However, we do note that these criteria contain important protections that should apply likewise to other species. Areas where species congregate or that contain high biodiversity and unique habitats must be protected, for current and future generations. Furthermore, the notion that we must protect roost and concentration areas for migration and wintering should be applied to ESA species as well. Criterion 9 protects critical habitat; however, not all listed species have designated critical habitat. Therefore, we urge that these protections be extended, such that all lands that are relied on by listed species, as well as those that contain important habitat areas for other species, are not despoiled by mining activities. This should include not just those areas that species currently rely on, but also those areas that are important for habitat connectivity, which is essential for climate resilience (i.e. species must be able to adapt to climate change, which in many cases requires north/south movement to maintain habitat niches as areas are altered by climate change).

Furthermore, the focus must be not only on the immediate area, but on the entire area impacted by coal mining activities. This is especially important for impacts to sensitive river systems and the species that rely on them, such as freshwater mussel, many of which are critically imperiled. Studies and analysis indicate that threatened and endangered species that rely on the waterways impacted by surface coal mining, such as fish and freshwater mussels, are most susceptible when they are within ten river miles of mining projects.²⁵⁶ The sediments and pollutants that harm these species are most prevalent within this ten mile area; therefore, we urge BLM to protect our rivers and streams, and to fulfill its ESA obligations, by ensuring that mining activities do not result in the introduction of sediment or other pollutants, such that no harm will occur to species within at least ten river miles of a mining project. We also emphasize that only considering pollution impacts ten river miles downstream may not adequately address comprehensive downstream water quality impacts such as cumulative sedimentation or biomagnification of contaminants. For this reason, we ask BLM to consult with the Services on this issue (see below).

We do note that Criterion 15 has the potential to provide a means for the protection of these essential habitat areas, and therefore it would seem that BLM understands ? at least in theory ? the prudence of habitat protection; however, the issue seems to be one of enforcement and accountability, and it is readily apparent that many such areas are not being protected from coal mining. As discussed above, even with these unsuitability criteria in place, data published since 1996 document increasingly significant declines in numerous imperiled and federally protected taxa, and degradation of their habitats, as the result of surface coal mining. Recent scientific and policy documents further show that surface mining is increasingly imperiling numerous species of many taxa.²⁵⁷ Clearly, more must be done to protect essential habitats and the species that rely on them from coal mining.

(247) See 43 CFR 3420.1-4(e)(3) (“In making these multiple use decisions, the Bureau of Land Management or the surface management agency conducting the land use planning shall place particular emphasis on protecting the following: Air and water quality; wetlands, riparian areas and sole-source aquifers; the Federal lands which, if leased, would adversely impact units of the National Park System, the National Wildlife Refuge System, the National System of Trails, and the National Wild and Scenic Rivers System.”).

(248) The public health issues raised by coal extraction, transportation and use include increased air pollution from coal dust (mercury, arsenic, lead, uranium), soil contamination by coal dust, and increased noise. The EIS should include a specific focus on children, the elderly, and other vulnerable members of the community. Air quality impacts and pollution from nitrogen dioxide (NO₂), particulate matter, and coal dust must be analyzed. NO₂ exposure can have a wide range of health impacts depending on the length of exposure and various other factors. Epidemiologic research establishes a plausible relationship between NO₂ exposures and adverse health effects ranging from the onset of respiratory symptoms to hospital admission. Particulate matter (PM) refers to a broad class of diverse substances that exist as discrete particles of varying size. Comment Excerpt Text:

Under BLM's coal mining regulations, coal cannot be leased competitively until it has been evaluated in a comprehensive land use plan or land use analysis. 43 C.F.R. § 3420.1-4(a). This analysis must be conducted pursuant to BLM's planning regulations at 43 C.F.R. Part 1600, which requires development of an EIS to support the RMP. Id. § 3420.1-4(b)(1). In making the "major land use planning decision" concerning the coal resource resulting from this planning, which is "the identification of areas acceptable for further consideration for leasing," four screening procedures that must be complied with are specified. Id. § 3420.1-4(e). The four screening criteria are:

1. Only areas that have "development potential" can be deemed acceptable for further consideration for leasing.
2. The BLM must assess whether the areas being considered for possible leasing are unsuitable for all or certain stipulated methods of mining, as provided for in the BLM's unsuitability regulations. 43 C.F.R. Part 3460.
3. After application of the unsuitability criteria the BLM is to make further multiple-use decisions which "may eliminate additional coal deposits from further consideration for leasing" so as to protect other resource values and uses that are important or unique but not included in the unsuitability criteria. These multiple use considerations include those specified in section 522(a)(3) of SMCRA and the OSMRE regulations at 30 C.F.R. § 762.5. "[P]articular emphasis" is to be placed on protecting air and water quality, wetlands, riparian areas, and sole source aquifers, as well as Federal lands in the following systems: National Park System, National Wildlife Refuge System, National System of Trails, and the National Wild and Scenic River System.
4. In preparing the land use plan analysis, the BLM is to consult with surface owners who meet certain criteria "to determine preference for or against mining by other than underground mining techniques."

