reviews, by contrast, would help agencies move beyond the frequent and problematic boilerplate statements about climate change by providing a scientifically defensible means of quantifying the federal coal leasing program's climate impacts. Understanding the climate impacts of coal mining are particularly useful on a programmatic level, given the cumulative and global nature of climate change. As noted in CEQ's draft NEPA climate guidance, analyzing the climate impact of any one proposal may appear small given the global nature of the problem, whereas a programmatic review of the federal coal program will provide a far more comprehensive understanding of BLM's contribution to the climate problem and the economic damages from climate change that are already being felt in this country. Given that in most years federally-owned coal accounts for approximately 41 percent of all coal burned in the U.S., 81 Fed. Reg. 17,200, 17,221 (Mar. 31, 2016), the social costs of burning that much coal are surely significant. For example, the gross 67 U.S. Environmental Protection Agency, Regulatory Impact Analysis of the Proposed Emission Standards for New and Modified Sources in the Oil and Natural Gas Sector, 4-12 to 4-17 (August 2015), available at

http://www3.epa.gov/airquality/oilandgas/pdfs/og_prop_ria_081815.pdf (last visited July 27, 2016). 68 Id. at 4-14. 69 Id. 70 In any event, it is possible that the PEIS at issue here will involve proposed changes to BLM regulations, which would trigger the use of the social cost metrics. 71 Interagency Working Group on Social Cost of Carbon, Technical Support Document, at 1. 72 Consideration of Greenhouse Gas Emissions and Climate Change Effects in NEPA Reviews, 79 Fed. Reg. at 77,825. 73 Id. 29 social costs of burning the approximately 400 million tons of coal mined from federal leases each year is approximately \$30 billion per year. 74 That is more than 20 times BLM's annual budget. The gross social costs between now and 2050 of the federal coal program, continued at current levels, would likely exceed \$1 trillion. Despite some uncertainties, the social cost of carbon and social cost of methane nonetheless reflects the best economic and scientific understanding available, and are intended to be updated to reflect the most current thinking on the topic. In July 2014, the Government Accountability Office affirmed the IWG's 2010 and 2013 analyses on the social cost of carbon and praised the group for its transparent process, accurate disclosure of scientific and economic uncertainties, and consensus-based decision making model. 75

BLM must also be aware that the federal social cost of carbon values likely under-count the true social cost of an additional ton of CO₂, perhaps by multiple orders of magnitude. For instance, researchers at Stanford University published a study showing that the integrated assessment models ("IAMs") that generated the federal social cost of carbon ("SCC") estimates do not properly account for several critical variables, particularly effect of climate change on economic growth rates and resulting disparities between rich and poor regions. This study calculated that adjusting the IAM models to account for these factors would increase the near-term SCC by a factor of close to seven. 78 Other research demonstrates that the SCC discount rates do not adequately represent the level of risk aversion that decisionmakers generally adopt in response to conditions of heightened uncertainty. Adjusting the SCC to include a risk premium in accord with accepted econometric principles would increase the federal values by several orders of magnitude. 79 Another critique of the federal SCC values observes that the IAM models use quadratic damage functions, which greatly underestimate the rate and intensity of economic damage after a certain temperature threshold is crossed. 80 76 Mark Squillace & Alexander Hood, NEPA, Climate Change, and Public Land Decision Making, 42 ENVTL. L. 469, 510, 517 (2012). 77 Moore, F. & Diaz, D., Temperature impacts on economic growth warrant stringent mitigation policy, 5 NATURE CLIMATE CHANGE 127-131 (Jan. 12, 2015), prepublication version attached as Ex. 8. 78 Id. at 128. 79 Howarth, R.B., et al., Risk mitigation and the social cost of carbon, 24 Global Environmental Change 123-131 (Jan. 2014), prepublication version attached as Ex. 9. 80 Weitzmann, M.L., GHG Targets as Insurance Against Catastrophic Climate Damages, National Bureau of Economic Research Working Paper No. 16136 (2010), attached as Ex. 10; see also Sierra Club, Comments on the Interagency Working Group's (IWG) Technical Support Document: Social Cost of Carbon (SCC) for Regulatory Impact Analysis Under Executive Order 12866 (Docket Not.OMB-2013-0007-0083) (Feb. 25, 2014), attached as Ex. 11 (discussing Weitzmann, Howarth, and other research). 31 EPA itself has reached a similar conclusion: [G]iven current modeling and data limitations, [the federal SCC values] do[] not include all important damages. As noted by the IPCC Fourth Assessment Report, it is "very likely that [SCC] underestimates" the damages. The models used to develop SCC estimates, known as integrated assessment models, do not currently include all of the important physical, ecological, and economic impacts of climate change recognized in the climate change literature because of a lack of precise information on the nature of damages and because the science incorporated into these models naturally lags behind the most recent research. 81 BLM should explain this fact in its PEIS and at least acknowledge the body of a research pointing to much higher values for each additional ton of carbon emitted. While we agree that BLM should start with the federal SCC values when analyzing the impacts of the carbon dioxide emissions from the federal coal leasing program and its alternatives, BLM must also directly confront the fact that the true social impacts of the associated carbon

dioxide emissions are probably much greater than the federal SCC values represent. Third, although NEPA does not require agencies to conduct a cost-benefit analysis (i.e., a comparison where a project gets approved only if the benefits outweigh the costs), in every NEPA document, BLM and other agencies routinely calculate a proposed project's economic benefit to the local economy, measuring the dollar value of jobs, royalties, and taxes, among other factors. 82 Agencies often use these quantified economic benefits to justify approving the 81 U.S. Environmental Protection Agency, *The Social Cost of Carbon*, <http://www.epa.gov/climatechange/EPAactivities/economics/scc.html> (last visited July 27, 2016). 82 See, e.g., Office of Surface Mining Reclamation & Enforcement, *Bull Mountains Mine No. 1 Environmental Assessment* (Jan. 2015), <http://www.wrcc.osmre.gov/initiatives/bullMountainsMine/BullMountainsMineEA.pdf>; U.S. Forest Service, *Final Environmental Impact Statement for Pawnee National Grassland* (Dec. 2014), http://a123.g.akamai.net/7/123/11558/abc123/forestservic.download.akamai.com/11558/www/nepa/95573_FSPLT3_2393686.pdf. 32 project, without any attempt to quantify the costs of the agency's decision. 83 Using the social costs of carbon and methane in the PEIS would provide a useful dollars-to-dollars comparison outside the parameters of a strict cost-benefit analysis, allowing the public to understand the scale of climate impacts of the federal coal leasing program and its alternatives. It would further provide BLM with the opportunity to weigh global economic harm caused by the climate impacts of the program against the extent of any economic benefit in terms of jobs, taxes, etc., and thus allow BLM and the Secretary of Interior to make a fully informed decision on the best course forward. By omitting any discussion of the economic harm caused by a project, federal agencies often effectively put a zero on that side of the ledger, making it appear as though there is no quantifiable cost associated with a project. In the context of climate change, this is a demonstrably (and overwhelmingly) untrue assumption—the social costs of carbon and methane allow decision makers and the public to estimate the climate-based costs of a proposed project. The White House estimates that in 2012, climate-related disasters cost the American economy more than \$100 billion⁸⁴ and affirmed that “climate change is not a distant threat, we are already seeing impacts in communities across the country.”⁸⁵ Moreover, NEPA specifically requires federal agencies to analyze and disclose the environmental effects of their actions, including “ecological . . . economic [and] health” impacts. 40 C.F.R. § 1508.8. By ignoring the social costs of carbon and methane, as most federal agencies do now when evaluating federal coal leases, the agencies perform half of an analysis, quantifying purported economic benefits while ignoring an available and easy-to-use tool for similarly quantifying economic costs of the proposed project—precisely the sort of misleading analysis NEPA is designed to avoid. See *Ctr. for Biological Diversity v. NHTSA*, 538 F.3d 1172, 1217 (9th Cir. 2008). 83 See, e.g., Bureau of Land Management., *Environmental Assessment for the West Elk Coal Lease Applications* (June 2012), available at http://www.blm.gov/pgdata/etc/medialib/blm/co/information/nepa/uncompahgre_field/ufo_nepa_documents0.Par.96415.File.dat/12-13%20West%20Elk%20Coal%20Lease%20Mod%20EA.pdf (last visited July 28, 2016); Bureau of Land Management, *Wright Area FEIS* available at <http://www.blm.gov/wy/st/en/info/NEPA/documents/hpd/Wright-Coal.html> (last visited July 28, 2016); Office of Surface Mining Reclamation & Enforcement, *Bull Mountains Mine No. 1 Environmental Assessment* (Jan. 2015), available at <http://www.wrcc.osmre.gov/initiatives/bullMountainsMine/BullMountainsMineEA.pdf> (last visited July 28, 2016). 84 The White House, *Climate Change and President Obama's Action Plan*, <http://www.whitehouse.gov/climate-change> (last visited July 26, 2016). 85 White House, *Fact Sheet, Administration Announces Actions To Protect Communities From The Impacts Of Climate Change*, (Apr. 7, 2015), <https://www.whitehouse.gov/the-press-office/2015/04/07/fact-sheet-administration-announces-actions-protect-communities-impacts-> (last visited July 28, 2016). 33 As one recent example reveals, BLM has already utilized a social cost metric for determining the potential benefits of a rulemaking proposal to reduce climate emissions. On February 8, 2016, BLM published a proposed rule to reduce waste of natural gas from venting, flaring, and leaks during oil and natural gas production. BLM, *Proposed Rule, Waste Prevention, Production Subject to Royalties, and Resource Conservation*, 81 Fed. Reg. 6616 (Feb. 8, 2016). BLM used the social cost of methane metric developed by EPA experts to evaluate the costs and benefits of the proposed rule, relied on the metric throughout its analysis, and explicitly concluded that the benefits of the proposed natural gas rule outweighed the costs based on the monetized benefits of methane reduction as calculated via the social cost of methane. See *id.* at 6624-25, 6670-72. The Regulatory Impact Analysis (“RIA”) for the rule explains BLM's use of the metric,

stating: [BLM] estimated the social cost of methane using the values presented by Marten et al. (2014) and used by the EPA in its analysis of its Subpart OOOOa proposed regulation . . . and its proposed rule New Source Standards of Performance for Municipal Solid Waste Landfills. . . . [BLM] calculated the global social benefits of methane emissions reductions expected from the proposed NSPS [New Source Performance Standards] using estimates of the social cost of methane (SC-CH₄), a metric that estimates the monetary value of impacts associated with marginal changes in methane emissions in a given year. It includes a wide range of anticipated climate impacts, such as net changes in agricultural productivity and human health, property damage from increased flood risk, and changes in energy system costs, such as reduced costs for heating and increased costs for air conditioning. 86 Consistent with BLM’s analysis of the draft natural gas waste rule, the PEIS should use social cost metrics, including the 2013 Interagency Working Group’s social cost of carbon, and EPA’s 2014 social cost of methane, and any subsequent updates thereto, in evaluating the climate impacts of each alternative. 87 86 See Bureau of Land Management, Regulatory Impact Analysis for: Revisions to 43 C.F.R. 3100 (Onshore Oil and Gas Leasing) and 43 C.F.R. 3600 (Onshore Oil and Gas Operations) (RIA) (Jan. 14, 2016) at 32-33, attached as 12. 87 We note that the leaders of the U.S., Mexico, and Canada last month issued a joint statement in which stated in part: “Canada, the U.S. and Mexico will align approaches to account for the social cost of carbon and other greenhouse gas emissions when assessing the benefits of emissions-reducing policy measures.” See The White House, Leaders’ Statement on a North American Climate, Clean Energy, and Environment Partnership (June 29, 2016), attached as Ex. 13. A policy measure to reduce federal coal mining is one that would result in emissions reductions, and thus per the partnership agreement should be accounted for using the social cost of carbon.

Comment Excerpt Text:

The Social Cost of Carbon and Social Cost of Methane Are Helpful to Decision Makers in the NEPA Process The guiding principle of NEPA is that the public is entitled to a clear understanding of the likely impacts of federal agencies’ decisions. The U.S. Supreme Court has called the disclosure of impacts the “key requirement of NEPA holding that agencies must “consider and disclose the actual environmental effects” of a proposed project in a way that “brings those effects to bear on [an agency’s] decisions.” *Baltimore Gas & Elec. Co. v. Nat. Res. Def. Council, Inc.*, 462 U.S. 87, 96 (1983). The social cost of carbon and social cost of methane provide decision makers and the public with an informative, accessible mechanism for both analyzing and understanding the climate impacts of a proposed decision. First, although agencies such as BLM, the Forest Service, and OSMRE often quantify the amount of carbon dioxide or CO₂-e (carbon dioxide equivalent) emissions from mining and burning coal from federal leases, these agencies have not yet taken the next step of employing the social cost of carbon to inform the public about the impact of those emissions. An isolated calculation of the amount of carbon emissions that would result from a particular project provides no meaningful insight as to the effect that those emissions will have on our climate. By contrast, the social cost of carbon offers an actual estimate of the damage caused by each incremental ton of carbon emissions. Second, the social cost of carbon and methane protocols describe those damage estimates in monetary terms, which are far easier for decision makers and the public to comprehend and contextualize than tons of CO₂-e. In doing so, the social cost of carbon provides a concrete assessment of a project’s social and environmental impacts and provides a tangible sense of the 74 Calculated by taking 400 million (tons coal mined per year) * 2 (tons of CO₂ emitted during combustion per ton of coal mined, at a conservative estimate) * \$38 (per ton figure for the 2015 SCC at 3% discount rate) = \$30.4 billion. This is the gross, rather than net social cost. Net social cost would account for substitution of other fuels such as coal, natural gas, and renewables, and overall changes in electricity demand. 75 Gov’t Accountability Office, Regulatory Impact Analysis: Development of Social Cost of Carbon Estimates (July 2014), available at <http://www.gao.gov/assets/670/665016.pdf>. 30 scale of damage that both the public and decision makers can readily understand. As explained by one legal commentator, the social cost of carbon “allow[s] agencies to consider those GHG emissions . . . in a meaningful way,” and “assigning a price to carbon emissions – even a

conservative price – makes the cost of those emissions concrete for agency decision makers.”⁷⁶ Of course, we do not imply that the impacts of climate change can be fully captured by a dollar figure. Droughts, floods, extreme weather events, rising sea levels, and other phenomena related to climate change present threats to our planet that extend far beyond economic harms. Agencies must analyze not only the quantitative (and monetizable) climate impacts of proposed actions, but the qualitative and non-monetizable impacts as well. Nevertheless, to the extent that a project’s impacts can be quantified, the social cost of carbon and social cost of methane are the best and most rigorous tools currently available for understanding the damages linked to GHG emissions, rather than simply the extent of the emissions themselves.

First of all, American citizens will not realize a fair return from the sale of federal coal until royalty rates reflect the true costs of coal extraction, transportation, combustion, and waste disposal. The current coal leasing program fails to adequately monetize the societal and environmental damages caused by coal taken from federal lands. In fairness, these expenses -now borne by taxpayers- should be incorporated into what companies must

pay for coal. Royalty rates may need to be raised significantly; and, the practice of royalty rate reductions should probably be eliminated.

Comment Excerpt Text:

The PEIS now underway presents an opportunity for the federal government to develop a comprehensive, coal-specific "costs test" analysis tool that can be used to not only monetarily assess the full range of societal and environmental damages caused by coal, but also monetize the true "avoided costs" value of renewables when used to replace coal. This new costs-of-coal model should be used to inform fair royalty rates.

Bowie recognizes that the Secretary is constrained by Administration policy to use the Federal Social Cost of Carbon (SCC") in rulemaking proceedings, despite the fact that the SCC is technically unsound, was not

developed through notice-and-comment rulemaking, and sharply diverges from OMB guidelines regarding critical elements such as discount rates. Nevertheless, the Secretary does have discretion to set policy for project-level decisions, including leasing decisions, and should categorically reject the SCC in those contexts. Not only was the SCC not developed for project-level decisions, but the SCC cannot provide useful information at the project level. This is because at the project level, the incremental SCC impact of the proposed action in relation to the no-action alternative or other project alternatives will generally be indeterminable. For example, for local effects, e.g., the impact of a lease on a stream, the no action or project alternatives will have identifiably different impacts. But for global impacts of the type attempted to be measured by the SCC, one cannot know the effect of, for example, the no action alternative, without knowing how the various actors will respond. Even if coal lease application A is denied, there will be no effect on net SCC calculations unless there is a coordinated policy to deny other similarly-situated coal leasing, and such broad policy determinations are inherently beyond the scope of project-level analyses.

Comment Number: 0020056-12

Organization I: Bowie Resource Partners, LLC

Commenter I: Gene DiClaudio

Comment Excerpt Text:

In addition, as the BLM and OSMRE have recognized in recent project level NEPA analyses, the SCC by itself provides an incomplete and biased accounting of the impacts of a decision. There is presently no corresponding Social Benefit of Carbon metric. While short term tax, employment, and economic activity measures account for some of the benefits of coal production, they are by no means a complete accounting in the same manner and at the same horizon and scale as attempted by the SCC. Consequently, the SCC is not useful at the project level and the PEIS and any resulting regulatory or policy changes should make that clear.

Comment Number: 0020056-21

Organization I: Bowie Resource Partners, LLC

Commenter I: Gene DiClaudio

Comment Excerpt Text:

To date the SCC has not undergone notice-and-comment rulemaking, and is deeply problematic at a technical and procedural level. In addition, the discounting and time horizon assumptions in the SCC render the SCC an inter-generational wealth transfer mechanism. This is especially true of any attempt to impose SCC-derived fees or taxes. Finally, the SCC also generates such large value ranges that it is uniquely susceptible to result-driven policy choices, that is, project proponents will always be able to identify values that support approval, and project opponents will always be able to identify values that support denial. Because of these inherent and profound philosophical and policy dimensions, the SCC is poorly suited to the secretive, unilateral Executive processes under which it has been developed to date. Rather, the Secretary (and the Administration generally) should seek express Congressional authorization and guidance to the extent there is a desire to continue to employ the SCC in federal decision-making. Such authorization, if obtained, would place the Executive on a far sounder democratic and constitutional footing than under current and potentially future practices

WMA is concerned about possible artificial inflation of FMV through the use of arbitrary “social cost of carbon” standards. Attempts to artificially increase the FMV on these grounds appear political with the intent of making the resource uneconomical to develop in violation of the Mineral Leasing Act. The cost of excessive manipulation

in determining FMV will fall on American consumers. If the agency does choose to pursue this, we would surely recommend the inclusion of a much more empirical “social benefit” standard to include not only the positive economic realities of vital jobs and revenue, schools and infrastructure, but the measurable positive contribution of reliable, low-cost electricity to our country and the world.

Comment Excerpt Text:

But ultimately, the most important consideration to this issue is how much coal can still be burned in our remaining carbon budget. How much must we reduce our carbon emissions to prevent a 2 degree Celsius warming and to try to stay within a 1.5 degree Celsius warming? Most of the people I know will say that we must keep fossil fuels in the ground. The BLM has many competing interests to think about, but at the very least it seems to me that if the BLM continues to lease federal lands for coal, then it must be at a price that accounts for the social cost of carbon and it must be at a price that allows clean, renewable energy to rapidly overtake fossil fuels in the energy marketplace.

I believe that what we should be doing is using some of the \$11.3 billion per year that currently subsidizes large-scale wind and solar projects to developing the commercialized carbon capture and storage. This is what the scientists of the IPCC called for in the 2014 Mitigation of Climate Change report. This advice from the IPCC is ignored by most groups who consider our climate. If the U.S. put some effort into this carbon capture, it could lead the world among power producers by reducing emissions massively and allow the world to have affordable electricity.

In July 2016, Eco-Shift consulting projected the "production horizons"- the number of years' worth of remaining

production - from currently leased federal fossil fuels using the U.S. Energy Information Administration's (EIA) 2016 "reference case" for fossil fuel production.¹³² EcoShift found that, under the EIA reference case (including Clean Power Plan implementation), "Coal under federal lease would last 25 years, through 2041."¹³³ This production horizon greatly exceeds the dates at which carbon budgets for 1.5°C and 2°C would be exceeded by continued emissions at 2014 rates – 2021 and 2036 respectively.¹³⁴ The discrepancy between the production horizon for already-leased coal and carbon budget exceedance dates makes clear that, barring either extraordinarily rapid global emissions declines or rapid, widespread and successful deployment of carbon capture and sequestration technology, there is no scenario where new federal coal leasing at any significant level is consistent with the nation's stated climate aims.

Global Carbon Budgets I (July 2016).

(133) *Id.*

(134) *Id.* at Figure 1.

Significantly, both Vulcan and SEI examined the effect of leasing policies in a context where the Clean Power Plan was the only meaningful downstream constraint on U.S. coal consumption. More recently, Energy Transition Advisors, Earth Track, and Carbon Tracker Initiative undertook to examine the role of federal Powder River Basin coal in a (modestly ambitious) climate scenario – the International Energy Agency's "450 scenario" aimed at modeling the energy demands consistent with an atmospheric CO₂ concentration of 450 ppm, and an ensuing 50% probability of keeping warming within 2°C of preindustrial levels.¹³⁵ Although the IEA "450 scenario" is less ambitious than Paris goals or the demands of protecting health and biodiversity, it provides an existing model for assessing the role of federal leasing, PRB production, and coal markets in a modestly climate-constrained scenario.¹³⁶ The ETA first examined U.S. EIA "reference case" coal production projections under the CPP to conclude that demand for PRB coal tracks reasonably well with US-wide demand for power-sector control under a modestly CO₂-constrained scenario.¹³⁷ It then applies coal trajectories under the IEA "450 Scenario" to the Powder River Basin, to find, under various CCS scenarios, a rapid decline in demand for PRB coal from 2016 through 2030, leveling off somewhat around 2030.¹³⁸ Fulton et al. then compared these anticipated demand scenarios with the best available information regarding coal deposits already under lease in the PRB.¹³⁹ Their conclusion was that, "[u]nder the 450 Scenario with no CCS, potential production from existing leases is sufficient to meet projected demand in every year through 2040."¹⁴⁰ Moreover, they found that "even without additional efforts to pursue a 2°C scenario beyond those already announced, significant production from new leases is not expected to be needed until 2031."¹⁴¹

The potential supply from existing leases from 2016 to 2040 is 5,763 million metric tons (Mt), which is 1,252 Mt greater than the supply required under the 450 Scenario (See Figure 1).

The 450 scenario assumes an aggressive build-out of CCS technology, at a pace that outstrips current market trends. In order to better reflect likely real-world conditions, Carbon Tracker also assessed scenarios in which large-scale deployment of CCS does not occur until 2030, and in which this technology never becomes a significant factor in energy supply markets. Because lower levels of CCS deployment reduce the ability to mitigate coal's intrinsic high carbon intensity, production from existing mines is necessarily also sufficient under scenarios where CCS is delayed until 2030 (cumulative supply production of 2985 Mt) and where no CCS is deployed (cumulative supply production of 2773 Mt).¹¹ In the energy scenario where no CCS is deployed, the projected production from existing leases alone is 2,990 Mt greater than the 2°C scenario carbon budget threshold.¹² As noted above, the 450 Scenario is also a higher risk pathway due to the 50% probability it assigns for achieving 2°C, and thus coal production consistent with a climate safe scenario would be even less when assigning a higher probability of success.

Comment Excerpt Text:

An essential focus for CCUS technology R&D efforts around the world is to recycle/reuse energy by utilizing CO₂ emitted from burning biomass or fossil energy natural resources. The production of numerous products being pursued by conversion of CO₂ and described in the Department of Energy (DOE) Carbon Capture Technology Program Plan and the NRG COSIA Carbon XPRIZE would provide increased quality full-time jobs for the American public. See National Energy Technology Laboratory Carbon Capture Program Plan (2013); (WY0-03773 to 03834); National Energy Technology Laboratory Carbon Capture News; (WY0-03836 to 03856). [5, 6] Since CO₂ is a very low density substance, export of CO₂ created in the U.S. for conversion into products by other countries would not be cost-effective nor a sustainable energy and economic consideration. In fact, the CO₂ emitted by the U.S. can now be considered a global competitive advantage as a domestic resource feedstock to bolster U.S. manufacturing sustainability and in turn increase U.S. jobs

In addition, the sourcing of supply chain materials and products domestically would aid wealth creation, contribute to lowering the U.S. balance of trade deficit, and enhance global environmental health by avoiding energy consumption and emissions within existing conventional material and product supply chain long-distance transportation life cycle activities. This provides a framework for the U.S. to advance progress toward greater national energy, resource and financial efficiency akin to the strategic planning and achievements sought through the U.S. Green Building Council's Leadership in Energy Environmental Design [7] certification program and the Energy Productivity [8] strategic goal described in the DOE's 2006 Strategic Plan.

This positive outcome provides the DOI with potential to gain higher value returns to the American public when it displaces import of materials and products from countries that use local resources as geopolitical and economic trade weapons and use the attendant wealth to support terrorist activities against the U.S. and our allies.

Therefore, by utilizing the U.S. CO₂ emissions as a productive resource the American public can actually realize a greater holistic fair return rather than zero return as would result if the DOI followed non-holistic "thought leadership" presented to date by anti-fossil energy advocates.

I. BLM Should Prepare Inventories of Direct and Indirect GHG Emissions

We recommend that BLM prepare an inventory of all direct and indirect GHG emissions from federal coal leasing, including downstream emissions from the transportation, processing and end-use of federal coal. The inventory should encompass current and projected emissions under existing leases, and emissions from future leasing scenarios that are under consideration in the PEIS. (1) It should also clearly delineate estimated emissions from different parts of the coal supply chain and different emission sources. Finally, the information should be presented in a way that is clear and accessible to decision-makers and the public – for example, readers should be able to easily determine the proportion of emissions that is attributable to a particular activity or source category, and compare emissions across different leasing scenarios.

(1) If data is available, BLM may also want to account for historical emissions so that it can consider the long-term cumulative impact of the federal coal program on climate when deciding how to proceed with the program.

Demonstrating that such analysis is feasible, many federal agencies (including BLM) have begun to account for downstream emissions in their NEPA reviews. For example, the United States Forest Service ("USFS") conducted a life cycle assessment for an oil and gas leasing decision in 2013, which quantified emissions from transport, refining, and end-use. (9) In 2015, USFS prepared a revised DPEIS for the Colorado Roadless Rule coal mining exemptions that included a much more detailed analysis of GHG emissions from mining, transportation (both within the U.S. and to overseas markets) and combustion. (10) BLM also recently published an EIS in which it acknowledged that "the burning of the coal is an indirect impact that is a reasonable progression of the mining activity" (11) and quantified emissions from combustion. (12)

Organization I: Sabin Center for Climate Change Law, Columbia Law School

Commenter I: Jessica Wentz

Other Sections: I

Comment Excerpt Text:

The NEPA documents cited above suggest that the preparation of a downstream emissions inventory is a relatively straightforward task, and that tools and data are available to estimate emissions from each different phase of the coal supply chain. (13) The more challenging task is to determine how these emissions differ from a theoretical "no action" baseline – the idea being to calculate the incremental (or net) impact of agency action on GHG emissions. (This type of analysis has not been required by the courts, but it has been upheld. (14)) To calculate net impact, agencies typically use a model to determine what energy sources would be substituted for the federal resource if it were not produced (e.g., non-federal coal, oil and gas, renewables, energy efficiency, and energy conservation) and then estimate the supply chain emissions for the substitute energy sources.

(13) For example, BLM can estimate emissions from the combustion of coal by multiplying the amount of coal to be produced by the emissions factor for that type of coal. BLM could also adjust its estimates of future emissions to account for the installation of carbon capture and sequestration (CCS) technology at coal-fired power plants. To do so, BLM should use two or more scenarios that reflect varying levels of CCS deployment.

(14) See, e.g., *Mayo Foundation v. Surface Transportation Board*, 472 F.3d 545, 556 (8th Cir. 2006) (finding that, in the downstream emissions analysis for a coal railway, it was appropriate to rely on an assumption that “not all of the... transported coal would represent new combustion, that some would simply be a substitute for existing coal supplies”).

We have two recommendations for BLM in regards to a net impact analysis. First, BLM should disclose gross emissions as well as net emissions and all underlying assumptions in the draft PEIS. This will make it easy for the public to comment on the integrity and accuracy of the analysis. Second, BLM should use a reference case that corresponds with a scenario where the United States meets its GHG reduction targets. This is important because the choice of reference case determines the outcome of the analysis: in a scenario where we exceed the GHG targets, a larger proportion of the foregone federal coal production will be substituted by other coal and fossil fuel resources (as opposed to renewables or energy efficiency), and thus the net GHG impact of federal coal production will appear to be smaller. (15)

(15) To illustrate this point: the Bureau of Ocean Energy Management (BOEM) used the Energy Information Agency (EIA)'s 2015 Reference Case to calculate future demand for oil and gas in the United States when the incremental GHG impacts of the proposed 2017-2022 Outer Continental Shelf (OCS) Leasing Program. The EIA 2015 Reference Case does not account for present and future actions aimed at reducing fossil fuel consumption in the United States, such as the Clean Power Plan, and reflects a scenario in which we would completely fail to meet our domestic and international GHG reduction targets (under the Reference Case, the U.S. will have 445% higher GHG emissions than the level we committed to in our INDC). Because it relied on this Reference Case, BOEM predicted that the demand for oil and gas would remain strong in future years and that it would actually reduce emissions slightly to produce oil and gas closer to home. Thus, “BOEM is dismissing the climate impact of drilling for fossil fuels... because its model assumes we will not act on climate and will accept a catastrophic level of climate change.” See Lorne Stockman, *Government Assumes U.S. Will Fail Climate Goals in Its 5-Year Offshore Drilling Proposal* (2016), <http://priceofoil.org/content/uploads/2016/04/5YearPlan-ClimateTest.pdf>.

A near-term phase-out of federal coal is also critical because new leasing locks in investment and high-carbon infrastructure for mining, transport, and coal combustion, all of which is inconsistent with the pressing need to end fossil fuel emissions.

Comment Number: 0002467_Fettus_20160728-13

Organization I: Natural Resources Defense Council

Commenter I: Geoffrey Fettus

Comment Excerpt Text:

As discussed, see *supra* at 13-14, climate change poses concrete risks to the environment globally, including water availability, ocean acidity, weather, sea-level rise, and the health of ecosystems and the public. To address these concerns, the United States and other countries committed in the Paris Agreement for the United Nations Framework Convention on Climate Change to “Holding the increase in the global average temperature to well below 2°C above pre-industrial levels.” Some reports have estimated that to meet this goal 90% of U.S. coal reserves must remain in the ground. See, e.g. Christophe McGlade & Paul Ekins, “The geographical distribution of

fossil fuels unused when limiting global warming to 2 °C,” *Nature*, Jan. 8, 2015; see also July 27, 2016 Letter from Scientists on the BLM PEIS.

The first order of business is for BLM to develop the appropriate methodologies to calculate the GHG emissions associated with the entire fuel cycle for federally leased coal, including extraction, transportation and refining, and combustion, for only through such an approach can the climate change impacts of coal be properly assessed. Next, the PEIS must explore alternatives that should be considered to mitigate those impacts and insure that federally leased coal does not stand as an obstacle to GHG emission reduction goals.

Comment Excerpt Text:

A critical threshold change required in BLM’s approach to federal coal leasing, and crucial for a technically defensible NEPA analysis in the PEIS, is to account for all the “links in the chain” stemming from granting coal leases, and consideration of those links comprehensively. This includes emissions associated with coal extraction, transportation, refining, and combustion – i.e., the entire coal fuel cycle.

NEPA requires just such an approach, for, as noted, it calls on agencies to take a hard look at the direct, indirect, and cumulative impacts of federally permitted activities, as well as impacts from related activities. See, e.g. 40 C.F.R. § 1508.8(b) (requiring consideration of “growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems, as well as “effects on natural resources and the components, structures, and functioning of affected ecosystems,” including “effects on air and water and other natural systems”); see also Climate Change Guidance at 11 (requiring consideration of all emissions having “a reasonably close causal relationship to the Federal action, such as those that may occur as a predicate for the agency action (often referred to as upstream emissions) and as a consequence of the agency action (often referred to as downstream emissions) . . .”).

Recognizing this obligation, other agencies have begun to include this kind of analysis in their environmental review documents. For example, the Department of Energy has begun doing lifecycle GHG analyses in considering the impacts associated with Liquid Natural Gas terminals and exports. (13) The Forest Service has also considered CO₂ emissions from coal combustion anticipated to be produced under coal leases, (14) and the State Department included a relatively comprehensive life-cycle GHG analysis in its review of the proposed Keystone XL Pipeline. (15) EPA has also commented on FERC proposals that upstream and downstream emissions should be considered (Burger and Wentz at 27-28). Finally, numerous courts have confirmed that, to comply with NEPA, agencies must consider upstream and/or downstream emissions associated with fossil fuel projects. See Burger and Wentz at 3, 28-57 (citing cases); e.g. *High Country Conservation Advocates v. United States Forest Serv.*, 52 F. Supp. 3d 1174, 1196 (D. Colo. 2014).

BLM itself has also begun to include some consideration of downstream emissions in EISs. (16) Nonetheless, in some prior environmental review documents, BLM – and other agencies – have suggested that the GHG emissions from fossil fuel combustion can ultimately be ignored because the same quantity of coal or other fuel will be used regardless of its source. (17) BLM should reject this “perfect substitute” approach in the PEIS. Rather, BLM must engage in a reasoned energy substitution analysis to estimate the extent to which other coal – or other energy sources – might replace reduced quantities of federal coal in the marketplace. Although BLM should assume implementation of the Clean Power Plan in undertaking this analysis (which would partially, though not completely, resolve emission externalities), it should also consider how the analysis might change in the unlikely event the Plan does not go into effect. See James Stock et al, Federal Coal Program Reform, the Clean Power Plan, and the Interaction of Upstream and Downstream Climate Policies (Harvard Kennedy School April 2016) at 3 (concluding that a royalty adder that addresses the social cost of carbon could reduce emissions by roughly 3/4 of the emissions reduction that the Clean Power Plan is projected to achieve).

In considering this issue, we urge BLM to consider the numerous peer-reviewed studies and government reports that evaluate the life-cycle emissions associated with coal development. (18)

Comment Excerpt Text:

A full life-cycle analysis must also include the other downstream emissions that come before combustion. This includes emissions tied to the substantial amount of electricity and fossil fuels used to operate mining equipment, as well as those associated with the transportation of coal and other coal related infrastructure. In the United States, coal companies transport 70% of their product by rail, approximately 10% by truck, 10% or more by waterways, and the rest using a variety of means including conveyor belts and slurry pipelines. Jayni Hein and Peter Howard, Institute for Policy Integrity, *Reconsidering Coal's Fair Market Value* (New York Univ. School of Law 2015) at A4. One report estimates that transportation of coal accounts for 1.7% of CO₂ emissions in the life cycle of coal production. See Spath, P. L., Mann, M. K., & Kerr, D. R., *Life Cycle Assessment of Coal-fired Power Production* (National Renewable Energy Lab 1999). Each of these forms of transportation must be factored into determining the entire fuel cycle cost of federally leased coal.

In terms of combustion emissions, we applaud Secretary Jewell's plan to have the U.S. Geological Survey establish and maintain a public database to account for the annual carbon emissions from fossil fuels developed on federal lands. If completed in a timely manner, this quantitative database can certainly contribute to the required analysis. However, even without this database, BLM can – and must – quantify emissions for this PEIS. One straightforward approach to calculate those emissions is to multiply the amount extracted by the CO₂ emissions factor for that fuel (Burger and Wentz at 58). (19)

(19) The U.S. Energy Information Administration (EIA) publishes emission factors (or coefficients) for the amounts of certain gases that are released when fuels are burned, and publishes emission factors for when electricity is generated and used. For example, for subbituminous coal, EIA's emission factor for electricity generation is 97.20 kilograms of CO₂ emitted per million Btu (and a Btu refers to the amount of energy needed to raise the temperature of one pound of water by one degree Fahrenheit). See https://www.eia.gov/environment/emissions/co2_vol_mass.cfm.

Comment Excerpt Text:

In May 2016, the Stockholm Environment Institute, building on the Vulcan/ICF modeling, undertook a more nuanced analysis of the emissions consequences of federal leasing cessation, taking into account additional factors including (a) a supply and demand model for coal exports; (b) exclusion of metallurgical coal; (c) accounting for non-federal coal that may be constrained due to the highly-intermingled ownership of federal and nonfederal coal in the PRB.¹²⁷ Applying this more nuanced model to Vulcan's ICF results, SEI ultimately found:

In our reference case, assuming Clean Power Plan implementation, we find that leasing restrictions would reduce CO₂ emissions in 2030 from coal by about 107 Mt CO₂, but increased use of gas would increase emissions by about 36 Mt CO₂, resulting in a net reduction of 71 Mt CO₂.¹²⁸

SEI notes that this 2030 reduction of 2030 million tons CO₂ would be rivaled, as an emissions reduction policy, only by the EPA CAFÉ standards for light-duty vehicles (approximately 200 Mt) and the Clean Power Plan (up to 610 Mt).¹²⁹ Should the Clean Power Plan not be implemented, a coal leasing cessation would reduce emissions by 270 Mt in 2030 – nearly half the savings of the CPP.¹³⁰ Ultimately, SEI concludes that ending new leasing (and lease modifications expanding reserves), would;

Send national coal production on a declining pathway, potentially to levels more consistent with a 2°C pathway for U.S. coal extraction. Such an action could leave 4 billion short tons of federal coal in the ground that otherwise would be combusted between now and 2040, equivalent to about 7 Gt of CO₂ emissions.¹³¹ (127) Peter Erickson and Michael Lazarus, How would phasing out U.S. federal leases for fossil fuel extraction affect

CO₂ emissions and 2°C goals? at 18-22 (May 2016), SEI Working Paper 2016-02.

1. Current life cycle analysis (LCA) studies are inadequate and do not factor in all variables. Any LCA that the BLM may undertake as a part of this review needs to be a consequential LCA.
2. If the BLM studies the LCA of mined federal coal, it must take into account current and future technological advancements that may reduce emissions. Studies have shown that new technologies can drastically reduce coal 's C02 emissions.
3. Because of the highly speculative nature of a social cost of carbon analysis, the BLM should avoid conducting one as part of the PEIS.
4. The BLM lacks the statutory authority and technical expertise to implement a carbon taxing program or promulgate other requirements to address C02 and other GHG emissions.

A GHG lifecycle analysis of coal extraction should limit its focus to extraction. It is too speculative to analyze or address the possible impacts of unknown future projects, especially where there is no information on how the resource will be used or control technologies that will be employed until and well after there is a specific project proposed. However, should the BLM proceed with such a speculative analysis as part of the PEIS, the BLM must limit its analysis to the extraction phase emission profiles of coal and other fuels, and the potential consequential NCCIBs of national and international climate and energy policies, CCUS technology commercialization, national and economic security, laws, and regulations on the demand for and supply of coal and other energy resources and products produced by CCUS technologies.

Comment Excerpt Text:

BLM Must Use One of the Available Energy Models to Analyze Market Effects of Alternatives in the PEIS. There are multiple models that exist and have already been used for decades by other federal agencies that can assist BLM in quantifying the amount of climate pollution emissions (principally carbon dioxide and methane) that will likely occur as a result of considered alternatives in the PEIS. Understanding the net climate pollution differences is essential information in any review that promises to analyze “[t]he impact of possible program alternatives on the projected fuel mix” in order to understand the comparative differences in the resulting GHG emissions.”³⁸ NEPA requires agencies to use the tools available to them in order to ascertain essential information or explain why they cannot do so. 40 C.F.R. § 1502.22. Under the applicable NEPA regulations, if an agency intends not to include essential information in its NEPA review, it “shall” explain (1) why such essential information is incomplete or unavailable; (2) its relevance to reasonably foreseeable impacts; (3) a summary of existing science on the topic; and (4) the agency’s evaluation based on any generally accepted theoretical approaches. *Id.* § 1502.22(b). That other agencies have long used energy models to analyze market and climate impacts of their proposals, that information is plainly “available” within the meaning of the regulation, and BLM must utilize these available tools to understand the impacts of various alternatives in this PEIS. In 2015, Power Consulting prepared a thorough investigation of available energy-economy models that the Forest Service could have used in evaluating the market and climate impacts of a proposal to open up federal lands for coal mining in Colorado. ³⁹ That report concluded that the two models best suited to the task, based on the prior use by other agencies and the known characteristics of the models, were the Energy Information Administration’s (“EIA”) National Energy Modeling System (“NEMS”), used by EIA to generate its widely-cited Annual Energy Outlook reports, and, to a lesser degree, ICF International’s Integrated Planning Model (“IPM”), used for years by EPA to evaluate market responses to various policy proposals since at least 2004.⁴⁰ EIA’s NEMS model is an energy-economy model that projects future energy prices, supply, and demand and can be used to isolate variables such as changes in coal supply and ³⁷ *Id.* at 97. ³⁸ 81 Fed. Reg. 17,200, 17,226 (Mar. 30, 2016) (emphasis added). ³⁹ Thomas Power, et al., ASSESSING THE ABILITY OF CONTEMPORARY MODELS TO CALCULATE THE GHG IMPLICATIONS OF FEDERAL COAL LEASING DECISIONS AND OTHER FEDERAL ENERGY MANAGEMENT DECISIONS (2015), attached as Ex. 4. ⁴⁰ *Id.* at v. 21 variations in delivered coal price. NEMS uses input data from all sectors of the energy economy to forecast national energy supply and demand balance for varying sets of regulatory and fuel price scenarios. The model has a high degree of sophistication in its structure, which allows the model to give solutions for many types of problems. As noted by the Surface Transportation Board, which used NEMS to evaluate the market effects of a proposal to build a coal rail line, NEMS “not only forecasts coal supply and demand but also quantifies environmental impacts.” *Mayo Found. v. Surface Transp. Bd.*, 472 F.3d 545, 555 (8th Cir. 2006). According to ICF, its Integrated Planning Model (IPM) uses a linear optimization framework and can be used to evaluate changes in wholesale power dispatch taking into account system reliability, environmental constraints, fuel choice, transmission, and capacity expansion. ⁴¹ ICF has been used in recent years to evaluate the market and environmental impacts of several high-profile proposals related to the extraction and transportation of fossil fuels, including the U.S. State Department’s review of the Keystone XL tar sands pipeline, the Surface Transportation Board’s evaluation of the proposed Tongue River Railroad, EPA’s evaluation of the Clean Power Plan, the Forest Service’s supplemental evaluation of a proposed coal mining loophole for the Colorado Roadless Rule, and Washington Department of Ecology’s evaluation of the Millennium Bulk coal export terminal. Earlier year, the Institute for Policy Integrity released a report detailing and evaluating various strengths

and weakness of three available models: the Bureau of Ocean Energy Management's MarketSim model; the U.S. Energy Information Administration's National Energy Modeling System (NEMS); and ICF International's Integrated Planning Model (IPM). 42 That report in particular highlights the tradeoff between model complexity and transparency that BLM will need to address in selecting one or more models to use in its analysis.

the BLM leasing process is not the appropriate means to address emissions of any kind unless they are occurring at the mining operation. The facility using the coal mined on BLM lands is required to obtain an operating permit or license that will address their emissions and interior facilities to use coal. Any impacts should be addressed at the user level, not at the producer level.

Comment Number: 0020031_Parkins_20160722-17

Organization I:

Comment Excerpt Text:

The BLM leasing process is not the appropriate place to review climate impacts associated with the use of coal. The BLM and a Proponent interested in leasing the BLM coal lands cannot know definitively what the final use will be for the coal mined or how efficiently it will be burned. This is determined by the purchaser of the product. Climate impacts must be considered at the point of use not the point of production. Operations using coal mined on BLM lands are required to obtain air quality permits and other licenses to address their emissions and coal handling facilities. Also they be covered by the EPA's Clean Power Plan when it is implemented. Additional stipulations or regulations by the BLM would only add confusion to a process that already exists to evaluate the impact of emissions, and regulate them. BLM adding climate change impact stipulations to the leasing process effectively is a doubling up on those impacts and will inappropriately apply any unfavorable impacts twice, once at the point of production, and once at the point of sale.

Comment Number: 0020056-5

Organization I:Bowie Resource Partners, LLC

Commenter I:Gene DiClaudio

Comment Excerpt Text:

As noted in Order 3338, a current area of controversy is the degree to which the BLM should analyze the effect of leasing decisions on coal combustion downstream. Bowie does not object to the consideration of the impact of federal coal leasing in the aggregate on net coal combustion, but any such analysis must consider the interaction of federal coal leasing with other law and market constraints. The most important of these is EPA's Clean Power Plan (CPP). Should the CPP survive judicial review, national coal consumption, and derivatively federal coal production, will be capped. As a result, leasing policy will have little effect on aggregate emissions, and extensive analysis of combustion effects will serve no policy purpose.

Moreover, even if the CPP is overturned, leasing policy is only a small driver of net coal combustion. The combined effect of MATS, CSAPR, regional haze, and NAAQS revisions has been to render fuel costs a continually declining share of consumer operating costs, and to complicate any cause-and-effect relationship between federal coal leasing policy and net coal combustion. As a result, whether the CPP is upheld or not, any PEIS must evaluate net coal combustion effects of various leasing policy proposals with appropriate sensitivity to the highly regulated character of the coal consumer market.

we should make sure that the coal program is aligned with -- and even more ambitious than-- the Paris Climate Agreement. Not only our national contribution (or INDC) to the global target, but to the full ambition of the agreement itself -- limiting warming to well below 2 degrees celsius, and targeting 1.5 degrees.

Comment Number: 0002303_Steitz_20160705-2

Commenter I: Jim Steitz

Comment Excerpt Text:

To keep climate change under 2 degrees C, as the US committed in the Paris accord, requires that our carbon emissions decline by at least half by 2040, and continue to decline thereafter. To issue leases on federal land that

extend for decades, supplying subsidized coal that undercuts a true market cost for electricity, renders this mathematically impossible.