Comment Excerpt Text:

The BLM should adopt a new policy that would require the BLM to complete and document all 4 steps of the screening process as part of the land use planning process. Emphasis should be placed on ensuring there is full consideration of the specified multiple-use values rather than defaulting to leaving the vast majority of areas available for coal leasing. There is also a need for full compliance with and application of the unsuitability criteria at the land use planning stage. The new policy could also note the types of "land uses" to be protected by application of the multiple-use principles, including preference for renewable energy development and other uses that would have the effect of reducing the climate change contribution of coal from the federal lands.

Comment Excerpt Text:

The PEIS should reiterate and require that when the BLM makes the "acceptable for further consideration for leasing" determination in its land use plans that it fully applies the four specified screening factors specified in its

regulations at the planning stage, although additional information can certainly be considered at the time of leasing. In particular, the unsuitability criteria and consideration of additional multiple use values which “may eliminate additional coal deposits from further consideration for leasing” and which should be given “particular emphasis” should be fully applied at the planning stage such that the agency does not continue to default to keeping all lands available for coal leasing. As part of this planning, the BLM should also emphasize the potential impacts from precluding development of renewable sources of energy on the federal estate, which could assist in our transition away from fossil fuels. The PEIS should ensure that new leasing does not occur without further evaluation of the unsuitability criteria and multiple use considerations. Further, the PEIS should update the decisions in priority RMPs where ongoing leasing and development are most likely to address potential conflicts, as set out above.

Comment Excerpt Text:

Meeting the existing unsuitability criteria specified in the BLM’s regulations so as to determine areas that should not be available for coal mining is one of the most important environmental protection mechanisms that is available to the BLM. BLM’s regulations call for the application of these criteria when RMPs are developed. Unfortunately, however, the BLM has all too often deferred application of the unsuitability criteria at the planning stage. The PEIS should direct that the unsuitability criteria must be faithfully, and fully, applied when the BLM develops an RMP. Loopholes in the unsuitability criteria should also be scrutinized and narrowed as appropriate. In addition, the BLM should also consider whether the existing criteria are sufficient and develop new criteria as needed, such as to deal with climate change issues.

Comment Excerpt Text:

Interim guidance should also be issued to:

1. Define the “public interest” that governs decisions in the coal program and elaborate on how this can and should be taken into account in evaluating leasing proposals.
2. Require tracking and quarterly reporting of climate emissions;
3. Require development and application of a climate budget, as well as quarterly reporting on actions taken toward achieving the budget;
4. Reiterate the intent and application of the unsuitability criteria and multiple-use considerations and require evaluation of whether proposed leases meet these criteria in the context of the planning area prior to any new leasing;
5. Require that BLM complete and document all 4 steps of the screening process as part of the land use planning process, with an emphasis on ensuring that BLM evaluates the “multiple use considerations” carefully, looking at impacts on land health, species, water, air and protected lands, to determine if conflicts would support making land unavailable and/or specifying required mitigation practices. The policy would also note that the types of “land uses” to be protected by application of the multiple use consideration include the preemption of renewable energy development and other uses that would have the effect of reducing the climate change contribution of the federal lands.
6. Require an enhanced showing of technical and financial capability to qualify for leasing.

Comment Excerpt Text:

For plans that were completed without making these determinations, the BLM would ensure that a more rigorous application of the criteria would be made prior to new leasing and commit to a schedule for updating those determinations and plans. For areas that currently have ongoing coal leasing and development, BLM should complete these updated analyses and amendments as part of the PEIS. We recommend the BLM address needed updates to the following RMPs in the PEIS:

- Miles City RMP, Montana,
- Buffalo RMP, Wyoming,
- Bighorn Basin RMP, Wyoming
- Kanab RMP, Utah,
- Uncompahgre RMP, Colorado (a Draft RMP was recently issued without a sufficient analysis; a supplement could efficiently incorporate appropriate analyses and updated decisions into the range of alternatives).