The PRB mining companies are now laying the groundwork for massive coal exports to Asia to take advantage of the huge subsidy of PRB coal taking place under the current Federal coal leasing program. If DOI does not take steps to eliminate that subsidy, the consequence will be additional CO₂ emissions in Asia that more than offset all the emission reductions that the Obama Clean Power Plan is struggling to achieve domestically. It will not only doom the Obama Administration's climate mitigation goals within the United States to failure, but could undo commitments made by 190 nations at the Paris climate summit last December to mitigate climate change.

Commenter I:Malin Moench

Comment Excerpt Text:

To mitigate that threat, the Obama Administration has devised a Clean Power Plan (CPP) that applies to every part of the country, including the part containing the PRB. The goal of the Clean Power Plan is to enforce the Clean Air Act's mandate to reduce CO₂ emissions, which have been found to endanger public health. To do this, the CPP requires each state or region to reduce the carbon intensity of the electricity that it generates. The CPP's primary strategy for achieving that objective is to shift the nation's electric power industry away from its reliance on coal. By selling massive amounts of coal far below its fair market value, current Federal coal leasing policies pull strongly in the opposite direction

Comment Excerpt Text:

If the Department of the Interior, for some reason, refuses to recertify PRB as a Coal Production Region, and continues the current leasing system with only the minor tweaks that are currently proposed, the production of PRB coal will continue to be subsidized and the broader effects of these subsidies will continue to be ignored. Continuing such subsidies, for example, will give the electric power industry an artificial incentive to reject clean energy in favor of coal. This will directly conflict with the Administration's efforts to reduce the nation's carbon emissions.

Comment Excerpt Text:

As noted earlier, continuing to subsidize PRB coal has the potential to alter the economics of exporting coal to South Asia. Subsidizing the price of PRB coal will artificially make exporting this coal to China and India profitable where it would not otherwise be. If China and India can count on a long-run supply of underpriced coal from the United States, it will increase their use of coal to generate electric power and raise the odds that they will rely on coal rather than renewable forms of energy as both of these countries race to industrialize. This would undermine the commitment that the Administration secured from China in 2015 to cap its reliance on coal after the year 2020.

Comment Number: 0002326_Moench_20160724_UtahPhysicHealthyEnviron-4

Comment Excerpt Text:

Because Asia's demand for coal is highly elastic, shipping subsidized coal into that market will stimulate the use of coal in that region. This prospect is in direct conflict with the objectives of the Obama Administration's Climate Action Plan, including its Clean Power Plan, its recent agreements with China and India to reduce their reliance on coal for power generation, and its agreement with the 30 OECD countries to phase out their financing of coal-fired power plants in less developed countries

Commenter I:Malin Moench

Comment Excerpt Text:

A key assumption underlying the emission-reduction targets that the EPA has assigned to each State is that they can cut the CO₂ emissions of a coal-fired power plant in half by converting it to a gas-fired plant of equivalent Btu capacity. The presence of massive amounts of cheap PRB coal in our domestic energy markets, however, is a powerful disincentive to do that. By one estimate, the presence of low-priced PRB coal in the domestic energy market (the 800-pound gorilla in the room) reduces domestic demand for natural gas by 27%, and thereby prevents the use of 5.5 trillion cubic feet of natural gas annually in the electric power industry. (Considine, T., 2013.)

Commenter I:Malin Moench

Comment Excerpt Text:

The Federal government's Clean Power Plan proposes state standards for reducing CO₂ emission-rates for existing power plants. This is a modest first step towards meeting America's obligation to keep global warming within the 2°C limit that was committed to in the landmark COP 21 Agreement reached in Paris last December. The Federal coal leasing program currently transfers massive quantities of coal to private hands virtually without charge, thereby incentivizing America's overreliance on coal. If not reformed, it will offset all of the benefits of the Clean Power Plan and increase the risk that the COP 21 agreement to mitigate climate change signed by 190 nations will unravel.

The BLM's subsidies of Federal coal distort U.S. energy markets, incentivize U.S. coal exports by subsidizing transportation costs, put clean sources of energy at a disadvantage, and ultimately undercut the goals of the President's Climate Action Plan. It is essential that the Bureau of Land Management reform its current leasing program by formally certifying the Powder River Basin as a Coal Production Region, thereby invoking the legal

obligation to begin the leasing process with regional planning that takes into account market conditions and the environmental and climate impact of leasing Federal coal.

As part of our participation in the Paris Agreement to the United Nations Framework Convention on Climate Change (UNFCCC), we have stated that we intend to reduce our economy-wide GHG emissions by 26-28% below 2005 levels by 2025, which will put us on a trajectory to achieve emission reductions of 80% or more by 2050. (24) To achieve this, we must lower annual emissions to 5,460 – 5,312 MtCO₂e by 2025 (a reduction of 1,410 – 1,558 MtCO₂e over 2014 levels). (25) Even with the Clean Power Plan and other existing regulations, the U.S. is not yet on track to achieve these reductions—additional measures will be needed to meet the 2025 target. (26)

This short term emissions reduction target is part of a broader commitment on the part of the U.S. and the 177 other signatories of the Paris Agreement to limit global warming to “well below” a 2 °C increase above pre-industrial temperatures, and seek to limit it to 1.5 °C. (27) The only way to achieve this goal is to refrain from extracting and using the majority of the planet's known fossil fuel reserves. According to a recent scientific study, over 80% of global coal reserves and 92% of U.S. coal reserves must remain unused to have even a 50% chance of meeting the 2 °C target. (28) President Obama cited this need to keep fossil fuels in the ground as one of the reasons for rejecting the Keystone Pipeline. (29)

Comment Excerpt Text:

To understand the magnitude of these emissions, it is helpful to compare them to our “carbon budget” (the total amount of CO₂ or CO₂e that can be emitted if we are to limit warming to 1.5 °C or 2 °C). One of the most recent studies on the global carbon budget concluded that, in order to have a > 66% chance of meeting the 2 degree C target, we must limit future emissions to 590 – 1,240 GtCO₂ (590,000 – 1,240,000 MtCO₂). (32) There are various ways to determine the U.S. share of this budget. One approach is to simply divide the budget by our proportion of the global population (~ 4%), in which case the U.S. emissions budget is 23,600 – 49,600 MtCO₂. Using this as our benchmark, the combustion of all of the recoverable coal under existing federal leases would account for 36 – 76% of the U.S. emissions budget.

Pete Erickson (Senior Scientist, Stockholm Environment Institute) discussed the impact of ramping down federal coal and oil leasing on U.S. carbon dioxide emissions and climate change goals. The Stockholm Environment Institute released a new study on federal coal, oil, and gas leasing, looking specifically at lease phase-out or an extension of the coal moratorium.

For example, under an economically efficient 2 degrees Celsius limit scenario (with the Clean Power Plan in effect), U.S. coal production drops dramatically and immediately. The Institute's analysis finds that in 2030 under a permanent moratorium on new leases, Interior could save about 70 million tons of net CO₂ in 2030 and an additional 30 million tons of CO₂ if this policy were extended to federal oil leases, as well. (This analysis accounts for energy substitution effects.) These greenhouse gas emission reductions are at least as large (if not larger) than those expected from the new EPA fuel economy standards for medium- and heavy- duty vehicles, and approaching the reductions expected from new light-duty vehicle standards. Erickson stressed that there is no single right answer as to how the U.S. could best develop a carbon budget for federal lands that is consistent with the 2 degree Celsius warming limit goal as articulated in the Paris Agreement, but that BLM could develop criteria for which lands (both federal and non-federal) should get preference in meeting such a carbon budget and could then analyze different scenarios as part of the PEIS to determine how each would play out.

Chase Huntley (Director of the Energy & Climate Program, The Wilderness Society) focused on the policy goals and process for carbon budgeting for federal lands. Huntley pointed to the stark contrast between an Administration that has made more progress on climate than any before it with an Administration that has presided over the two largest coal lease sales in U.S. history. He said that the federal government has not invested in the data systems needed to track the kinds of emissions data that an accurate assessment of climate emissions from public lands needs. An agency cannot accurately manage something that it is not measuring. The Secretarial Order acknowledges this and tasks the United States Geological Survey (USGS) with creating a database of emissions (fossil energy volumes on a production basis) from public lands. Huntley summarized: the United States can set and meet meaningful goals, but first it will need to decide on an appropriate contribution of public lands to total U.S. emissions and the role of coal in that portfolio; that the maximum allowable carbon emissions from all fossil energy under the current climate commitments are about 500 million metric tons of CO₂e in 2050; and that finally, we want to improve transparency and the performance of Interior as the energy asset manager for the American public.

Comment Excerpt Text:

As of 1970, the mean level of atmospheric carbon dioxide had been elevated to 325 parts per million (ppm). Since 1970, the concentration of atmospheric carbon dioxide has increased at a rate of about 1.6 ppm per year (1970–2012) to approximately 395 ppm in 2014. It is now well established that rising global atmospheric GHG emission concentrations are significantly affecting the Earth's climate. These conclusions are built upon an incontrovertible scientific record including key contributions from the United States Global Change Research Program, the National Research Council, and the Intergovernmental Panel on Climate Change. Broadly stated, the effects of climate change observed to date and projected to occur in the future include more frequent and intense heat waves, more and/or severe wildfires, degraded air quality, more heavy downpours and flooding, increased drought, greater sea-level rise, more intense storms, harm to water resources, harm to agriculture, and harm to wildlife and ecosystems. For these reasons, and others, the Environmental Protection Agency (EPA) has issued a finding that the changes in our climate caused by increased concentrations of atmospheric GHG emissions endanger public health and welfare.

To address this fundamental threat to our planet and humanity, last year countries around the world committed to the United Nations Framework Convention on Climate Change (Paris Agreement). In the Paris Agreement the United States and other countries committed to a goal of "Holding the increase in the global average temperature to well below 2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5°C." In addition the United States committed to reduce the GHG emissions from within our borders by 26-28% below 2005 levels by the year 2025.

In January 2016, Vulcan Philanthropy., employing analytic models supplied by ICF International, “commissioned a forward-looking analysis using ICF International’s (ICF) Integrated Planning Model (IPM®), relying on assumptions and scenarios as specified by Vulcan.”¹²⁰ The Vulcan study applied the ICF model of coal prices and consumption to various scenarios including no Clean Power Plan, a Clean Power Plan with mass-based caps on emissions, and a Clean Power Plan with emissions trading under a rate-based rule. The study then assessed the effects of various policy choices, including royalty increases based on the Social Cost of Carbon and (in their policy case 6), a 100% ramp-down of federal coal leasing. The Vulcan application of the ICF model found that a “production limit policy case,” i.e. a cessation of new federal leasing, would have significant impacts on coal production, coal markets and exports, generation capacity and mix, and ultimately CO₂ emissions.¹²¹ Ultimately, Vulcan found that ending new leasing would sharply reduce PRB coal production from 2037 on, with only a partial shift to production in other regions.¹²² This would also end Montana coal exports starting in 2040.¹²³ The net result of Vulcan’s finding is that, for a no new leasing policy, U.S. coal production would decline 348 Mt through 2040 without the Clean Power Plan, and 85 Mt under a mass-based Clean Power Plan.¹²⁴ This in turn would result in a shift to more efficient gas-fired generation and, to a lesser extent, renewable energy deployment and efficiency improvement.¹²⁵ Vulcan concludes the net effect on CO₂ emissions in 2040 would be nearly 500 Mt/year without the CPP, and a lesser reduction under the CPP.¹²⁶

Comment Excerpt Text:

In July 2016, Eco-Shift consulting projected the “production horizons”- the number of years’ worth of remaining production - from currently leased federal fossil fuels using the U.S. Energy Information Administration’s (EIA) 2016 “reference case” for fossil fuel production.¹³² EcoShift found that, under the EIA reference case (including Clean Power Plan implementation), “Coal under federal lease would last 25 years, through 2041.”¹³³ This production horizon greatly exceeds the dates at which carbon budgets for 1.5°C and 2°C would be exceeded by continued emissions at 2014 rates – 2021 and 2036 respectively.¹³⁴ The discrepancy between the production horizon for already-leased coal and carbon budget exceedance dates makes clear that, barring either extraordinarily rapid global emissions declines or rapid, widespread and successful deployment of carbon capture and sequestration technology, there is no scenario where new federal coal leasing at any significant level is consistent with the nation’s stated climate aims.

(134) *Id.* at Figure 1.

Significantly, both Vulcan and SEI examined the effect of leasing policies in a context where the Clean Power Plan was the only meaningful downstream constraint on U.S. coal consumption. More recently, Energy Transition Advisors, Earth Track, and Carbon Tracker Initiative undertook to examine the role of federal Powder River Basin coal in a (modestly ambitious) climate scenario – the International Energy Agency’s “450 scenario” aimed at modeling the energy demands consistent with an atmospheric CO₂ concentration of 450 ppm, and an ensuing 50% probability of keeping warming within 2°C of preindustrial levels.¹³⁵ Although the IEA “450 scenario” is less ambitious than Paris goals or the demands of protecting health and biodiversity, it provides an existing model for assessing the role of federal leasing, PRB production, and coal markets in a modestly climate-constrained scenario.¹³⁶ The ETA first examined U.S. EIA “reference case” coal production projections under the CPP to conclude that demand for PRB coal tracks reasonably well with US-wide demand for power-sector control under a modestly CO₂-constrained scenario.¹³⁷ It then applies coal trajectories under the IEA “450 Scenario” to the Powder River Basin, to find, under various CCS scenarios, a rapid decline in demand for PRB coal from 2016 through 2030, leveling off somewhat around 2030.¹³⁸ Fulton et al. then compared these anticipated demand scenarios with the best available information regarding coal deposits already under lease in the PRB.¹³⁹ Their conclusion was that, “[u]nder the 450 Scenario with no CCS, potential production from existing leases is sufficient to meet projected demand in every year through 2040.”¹⁴⁰ Moreover, they found that “even without additional efforts to pursue a 2°C scenario beyond those already announced, significant production from new leases is not expected to be needed until 2031.”¹⁴¹

Comment Excerpt Text:

Our analysis suggests that pursuit of a 2°C or less climate commitment obviates the need to award new leases for PRB coal mining through at least 2040. Under the power system that the US must transition to if it is to fulfill its Paris Agreement commitments, the 745 Mt of potential production from new PRB mines is unneeded to meet projected demand through 2040.

In contrast, awarding leases for such mines invites up to \$2.9 billion of investment that is at odds with America's stated climate ambitions and should prove unnecessary as the world moves towards a 2°C outcome. As PRB mines account for the majority of coal produced on federal lands, this suggests that a continued moratorium on all new leases is warranted under a 2°C scenario. Indeed, taking steps to slow production from the PRB would send a strong signal to other parties to the Paris Agreement that the United States is beginning to put its own house in order.

The IPCC and National Climate Assessment further decisively recognize the dominant role of fossil fuels in driving climate change:

While scientists continue to refine projections of the future, observations unequivocally show that climate is changing and that the warming of the past 50 years is primarily due to human-induced emissions of heat-trapping gases. These emissions come mainly from burning coal, oil, and gas, with additional contributions from forest clearing and some agricultural practices.¹⁶

CO₂ emissions from fossil fuel combustion and industrial processes contributed about 78% to the total GHG emission increase between 1970 and 2010, with a contribution of similar percentage over the 2000–2010 period (high confidence).¹⁷

These impacts emanating from the extraction and combustion of fossil fuels are harming the United States in myriad ways, with the impacts certain to worsen over the coming decades absent deep reductions in domestic

and global GHG emissions. EPA recognized these threats in its 2009 Final Endangerment Finding under Clean Air Act Section 202(a), concluding that greenhouse gases from fossil fuel combustion endanger public health and welfare: “the body of scientific evidence compellingly supports [the] finding” that “greenhouse gases in the atmosphere may reasonably be anticipated both to endanger public health and to endanger public welfare.”¹⁸

The United States has committed to the climate goal of holding the increase in the global average temperature to “well below 2°C above pre-industrial levels” and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels under the Paris Agreement.⁷⁵ Human-caused climate change is already causing widespread damage from intensifying global food and water insecurity, the increasing frequency of heat waves and other extreme weather events, inundation of coastal regions by sea level rise and increasing storm surge, the rapid loss of Arctic sea ice, increasing species extinction risk, and the worldwide degradation of coral reefs. Limiting further temperature rise is needed to prevent increasingly dangerous and potentially irreversible impacts.⁷⁶ However, current climate policy and emissions reduction pledges in the United States and globally are not sufficient to achieve a 1.5°C or 2°C limit, and stronger action to reduce greenhouse gas emissions is urgently needed.⁷⁷

(75) The Paris Agreement, which was adopted at the 2015 United Nations Framework Convention on Climate Change Conference of the Parties and signed by the United States in April 2016, commits all signatories to “[h]olding the increase in the global average temperature to well below 2°C above pre-industrial levels and to pursue efforts to limit the temperature increase to 1.5°C above pre-industrial levels, recognizing that this would significantly reduce

the risks and impacts of climate change.” See Paris Agreement at Article 2, Section 1(a),

International consensus and commitments acknowledge the global climate emergency and demand decisive action to limit fossil fuel extraction. On December 12, 2015, 197 nation-state and supra-national organization parties meeting in Paris at the 2015 United Nations Framework Convention on Climate Change Conference of the Parties consented to an agreement (Paris Agreement) committing its parties to take action to avoid dangerous climate change.⁷⁸ As the Paris Agreement opens for signature in April 2016⁽⁷⁹⁾ and the United States is expected to sign the treaty as a legally binding instrument through executive agreement,⁸⁰ the Paris Agreement commits the United States to critical goals—both binding and aspirational—that mandate bold action on the United States’ domestic policy to rapidly reduce greenhouse gas emissions.

The United States and other parties to the Paris Agreement recognized “the need for an effective and progressive response to the urgent threat of climate change on the basis of the best available scientific knowledge.”⁸¹ The Paris Agreement articulates the practical steps necessary to obtain its goals: parties including the United States have to “reach global peaking of greenhouse gas emissions as soon as possible . . . and to undertake rapid reductions thereafter in accordance with best available science,”⁸² imperatively commanding that developed countries specifically “should continue taking the lead by undertaking economy-wide absolute emission reduction targets”⁸³ and that such actions reflect the “highest possible ambition.”⁸⁴

The Paris Agreement codifies the international consensus that climate change is an “urgent threat” of global concern,⁸⁵ and commits all signatories to achieving a set of global goals. Importantly, the Paris Agreement commits all signatories to an articulated target to hold the long-term global average temperature “to well below 2°C above pre-industrial levels and to pursue efforts to limit the temperature increase to 1.5°C above pre-industrial levels”⁸⁶(emphasis added).

Comment Excerpt Text:

In light of the severe threats posed by even limited global warming, the Paris Agreement established the international goal of limiting global warming to 1.5°C above pre-industrial levels in order to “prevent dangerous

anthropogenic interference with the climate system,” as set forth in the UNFCCC, a treaty which the United States has ratified and to which it is bound.⁸⁷ The Paris consensus on a 1.5°C warming goal reflects the findings of the IPCC and numerous scientific studies that indicate that 2°C warming would exceed thresholds for severe, extremely dangerous, and potentially irreversible impacts.⁸⁸ Those impacts include increased global food and water insecurity, the inundation of coastal regions and small island nations by sea level rise and increasing storm surge, complete loss of Arctic summer sea ice, irreversible melting of the Greenland ice sheet, increased extinction risk for at least 20-30% of species on Earth, dieback of the Amazon rainforest, and “rapid and terminal” declines of coral reefs worldwide.⁸⁹ As scientists noted, the impacts associated with 2°C temperature rise have been “revised upwards, sufficiently so that 2°C now more appropriately represents the threshold between ‘dangerous’ and ‘extremely dangerous’ climate change.”⁹⁰ Consequently, a target of 1.5°C or less temperature rise is now seen as essential to avoid dangerous climate change and has largely supplanted the 2°C target that had been the focus of most climate literature until recently. As demonstrated below, under any formulation, the majority of United States fossil fuels, particularly federal coal, must stay in the ground.

Comment Excerpt Text:

The question of what amount of fossil fuels can be extracted and burned without negating a realistic chance of meeting a 1.5 or 2°C target is relatively easy to answer, even if the answer is framed in probabilities and ranges. The IPCC Fifth Assessment Report and other expert assessments have established global carbon budgets, or the

total amount of remaining carbon that can be burned while maintain some probability of staying below a given temperature target. According to the IPCC, total cumulative anthropogenic emissions of CO₂ must remain below about 1,000 gigatonnes (GtCO₂) from 2011 onward for a 66% probability of limiting warming to 2°C above pre-industrial levels.⁹² Given more than 100 GtCO₂ have been emitted since 2011,⁹³ the remaining portion of the budget under this scenario is well below 900 GtCO₂. To have an 80% probability of staying below the 2°C target, the budget from 2000 is 890 GtCO₂, with less than 430 GtCO₂ remaining.⁹⁴

To have even a 50% probability of achieving the Paris Agreement goal of limiting warming to 1.5°C above pre-industrial levels equates to a carbon budget of 550-600 GtCO₂ from 2011 onward,⁹⁵ of which more than 100 GtCO₂ has already been emitted. To achieve a 66% probability of limiting warming to 1.5°C requires adherence to a more stringent carbon budget of only 400 GtCO₂ from 2011 onward,⁹⁶ of which less than 300 GtCO₂ remained at the start of 2015. An 80% probability budget for 1.5°C would have far less than 300 GtCO₂ remaining. Given that global CO₂ emissions in 2014 alone totaled 36 GtCO₂,⁹⁷ humanity is rapidly consuming the remaining burnable carbon budget needed to have even a 50/50 chance of meeting the 1.5°C temperature goal.⁹⁸

(92) IPCC AR5 Physical Science Basis at 27; IPCC AR5 Synthesis Report at 63-64 & Table 2.2.

(93) From 2012-2014, 107 GtCO₂ was emitted (see Annual Global Carbon Emissions at <http://co2now.org/Current-CO2/CO2-Now/global-carbon-emissions.html>).

(94) Carbon Tracker Initiative at 6; Meinshausen et al. 2009 at 1159

(95) IPCC AR5 Synthesis Report at 64 & Table 2.2.

(96) *Id.*

(97) See Global Carbon Emissions, <http://co2now.org/Current-CO2/CO2-Now/global-carbon-emissions.html>

(98) In addition to limits on the amount of fossil fuels that can be utilized, emissions pathways compatible with a 1.5 or 2°C target also have a significant temporal element. Leading studies make clear that to reach a reasonable likelihood of stopping warming at 1.5° or even 2°C, global CO₂ emissions must be phased out by mid-century and likely as early as 2040-2045. See, e.g. Joeri Rogelj et al., Energy system transformations for limiting end-of-century warming to below 1.5°C, 5 *Nature Climate Change* 519, 522 (2015). United States focused studies indicate that we must phase out fossil fuel CO₂ emissions even earlier—between 2025 and 2040—for a reasonable chance of staying below 2°C. See, e.g. Climate Action Tracker, <http://climateactiontracker.org/countries/usa>. Issuing new legal entitlements to explore for and extract federal fossil fuels for decades to come is wholly incompatible with such a transition.

The BLM is clearly required to measure, evaluate and fully consider the GHG emissions and climate change impacts of the federal coal program in the PEIS based on a number of policies of the BLM and other agencies, and even the President. NEPA also requires the BLM to fully consider climate change issues in the PEIS. This must include both upstream and downstream emissions, including those from coal combustion at power plants. This analysis must inform BLM's requirements to avoid, minimize and compensate for these impacts consistent with this country's climate change commitments, specifically the requirement to reduce emissions by 26 to 28 percent below 2005 levels by 2025. This analysis and decision-making should seek to achieve a no more than 2 degrees C temperature increase, which will require the U.S. to reduce emissions an average of 70 to 80 percent below 2000 levels by 2050. The PEIS should put in place requirements to achieve these commitments.

A “carbon budget” is often defined as the quantity of carbon dioxide that the nations of the world can emit and still limit warming to 2-degree C above pre-industrial levels, although recently it has been applied to determine quantities of fossil energy that could be burned by individual nations consistent with their commitments.

Commenter I: Nada Culver

Comment Excerpt Text:

In the context of these comments, we use the term “carbon budget” to refer to the estimated annual volumes of CO₂ advisable from federal lands under international goals set by leading climate science and prevailing national climate emissions reduction commitments. To us, these volumes function best as performance targets set as a matter of policy rather than as a hard and fast cap. We believe BLM can create a “carbon budget” to establish a CO₂ emission reduction target that takes into consideration our domestic and international climate commitments and can be used as a policy and decision-making tool when addressing the questions of when and how much fossil fuel development should be permitted on federal land.

Comment Excerpt Text:

The IPCC’s analytic method was further advanced in January 2015 in a paper published in the scientific journal *Nature* entitled “The geographical distribution of fossil fuels unused when limiting global warming to 2 degrees C.” (35) The study evaluates known fossil fuel reserves to determine, based on current emissions factors and global warming potential, how much should be left in-place to maximize the planet’s chances of remaining below 2 degrees C. Importantly, it quantifies the regional distribution of known fossil-fuel reserves and resources and, through modeling a range of scenarios based on least-cost climate policies, identifies geographically-specific resources that should not be burned between 2010 and 2050 to ensure the world stays within a 2-degree C limit in the most cost-efficient manner. (36) This study demonstrates two important facts: first, one way in which geographically-specific analysis can be undertaken to make comparative judgments about the appropriateness of tapping into different resources and plays, and, second, that policy priorities can be brought into such an analysis—in *McGlade et al* it was cost-efficiency, but priorities like land use intensity, water demand, or impact on sensitive resources could as well. In addition to being the analytic source of ignition for the self-proclaimed “Keep it in the Ground” movement, the paper spawned a number of related inquiries looking at modified scenarios and derivative analysis examining U.S. demand scenarios in the specific context of already-leased federal fossil energy resources. (37) Attachment I provides a fuller discussion of the literature.

Reaching international climate commitments, including the Paris Agreement goals, will require the U.S. to adopt measures that reduce the GHG associated with production of fossil fuels on public lands in addition to efforts to reduce GHG from power plants and fuel efficiency for vehicles. (38) Nearly all other significant federal activities

have had GHG reduction targets set for them (see Appendix I)—it is time to put a similar set of performance targets in place for federal fossil energy leasing and production. As described below, it also will require measures that phase down the supply of fossil fuels from federal lands starting with the coal PEIS.

(38) 80 Fed. Reg. 64,662 (Oct. 23, 2015) (existing power plants); 80 Fed. Reg. 64,510 (Oct. 23, 2015) (new power plants); 77 Fed. Reg. 62,624 (Oct. 15, 2012) (light-duty vehicles); 76 Fed. Reg. 57,106 (Sept. 15, 2011) (medium- and heavy-duty vehicles).

Comment Excerpt Text:

We provide the results from our assessment of a “carbon budget” for federal lands to illustrate that such an exercise can be conducted with available data provided key assumptions are disclosed, and encourage BLM to prepare its own analysis utilizing a similar approach. From there, BLM can create a coal target based on coal’s projected future share of federal fossil energy production and/or CO₂e emissions. (40) We recommend the agency focus on simple scenarios, rather than complex models, to establish leasing targets based on a “carbon budget” analysis. A scenario-based approach was used by the Carbon Tracker Initiative in determining a critical input (future demand for Powder River Basin coal under a 2-degree scenario) used in their recent report reviewing the necessity of future federal coal leasing. (41) This approach should be closely examined by the agency for potential use in establishing a coal production target under a fossil energy “carbon budget” for the Department. We will explore this and alternative methods more fully in our forthcoming whitepaper.

(40) This determination is based on scenario modeling and therefore will require the agency to be transparent with its methods.

BLM also has the authority—and we believe the obligation—to reduce climate emissions from the federal coal program through regulation. The PEIS should examine and advance regulations to reduce the emissions of methane and other greenhouse gases from coal mining operations. BLM has already taken steps in this direction with an advance notice of proposed rulemaking to regulate methane that is released as a direct result of mining operations, known as waste mine methane. BLM should move forward with the Coal Mine Waste rule and, through the PEIS, examine other rules to reduce greenhouse gas emissions from coal mining operations.

Attachment I. History of the Origins of the Carbon Budget Concept in the Scientific Literature
In 2012, the International Energy Agency, an international organization established to “provide authoritative research and analysis on ways to ensure reliable, affordable and clean energy” for its members, (76) concluded there is a limit to the amount of fossil fuels that can be developed if the world is to remain within acceptable warming thresholds. Based on an assessment of global carbon reserves, and given existing pollution controls, the agency concluded that “[n]o more than one-third of proven reserves of fossil fuels can be consumed prior to 2050 if the world is to achieve the 2-degree C goal.” (77)

In addition, on June 29, 2016, the leaders of Canada, Mexico, and the United States committed to the North American Climate, Clean Energy, and Environment Partnership. Under this agreement the countries will pursue an historic goal for North America to strive to achieve 50 percent clean power generation by 2025. “Canada, the U.S., and Mexico will work together to implement the historic Paris Agreement, supporting our goal to limit temperature rise this century to well below 2 degrees C, and pursuing efforts to limit the temperature increase to 1.5 degrees C.” (22)

(22) See <https://www.whitehouse.gov/the-press-office/2016/06/29/leaders-statement-north-american-climate-clean-energy-and-environment> (presenting Leaders’ Statement on a North American Climate, Clean Energy, and Environment Partnership).

These commitments are consistent with and required by The President’s Climate Action Plan (June 2013) which calls for many steps to combat climate change such as reductions in CO₂ emissions from power plants, increased use of renewable energy, improved automobile efficiency standards, and reducing methane emissions, among many other things. (23) But to achieve the goals of the Climate Action Plan, which include “steady, responsible

action to cut carbon pollution, [so] we can protect our children’s health and begin to slow the effects of climate change so that we leave behind a cleaner, more stable environment,” it will also be necessary to address issues related to fossil fuel extraction from our public lands. The Coal PEIS and other BLM regulatory actions should look to these commitments as part of decision-making, in order to ensure that steps are taken to meet these commitments.

(23) See also Climate Action Plan Strategy to Reduce Methane Emissions (March 2014) (presenting the President’s methane reduction strategy).

Comment Excerpt Text:

The concept of a carbon budget builds upon the well-established scientific understanding that the global increase in temperature due to greenhouse gas emissions must be capped at or below 2-degree C to avoid unmanageable climate change consequences. The 2-degree C threshold was first enshrined in the 2009 Copenhagen Accord (32) and reaffirmed in the 2015 Paris Agreement as the limit for “acceptable” warming. (33)

(32) Copenhagen Accord ¶ 1, agreed Dec. 18, 2009, FCCC/CP/2009/11/Add.1, available at <http://unfccc.int/resource/docs/2009/cop15/eng/11a01.pdf> (“recognizing the scientific view that the increase in global temperature should be below 2 degrees Celsius” relative to pre-industrial temperatures to “stabilize greenhouse gas concentration in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system”); id. at ¶ 2 (agreeing that “deep cuts in global emissions are required according to science” to meet this goal).

(33) The United States and other signatory nations committed to reducing greenhouse gas emissions “well below 2 °C above pre-industrial levels and to pursue efforts to limit the temperature increase to 1.5 °C above pre-industrial levels.” Paris Agreement art. 2, ¶ 1(a), adopted Dec. 12, 2015, FCCC/CP/2015/L.9, available at <http://unfccc.int/resource/docs/2015/cop21/eng/l09r01.pdf>. The authority cited in the letter is being provided via regulations.gov and it should be included in the administrative record for this decision.

During that time, the international scientific community’s understanding of the interaction between fossil fuel development and temperature thresholds has greatly increased, and today it is widely agreed that development of additional reserves should be considered in the context of warming goals—giving rise to the idea of a carbon budget for the planet. In fact, this notion has been assessed and supported by the IPCC in all assessment reports going back to 1990 and has yielded a methodology routinely employed and updated annually by the Global Carbon Project. (34)

(34) The IPCC has produced and reviewed a carbon budget for the planet in all assessment reports (Ciais et al., 2013; Denman et al., 2007; Prentice et al., 2001; Schimel et al., 1995; Watson et al., 1990), as well as by others (e.g. Ballantyne et al., 2012). These assessments included carbon budget estimates for the decades of the 1980s, 1990s (Denman et al., 2007) and, most recently, the period 2002–2011 (Ciais et al., 2013). The IPCC methodology has been adapted and used by the Global Carbon Project (GCP, www.globalcarbonproject.org), which has coordinated a cooperative community effort for the annual publication of global carbon budgets up to the year 2005 (Raupach et al., 2007), 2006 (Canadell et al., 2007), 2007 (published online; GCP, 2007), 2008 (Le Quéré et al., 2009), 2009 (Friedlingstein et al., 2010), 2010 (Peters et al., 2012b), 2012 (Le Quéré et al., 2013; Peters et al., 2013), 2013 (Le Quéré et al., 2014), and most recently 2014 (Friedlingstein et al., 2014; Le Quéré et al., 2015). Each of these papers updated previous estimates with the latest available information for the entire time series. From 2008, these publications projected fossil fuel emissions for one additional year using the

projected world gross domestic product (GDP) and estimated trends in the carbon intensity of the global economy (Rogelj, 2016).

In the fall of 2014, this analysis was expanded and strengthened by the Intergovernmental Panel on Climate Change (Panel). The Panel published a comprehensive synthesis of the latest worldwide scientific consensus on climate change, called the Climate Change 2014 Synthesis Report. (78) The synthesis describes the recent scientific consensus that there is an overall limit to the amount of carbon dioxide (CO₂) that can be released into the atmosphere to stay within the 2 degree C warming cap. (79) It calculated that emissions from the year 1870 on would need to be limited to about 2,900 gigatons of CO₂ (GtCO₂) to have a reasonable chance of staying within the cap. (80) The Panel noted that as of 2011, about 1,900 GtCO₂ had already been emitted. (81) Therefore, the report concluded, to provide better than a 66 percent chance of limiting warming to less than 2 degree C, additional carbon dioxide emissions must be limited to 1,000 GtCO₂. (82) The Panel also estimated that there are about 3,670 to 7,100 GtCO₂ in proven fossil fuel “reserves” remaining in place, (83) which it describes as quantities of fossil fuels “able to be recovered under existing economic and operating conditions.” (84) As the report notes, this volume of reserves is four to seven times the amount that can be burned to have better than a 66 percent chance of remaining within the 2 degree C warming goal. (85) One of the expert reports feeding into the Panel’s synthesis explained that to meet “[t]he emissions budget for stabilizing climate change at 2 degree C above pre-industrial levels... only a small fraction of reserves can be exploited.” (86)

(78) Intergovernmental Panel on Climate Change (Panel), Climate Change 2014: Synthesis Report (2014), available at <http://www.ipcc.ch/report/ar5/syr/>. In fact, a carbon budget has been assessed by the IPCC in all assessment reports (Ciais et al., 2013; Denman et al., 2007; Prentice et al., 2001; Schimel et al., 1995; Watson et al., 1990), as well as by others (e.g. Ballantyne et al., 2012). These assessments included budget estimates for the decades of the 1980s, 1990s (Denman et al., 2007) and, most recently, the period 2002–2011 (Ciais et al., 2013). The IPCC methodology has been adapted and used by the Global Carbon Project (GCP, www.globalcarbonproject.org), which has coordinated a cooperative community effort for the annual publication of global carbon budgets up to the year 2005 (Raupach et al., 2007), 2006 (Canadell et al., 2007), 2007 (published online; GCP, 2007), 2008 (Le Quéré et al., 2009), 2009 (Friedlingstein et al., 2010), 2010 (Peters et al., 2012b), 2012 (Le Quéré et al., 2013; Peters et al., 2013), 2013 (Le Quéré et al., 2014), and most recently 2014 (Friedlingstein et al., 2014; Le Quéré et al., 2015). Each of these papers updated previous estimates with the latest available information for the entire time series. The Panel's synthesis analysis was refined further in January 2015, when the scientific journal Nature published a study entitled "The geographical distribution of fossil fuels unused when limiting global warming to 2 degree C." (87) The study identifies which fossil fuels must remain undeveloped to improve the chances of remaining below the warming cap. It quantifies the regional distribution of fossil-fuel reserves and resources and, through modeling a range of scenarios based on least-cost climate policies, identifies which reserves and resources could not be burned between 2010 and 2050 if the world efficiently complies with the 2 degree C limit. (88) It concludes that "a stark transformation in our understanding of fossil-fuel availability is necessary," because "large portions of the reserve base and an even greater proportion of the resource base should not be produced if the temperature rise is to remain below 2 degree C." (89) Thus, expanding on the prior analyses' conclusion that development of already-existing reserves would far exceed the cap, let alone development of the more speculative category of resources, the study concludes that a commitment to meet the 2 degree C limit would "render unnecessary continued substantial expenditure on fossil-fuel exploration, because any new discoveries could not lead to increased aggregate production." The most straightforward route would be to implement a carbon adder for upstream (or direct) emissions – those occurring during the mining and production phase. Recent research estimates those costs would be roughly \$2 for surface federal coal and \$6 for underground federal coal. Without a more comprehensive carbon pricing program – like a national carbon tax, and given the widely recognized externalities associated with coal use, choosing not to price coal emissions from federal production via an upstream adder (or another similar approach) would represent a glaring misstep in meeting the nation's climate commitments.

Comment Excerpt Text:

The principle finding that informs our recommendation is that more recoverable coal is currently under lease than can safely be developed under a carbon budget that limits global warming to 2°C. Interior has the legal authority and a strong policy basis to align the federal coal program with U.S. commitments on climate change. Interior should therefore reject any reforms to the coal program that imply a level of coal production that is inconsistent with a scientifically sound carbon budget. Ultimately, the agency must end the practice of issuing new

coal leases and undertake other necessary reforms to conform the program to the United States' policy goals and international commitments to limit global warming to well below 2°C.

Comment Excerpt Text:

The production models analyzed by Carbon Tracker, which inform our recommendations for modernizing the federal coal program, are inherently conservative on the basis of two factors.⁸ First, the 2°C target used by the IEA is an uppermost-limit for temperature warming but does not represent a “safe” threshold. For this reason, technical experts to the United Nations Framework Convention on Climate Change (“UNFCCC”) have cautioned keeping temperature warming well below 2°C in order to significantly reduce the risks of climate change, and Parties to the UNFCCC adopted this goal under the Paris Agreement.⁹ Second, the IEA 450 Scenario only assigns a 50% probability of successfully staying below the 2°C threshold and assumes a relatively rapid deployment of CCS technology by 2020.¹⁰

[⁸ The calculated balance of the global carbon budget and the implication for fossil fuel use varies across studies. A recent article in the scientific journal Nature applies a global carbon budget to identify the fraction of U.S. coal reserves that are unburnable before 2050 under a 2°C scenario, concluding that 95% of U.S. reserves cannot be combusted. The Nature analysis models the optimal global use of oil, natural gas and coal with the constraint of a 2°C emissions trajectory. Coal is heavily disfavored in relation to oil and gas, especially in the United States, due both to coal’s carbon intensity and the wide availability of lower-cost, lower-carbon electricity sources. Even with CCS technology widely deployed from 2025 forward, the study concludes that 92% of U.S. coal reserves remain unburnable. See Christopher McGlade & Paul Eakins, The geographic distribution of fossil fuels unused when limiting global warming to 2 °C, 215 Nature 187 (January 8, 2015) at 189.]

[⁹ For a discussion on the relative risks of temperature targets, see: United Nations Framework Convention on Climate Change Secretariat, Report on the structured expert dialogue on the 2013-2015 review (2015). Available at <http://unfccc.int/resource/docs/2015/sb/eng/inf01.pdf>. The Paris Agreement on climate change identifies the need for greater temperature ambition. The Agreement aims to hold “the increase in the global average temperature to well below 2°C above pre-industrial levels” with “efforts to limit the temperature increase to 1.5°C above pre-industrial levels” (emphasis added). Paris Agreement, Article 2 (Dec. 13, 2015), in UNFCCC, Report of the Conference of the Parties on its Twenty- First Session, Addendum, at 21, UN Doc. FCCC/CP/2015/10/Add.1 (Jan. 29, 2016) (hereinafter, “Paris Agreement”).]

[¹⁰ Forecasting the rapid deployment of carbon capture and storage projects is characterized by uncertainty. CCS projects are not utilized at scale and only 15 large-scale projects currently operate. See Global CCS Institute, “Large Scale CCS Projects,”<https://www.globalccsinstitute.com/projects/large-scale-ccs-projects>.]

The potential supply from existing leases from 2016 to 2040 is 5,763 million metric tons (Mt), which is 1,252 Mt greater than the supply required under the 450 Scenario (See Figure 1).

The 450 scenario assumes an aggressive build-out of CCS technology, at a pace that outstrips current market

trends. In order to better reflect likely real-world conditions, Carbon Tracker also assessed scenarios in which large-scale deployment of CCS does not occur until 2030, and in which this technology never becomes a significant factor in energy supply markets. Because lower levels of CCS deployment reduce the ability to mitigate coal's intrinsic high carbon intensity, production from existing mines is necessarily also sufficient under scenarios where CCS is delayed until 2030 (cumulative supply production of 2985 Mt) and where no CCS is deployed (cumulative supply production of 2773 Mt).¹¹ In the energy scenario where no CCS is deployed, the projected production from existing leases alone is 2,990 Mt greater than the 2°C scenario carbon budget threshold.¹² As noted above, the 450 Scenario is also a higher risk pathway due to the 50% probability it assigns for achieving 2°C, and thus coal production consistent with a climate safe scenario would be even less when assigning a higher probability of success.

The EIA projects that fully implementing the CPP will reduce coal's share of the generation mix to 21% in 2030 (down from 50% in 2005 and 33% in 2015).⁴⁰ The Clean Power Plan establishes a clear mandate for states to develop a comprehensive framework for climate action that will cut CO₂ emissions from the electricity sector. The federal coal program is currently inconsistent with the policy vision established by the Clean Power Plan, envisioning a perpetual continuation of coal production from federal lands, and a constant stream of revenues and royalties associated with this mining to fund reclamation and offset other costs associated with coal production and combustion.

On March 31, 2015, the U.S. submitted its Intended Nationally Determined Contribution (INDC) to the United Nations Framework Convention on Climate Change. The INDC articulates a national target of reducing greenhouse gas emissions by 26%-28% below the 2005 level in 2025 while making “best efforts” to reduce emissions by the upper-target of 28%.⁴² As part of this target, the U.S. INDC explicitly accounts for the land sector, stating that the United States will “include all categories of emissions by sources and removals by sinks, and all pools and gases, as reported in the Inventory of the United States Greenhouse Gas Emissions and Sinks; to account for the land sector using a net-net approach.”⁴³ This means that the United States commits to accounting for carbon emissions beyond the smokestack and tailpipe. We are committed to accounting for and planning around a comprehensive picture of our carbon profile, including our fuel stocks and our policies that affect how those stocks are deployed – whether they are sold off to be burned at taxpayer expense, or maintained as a permanent reserve stock of sequestered potential carbon pollution.

Article 4.19 of the Paris agreement provides a policy basis for why BLM should account for coal resources in federal lands in alignment with climate objectives, stating that all Parties should “strive to formulate and communicate long-term low greenhouse gas emission development strategies, . . . taking into account their common but differentiated responsibilities and respective capabilities, in the light of different national circumstances.”⁴⁴

[44 Paris Agreement, *supra* note 9.]

Article 4.2 of the Paris Agreement establishes the requirement for countries to contribute domestic mitigation measures. Article 4.2 states that “Parties shall pursue domestic mitigation measures, with the aim of achieving the objectives of such [Nationally Determined Contributions].”⁴⁵ The U.S. INDC to the Paris Agreement reflects the

national ambition to address climate change. When combined with the commitments from 187 other countries, the U.S. INDC aims to serve the Paris Agreement objective of limiting the global average temperature to well below 2°C above pre-industrial levels.⁴⁶ Interior should reform its coal program in a way that is consistent with our nation’s commitment to the international community. This conclusion is also affirmed by 67 climate scientists who wrote to Interior to express their support for ending coal leasing on public lands, stating, “The science is clear: to satisfy our commitment under the Paris Agreement to hold global temperature increase well below 2°C, the United States must keep the vast majority of its coal in the ground.”⁴⁷

Climate consistency must be a criterion for deciding whether to include – and then ultimately in evaluating whether to support – a decision alternative under the PEIS. Climate consistency is a key criterion because of the significant and cumulative nature of the program’s environmental effects. The CEQ draft guidance provides a framework how Interior should consider the effects of its decisions on climate change.⁵⁵ This draft guidance states, “Federal agencies, to remain consistent with NEPA, should consider the extent to which a proposed action and its reasonable alternatives contribute to climate change through GHG emissions.”⁵⁶ Agencies that fail to effectively compare decision alternatives are increasingly at risk of facing legal challenge. In a review of NEPA

alternative analysis case law, Michael Smith identifies that the “most common challenge [to alternative analyses] was that federal agencies had not included a full reasonable range of alternatives.”⁵⁷

Comment Excerpt Text:

Interior should evaluate decision alternatives in a manner that reasonably examines a range of climate-consistent scenarios, and should reject alternatives that assume or result in projected carbon emissions above the level set in the carbon budget. Pursuant to the National Environmental Policy Act, environmental impact statements should “include the environmental impacts of the alternatives including the proposed action, any adverse environmental effects which cannot be avoided should the proposal be implemented . . . and any irreversible or irretrievable commitments of resources which would be involved in the proposal should it be implemented.”⁶³ Critically, this evaluation of environmental effects includes the question of whether a given action exceeds the limited available carbon budget for the Powder River Basin. Interior should evaluate climate consistency under the three 450 Scenarios discussed in Part I: climate consistency with CCS deployment in 2020, climate consistency with widespread CCS deployment in 2030, and climate consistency with no CCS deployment through 2040, in addition to any other climate-consistent scenarios.