Comment Excerpt Text:

Currently there are 20 criteria listed in the regulations that define areas as unsuitable for surface mining. 43 C.F.R. §§ 3461.5(a)(1) to (t)(1). In the PEIS the BLM should carefully review these criteria and determine whether new criteria should be added to the regulations. It seems apparent the current regulations are not comprehensive enough—there are many conditions that should make an area unsuitable for surface mining that are not recognized in the current regulations. For example, areas with important bat roosts and colonies should probably be made unsuitable. Important Greater sage-grouse habitats—priority habitat management areas (PHMA) and sagebrush focal areas (SFA)—should clearly be made unsuitable for coal mining. This change will likely also require amendments to the recent land use plan revisions the BLM put in to place for sage-grouse conservation, and this issue will be discussed further below. (6) And perhaps most importantly, the BLM should consider designating areas unsuitable for surface mining where the coal mining would have significant climate change impacts. In particular, if an area can serve as important carbon sink it should not be available for coal mining. There are likely many other additions to the unsuitability criteria that should be made in the PEIS and related rulemaking.

(6) See <http://www.blm.gov/wo/st/en/prog/more/sagegrouse.html> (presenting the BLM sage-grouse RMP revisions and amendments).

Comment Excerpt Text:

BLM should determine where additional leasing should be given “particular emphasis” and “eliminate additional coal deposits from further consideration for leasing” within RMPs, or for areas where such determinations have not been made, as part of the 5-year plans. Within the Western Coal Production Region, BLM should prioritize revising land use plans in areas where there are active coal mines.

Commenter I: Stuart Sanderson

Comment Excerpt Text:

In response to climate related concerns raised by stakeholders, BLM will also be considering through the PEIS the methodology for determining which, or how much, Federal coal and/or acreage is made available for leasing; and whether to develop a landscape-level approach to identify geographic areas for potential leasing to identify and address potential conflicts (81 FR 17727). BLM must ensure that the future DEIS documents comply with FLPMA's multiple use and sustained yield mandate under § 102(a)(7), and in the land use planning title of FLPMA at § 202(c)(1), and the directive under § 102(a)(12), to recognize the Nation's need for domestic sources of minerals.

Comment Excerpt Text:

BLM's proposed changes to the federal coal program threaten to discourage the development of federal coal resources. BLM's consideration of increased costs on federal coal leasing and production will make the business of coal mining uneconomic and will deter future coal development on public lands. BLM's discouragement of federal coal production will harm state and local economies, which rely heavily on the royalties and taxes generated from coal mining operations. State and local governments have a direct and substantial economic interest in the continued production of federal coal. For instance, in Wyoming coal mining provides the second largest source of tax revenue for state and local governments, generating more than \$1 billion in annual revenue from royalties and taxes. See Attachment 6, Wyoming Mining Association, "Coal's Economic Impact."

Comment Excerpt Text:

BLM should review its unsuitability screening criteria, which is used to identify geographic areas suitable for federal coal leasing. Under the existing regulatory scheme, many of the criterion are arbitrary, impractical, and prevent BLM from maximizing the full economic recovery of federal coal. The application of the existing unsuitability screening criterion at the land use planning stage often results in a premature determination regarding the appropriateness of leasing coal in a given area. Often, geographic areas are excluded from coal leasing before a determination can be made as to whether there is any concern that legitimately prevents coal mining or whether those concerns could be avoided through stipulations or other measures. Many of the existing criteria cannot be properly evaluated during the land use planning stage, which involves a high-level view of the geographic landscape to determine available uses on public lands.

For example, Criterion Number 3 requires an unsuitability finding for lands located within 100 feet of public roads. Yet, BLM regularly and consistently uses exemptions as a tool to maximize the economic recovery of federal coal. Criteria Numbers 2 and 6 should also be reviewed at the time BLM considers specific leasing actions. Moreover, Criteria Numbers 9 through 15 relate to the exclusion of certain habitats from coal leasing before the potential impacts from a specific coal leasing action can be assessed. The evaluation of potential impacts to threatened or endangered species and critical habitats could be conducted more effectively and more efficiently at the time BLM considers a specific leasing action. For these reasons, the regulations should be modified to allow BLM to make a determination as to whether leasing in the area is appropriate at the time an applicant submits an application for leasing. BLM's standard practice of granting exemptions for the above-listed criteria is evidence

that the consideration of geographic areas for leasing and development is best addressed in the context of specific leasing applications, not in the broader context of land use planning.