The remaining available carbon budget for limiting temperature increase to 2°C depends on key physical and mathematical parameters, such as the modeled sensitivity of the atmosphere to carbon pollution, potential

climate feedback effects, and other factors that affect the probability of successfully staying below the chosen temperature target.² Across a range of budgets based on a variety of reasonable and conservative inputs, expert analysis collectively identify a constraint imposed on fossil fuel production.³ Extrapolating from a carbon budget that reflects a maximum level of atmospheric CO₂, it is possible to assess energy demand scenarios for consistency with that budget based on energy market data and the carbon intensity of various fuels.

[² Additional factors that impact the carbon budget include the time period covered, assumptions regarding mitigation of other greenhouse gas emissions, and the scale and success of CCS deployment. Comment Excerpt Text:

To meet US climate commitments, nearly all US coal reserves must remain unburned. In order to meet the US and global community's commitments to avoid two degrees of global warming, nearly all US coal reserves must remain unburned. A January 2015 study published in Nature, “The geographical distribution of fossil fuels unused when limiting global warming to 2 °C,” (5) found that between 90% and 95% of US coal reserves must remain unburned (including both federal and nonfederal coal) in order to stay within the two degree carbon budget. (6) (5) <http://www.nature.com/nature/journal/v517/n7533/nature14016/metrics/news>

(6)

<http://www.bloomberg.com/news/articles/2015-10-07/more-than-90-percent-of-us-coal-should-stay-underground-climate-study>

Importantly, the study found that even using optimistic assumptions about the viability and widespread future use of carbon capture and sequestration technologies wouldn't significantly change the need to avoid extraction and burning of nearly all US coal reserves. The optimistic CCS scenarios allow the 90% figure, instead of 95% without CCS:

Because of the expense of CCS, its relatively late date of introduction (2025), and the assumed maximum rate at which it can be built, CCS has a relatively modest effect on the overall levels of fossil fuel that can be produced before 2050 in a 2 °C scenario.

A July 2016 study, “Enough Already: Meeting 2°C PRB Coal Demand Without Lifting the Federal Moratorium” (7) looked more specifically at the implications for federal coal of US climate policy commitments, and found that there is more federal coal already under lease than can be burned in scenarios that would avoid two degrees of global warming. That means that in order to support US and global climate change commitments, no new federal coal should be leased, and the moratorium on new federal coal leases should be made permanent. (7)

Comment Excerpt Text:

Some federal coal already under lease should be taken back. Moreover, meeting US climate commitments to avoid two degrees of warming means that a significant amount of federal coal that has already been leased should be taken back from current lease holders. Accordingly, the PEIS scoping process should study which federal coal reserves that have already been leased should be taken back from coal mining companies. That could include lower BTU coal that is uneconomic in the current market. The Institute For Energy Economics and Financial Analysis found that of the roughly 6 billion tons of federal coal under lease to the top four federal coal lease holders (Peabody Energy, Arch Coal, Cloud Peak Energy, and Alpha Natural Resources), “1.957 billion tons — or 32% of the total currently under lease — is low-quality coal and is not economically recoverable.”

Comment Excerpt Text:

The coal industry’s collapse is a clear sign that now is the time for a new path forward for managing publicly owned coal that moves us away from this destructive, carbon-based form of energy. This is underscored by the reality that, to meet our nation’s and our world’s climate objectives, we have to completely transition from burning coal—and unleashing the attendant carbon pollution—as quickly as possible. This means not only transitioning electricity generation from coal to cleaner sources of energy, a shift that is already happening, but also keeping unmined coal reserves in the ground.

How does keeping coal in the ground work to combat climate change and rein in carbon pollution? Aside from the obvious, which is that coal left unmined will never be burned, reports have found myriad reasons for the climate benefits of keeping coal, as well as other fossil fuels, in the ground. Among them:

- Keeping coal in the ground could “widen the cost mitigation curve,’ allowing greater emission reductions at the same (or lower) cost than demand-side policies alone, and can also help address carbon leakage risks;”

- Keeping coal in the ground “can help to reduce carbon lock-in effects, making it easier for lower-carbon alternatives to compete with fossil fuels;”

- Keeping coal in the ground can “bring added pressure to bear on climate change mitigation efforts, and could help make the case for more ambitious global climate action.” (15) Exhibit 7, Lazarus, M., P. Erickson, and K. Tempest, “Supply-side climate policy: the road less taken,” Stockholm Environment Institute, Working Paper No. 2015-13 at 18, available online at http://sei-us.org/Publications_PDF/SEI-WP-2015-13-Supply-side-climate-policy.pdf.

Not surprisingly, scientific reports confirm that keeping coal and other fossil fuels unburned is a critical means of reducing carbon emissions and limiting global warming. As a recent report in the journal *Nature* found to meet international goals of limiting global temperature increases to no more than 2°C, 95% of all U.S. coal reserves, or 245 billion metric tons of coal, must remain unburned. (16) A recent report prepared by the Stockholm Environmental Institute confirmed that the benefits of putting an end to new federal coal leasing and the inevitable mining, effectively avoiding carbon “lock-in effects,” stands to reduce carbon emissions by 238 million metric tons annually. (17)

(16) See Exhibit 8, McGlade, C. and P. Ekins, “The geographical distribution of fossil fuels unused when limiting global warming to 2°C,” *Nature*, Vol. 15 (Jan. 2015).

(17) See Exhibit 9, Erickson, P. and M. Lazarus, “How would phasing out U.S. federal leases for fossil fuel extraction affect CO₂ emissions and 2°C goals,” Stockholm Environmental Institute Working Paper No. 2016-02 (May 2016) at 27, available online at <https://www.sei-international.org/mediamanager/documents/Publications/Climate/SEI-WP-2016-US-fossilfuel-leases-climate.pdf>.

Perhaps it’s not surprising that the President himself recently remarked, “[I]f we’re going to prevent large parts of

this Earth from becoming not only inhospitable but uninhabitable in our lifetimes, we're going to have to keep some fossil fuels in the ground rather than burn them and release more dangerous pollution into the sky.” (18) (18) See Exhibit 10, President of the United States, “Statement by the President on the Keystone XL Pipeline” (Nov. 6, 2015), available online at <https://www.whitehouse.gov/the-press-office/2015/11/06/statement-president-keystone-xl-pipeline>.

Comment Excerpt Text:

Burning coal produces a third of global carbon emissions and is one of the largest contributors to climate change. To hold up our end of the deal and prevent the global average temperature from rising above one and a half or two degrees Celsius, the federal coal-leasing program must be reformed and the moratorium on new leases must be made permanent. This PEIS provides the BLM the opportunity to reevaluate how our public lands should be managed for the best interests of people and the environment. To better align the federal coal program with a safe climate future that protects people and the planet, the federal coal PEIS must do two important things:

I. Fully evaluate the climate impacts from future federal coal production in relation to meeting national and international climate commitments.

At least 80 percent of global coal reserves and 90 percent of U.S. coal reserves must remain in the ground to have a 50 percent chance of avoiding catastrophic levels of global warming. Unleased federal coal contains up to 212 billion tons of potential greenhouse gas emissions, which is 43 percent of the potential emissions of all remaining federal fossil fuels, including oil and gas. With more than 57 percent of fossil fuel emissions from federal areas coming from the combustion of federal coal, there is no place for the federal coal program in a carbon-constrained world.

Comment Excerpt Text:

BLM Must Evaluate Whether Continued Federal Coal Leasing is Inconsistent with U.S. GHG Emission Reduction Goals and International Climate Commitments. President Obama has called climate change “a challenge that will define the contours of this century more dramatically than any other.”⁴³ As aptly summarized in PEIS scoping comments submitted by dozens of renowned climate scientists: “We are scientists writing to urge the Department of the Interior to take meaningful action to fight climate change by ending federal coal leasing, extraction, and burning. The vast majority of known coal in the United States must stay in the ground if the federal coal program is to be consistent with national climate objectives and be protective of public health, welfare, and biodiversity.”⁴⁴ Given this strong and clear signal from leading climate scientists, as well as the ever

growing body of research demonstrating the need to keep fossil fuels in the ground in order to avoid the work effects of climate change, it is imperative that BLM analyze whether the continuation of the federal coal leasing program is consistent with our international climate commitments and the need to keep global warming within tolerable levels. In particular, BLM 43 President Obama, Remarks By The President At The Glacier Conference -- Anchorage, AK (SEPT. 1, 2015), available at <https://www.whitehouse.gov/the-press-office/2015/09/01/remarks-president-glacier-conference-anchorage-ak> (last visited July 18, 2016). 44 Letter from Ken Caldeira, et al., to Sec'y Sally Jewell, et al., "Scientists Support Ending Coal Leasing on Public Lands to Protect the Climate, Public Health, and Biodiversity" (July 27, 2016), attached as Ex. 5. 23 should listen to what the Obama administration's climate scientists have said on the importance of taking immediate steps to curb GHG emissions. In December 2015, U.S. EPA climate scientists with more than 25 years of professional experience in climate change, including work on the Intergovernmental Panel on Climate Change ("IPCC") reports, Dr. Christopher Field submitted a declaration in support of the President's Clean Power Plan that included a stark picture of the dire need to take immediate steps to keep fossil fuels in the ground in order to address the worst effects of climate change. Dr. Field states, "[i]f the world is to limit the likelihood of exceeding 2°C over pre-industrial temperatures, the window for cost-effective action is narrow and rapidly closing. A delay of only a few years will increase the likelihood of missing the target as well as the cost and complexity of reaching it."⁴⁵ With regard to the available global carbon budget for remaining within 2 degrees Celsius of pre-industrial times, Dr. Field's finding is dramatic: "at 2014 emission rates, we burn through the remaining budget of 900 billion tons of CO₂ in only 24 years. In every passing year without action, CO₂ emissions consume about 4% of the total remaining budget. Against this background, it is apparent why delaying emission reductions by even a few years can make a big difference for our prospects for staying within this budget and limiting the risks of severe consequences."⁴⁶ In the PEIS, BLM must address whether issuing new federal coal leases and renewals for existing federal coal leases is in line with the goals of our national climate objectives and international climate commitments, and it must do so in the context of the overwhelming state of science that tell us we must take immediate action to avoid irreversible climate harms. It appears very unlikely, given the state of scientific consensus around climate change, that efforts to meet our international climate commitments are compatible with leasing and burning federally-owned coal well into the future. Simply put, BLM must evaluate whether it is time for the U.S. government to get out of the business of selling taxpayer owned coal based on the urgent need to address GHG emissions and the desire to meet our national and international emission reduction goals. As explained by the Council on Environmental Quality in its 2014 Draft Climate Guidance, federal agencies evaluating the climate impacts of their decisions should "incorporate by reference applicable agency emissions targets such as applicable Federal, state, tribal, or local goals for GHG emission reductions to provide a frame of reference and make it clear whether the emissions being discussed are consistent with such goals."⁴⁷ This draft guidance, of course, does not impose any new obligations on agencies. NEPA regulations provide that federal agencies "shall discuss any inconsistency of a proposed action with any approved State or local plan," 40 C.F.R. § 1506.2(d), and further require agencies to disclose "[p]ossible conflicts between the proposed action and the objectives of Federal, regional, State, and local (and in the case of a 45 Declaration of Christopher Field, U.S. Environmental Protection Agency, in *West Virginia v. EPA*, Case No. 15-1363, Document #1586661, (D.C. Cir.) (filed Dec. 3, 2015) at 3, attached as Ex. 6. 46 *Id.* at 9-10. 47 Council on Environmental Quality, "Revised Draft Guidance on the Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in NEPA Reviews," 79 Fed. Reg. 77,802, 77,826 (Dec. 24, 2014) (emphasis added). 24 reservation, Indian tribe) land use plans, policies and controls for the area concerned." 40 C.F.R. § 1502.16(c). The U.S. has established several critical targets calling for the reduction of greenhouse gas emissions. Most prominently, earlier this year the U.S. signed the historic Paris Agreement, which represents an international agreement to limit global temperatures to 1.5-2°C above pre-industrial levels: This Agreement, in enhancing the implementation of the Convention, including its objective, aims to strengthen the global response to the threat of climate change, in the context of sustainable development and efforts to eradicate poverty, including by: (a) Holding the increase in the global average temperature to well below 2 °C above pre-industrial levels and to pursue efforts to limit the temperature increase to 1.5 °C above pre-industrial levels, recognizing that this would significantly reduce the risks and impacts of climate change. 48 To meet this threshold of safety, "deep reductions in global emissions will be required," and "Developed country Parties shall continue taking the

lead by undertaking economy-wide absolute emission reduction targets.”⁴⁹ Further, an increasing body of scientific literature indicates that to avoid the worst consequences of climate change, the vast majority of fossil fuel reserves must stay in the ground. President Obama expressed a similar point when rejecting a permit for the Keystone XL pipeline, stating: “if we’re going to prevent large parts of this Earth from becoming not only inhospitable but uninhabitable in our lifetimes, we’re going to have to keep some fossil fuels in the ground rather than burn them and release more dangerous pollution into the sky.”⁵⁰ For example, the IPCC has concluded that in order to have better than even odds of keeping global temperatures at tolerable levels, “cumulative CO₂ emissions from all anthropogenic sources [must] stay between ... 0 and 1000 GtC.... An amount of 531 [446 to 616] GtC, was already emitted by 2011.”⁵¹ This means that for the rest of century all nations on the planet can only emit approximately 470 GtC. To meet this limit, “between two-thirds and 48 United Nations, Framework Convention on Climate Change, Paris Agreement, Article 2 ¶ 1(a) (Dec. 11, 2015). ⁴⁹ Paris Agreement, Adoption of the Paris Agreement, Proposal by the President, Draft decision-/ CP.21, at 1; id. at Article 4 ¶ 4. ⁵⁰ The White House, Statement by the President on the Keystone XL Pipeline (Nov. 6, 2015), attached as Ex. 2, and available at <https://www.whitehouse.gov/the-press-office/2015/11/06/statement-president-keystone-xl-pipeline> (last visited July 28, 2016). ⁵¹ IPCC, Working Group I Contribution to the IPCC Fifth Assessment Report: Climate Change 2013: the Physical Science Basis: Summary for Policy Makers (2013) at 25. 25 four-fifths of the planet’s reserves of coal, oil, and gas” need to stay in the ground. ⁵² However, if unabated, “[b]urning all fossil fuels would produce a different, virtually uninhabitable, planet.”⁵³ A recent peer-reviewed article published in the prestigious research journal *Nature* concluded that if we are to keep climate change below dangerous levels – 80 percent of global coal reserves, half of all oil reserves, and a third of oil reserves must stay in the ground through 2050.⁵⁴ The United States must leave between 92% and 95% of its coal reserves in the ground. ⁵⁵ As President Obama affirmed recently, “climate change can no longer be denied – or ignored.”⁵⁶ In May 2016, the Stockholm Environment Institute (“SEI”) released a paper analyzing the reductions in greenhouse gas emissions that could be achieved by a policy of rejecting new lease proposals for fossil fuel extraction on federal lands and waters, and not renewing existing leases when their current authorization expires. The study explained the need for meaningful evaluation of strong policy choices in stark terms: “[e]ven with large-scale deployment of bioenergy and carbon capture and storage technologies, scientific assessments show that limiting warming to 2°C, and avoiding dangerous climate tipping points, will require a rapid phase-out of fossil fuels around the world. ⁵⁷ SEI ultimately concluded that under a choice to phase out the federal coal leasing program in favor of a “no leasing” alternative, “U.S. coal production would steadily decline, moving closer to a pathway consistent with a global 2°C temperature limit. ... Phasing out federal leases for fossil fuel extraction could reduce global CO₂ emissions by 100 million tonnes per year by 2030, and by greater amounts thereafter.” ⁵⁸ In addition to the Paris Agreement and the IPCC findings, the Clean Power Plan, implementation of which is currently stayed pending litigation, calls for reducing power sector ⁵² Bill McKibben, *Global Warming’s Terrifying New Math*, ROLLING STONE (Aug. 2, 2012); Bill McKibben, *Obama and Climate Change: The Real Story*, ROLLING STONE (Dec. 17, 2013). ⁵³ Hansen, et al., *Climate Sensitivity, Sea Level and Atmospheric Carbon Dioxide*, 371 PHIL. Erickson & M. Lazarus, Stockholm Environment Institute, *How would phasing out U.S. federal leases for fossil fuel extraction affect CO₂ emissions and 2°C goals?*, at 9 (May 2016) (citing Rogelj et al. 2011; IPCC 2014; Raupach et al. (2014)), attached as Ex. 7. ⁵⁸ Id. at 3. 26 greenhouse gas emissions to 30 percent below 2005 levels by 2030.⁵⁹ In November 2014 the President announced a joint U.S.-China agreement aimed at reducing climate pollution that calls for even more aggressively cutting net greenhouse gas emissions to 26-28% below 2005 levels by 2025,⁶⁰ which mirrors the United States’ Paris agreements. ⁶¹ Even assuming the Clean Power Plan is implemented as designed, in combination with other efforts, at least one study has concluded that the U.S. is unlikely to meet the 26%-28% reduction target without

deep additional cuts to GHG emissions, and that leasing additional coal will only make that job more difficult. 62 In order to comply with its NEPA obligations and the draft guidance provided by CEQ, BLM must evaluate whether continued expansion and operation of the federal coal program is consistent with the nation's GHG emission reduction goals and international agreements. BLM must be frank with the public and decisionmakers about the scientific consensus to leave fossil fuels in the ground in order to avert the worst impacts of climate disruption, and BLM must evaluate whether a decision to continue with the federal coal program would undermine our efforts to meet our national and international climate commitments. We are skeptical that business as usual in the federal coal program—or any new leasing at all—is compatible with achieving the interim goals of a 25%-28% reduction in U.S. GHG emissions by 2025, or 80% by 2050, let alone the goal of keeping global temperatures below 1.5- 2.0 degrees Celsius.

Comment Excerpt Text:

At the outset, BLM should identify the purpose and need for the programmatic EIS that is consistent both with the purposes of the federal coal leasing program and national policies to reduce U.S. greenhouse gas emissions from burning fossil fuels. In particular, the purpose and need of the EIS is to meet the nation's energy needs in a manner that is consistent with our nation's commitments to dramatically reduce domestic greenhouse gas emissions. An EIS must "briefly specify the underlying purpose and need to which the agency is responding in proposing the alternatives including the proposed action." 40 C.F.R. § 1502.13. This requirement is a key component of NEPA. "The EIS's purpose-and-need statement reflects both the agency's immediate objective ... as well as the broader policy goals that the agency considered in deciding among alternative proposals." *Protect Our Communities Found. v. Jewell*, No. 14-55666, 2016 WL 3165630, at *5 (9th Cir. June 7, 2016) (noting "the agency's duty to consider federal policies" in its NEPA review). Here, those policy goals necessarily include U.S. commitments in connection with the Paris Agreement to the United Nations Framework Convention on Climate Change ("UNFCCC"). To satisfy those commitments, the U.S. must reduce our economy-wide greenhouse gas ("GHG") emissions by 26-28% below 2005 levels by 2025, which will put us on a trajectory to achieve emission reductions of 80% or more by 2050.¹⁵ This goal is part of the broader commitment by the nearly 180 signatories to the Paris Agreement to limit global warming to "well below" a 2°C above pre-industrial temperatures, with a goal of limiting warming to just 1.5°C.¹⁶ One recent analysis concluded that 92% of U.S. coal reserves—including reserves already under lease—must remain unused to have even a 50% chance of remaining below the 2°C threshold.¹⁷ Secretarial Order 3338, which directs BLM to prepare the federal coal program PEIS, states that the purpose of the PEIS is "to undertake a comprehensive review of the [federal coal leasing] program and consider whether and how the program may be improved and modernized to foster the orderly development of BLM administered coal on Federal lands in a manner that gives proper consideration to the impact of that development on important stewardship values, 14 See *infra* § III.A. 15 See United States, UNFCCC submission *supra* note 11. 16 Paris Agreement, Article 2, FCC/CP/2015/L.9 (Dec. 12, 2015). 17 Christophe McGlade & Paul Ekins, *The Geographical Distribution of Fossil Fuels Unused When Limiting Global Warming to 2 °C*, 517 *NATURE* 187 (2015), attached as Ex. 3. 11 while also ensuring a fair return to the American public." 18 We largely agree with this statement.

Commenter I:Brenda Lindlief Hal

Comment Excerpt Text:

Until sweeping reforms addressing our concerns are in place National Wildlife Federation requests no new coal leases on our federal lands. We respectfully request that the BLM, the OSM, ONRR work in concert and for now that there be no new leases until coal companies are held fully accountable for complete reclamation of federal lands they have mined. No new leases until self-bonding is banned and surety bonds are in place to ensure complete reclamation. No new leases until we are assured of a fair return to taxpayers for the lease of federal coal and that there be transparency in the leasing process and that royalties are commensurate with the true costs of leasing coal.

Commenter I:Bill Schilling

Comment Excerpt Text:

In the "Federal Register" that talked about this program today, the EIA talked about a five-year cycle 2008 to 2013, where coal production was down by 16 percent nationwide. That's correct. But what that register fails to do and what the BLM and, I'm assuming, EPA and others combining forces in terms of research failed to mention is the cyclical nature of commodity production, and that needs be to accounted for in your research because minerals have a cyclical effect because of supply and demand, generally five- to ten-year cycles.

Organization I:

Commenter I: Wayne Stevens

Comment Excerpt Text:

Another theme at this meeting was that "coal does not get subsidies from the federal government." This statement is not true. Subsidies are received through mining on public lands where royalties are low. The Coal Industry gets or has gotten, billions of dollars of funding and loans from the US Government. The Coal industry has also gotten tax exempt and Build America bonds from the government for the construction of coal fired power plants. Coal fired power plants received funding for "retrofitting" power plants to comply with the Clean

Air Act. Another subsidy, albeit, hidden and at the end of useful life of a coal mine is the cost to reclaim the mining area.

No coal!

Comment Number: 0002145_Buchanan_20160513_IEEFA-10

Organization I: Institute for Energy Economics and Financial Analysis

Commenter I: Tom Sanzillo

Other Sections: 2

Comment Excerpt Text:

IEEFA proposes an alternative to the current system that incorporates the following major elements:

- Financing would come from a combination of private-sector borrowing and public-sector asset transfers (of coal), revenue and market guarantees (through price setting) and regulatory streamlining. This public-private partnership arrangement would will be faster, more certain and more accountable than the current system (see discussion on planning) below.

- All planning for new coal offerings would be the domain of the Department of Interior (10) in consultation with the Department of Energy (DOE). The first assignment of the DOI/DOE team would be to assess the true level of economically available coal under lease, various coal demand scenarios, (11) and an accurate read of the life cycle of existing mines. This analysis would provide the basis for determining if and when new coal reserves are needed. Based on this information, a system would be established for the federal government to take back leases from coal companies (many such mines will have no value and carry only liabilities). (12) The review should establish the broad parameters for the demand for coal in the U.S. and the role of federal coal in meeting that demand. The Departments, collectively and with the advice and guidance of Congress, would work with the coal industry to implement public policy goals. Coal producers would submit both long-term and short-term mining plans very similar to the planning analysis that currently takes place within each corporation under the current program design.

- Price-setting for the sale of coal would be done by a federal-state coal price commission. The Commission would establish prices that would cover a coal producer's reasonable operational costs (including full funding of pension and environmental liabilities), debt, and profit (reinvestment and dividends). The lower limit of the pricing structure would be driven in large measure by state public service commissions. They would set the lower price levels consistent with their mission to maintain affordable and reliable electricity to residents. The price would be set at the upper limit by establishing a national energy adjusted average for the price of coal sold in the rest of the country (outside the PRB) through traditional market mechanisms. The Commission would be bound by these upper and lower limits and set annual prices according to their own methodology.

- Prices would be established annually to allow for changing market conditions and state variations. Adjustments on a year-to-year basis could be established very much like that used in rate-setting for regulated utilities. A price-setting committee could consist of representatives of the Department of Energy, Department of the Interior, Office of Management and Budget, Securities and Exchange Commission (13) and two members selected by the National Governors Association and two members selected by the National Association of Regulatory Utility Commissions. Staff from the Department of Energy would be responsible for technical monitoring and data inputs necessary to maintain real-time changes. DOI would be required to maintain basic financial and economic data required to ensure market balance and adherence to national policy directives. The Department of Interior would be the lead staff and prepare all documents and studies necessary to set annual prices and keep committee members informed. All of this information should be presumed to be public information for the purpose of stimulating and maintaining a robust environment for external review.

- Coal producer borrowing for any venture outside of mining operations for mines under contract with the federal government would have to receive the approval of the Department of Interior in consultation with the

price-setting Committee. As a matter of national security and to protect against reckless speculation, coal exports would be prohibited. Such prohibition would cover mine acquisitions outside the U.S., mine acquisitions inside the U.S. to be used for exports, and port and rail projects related to exporting coal.

- Consistent with the public-private partnership, the lease program would establish standards for coal producers based upon coal producer competencies in coal mining and production efficiencies, not the gaming of a government program.
- Royalty policy would be amended. The current policy of dividing coal royalty revenue between the federal and state government lacks a rationale. The federal portion of the money goes for general funding purposes at the federal level, and states tend to do much of the same with some targeting money to coal infrastructure and other coal-related programs. The federal portion of the royalty money should instead be set aside to satisfy coal liabilities: 1) to establish a new arrangement where coal producers and the federal government share responsibility for coal reclamation cleanups (bonds should be required of coal producers for their portion, self-bonding should be eliminated, and the federal government should set aside an actuarially-sound portion of federal coal revenues to meet their portion of cleanup costs) and 2) to provide additional set-asides for coal miner employee pensions.
- For the first six years of the Committee's existence, the Inspector Generals from both the Department of Energy and Department of Interior would be required to conduct bi-annual oversight evaluations (14) of price setting and other related program elements to insure: 1) adherence to internal control procedures; 2) proper accounting for coal price setting and underlying valuation mechanisms; 3) proper accounting for the levels of government support of coal production and coal producers; 4) protections against fraud and abuse; 5) assessments of methods used by state public service commissions to establish the price floor, the methods used by the Commission to establish the ceiling and to establish an annual coal price; and 5) assessments of the impact of lobbying and political interference on the program design and model.
- Consistent with the management of an ongoing public-private partnership, the BLM would retrain staff and add new competencies to secure the benefits sought on the government side of the equation. BLM would need to hire at a minimum: 1) expert investment specialists with core competencies in infrastructure development (supported by individuals that possess an understanding of institutional investment asset allocations); 2) mining engineers and mine operators; 3) labor experts; 4) energy planners and 5) negotiators with competency in business, contract and budget negotiations.

IEEFA has commented extensively on the federal coal leasing program in the past, (3) beginning with our Great Giveaway report in 2012, which demonstrated that the coal lease program had not been audited in 30 years, recommended a moratorium, and prompted several federal investigations of the program. IEEFA provided extensive comments on the DOI Inspector General's audit of the program in 2013, commented on proposed royalty reforms in 2015, and testified at Bureau of Land Management (BLM) "listening sessions" in 2015. Our research on the coal industry is informed by continuous monitoring of companies, coal production and pricing trends.

An example of the industry's failure to grasp new market realities is the outlook that Peabody Energy projects in its bankruptcy filings. Rather than recognizing the shrinking markets and persistent low prices, Peabody's plans for success require increases in natural gas prices and a more robust global market to support the new entity as a going concern. (5) Neither of these trends in the cards for the foreseeable future, yet this is the position of the largest holder of federal coal leases.

In 1979, one political commenter, Guy Paul Land, made a salient observation on why the courts are sometimes asked to resolve problems that are more appropriately the domain of legislative and executive action. The political dynamic he describes can clearly be applied to coal policy in the U.S. today:

"Perhaps the most crucial factor shaping the increased resort to the courts—and the one with the most important long-term consequences—is the growing dissatisfaction and disillusionment with the ability of representative assemblies, at whatever level, to reflect accurately, efficiently and effectively the desires of the people whom they presume to represent. Over the past decade, public opinion polls have shown a consistent decline in the American public's belief in the efficacy of Congress to solve major problems or protect private rights ... In the view of many Americans, their representatives are more the voices of large, organized special interests and less the spokesperson for individual constituents. In short, there is a growing feeling among the public that many of its elected officials and their agents cannot or will not adequately serve the individual interests and needs of the members of society."

Comment Excerpt Text:

The PEIS and the moratorium that accompanies it come at a time of energy transition in the U.S. The coal industry's widespread financial distress has now moved from being a principally Central Appalachian phenomenon to the Powder River Basin. Three of the largest holders of coal leases on western land—Peabody Energy, Alpha Natural Resources, and Arch Coal — have declared bankruptcy. Most of the coal producers in the U.S. presume that bankruptcy will allow them to get rid of burdensome debt and liabilities, close some mines, and emerge as new companies, leaner and able to operate as going concerns.

This presumption is false because it assumes there will be an ongoing, stable demand environment for coal (and that demand may even increase) and that coal prices will rise. It ignores the reality that the coal industry is undergoing a structural realignment, caused by shrinking demand for coal in the United States and globally.

Comment Excerpt Text:

The federal coal lease program is also built on a cornerstone belief in constant growth, whether it be slow and steady or more aggressive. The federal government expects coal producers to apply for new sites when there is a market for the coal and it always presumes a market for coal, more or less. Prior coal lease moratoria always took place when the industry and the federal government were facing growth and coal market expansion. This is not the case in the current environment.

Finally, Anna Zubets-Anderson provided the perspective of a credit rating company on the current status of coal mining companies. She noted that the credit ratings for coal companies have declined quite sharply in recent years, and that the outlook for the coal industry is negative. She said that companies that recently reorganized

under Chapter 11 are better situated in many instances than the companies that have not filed for bankruptcy, but this does not change the long-term outlook for these companies. She concluded by saying that, even if gas prices go up, the credit ratings of coal companies will likely remain low due to the regulatory environment.

The panelists generally agreed that a build-out of gas pipelines and export facilities would boost natural gas prices, at least regionally and under certain circumstances, by connecting the Marcellus and Utica shale plays to national and international markets, and that the coal industry would benefit from this price increase. However, they also generally agreed that U.S. coal would benefit relatively little over the long term from changes in Asian markets, because of the competition they would face from producers across the Pacific.

Comment Excerpt Text:

Colleen Regan noted the recent crescendo in coal-fired power plant closures—14.5GW in 2015—and anticipated that additional closures would follow in the coming years. She said that four key non-regulatory factors account for this: oil and gas prices have fallen to historic lows; renewables are putting downward pressure on electricity prices; steady improvements to energy efficiency are keeping rates of electricity demand flat; and increasing usage of demand side management tools are shaving peaks off of high-demand days and with them higher electricity prices. In addition to these factors, Regan also observed that U.S. coal plants are generally quite old, meaning that they are not good candidates for the addition of emissions control equipment. David Schissel echoed several of Regan's points, illustrating some of them with the example of seven plants in Texas whose financial profiles have been undermined by natural gas and renewables, as well as by compliance requirements related to the newly issued Haze Rule. Schissel also pointed out that an enormous volume of natural gas capacity—16GW in PJM alone—will shortly come online, that wind capacity factors are rising nationwide, and that coal is in many instances no longer providing base load power, but only load-following or peaking service. Clark Williams-Derry supplemented Regan and Schissel's description of domestic electricity sector dynamics with several points about international markets for coal, and metallurgical coal in particular. He described the recent history of the Pacific rim market as featuring two bubbles: the general commodities bubble that ended with the 2009 crash, and a bubble specific to Chinese metallurgical coal demand that burst in 2012. Williams-Derry described how U.S. coal companies engaged in a bidding war for assets and firms in Australia and elsewhere in the run up to the burst of the second bubble, in the hopes of offsetting losses in the U.S. with sales abroad. That resulted in those companies paying top dollar at the height of the 2011 coal price peak and then facing a sharp downturn in coal prices and demand as China reduced its demand for coal and as multiple competing sources of coal came online in Australia, Indonesia, Russia, within China, and elsewhere. The acquisition of these overpriced assets, coupled with a generally unforgiving U.S. market for coal, pushed several firms into bankruptcy. All three panelists agreed that fluctuations in natural gas prices would lead to occasional departures from U.S. coal's secular downward trend, but that the growth of renewables and storage would continue to gnaw away at an accelerating rate at the basic underpinnings of coal's place in the electricity sector.

Comment Excerpt Text:

The panelists described different facets of the coal marketplace, but all—implicitly or explicitly—highlighted the relevance of policy to coal’s future. Howard Gruenspecht of the U.S. EIA noted that about 95% of coal consumed in the U.S. is burned to generate electricity, but that EIA’s projections had included no new coal-fired plants since 2012 owing to several factors. That particular projection did not change in a modeled scenario in which the Clean Power Plan never entered into force. However, other EIA projections reflect significant negative effects of the CPP on coal production in the Powder River Basin, and lesser but still notable effects in the Illinois Basin and Appalachia. Gruenspecht also pointed out that EIA does not anticipate that prospective changes in international demand will offset the large secular declines expected in domestic markets. Tony Yuen titled his presentation “a duel between policy and markets,” and summarized the scenario facing coal in this way: the U.S. pie (i.e., the domestic electricity marketplace) is shrinking owing to renewables growth, efficiency gains, and demand side management, but international coal consumption is likely to continue at its current rate, and the coming rise in natural gas prices is likely to slow or stop coal’s recent slide in the near term. In consequence, policy, by putting a thumb on the scales in one direction or another, will matter a great deal to coal’s prospects.

Ted O’Brien described 2011-2015 as a disastrous window of years for U.S. coal, but also described relatively rosy prospects for coal in the near future. He said that prices have jumped in recent months—and even days—owing to several sources of novel international demand (notably including mandated limits on Chinese coal mine production) and hiccups in several Australian mines. He also said that coal-to-gas switches in the U.S. electricity sector would likely reverse in several instances as natural gas prices rise in the coming year.

Comment Excerpt Text:

Professor Ed Morrison began the panel with an overview of bankruptcy law and the procedural aspects of bankruptcy proceedings for coal companies. He noted that there has been a significant increase in bankruptcy in the past few years, with nearly 40 filings in 3 years by mid-2015. While 50% of the recent filings are liquidations under Chapter 7 of the Bankruptcy Code, the largest coal companies have filed for bankruptcy under Chapter 11. Under Chapter 11, the debtors can seek to adjust and reorganize debts in order to keep the business alive and pay creditors over time. There are several approaches to Chapter 11 bankruptcy. The first is a traditional bargaining procedure whereby the debtor proposes a plan of reorganization, the creditors vote on it, and if enough creditors support the plan, the debtor can override dissent by showing that the plan complies with certain rule. This process can take years to complete. There are also two faster approaches to bankruptcy which have become increasingly common: the debtor can sell itself to a buyer during bankruptcy, and the cash is distributed in order of priorities to creditors, or the debtor can pre-negotiate a plan with creditors before it enters bankruptcy. Several coal companies, such as Patriot Coal and Arch coal, have opted to sell all or part of the company during their bankruptcy proceedings. Professor Morrison also highlighted several “wrinkles” in the bankruptcy proceedings for coal companies. First, he noted that the automatic stay which occurs during bankruptcy proceedings (which stops nearly all creditors from pursuing action against a debtor) does not stop the government from obtaining an injunction to enforce clean-up of a mine site. Second, he noted that it can be difficult to assign a value to future harms and clean-up costs during the claims valuation process, which means that these financial obligations may be undervalued during the process. Third, he noted that debtors can typically abandon burdensome properties, and that coal mine properties might fall into this category (however, the Supreme Court has held that you cannot abandon

property if it poses an imminent risk of harm to the public). Fourth, he noted that collective bargaining agreements and pension and employee benefits can be terminated in bankruptcy proceedings under § 1113 of the Bankruptcy Code, if termination is necessary to complete reorganization (2nd Cir.) or liquidation (3rd Cir.).

Comment Excerpt Text:

I am writing in opposition to Senator Daines beliefs - It is Not absurd that the Obama administration recognizes the long term effects of burning coal on the health of the planet , its people and all living beings with which we share the planet. While it is true that we will need to burn coal for the foreseeable future, it is NOT true that we must live with the unhealthy effects of coal for many generations.

Therefore I stand WITH the President of the United States in his recognition of what we have done to the our (at this point in time) only home. The regulations are not job killing. Coal miners and operators of plants can learn new jobs in the industries that are better for all of us.

Comment Number: 0002216_Bard_20160619-1

Commenter I: Eric Bard

Comment Excerpt Text:

Even without considering climate change, strip mining, developing, and burning of coal has a high cost to our environment, creates air pollution, and is a detriment to our economy in terms of limiting recreation and tourism potential on and around our public lands. We also know that coal use is driving increased global warming/climate change as a major contributor of greenhouse gases to our atmosphere.

Comment Excerpt Text:

The coal industry is in a period of rapid transition as the United States and world energy markets shift speedily away from coal due to changing fuel prices, concerns of over carbon pollution, and the development of cleaner, often cheaper, fuel and energy sources. Unlike other periods in coal's history, these changes appear to be long term and signal the end of the dominance of coal as a source of electric and power generation. It is important DOI and BLM's reform of the coal program account for this seismic shift in the coal and energy sector.

Until recently, coal had been by a significant number the primary source of electricity generation at over or about 40% of all generation, but production and use are falling fast. (78) The numbers paint a clear picture. In 2016, coal production is on pace to fall 16.7%, a 25% decrease in coal production since 2014. The largest production cuts to come from the Appalachian and western regions, at 15% and 20%, respectively. (79) This falling production comes in the face of falling demand. According to the U.S. Energy Information Administration, domestic coal-fired generators burned an average of 948 million tons annually from 1997 through 2015 compared to a projected 682 million tons for 2016. (80) Last month, the government projected coal would account for roughly 31% of the nation's electricity needs to natural gas' 33.9% in 2016, but the latest projections have coal providing roughly 30.5% of generation to natural gas' 34%. (81)

Commenter I:Mark Compton

Comment Excerpt Text:

Coal is a Critical Energy Resource for Utah and the World

Most of the coal produced in Utah stays in Utah, and almost all of that goes to generate electricity. In fact, coal provides roughly 75% of the electricity in the state. It's no coincidence that states like Utah with high levels of coal generation of electricity offer the lowest electricity costs in the country.

That low cost of electricity is good for Utah families and businesses. Energy costs are rising, in part due to short-sighted regulations that make coal-fired electricity generation costly if not impossible. Families are paying a higher and higher percentage of their monthly income towards energy, forcing them to forego other expenses and in some cases making it difficult just to pay rent.

Utah is well-known nationally as a business friendly state, with a low burden of regulation and low cost of doing business. One of Utah's advantages to attracting businesses, manufacturing and high-tech jobs is our low cost of electricity. Affordable coal-generated power makes Utah more competitive and a great place to do business and raise a family.

Gunnison County is home to historic and active coal mining. The northern area of the county includes part of the Somerset coal field, where production totals averaged approximately 11.2 million tons per year for the five years ending in June 2014.¹ Production for the year ending in June 2015 was 8.009 million tons.² The BLM currently manages several active and proposed federal coal leases at the West Elk mine in Gunnison County. The West Elk is an actively producing long-wall, underground coal mine, producing approximately 5.2 million tons of coal in 2015.³ It is owned by St. Louis-based Arch Coal Company, which filed for bankruptcy in January.⁴

Comment Excerpt Text:

Federal coal is a large share of total U.S. coal production. In 2015, 409 million tons of coal was extracted from federal coal leases, 13 more than 43 percent of total coal production nationally (943 million tons).¹⁴

Federal coal extraction is located predominantly in the West. In 2014, Wyoming hosted 80 percent of total federal coal extraction, and combined with Colorado, Utah, New Mexico, and Montana, the West hosts over 98 percent of all federal coal extraction.¹⁵

Coal extraction is highly concentrated geographically. Nationally, the BLM administers 306 coal leases.¹⁶ As of February 2015, active BLM coal leases were located in 47 individual mines located in 28 counties, including seven counties in Colorado, five counties in Wyoming, and four counties in Montana.¹⁷

Federal coal production has grown significantly in the last 40 years. Federal coal increased from 130 million tons in 1982 (15% of total U.S. production) to a high of 507 million tons in 2002 (46% of total U.S. production).²⁴

Productivity advantages and declining rail shipment costs in the Powder River Basin led to a shift in coal extraction from the East to the West.²⁵

Comment Excerpt Text:

Less coal will be produced in the future. More recently, federal coal production is down from a high of 482 million tons in 2015.

Production is expected to remain at lower levels for several reasons:

-Hundreds of coal-fired power plants have retired since 2010. Retirements tended to be older and smaller plants and account for only a small share of total coal generating capacity. Coal-fired retirements in 2015 totaled 4.6 percent of total coal-fired generating capacity.²⁶

-New capacity is being added in natural gas and renewable energy.

-Competition with natural gas has resulted in decreased utilization of existing coal-fired power generation capacity. The average capacity factor (the rate at which coal-fired power plants are operated) for coal plants declined from nearly 70 percent in 2010 to 55 percent in 2015.²⁷ The reduction in utilization reflects increased competition with natural gas which is displacing coal generation.

Principal Recommendations.

While we include specific recommendations with each section of these comments, we wanted to highlight some of the key recommendations for the preparation of the PEIS and reform of the federal coal program, which include:

- The coal program must be designed and implemented in the "public interest" and must provide a fair return to taxpayers.
- The process for determining lands "acceptable for further consideration for leasing" must be fully complied with at the land use planning and leasing stage, including applying and updating the unsuitability criteria, considering effects on other multiple uses and developing a reasonably foreseeable development scenario
- The BLM should "take control" of the federal coal leasing program and develop a multi-year leasing program that replaces the current, industry-driven lease by application process, and can incorporate applicable elements from the Solar PEIS and oil and gas Master Leasing Plans.
- BLM must put in place a regional mitigation strategy based on landscape scale analyses to support coal leasing decisions, and coal leasing must proceed only if it is shown there will be a "net benefit" to society resulting from leasing and development.
- BLM must address climate change impacts and commitments by tracking emissions, analyzing impacts,

developing a carbon budget and applying compensatory mitigation where impacts cannot be avoided or sufficiently minimized.

· The PEIS should include planning for a future with declining coal production, addressing socio-economic impacts and considering tools to assist coal-dependent communities.

Comment Excerpt Text:

Due especially to the time since the last programmatic review, many of the central, underlying elements of the federal coal program need to be reviewed and updated in the PEIS. These include the definition of “public interest,” fair market value, royalties, rental rates, bonus bids, bonding standards and qualifications to hold a federal coal lease. Ensuring these elements are defined and updated in a manner that fulfills the BLM’s commitments and obligations as steward of our public lands is a vital part of ensuring the federal coal program is operated responsibly.

BLM must consider the cost to the coal industry of making it impossible to develop coal resources, without incurring costs that will cripple the industry. The cumulative activities across various Federal agencies and departments ranging from this government action, to Planning 2.0, to the ONNR rules, to the OSM rules, must be considered before moving forward with the PEIS, because in many cases the concerns raised here have already been addressed, or are currently being addressed. These tiered actions not only create redundant compliance issues, but will increase timing of permitting instead of simplifying the process.

Other Sections: 1

Comment Excerpt Text:

Throughout the public listening sessions on changes to the federal coal program, BLM and Department of the Interior officials were bombarded with claims about “loopholes” in the royalty valuation system and underpayment of royalties by coal producers. These allegations were almost always based on two so-called “Headwaters Studies.”⁷ Headwaters Economics (“Headwaters”) is an environmental advocacy group that falsely claims to be independent and non-partisan. Cloud Peak Energy incorporates by reference its comments on BLM’s coal listening sessions and the attached peer review on the

Headwaters Studies that refute its claims to be “an independent, non-partisan organization.” See Attachment 8, Energy Ventures Analysis, “A Peer Review of Previous Studies by Headwaters Economics” (Sept. 16, 2015).

(7) The Headwaters Studies are available at <http://headwaterseconomics.org/wphw/wp-content/uploads/Report-Coal-Royalty-Reform-Impacts.pdf>.

In two advocacy pieces (January 2015 and May 2015), Headwaters claimed to show that a “loophole” existed in current ONRR royalty valuation of non-arms’ length transactions and that coal producers evaded full royalty payment even in arms’ length transactions. Despite the fact that ONRR receives the sale contracts and details for every sale of federal coal and could readily contradict these unfounded allegations by Headwaters, ONRR has chosen not to do so. Cloud Peak Energy therefore contracted Energy Ventures Analysis (“EVA”) to undertake a peer review of the Headwaters Studies to determine if their data and methodologies were sound. The EVA peer review report categorically demonstrates that Headwaters used faulty data to draw unsupported conclusions and that the allegations of “loophole” exploitation to evade full royalty payment, as well as claims of underpayment of royalties on arms’ length transactions, are patently false. The EVA peer review arrived at the following conclusions:

- There is no basis for Headwaters’ conclusion that a calculated netback mine price is higher than the FOB mine price that producers report to ONRR.
- Headwaters made significant errors in its estimation of federal coal production, which distorted its results.
- The “data” relied upon by Headwaters—prepared by a third party service—on coal sales prices FOB mine do not constitute data. The information relied upon by Headwaters was merely an estimate, with large errors that distorted the analysis.
- The proposed changes to the methodology for valuing federal coal for royalty purposes suggested by Headwaters are neither “transparent” nor “efficient.”
- Headwaters has no basis to speculate that there is a large “loophole” exploited by affiliates and unnamed “brokers” to avoid royalty payments.
- The current valuation system is already “transparent” to the only entity that matters – ONRR.

As the peer review conducted by EVA will be filed electronically and made part of the public record, Cloud Peak Energy requests that any responses by BLM to stakeholders based upon mention of the Headwaters Studies be directed to the EVA peer review so that the public can better understand how they were manipulated by this organization. Furthermore, as part of its review of the federal coal program, BLM should reject the Headwaters Studies as unsupported and unreliable.