Even before the conclusion of the public scoping process for the current PEIS, the administration offered answers to some of the very questions for which it ostensibly seeks the public's input. On June 22, 2016, the White House Council of Economic Advisors issued a report (the "White House Coal Report") setting forth several conclusions and recommendations related to key questions at issue in BLM's PEIS. The administration's predetermination on these important issues has fundamentally undermined the integrity and objectivity of the NEPA process. See Attachment I, Letter from Senator Barrasso and 8 Other Senators to Secretary of the Interior Sally Jewell (July 14, 2016). BLM must disavow the White House Coal Report if it intends to retain any semblance of objectivity in the ongoing PEIS process.

The Mineral Leasing Act requires BLM to modify its coal leasing program to serve the public interest, which includes climate consistency

The Mineral Leasing Act of 1920 ("MLA") states that the Secretary of the Interior is authorized to divide any lands for coal leasing if found in the public interest.¹⁶ Interior has capacious legal authority to interpret this term. "The Secretary of the Interior is authorized to prescribe necessary and proper rules and regulations and to do any and all things necessary to carry out and accomplish the purposes of this chapter."¹⁷ This authority extends to Interior's discretion to reject individual leases or to end the practice of offering new leases and lease extensions altogether if the department determines that these practices are not in the public interest, on the basis of a broad array of factors.

Comment Excerpt Text:

Land Use Planning (FLPMA, FCLAA and SMCRA)

o BLM conducts, in cooperation with other federal agencies and states, a rigorous land use planning process to review the public lands for potential coal leasing incorporating the considerations set forth by statute in the Federal Land Policy Management Act (FLPMA), the Federal Coal Leasing Act Amendments (FCLAA) and the Surface Mining Control and Reclamation Act (SMCRA). These considerations include multiple use, sustained yield, protection of critical environmental areas and the application of specific unsuitability criteria. The purpose of the coal screening stage of the land use planning process is to identify those federal lands that are acceptable for further consideration for coal leasing and development. No other resource on federal lands is subjected to such a far ranging and in depth assessment for determining what lands should remain open for use or leasing.

* NEPA Analysis Prior to Coal Lease Sale

o When DOI accepts an application to lease a tract of federal lands for coal leasing, it begins an analysis under the National Environment Policy Act (NEPA) of potential environmental impacts of the proposed leasing action, including “reasonably foreseeable” direct, indirect, and cumulative impacts of leasing coal. Over the past several years, DOI has prepared multiple Environmental Impact Statements evaluating all of the issues raised in the Scoping Notice. See e.g., Final EIS for the Wright Area Coal Lease Applications (July 2010). Final EIS for the South Gillette Area Coal Lease Applications (Aug. 2009); Final EIS for the West Antelope II Coal Lease Application (Dec. 2008). Each EIS evaluates issues mentioned in the Scoping Notice, and more, including: quantity and quality of water resources; aquifer drawdown; impacts on streams and alluvial valley floors, air quality and associated effects on health and visibility; wildlife; endangered species; other land uses; effects of coal combustion on greenhouse gas emissions and associated climate change-related effects. Notably, the Scoping Notice is devoid of any discussion about these comprehensive reviews or the serial and unsuccessful attempts by certain so-called “stakeholders” to have them set aside in court as inadequate.

* Mine Plan Review (MLA and SMCRA)

o Any lessee must receive approval of a Mineral Leasing Act (MLA) mining plan by DOI that ensures the maximum economic recovery of the coal resource.

* Mining Permits (SMCRA and other laws)

o A state SMCRA permit application must be submitted and approved which includes a detailed operation and reclamation plan, monitoring, mitigation and reclamation requirements. Mining operations must also receive permits related to air and water quality under state corollaries to the Clean Air Act and Clean Water Act. Much of the analysis is redundant among these applications as well as with the NEPA analysis already performed prior to the lease sale.

Several organizations that the Scoping Notice refers to as “stakeholders” have also advanced a wholly uninformed critique of the coal industry’s environmental performance. To the extent they take issue with the percentage of mined lands reaching phase III bond release, their complaint goes to the applicable law—the Surface Mining Control and Reclamation Act—which precludes even applying for final release until at least 10 years after a mined area has been reclaimed. A substantial amount of the mine permit areas include long-term facilities (e.g., buildings, roads, stockpiles and ancillary support areas) that are intended to serve the life of the mine. When long term facilities are excluded to evaluate the pace of reclamation with mining, well over half--61 percent--of the lands disturbed by mining in Wyoming and Montana have already been restored (backfilled, graded and revegetated)

according to the Office of Surface Mining (OSM). Moreover, OSM reports that the mines in those states were free of any off-site impacts.