Comment Excerpt Text:

The federal coal program plays a critical role in meeting America’s domestic energy needs. According to the U.S. Department of Energy, coal is the largest domestically-produced source of energy in the United States.⁸ Over the last few years, approximately 41% of America’s coal production has occurred on federal lands. 81 Fed. Reg. 17721. In 2015, federal coal generated an estimated 14% of the electricity in the United States. Id. And when combined with state and private generation, coal accounted for 33% of the domestic energy portfolio. See Attachment 11, U.S. EIA, “What is U.S. electricity generation by energy source?” (Apr. 1, 2016). The generation of federal coal provides electricity and heat for millions of Americans every year. The significant contribution of federal coal to the energy sector and the American public is made possible through BLM’s administration of 306 federal coal leases, which contain approximately 7.75 billion tons of recoverable coal. 81 Fed. Reg. at 17721.

(8) The Department of Energy's discussion on domestic coal is available at <http://energy.gov/coal>.

Federal coal contributes to the domestic energy economy in several significant respects. First, coal provides a reliable, abundant, and cost-effective source of electricity compared to other energy sources. Historically, states that utilize coal-fired electricity have enjoyed lower electricity costs and less price fluctuation than those with little or no coal-fired electricity. Not only has the price of coal generally been more stable than alternative energy sources, but coal has also historically benefitted electricity consumers by creating a competitive market with natural gas, nuclear, and other electricity fuel sources.

Second, coal strengthens the domestic energy market by creating independence from foreign energy sources. Foreign energy independence protects the United States and the American people from disruptions in global energy supply and corresponding price fluctuations. Third, federal coal supports both local and national economies by providing an important source of jobs for coal miners and other professionals in industries related to coal production, transportation, and combustion. (For a general discussion of the economic benefits of federal coal, see Attachment 12, the comprehensive report by University of Wyoming Professor Timothy J. Considine, "Powder River Basin Coal: Powering America" (2013)). In short, the shift away from federal coal in America's energy portfolio would have deleterious consequences to the American public by substantially and unnecessarily increasing domestic energy costs and increasing price volatility for American electricity consumers.

Comment Excerpt Text:

BLM should consider the following facts and specific recommendations during its PEIS review:

- The current administration has targeted America's coal industry through a series of unlawful regulatory and administrative actions. Given the administration's unwillingness to conduct a fair and objective review of the federal coal program, BLM should lift the federal coal leasing moratorium pending its completion of the PEIS. Cloud Peak Energy also requests that BLM disavow the biased White House Coal Report.
- Although the Secretary has directed BLM to undertake a review of the federal coal program through the PEIS, BLM and federal courts have recently and consistently rejected the notion that a significant overhaul of the federal coal leasing program is legally warranted.
- In determining the FMV of federal coal, BLM should consider federal coal lessees' significant financial contributions to the American people, which we believe are unparalleled across any industry in the United States and clearly represent more than a "fair share."
- BLM should retain the current royalty rate and other leasing costs in order to ensure the continued leasing and production of federal coal in accordance with the MLA. Any increase in coal leasing costs would discourage federal coal development, while also reducing federal and state revenues from future coal lease payments.
- BLM should carefully and thoroughly evaluate the impacts of federal coal program reform on state and local communities through meaningful collaboration with coal-producing states concerning socioeconomic impacts related to federal coal mining.
- BLM should implement the recommendations in the IG Report and GAO Report and evaluate their effectiveness prior to undertaking an unnecessary overhaul of the entire federal coal program. In addition, BLM should reconvene the Royalty Policy Committee to undertake a detailed review of the complex royalty and revenue changes contemplated by BLM in its review of the federal coal program.
- BLM should retain the existing LBA framework, while considering ways to streamline the permitting process and reduce the economic burdens on federal coal lessees.
- BLM should not raise the royalty rate on federal coal production. Any increase in the royalty rate would result in the decreased FMV for federal coal leases and decreased lease bonus payments to federal and state governments.

- BLM should acknowledge, as it did in 2011, that it may not legally impose climate change fees or other climate-related fees under the MLA or any other federal statute. Any increase in coal leasing or production costs to advance the administration's political climate objectives would be unlawful.
- BLM should consider the adverse socio-economic impacts that would result from increased costs on federal coal production. Any increase in coal leasing costs would discourage the production of federal coal and thereby diminish the significant benefits to state and local communities dependent on federal coal production.
- BLM should consider the important role of federal coal in meeting America's domestic energy needs, including the benefits of low-cost, reliable electricity, independence from foreign energy sources, and jobs for workers in coal and coal-related industries.

BLM manages federal lands under the Federal Land Policy and Management Act (“FLPMA”) of 1976. This Act requires federal lands to be managed on the basis of multiple use in a combination “that will best meet the present and future needs of the American people.”³³ The multiple use definition also articulates that BLM should manage federal lands to account for “the long-term needs of future generations for renewable and non-renewable resources, including, but not limited to, recreation . . . natural scenic, scientific, and historical values.”³⁴ BLM’s interpretation of the multiple-use mandate through the federal coal program has historically been narrowly tailored around maximizing coal recovery through lease by application, which nominally aligns with the multiple use mandate because other federal lands are set aside for other uses such as recreation or conservation.

Comment Excerpt Text:

Leasing programs should recognize the permanent downward trend in the coal market and the likelihood that coal’s share will continue to shrink as the U.S. and the rest of the world pursue climate goals. This decline may outpace the reductions envisioned in the Clean Power Plan as domestic and international climate action accelerates, and as the costs of renewable energy continue to decline. Ultimately, coal production must virtually come to an end altogether if we are to have any hope of maintaining a relatively stable climate.⁴¹ The date for the eventual end of the coal program is within sight, potentially within 20 years, and almost certainly by no later than 2050. This necessary phase-down should be a prominent consideration as Interior undertakes this programmatic review, in order to ensure both climate consistency and an orderly transition to a post-coal economy nationally and in areas currently dependent on coal mining for vital revenue streams.

[41 In 2015, the United States added more wind (8.6GW) and solar (7.3GW) capacity than natural gas (6GW). Already competitive with fossil fuel generation, additional cost declines in renewable energy demonstrate why these technologies are a more effective tool for carbon pollution mitigation. Comment Excerpt Text:

The inter-relationships between net national environmental, economic, security and social impact and benefit factors linked within a comprehensive and accurate fair market analysis are numerous, complex and continually evolving, including competing energy resources, and hard to forecast externality factors such as geopolitical changes and large influential events. See University of Wyoming Center for Energy Economics and Public Policy- May 2015- The Impact of the Coal Economy on Wyoming, (WY0-00922 to 00931). For example, the Oil Embargo and Energy Crisis of the 1970s contributed to adverse economic conditions in the U.S. for approximately a decade and motivated use of domestic coal to strengthen energy and economic security and social wellbeing of American citizens. Therefore, an effective federal coal program must be designed to be highly agile to be continually competitive within global market and geopolitical dynamics and to thereby provide the best possible fair return to the American public over multiple decades.

2. Just Transition Alternative

The “Just Transition Alternative” is meant to both wind down the federal coal program in order to keep fossil fuels in the ground and to ensure an orderly, effective, and fair transition of workers and communities away from coal to more prosperous and sustainable economies. The “Just Transition Alternative” is defined by the following key components:

1. An end to federal coal leasing: Consistent with authorities and discretion under the Mineral Leasing Act, the Just Transition Alternative imposes a permanent pause on the leasing of federal coal. The primary basis for adopting this permanent pause would be to ensure the protection of the public interest and the interests of the United States. Such justification for an end to leasing is clearly supported by the Mineral Leasing Act. This pause would apply to all competitive leases (including all leases by application, including emergency leases, as defined by 43 C.F.R. § 3425.1-4) and lease modifications. We further believe there is ample justification for applying a permanent pause to other forms of non-competitive leasing, such as preference right lease applications and lease exchanges. With regards to lease exchanges, the BLM has clear authority to reject exchanges that are not in the “public interest.” 43 C.F.R. § 3435.4(a); see also 43 C.F.R. § 3436.0-2(b) (related to alluvial valley floor exchanges) and 43 C.F.R. § 2200.0-6 (generally related to exchanges). With regards to preference right lease applications, the BLM has the authority to reject such applications where there does not exist “commercial quantities” of coal. 43 C.F.R. § 3430.5-1(a)(1). Given the dismal state of the coal industry and the overwhelming

climate costs that coal imposes on society, it would be dubious at best to claim that any commercial quantities of coal exist where there are preference right lease applications. Accordingly, the BLM has the authority to reject such applications. (20)

Furthermore, to ensure an orderly end to federal coal leasing, the BLM and the Department of the Interior should issue a rule or guidance requiring that as land management planning is undertaken pursuant to 43 C.F.R. § 1610, et seq., that all lands within a resource management area that are not currently leased for coal, be made unavailable for leasing. The authority to impose such direction is set forth at 43 C.F.R. § 3420.1-4(e), which gives the BLM broad discretion to “eliminate additional coal deposits from consideration to protect other resource values.” 43 C.F.R. § 3420.1-4(e)(3).

(20) The only preference right lease applications that exist are in northwestern New Mexico, where Arch Coal, which is currently bankrupt, has the rights to acquire 21,000 acres of leases. Legislation was introduced in the U.S. House of Representatives that would allow the Secretary to retire these preference right lease applications. See HR-1820, available online at <https://www.congress.gov/bill/114th-congress/house-bill/1820/text>. If this legislation is passed, there would be no additional preference right lease applications requiring action. We support this legislation and urge the Secretary of the Interior to encourage its passage in the U.S. Senate and adoption into law.

Putting a permanent pause on leasing will not destroy the U.S. economy or otherwise endanger our energy security. As a recent report looking at leasing in the Powder River Basin found, existing leased reserves in the Powder River Basin are sufficient to meet demand and effectively contribute to limiting temperature increases.

(21) This report is instructive as the Powder River Basin is the largest coal producing region in the United States and imposes the greatest influence on energy supply and demand in the nation. If an end to federal leasing can be justified in the Powder River Basin, it can be justified for federal leasing elsewhere in the U.S.

21 See Exhibit 11, Fulton, M., D. Koplow, R. Capalino, and A. Grant, “Enough Already: Meeting 20C PRB Coal Demand Without Lifting the Federal Moratorium,” Report Prepared for Energy Transition Advisors, Earth Track, and Carbon Tracker Initiative (July 2016), available online at <http://www.carbontracker.org/report/enough-already-2c-powder-river-basin-coal-demand-federal-moratorium/>.

2. Increased royalty rates and rentals: Coal is exacting a tremendous toll on our nation, costing our society billions in climate damages, adverse health impacts from air pollution, and water contamination. Royalty rates from production on existing coal leases and rentals on existing leases must be increased to begin to recoup the costs of these externalities, which are currently shouldered by the public.

Although royalty rates are normally imposed through new leasing, we recommend that the Interior Department and BLM incorporate higher royalty rates into existing leases as existing leases are readjusted pursuant to 43 C.F.R. § 3451.1. To accomplish this, we urge the amendment of 43 C.F.R. § 3473.3-2(a)(1) and (2) to incorporate increased royalty rates for both surface and underground mining. As leases are readjusted, these royalty rates must be applied to existing leases pursuant to 43 C.F.R. § 3451.1(a)(2).

Increasing royalty rates has been recommended by the White House as both a means to generate revenue and address the costs of environmental externalities, including carbon costs. (22)

(22) See Exhibit 12, Executive Office of the President of the United States, “The Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to Taxpayers” (June 2016), available online at https://www.whitehouse.gov/sites/default/files/page/files/20160622_cea_coal_leasing.pdf.

Furthermore, royalty rate reductions should not be approved. Currently, royalty rate reductions are routinely granted as companies claim poverty or difficulty in mining with little apparent scrutiny as to whether the reductions are justified. In Colorado, for example, BLM officials have approved royalty rate reductions to facilitate methane venting and most recently proposed to approve a retroactive royalty rate reduction for a mine that was not even producing coal. (23) See Exhibits 13 and 14.

Similarly, we urge Interior and BLM to amend 43 C.F.R. § 3473.3-1(a) to raise rental rates for federal coal leases. Currently, rental rates are set at \$3.00 per acre, a figure that has not been adjusted since 1979, if not earlier. This rental rate not only has failed to be adjusted to account for inflation, but fails to account for the fact that some leases may be of small acreage, yet yield significant amounts of coal. Rentals should reflect the value of the lease, which depends on the amount of coal a lease contains. In accordance with 43 C.F.R. § 3473.3-1(a), any increased

rental rate must be applied to any readjusted coal lease.

3. Existing leases that are not producing must be canceled: Where a lease is not meeting continued operation requirements under 43 C.F.R. § 3483.1(a)(2), it is subject to cancellation pursuant to 43 C.F.R. § 3452.2. Where a lease is not meeting continued operation requirements, BLM and the Interior Department should make clear that cancellation of the lease must be pursued. To this end, discretionary avenues for avoiding cancellation should be prohibited. Thus, lease suspensions under 43 C.F.R. § 3483.3 and payment of advanced royalties in lieu of continued operation under 43 C.F.R. § 3483.4 should be barred.

The justification for imposing such direction is very clear. Currently, BLM regularly grants lease suspensions and allows payment of royalties in lieu of continued operation with no assessment of whether such actions are appropriate or in the public interest. BLM appears to be under the impression that lease suspensions or advanced royalties are somehow mandated, and that the agency has no choice but to approve company requests. An egregious example of this is with regards to Arch Coal's Carbon Basin Lease in southern Wyoming (No. WYW-139975). Arch acquired this lease with the aim of developing a mine to fuel a proposed coal to liquids facility. However, this coal to liquids facility has never materialized or even shown any promise of materializing. Most recently, the Wyoming Department of Environmental Quality terminated the permit for the proposed facility. (24) Nevertheless, since 2010, Arch has failed to meet continued operation requirements. The BLM has allowed Arch to maintain its lease, however, by routinely allowing the company to pay advanced royalties in lieu of continued operation. (25) These decisions appear to be pro forma in nature, and do not reflect any consideration as to whether it is appropriate or remotely in the public interest to accept advance royalties in lieu of continued operation.

(24) See Exhibit 15, Wyoming Department of Environmental Quality, "Permit Termination, Medicine Bow Fuel and Power Coal to Liquid Project" (June 27, 2016).

(25) See Exhibit 16.

Furthermore, where an existing lease is not producing, yet is part of a producing logical mining unit, BLM and the Interior Department should use their discretion to modify the boundaries of logical mining units to eliminate the non-producing lease and facilitate its cancellation. BLM has such discretion under 43 C.F.R. § 3478.1.

Cancelling leases that are not producing will serve the goal of preventing any potential future development of existing leases and contribute to an orderly end to the federal coal program.

4. Accounting for carbon costs in coal management: It should be made clear, whether through new rules or guidance, that carbon costs must be analyzed, assessed and disclosed as federal coal management decisions are made. Such decisions are most likely to include mining plan modifications issued pursuant to the Mineral Leasing Act, 30 U.S.C. § 207(c), and the Surface Mining Control and Reclamation Act ("SMCRA"), 30 C.F.R. § 746, and lease readjustments. It is imperative that the BLM and Interior maintain close accounting of the carbon emissions and costs resulting from its coal management actions, to ensure full transparency around these emissions and costs, and to meaningfully act to address these emissions and costs. Particularly given that, pursuant to authorities under the Mineral Leasing Act and SMCRA, the Secretary of the Interior has full discretion to disapprove mining plans authorizing the development of leased federal coal, it is imperative that carbon emissions and costs factor into and influence such decisionmaking.

5. Reclamation must be guaranteed: To ensure an orderly end to the federal coal program, full and final reclamation must be guaranteed within a reasonable timeframe. We urge two regulatory changes to ensure this occurs.

First, Interior should amend regulations at 30 C.F.R. §§ 816.100 and 817.100 to provide clarification and specificity around contemporaneous reclamation. Current rules are vague and fail to ensure that reclamation proceeds in a manner that is as "contemporaneously as possible" with mining in accordance with 30 U.S.C. § 1202(e). These regulations should be amended to make clear that the success of contemporaneous reclamation must be measured based on a comparison of Phase III bond release acres, as defined under 30 C.F.R. § 800.40(c)(3), with disturbed acres and ensure that reclamation proceeds at a 1:1 rate, in other words for every acre disturbed, one acre should be fully reclaimed to meet Phase III bond release standards.

Second, just as current BLM rules require diligent development of federal coal, these rules should also require diligent reclamation. To this end, Interior and BLM should consider rule changes to ensure that nonproducing coal leases are fully reclaimed within two years of failing to meet continued operation requirements and set deadlines for the full reclamation of federal coal leases that are no later than 2035. This reclamation deadline should be established by rule and incorporated into lease terms as leases are readjusted.

Finally, Interior should amend self-bonding regulations at 30 C.F.R. § 800.23, and any other regulations, as appropriate, to prohibit self-bonding whenever publicly owned coal is permitted to be mined. This will ensure that, as coal companies continue their decline, that American public resources are fully protected and fully guaranteed to be cleaned up.

6. Prioritizing transition: Above all, the BLM and Interior must make transition away from coal a foremost goal as the federal coal program comes to an end. To do this, the agencies should not only explicitly commit, to the extent possible, their leadership, resources, and expertise to ensure that workers and communities receive the support and assistance they need to transition to more sustainable and prosperous economies. Among the actions that Interior and BLM can and should undertake to ensure transition:

- Work to secure Congressional authorization to direct increased royalty and rental payments toward worker and community support. Under NEPA, agencies are required to rigorously explore and objectively evaluate reasonable alternatives “not within the jurisdiction of the lead agency.” 40 C.F.R. § 1502.14(c). Here, although BLM and Interior may not be able to direct royalties toward transition support, they can recommend that Congress pass legislation that provides such authorization.

- Establishing an Economic Transition Fund, which would be sustained by an increase in reimbursement fees charged by the Interior Department when processing coal-related applications. Under the Federal Land Policy and Management Act (“FLPMA”), Interior has authority to recover reasonable costs associated with its coal management program and to appropriate and spend such monies. Specifically, FLPMA provides the Secretary of the Interior with authority to “require a deposit of any payments intended to reimburse the United States for reasonable costs with respect to applications,” including coal lease application. See 43 U.S.C. § 1734(b). Such payments are “authorized to be appropriated and made available until expended” by FLPMA. Id. Funds from the Economic Transition Fund should be directed toward transition-oriented initiatives.

- Prioritizing support and assistance to help communities transition. In addition to securing funds and making them available, the Department of the Interior can play a key role in helping direct communities to support, steering resources to support conservation and research projects in or near communities, encouraging renewable energy development on public lands. Such leadership could be conveyed through a Secretarial Order that simply makes it an overarching priority of the Interior Department to advance transition

Overall, the Interior Department and BLM must move to keep our publicly owned coal in the ground. However, keeping coal in the ground should not mean that we turn our backs on the workers and communities that have been dependent on coal for so long. Embracing an alternative that ensures “Just Transition,” in other a fair, compassionate, and orderly transition away from coal, is the most effective way to both protect our climate and help our nation effectively move to more sustainable economies and reliable and affordable means of energy production.

c. The PEIS Must Thoroughly Analyze and Assess All Reasonably Foreseeable Impacts

As the PEIS is drafted, BLM and Interior must ensure that all reasonably foreseeable impacts associated with any action alternatives, including the No Action alternative, are fully analyzed and assessed. To this end, we request the agency ensure that, as a minimum, the following reasonably foreseeable impacts are addressed in the PEIS:

i. Impacts of coal mining

The PEIS must obviously analyze and assess the impacts that any proposed alternative will have on the mining of

federal and the impacts that will flow from that mining. Similar to other EISs prepared by the BLM for coal leasing, we expect the PEIS to fully analyze and assess the program-wide impacts to public lands, air quality, water quality, and fish and wildlife (in particular threatened and endangered species listed under the Endangered Species Act, 16 U.S.C. § 1531, et seq.). (45) Such an analysis must address total greenhouse gas emissions, including methane emissions, associated with mining operations.

(45) An example of an EIS where the BLM fully analyzed and assessed the impacts of mining to myriad resources is the Wright Area coal leasing FEIS, which is available on the BLM's website here, <http://www.blm.gov/wy/st/en/info/NEPA/documents/hpd/Wright-Coal.html>. Although we disagree that this FEIS was fully compliant with NEPA, it nevertheless addressed many important reasonably foreseeable impacts and stands for the proposition that federal coal management decisions can have far-reaching consequences that warrant detailed review under NEPA.

2) "Reflect its impacts on the environment"

The inability to lease federal coal tracts is not accounted for in North Dakota coal companies' contractual obligation to supply fuel for power generation and gasification. If a federal coal tract is bypassed, mining companies will have to pursue additional coal resources to make up for lost federal coal. As a result, there will be more disturbance, less efficiency, more fuel expended, etc. simply to provide the same amount of coal while increasing production costs that are ultimately borne by the consumer. Further, since mining companies hold the surface rights over federal coal tracts, the area will likely be disturbed to support mining activities regardless of whether the federal coal is retrieved or not. Finally, the rest of the world, particularly developing nations, is turning to coal to provide affordable and reliable electricity. A policy decision to restrict development of our coal resources will have no bearing on the decision of other nations to strive for the same standard of living coal has brought to the U.S., and as a result will have no meaningful impact on global emissions.

Market Conditions - Excessive regulation, discriminatory government policies, artificially low natural gas prices resulting from over-supply, and export barriers have resulted in very weak coal markets. Decreases in coal production, extensive layoffs, coal company bankruptcies, and significant adverse economic and social impacts on affected communities and regions have been the direct consequence of these conditions. These are very real and immediate impacts of the current policies and proposed changes which deserve to, and should be considered in any objective analysis. The current coal program includes provisions (royalty rate reduction) which can be used to reflect and adjust for adverse geologic, mining, and other conditions. The potential exists to also include market conditions as an adjustment factor.

Comment Excerpt Text:

The PEIS Should Examine Significant Non-climate Impacts Associated With Coal Mining, Transport, and Combustion. BLM's scoping notice acknowledges that "[t]he Federal coal program has other potential impacts on public health and the environment, beyond climate impacts, that will also be assessed in the Programmatic EIS." 170 However, the notice states that the EIS's analysis will "include the effects of coal production" without explicitly addressing the impacts of coal transport and combustion. 171 The scoping notice also commits to a broad analysis of the federal coal program's socioeconomic impacts. 172 Because NEPA requires agencies to evaluate the direct, indirect and cumulative impacts of a proposed action, and coal combustion is a foreseeable result 169 Comments of Phyllis Fox, Environmental Health and Safety Impacts of the Proposed Oakland Bulk and

Oversized Terminal, September 21, 2015, at 19. 170 81 Fed. Reg. at 17,725-26. 171 Id. at 17,726 (emphasis added) 172 Id. 50 of coal mining on federal lands, the PEIS must disclose the non-carbon environmental and socio-economic impacts of coal combustion. 173 It is particularly crucial that the PEIS address these impacts because they are likely significant. The that mining, transportation, and especially combustion of federally owned coal causes to life expectancy and health may be much larger than the current estimates and are tied to greenhouse gas emissions. In June 2016, a White House Council of Economic Advisors report on the economic impacts of the federal coal leasing program explicitly recognized that significant health-based costs are associated with the continued mining and burning of federal coal. 174 Specifically: On the production side, coal mining involves emissions of methane, which is a potent greenhouse gas. Coal extraction and processing also may lead to external costs from water pollution and land degradation. Transportation of coal is often energy and emissions intensive. Coal combustion releases carbon dioxide, mercury, and other harmful air pollutants. Impoundments and coal combustion waste can also lead to severe water . 175 All of these social and environmental costs must be disclosed in the PEIS. Numerous environmental reviews from the past several years support the White House Report findings concerning harms from the non-carbon emissions of coal-fired electric generators: sulfur and nitrogen oxides, particulate matter, volatile organic compounds, ammonia, and mercury. These environmental reviews reveal damage from coal burning to health, 173 In addition, this letter speaks at length about the need to analyze the impacts of the federal coal program's climate-related impacts. The program drives the continued production of coal and reliance on coal for energy generation, frustrating state, national, and international climate goals. In addition the federal coal program perpetuates and increases exposure by downstream communities to climate disruption. While this section focuses on non-climate impacts, the downstream climate impacts due to the federal coal program also should be analyzed in the PEIS. 174 White House Fair Return Report, at 28 175 Id. 51 longevity, quality of life, and property. 176 As discussed below, these are all environmental and health impacts that NEPA mandates that the PEIS address

Comment Excerpt Text:

As BLM notes in the NOI, "On average, over the last few years, about 41 percent of the Nation's annual coal production came from Federal land." Nearly all federal coal production is done in rural areas across the West. Production plays a vital role in supporting rural communities and their ability to maintain key governmental services. Additionally, the coal produced on federal land is used to generate reliable and affordable electricity, which is important to both rural and urban areas. Lastly, the development and production of federal coal must comply with strict environmental regulations and is historically more regulated than other sources of coal.

Given the many benefits of the federal coal program, the BLM should be looking at ways to increase- not decrease - production levels. Any proposal to increase federal royalty payments will increase the cost of doing business, resulting in a decrease in production and the benefits noted above.

coal could be used for a variety of high-tech uses. The group successfully created a simple electrical heating device with potential applications in window defrosting, which could be used to defrost wings of an airplane. Their research is focused on four different film of coal. Grossman told MIT News that when the group decided to explore coal as a material, rather than just something that could be burned, the chemical properties of the material were surprising quite rich and that coal -- I lost my place. This discovery sparked an interesting question. Could the unique chemical properties of coal be used to make electronic devices with useful functionality? Despite coal being widely used for centuries, it had optical and also electronic-type properties that could be used for other things. So, may electronic devices are made from chip-grade silicone or grapheme, both of which are very costly when it comes to the purification materials to create them. But, powdered coal could not only prove to be a cheap substitute, but could also offer chemical property advantages. Plus there's this high conductivity in its thermal [indiscernible]. As this report continued, it talks about using it in solar panels and all types of electronic devices with more sustainable success than some of the things we use today for those things. So, my testimony today is that coal is not something we should be keeping in the ground. It is something we should be putting money forward and exploring what else can we use coal for? It has some very unique properties that could be used in medical devices. They talk even a little bit about they're doing some research at Stanford on how we can stimulate dead muscles on people that have been paralyzed. And maybe we can use it [indiscernible].

I believe it's imperative that the Federal Government updates the coal leasing system to address the impacts that coalmining activities have on local communities and mitigate the challenges our communities face in indiscernible] cycles of mining. This includes requiring the highest degree of reclamation standards, [indiscernible] bonding for future reclamation activity, conducting a thorough analysis of all impacts to air, water, and wildlife, prior to issuing new leases and ensuring a fair return from coal leasing.

Comment Excerpt Text:

according to the Energy Information Agency, coal will play a significant role in providing electricity for decades to come. In 2014, coal delivered nearly 40 percent of our nation's electricity. It makes no sense to sit here and complain that the taxpayers are not getting a fair share -- a fair return on Federal leasing of coal. But, the Government can then take the taxpayers' money and waste billions and billions of dollars on intermittent energy sources, such as solar farms and wind farms, that are not reliable, not efficient, and very expensive. How about

we spend some of the government's money, or the taxpayer's money, on the already clean, cheap, and reliable coal industry to help make it better?

Comment Excerpt Text:

If they actually cared about the environment, they would see that coal has come further than any other energy producer in the America at reducing its CO emissions -- CO2 emissions. According to the EIA, the total U.S. CO2 emissions went down 504 million metric tons from 2006 to 2014. Clean coal technologies alone account for 86 percent of that reduction. A pretty impressive number considering coal- powered energy is only credited for 30 percent of our country's CO2 emissions. So, to say that again, coal powered energy accounts for only 30 percent of the country's CO2 emissions. [indiscernible] 86 percent of the [indiscernible] reduction.

Comment Excerpt Text:

Every major advancement that our country has had in the last two decades has on thing in common. It took electricity. In this day and age electricity is the lifeblood of our country. It affects every part of life as we know it, whether directly or indirectly. And it will never go away. We are passing the point of being able to decrease our energy consumption. In fact, worldwide energy consumption is projected by the EPA to grow 48 percent by 2040. Solar, wind and other renewable sources will not keep up with that growth. Energy prices will skyrocket. And energy availability will plummet without coal as a large player in our energy production

Comment Number: 00001279_Phillips_20160623-1

Comment Excerpt Text:

Coal can no longer compete with natural gas, wind, and solar. The era, the era of coal is coming to a close. This is happening, not just in the U.S., but also around the world. It is a global movement. Both India and China are moving away from coal. This means they're not only is the domestic market shrinking, but also the export market. The economics of coal are further threatened by probable carbon taxes around the world. Here in the U.S.A., massive amounts of natural gas will result in the long term, low prices for natural gas, making coal permanently uneconomical. Pure, nonpartisan economics dictate the end of the coal era. Unsubsidized gas, wind, and solar are now – or soon will be cheaper than coal-fired power generation. Wind and solar will continue to fall in price over time, putting even more pressure on coal

Even though RMPs show millions of acres of federal coal available for leasing, the vast majority of lease applications BLM receives are proposed by coal companies adjacent to companies' existing coal mines, allowing current mining operations to continue. Despite having "suitability" criteria that should guide whether BLM actually makes lands available for coal leasing and a broad multiple use mandate that requires the agency to consider how to protect other uses and values, BLM has failed to take lands off the table – neither finding lands "unsuitable" nor determining other resources should be protected.

Mining should not occur in unsuitable lands or environmentally sensitive lands. BLM should work with sister agencies to more appropriately determine areas that are unsuitable for mining and prohibit leases for mining in unsuitable areas, particularly those that cannot be reclaimed and those that are especially environmentally sensitive or have special habitat value. This includes areas where the hydrological balance cannot be restored to pre-mining conditions. BLM should also identify areas where coal development should be avoided due to high conflicts with wildlife and fisheries, water, air and protected lands, and amend resource management plans to exclude them from future leasing.

Comment Excerpt Text:

While, in theory, Land Use Plans, such as RMPs, provide BLM with an opportunity to evaluate suitable areas with mining potential, in practice they have not provided a framework for BLM to make affirmative and informed decisions about where, and on what terms, coal leasing may be appropriate as BLM defers all coal leasing screens to the time of a LBA. The Buffalo (WY) Field Office, for example, did not apply any leasing screens limiting where coal could be leased when revising its Resource Management Plan in 2015. BLM, Proposed Resource Management Plan and Final Environmental Impact Statement for the Buffalo Field Office Planning Area (May 2015) at 29 (“[N]o coal leasing allocation decisions are being made through the RMP revision process. . . . Prior to offering a coal tract for sale, the unsuitability criteria will be reviewed, a tract specific National Environmental Policy Act (NEPA) analysis will be completed, and there will be opportunity for public comment”). See also, Miles City Field Office Proposed Resource Management Plan and Final Environmental Impact Statement (June 2015) at 2-10 (“At the time an application for a new coal lease or lease modification is submitted to the BLM, the BLM will determine whether the lease application area is “unsuitable” for all or certain coal mining methods pursuant to 43 CFR 3461.5.”). BLM’s Buffalo (WY) and Miles City (MT) Field Offices cover federal coal in the Powder River Basin.

Although, as noted, BLM’s regulations specify some areas as unsuitable for mining, 43 C.F.R. § 3461.5, under this alternative BLM would more expansively identify specific areas where coal development should be avoided due to high conflicts with wildlife and fisheries, water, air and protected lands, and set a schedule for amending Resource Management Plans to exclude them from future leasing.

Comment Number: 0002468-1

Organization I: Powder River Basin Resource Council

Commenter I: Shannon Anderson

Comment Excerpt Text:

Our organizations strongly believe that any reform measures must achieve the following objectives:

- Ensuring a fair return to the American public for the leasing and mining of our publicly owned mineral resources by increasing royalty rates and closing loopholes in coal valuation processes;
- Increasing transparency of and public oversight around the federal coal program;
- Preventing impacts of coal leasing, mining, and burning on the global climate;

- Better protecting our air, land, water, and wildlife resources; and
- Addressing the legacy issues of decades of federal coal mining, including ensuring reclamation of currently leased areas before new leasing can proceed.

To meet these shared economic and environmental goals, as part of its coal reform efforts, the Department should propose to replace Coal Production Regions and Leasing by Application with a new model of leasing that balances the nation's energy needs with the effects of coal mining, transportation and burning on air, land, water, wildlife resources and the global climate. The new leasing model must take into account the latest information on the availability of coal reserves, coal demand, and replacement energy sources. The Department must re-assert itself as the driver of the leasing process and acknowledge that leasing should only be carried out if it can protect our public land resources and is consistent with the public interest objectives of the Mineral Leasing Act.

Comment Excerpt Text:

However, it is not only that the criteria themselves that are inadequate to prevent coal mining from unduly harming our communities and habitats? the implementation of the screening criteria is likewise inadequate. For example, several exemptions allow the criteria to be bypassed. Pursuant to 43 C.F.R § 3461.2-1(a)(1), "each of the unsuitability criteria shall be applied to all coal lands with development potential identified in the comprehensive land use plan or land use analysis;" however, that section adds that "for areas where 1 or more unsuitability conditions are found and for which the authorized officer of the surface management agency could otherwise regard coal mining as a likely use, the exceptions and exemptions for each criterion may be applied." This broad grant of authority to disregard the applicability of the unsuitability criteria in cases where coal mining is somehow still considered a "likely use" is dangerous, especially without any indication of the factors that would be used to determine its applicability. Allowing lands to be mined even when the unsuitability criteria suggest it should not be, simply because some "authorized officer" thinks that coal mining is a "likely use," provides nothing other than a means for mining companies to exert influence on the agency in an attempt to disregard the criteria intended to protect sensitive areas from harm. This provision must be changed such that no mining is allowed on lands that have been shown to be unsuitable.

Furthermore, 43 C.F.R § 3461.2-1(b)(1) allows the "authorized officer" to make that assessment "on the best available data that can be obtained given the time and resources available to prepare the plan." This standard falls well short of what is normally used to ensure that environmental resources are not unduly adversely impacted. Under both the ESA and NEPA, the standard is to use the "best available science."²⁴³ The limitation provided in 43 C.F.R § 3461.2-1(b)(1) regarding time and resources, however, is a slippery slope that would allow decisions to be made based on incomplete and unreliable information - especially given the fact that resources at both the state and federal level for gathering data to support studies regarding the impacts of coal mining on the environment are entirely lacking. The regulations also do not require that all relevant information be used in BLM's analysis. 43 C.F.R § 3461.2-1 states that "land use analysis shall include an indication of the adequacy and

reliability of the data involved;” however, the regulation does not prohibit BLM from making a determination if the information is incomplete, but rather allows BLM to determine that a criterion “cannot be applied” due to “inadequate or unreliable data,” and then merely requires that the “analysis [] discuss the reasons therefor and disclose when the data needed to make an assessment with reasonable certainty would be generated.” This provision allows decisions to be made without sufficient information or regard for environmental impacts, and is therefore precarious when we must be precautionary.

(243) See 16 U.S.C. § 1536(a)(2).

Comment Excerpt Text:

A provision that states emphatically that decisions must be based on the best available science, and that no mining may be allowed absent sufficient information on the potential impacts on human health and the environment, is necessary to prevent the devastating harm that coal mining has already caused and will continue to cause if more enforceable restrictions are not employed. NEPA, for example, requires agencies to gather information where there is incomplete information essential to making a determination of impacts.²⁴⁴ If that information cannot be obtained, then BLM should not merely have to disclose the reasons why the data is unavailable and when it could be obtained, but should have to assess the relevance of that information, as required under NEPA,²⁴⁵ and no determination must be made until such information is available.

(244) 43 C.F.R. § 1502.22(a) (“If the incomplete information relevant to reasonably foreseeable significant adverse impacts is essential to a reasoned choice among alternatives and the overall costs of obtaining it are not exorbitant,

the agency shall include the information in the environmental impact statement.”).

I. The Unsuitability Screening Criteria

i. Criterion I

Criterion I prevents coal mining on “all Federal lands” including not only obvious areas such as National Parks and wilderness areas, but on all National Forests. This is a reasonable limitation, especially given the fact that sufficient private land exists for coal exploitation, and public lands must be managed under public trust principles, which are inconsistent with the harms to both the local and global environment caused by coal mining. The only way to protect public lands and the species that rely on them from undue harm from coal mining is to prevent these activities on our public lands.

However, there is an exception that swallows this rule. It states that a lease may be issued for mining on National Forest lands if there are “no significant recreational, timber, economic or other values which may be incompatible with the lease, and [] surface operations and impacts are incident to an underground coal mine.” First, that surface impacts are incident to underground mining is meaningless, and does not prevent undue harm to our

National Forests. The fact that there is no language about minimizing these incidental impacts to the surface resources is totally unreasonable, given that minimization of impacts is essential to protecting resources. While the regulations provide for BLM to place “particular emphasis” on protecting certain environmental resources,²⁴⁷ a more specific requirement that harm be minimized should be included at the very least.

Second, this exception provides too much leeway for the decision to allow mining on National Forest lands. Whether there are “values” that are inconsistent or incompatible with the lease is a very broad, undefined inquiry. As discussed above, the “value” attributable to preventing further climate harm should outweigh all economic basis for allowing further coal mining; however, apparently this provision has not been properly employed, since coal mining continues to occur, regardless of the impacts. Further, this provision ignores impacts to habitats and species, focusing instead on the economic values associated with National Forests, such as timber and recreation. This provision should be broadened to include habitat, such that mining on National Forest lands may not be allowed if such activities are incompatible with the habitat needs of species that rely on those areas? particularly species protected under state and/or federal law, or that have been otherwise identified as imperiled.

ii. Criterion 3

Criterion 3 provides that lands within 100 feet of the outside line of the right-of-way of a public road or within 100 feet of a cemetery, or within 300 feet of any public building, school, church, community or institutional building or public park or within 300 feet of an occupied dwelling are unsuitable. While providing strict buffers for these sensitive areas is warranted (and the same must be done for environmental resources as well, such as streams), the distances provided here are insufficient to protect our communities. This provision allows coal mining within 300 feet (just one football field) of a school or home. Based on what we now know about the harmful effects of mining on local communities, including both water impacts from the release of pollutants and air impacts from toxic coal dust, a much larger buffer (i.e. 500 feet or more) should be employed.²⁴⁸

iii. Criterion 4

Criterion 4 states that “Federal lands designated as wilderness study areas shall be considered unsuitable while under review by the Administration and the Congress for possible wilderness designation. For any Federal land which is to be leased or mined prior to completion of the wilderness inventory by the surface management agency, the environmental assessment or impact statement on the lease sale or mine plan shall consider whether the land possesses the characteristics of a wilderness study area. If the finding is affirmative, the land shall be considered unsuitable....”

This provision, while protecting areas that have been designated for potential inclusion into wilderness areas, leaves too many sensitive areas open to coal mining activities. The provision should apply not only to wilderness study areas and those areas with wilderness characteristics, it should also include all inventoried roadless areas, as well as other large habitat blocks that are vital to species that rely on intact habitat.

Habitat fragmentation is one of the biggest threats to biodiversity.²⁴⁹ Maintaining large habitat blocks is not only essential for the species that rely on them, but for all species to adapt and adjust to climate change. Given that coal is rapidly becoming an obsolete source of energy mostly because we now know that exploiting coal resources is horrible for the environment? there is absolutely no reason to continue to allow mining activities in areas that would cause greater habitat fragmentation or otherwise adversely affect large habitat blocks. The revamped program should therefore provide that intact habitat blocks (i.e. greater than ___ acres) must be protected, and any lands where mining activities would contribute to fragmentation are unsuitable.

iv. Criterion 6

Pursuant to criterion 6, “Federal lands under permit by the surface management agency, and being used for scientific studies involving food or fiber production, natural resources, or technology demonstrations and experiments shall be considered unsuitable for the duration of the study, demonstration or experiment...” It is not clear whether “natural resources” is intended to cover studies regarding habitat or species, but it should be made clear that such studies ? especially those involving habitat needs and the impacts of mining on species or waterways ? would also render lands unsuitable.

v. Criterion 9

Criterion 9 states that designated or proposed critical habitat for listed species, and habitat for such species which is determined to be of essential value and where the presence of threatened or endangered species has been scientifically documented, shall be considered unsuitable. While this should be the end of it, and no coal mining activities should ever be allowed to take listed species or adversely modify essential or critical habitat, there is an exception in Criterion 9 that not only swallows the rule, it chews it up and spits it out.

The exception states that a “lease may be issued and mining operations approved if, after consultation with the Fish and Wildlife Service, the Service determines that the proposed activity is not likely to jeopardize the continued existence of the listed species and/or its critical habitat.”

There are several problems with this exception. The first is that while site-specific consultation may result in measures to reduce or avoid harm to species, that process fails to provide a holistic analysis of the cumulative impacts caused by coal mining activities.

The second is that consultation often does not take place on specific mining projects regulated under SMCRA, due to a 1996 Biological Opinion, which covers all take of all listed species, for all time (including future listed species) from impacts associated with coal mining.²⁵⁰ The Service relies on this BiOp to find that individual mines will not jeopardize listed species absent site-specific analysis, yet mining activities continue to drive species to the brink of extinction. This is due, in part, to the reliance on Protection and Enhancement Plans (PEPs), which are intended to implement measures to mitigate take, such that mining activities will not jeopardize species in violation of Section 7 of the ESA. However, FWS has only provided PEP Guidance for some listed species, such as the Indiana bat and blackside dace, but not for all species that may be directly and indirectly impacted by surface and/or underground coal mining of federal coal. Endangered or threatened species directly affected by existing or proposed mines on federal coal leases include but not limited to:²⁵¹

Ute ladies'-tresses blowout penstemon
 Gunnison sage-grouse Mexican spotted owl
 Southwestern willow flycatcher Yellow-billed cuckoo
 Greenback cutthroat trout Pawnee montane skipper
 Canada lynx Preble's meadow jumping mouse
 DeBeque phacelia Penland alpine fen mustard
 Colorado hookless cactus bonytail chub
 humpback chub razorback sucker
 Colorado pikeminnow Utah prairie dog
 gray bat Virginia Big-eared bat
 dusktail darter palezone shiner
 Cumberland darter Cumberland elktoe
 Fanshell Cumberlandian combshell
 oyster mussel tan riffleshell
 snuffbox pink mucket
 little-wing pearlymussel Cumberland bean pearlymussel

Cumberland sandwort Cumberland Rosemary
 American chaffseed white-haired goldenrod
 Virginia spiraea running Buffalo clover

Absent site-specific consultation and PEPs that actually implement protections for species, it is impossible for mine operators to “minimize disturbances and adverse impacts on fish and wildlife and related environmental values, including compliance with the Endangered Species Act...”²⁵² Further, even where the agencies do not rely on the 1996 BiOp and do conduct consultations, history has shown that this has not worked to protect imperiled species. Data published since 1996 document increasingly significant declines in numerous imperiled and federally protected taxa, and degradation of their habitats, as the result of surface coal mining.²⁵³

Recent scientific and policy documents further show that surface mining is increasingly imperiling numerous species of many taxa, contrary to the conclusions of the 1996 Biological Opinion, and perhaps specifically because OSM and FWS have failed to properly implement and oversee the implementation of the requirements of the 1996 Biological Opinion.²⁵⁴ It is therefore clear that this criterion is failing to ensure the protection of listed species.

As discussed above, there is no reason to allow coal mining generally, and even less to allow these activities in areas that support listed or proposed species. This dying industry should not be allowed to drag down with it the imperiled species that rely on lands that coal companies want to exploit for profit. Rather, the standard should be that any land with suitable habitat for listed or proposed species is unsuitable for coal mining, and if an exception must be provided (and there really is no good reason to do so), then the exception should be allowed only if after surveys and studies it has been shown that no habitat for listed or proposed species would be negatively impacted, and a concurrence letter from FWS stating that no take is expected to occur.

vi. Criterion 10

Criterion 10 states that Federal lands containing critical habitat for state listed plant or animal species shall be considered unsuitable. While in theory this is protective of species, it suffers from some of the same issues as discussed above regarding federally-listed species. In short, this is not being enforced correctly, and the results speak for themselves. Too many species have suffered from coal mining over the past few decades ? with many driven to the brink of extinction or extirpated entirely ? for anyone to argue that this criterion (or Criterion 9) is doing what it intended. A new rule that does not allow any adverse modification of habitat for any listed species, state or federal, is warranted to ensure that species do not continue to be harmed by a process that allows for wanton destruction of habitat.

It is, in fact, readily apparent that state programs are not being properly enforced. In West Virginia Highlands Conservancy, for example, the court detailed the damage done by OSM’s refusal to properly oversee the inadequate West Virginia program. It noted many direct impacts and wide ranging indirect impacts, finding:

“a climate of lawlessness, which creates a pervasive impression that continued disregard for federal law and statutory requirements goes unpunished, or possibly unnoticed. Agency warnings have no more effect than a wink and a nod, a deadline is just an arbitrary date on the calendar and, once passed, not to be mentioned again. Financial benefits accrue to the owners and operators who were not required to incur the statutory burden and costs attendant to surface mining; political benefits accrue to the state executive and legislators who escape accountability while the mining industry gets a free pass. Why should the state actors do otherwise when the federal regulatory enforcers’ findings, requirements, and warnings remain toothless and without effect?²⁵⁵

The Federal coal program is therefore not being properly implemented, which has resulted in undue adverse impacts to habitats and the species that rely on them.

vii. Criteria 12, 14 and 15

Criterion 12 protects bald and golden eagle roost and concentration area used during migration and wintering, and Criterion 14 protects high priority habitat for migratory bird species. While these protective measures are vitally important to these species, it is not clear that they are being properly implemented. As set forth herein, recent history has shown that coal mining has had severe adverse impacts on habitats. It is not clear whether the process that has been put in place to determine those areas that are vital to eagles and other migratory birds is being properly followed.

In order to be sufficiently protective, all concentration areas for eagles and migratory birds used for migration and wintering should be considered unsuitable. Moreover, there should be no exceptions to this rule. As discussed above, sacrificing any of these essential habitat areas in order to exploit coal resources is illogical and unconscionable. We must move beyond coal now, and cannot allow this dying industry to continue to cause undue adverse harm.