Comment Excerpt Text:

B. The PEIS Should Evaluate the Impacts of Federal Coal Leasing on Public Lands, Water, and Wildlife The PEIS also must evaluate whether mining federal coal is consistent with responsible stewardship of our public lands, water, and wildlife This stewardship is both a policy priority for the nation and an imperative under the statutes that govern BLM's management of public resources. In a November 3, 2015 Memorandum, President Obama established a policy for the Department of the Interior and other federal agencies that mining and other development projects on America's public lands should result in a net benefit—or at a minimum no net loss—for the nation's public lands, public waters, and wildlife resources. 113 The memorandum recognizes that “[w]e all have a moral obligation to the next generation to leave America's natural resources in better condition than when we inherited them. . . . It is this same obligation that contributes to the strength of our economy and quality of life today.” 114 This policy echoes BLM's statutory obligations under the Federal Lands Management Policy Act (“FLPMA”), 43 U.S.C. §§ 1701-1785, which directs that: public lands be managed in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values; that, where appropriate, will preserve and protect certain public lands in their natural condition; that will provide food and habitat for fish and 111 State of Colorado, Coal Mine Methane in Colorado, at 14, attached as Ex. 29. 112 See 2010 Conservation Scoping Letter (Ex. 30) at 88-89. 113 See Presidential Memorandum: Mitigating Impacts on Natural Resources from Development and Encouraging Related Private Investment (Nov. 3, 2015), available at <https://www.whitehouse.gov/the-press-office/2015/11/03/mitigating-impacts-natural-resources-development-and-encouraging-related>, published at 80 Fed. Reg. 68,743 (Nov. 6, 2015). 114 Id. 40 wildlife and domestic animals; and that will provide for outdoor recreation and human occupancy and use. Id. § 1701(a)(8). Under FLPMA's “multiple use and sustained yield” management directive, id. § 1701(a)(7), the federal government must manage public lands and resources in a manner that “takes into account the long-term needs of future generations for renewable and nonrenewable resources, including, but not limited to, recreation, range, timber, minerals, watershed, wildlife and fish, and natural scenic, scientific and historical values; and harmonious and coordinated management of the various resources without permanent impairment of the productivity of the land[.]” id. § 1702(3). Further, “[i]n managing the public lands the Secretary shall . . . take any action necessary to prevent unnecessary or undue degradation of the lands.” Id. § 1732(b). Under these authorities, BLM is required not only to evaluate the impacts of federal coal leasing to public lands, water, and wildlife resources, but to avoid harm to those resources whenever possible. As described below, thorough analysis of these impacts at the programmatic scale should lead BLM to conclude that the irreversible harmful consequences to these resources due to mining and burning coal irreconcilably conflict with BLM's stewardship obligations and can be avoided only by ending the federal coal leasing program

Comment Excerpt Text:

The moratorium on coal leasing also decreases the amount of money that the federal government receives in royalty payments. For the Powder River Basin in Wyoming, which produces over 80 percent of coal reserves on federal land, the federal government receives 40 cents on every dollar of coal sold. The question is with the national debt of \$18 trillion, you would think the federal government would be seeking to increase revenues off of coal. The federal coal program provides substantial revenues to the federal and state government totaling \$13.8 billion since 2013. To Wyoming in the last fiscal year, coal supplied just over \$1 billion in revenue to our state. Keeping federal coal in the ground results in no return to the taxpayers here in Wyoming or in Washington, D.C.

Comment Excerpt Text:

I recommend the BLM remove the three- year moratorium. The coal program can be analyzed without delaying three years. The federal government makes important decisions every day without taking a three-year sabbatical. The existing federal leasing program is much less complex and can be done without delaying future leasing actions. Placing a moratorium on federal coal leasing only adds more uncertainty to the future of acquiring coal mines. This detracts future investments and increases the likelihood of shutting down more coal mines. I

Nationwide, coal mines on federal leases account for 42 -- I think somebody said 43, I've got 42 percent of all the US production. This moratorium could eliminate a major portion of domestic coal supplies, create less fuel diversity and seriously -- with serious consequences for power generation, both terms of affordability and reliability.

Comment Number: 00000347 _ Johnson _20160519-2

Organization I:Alton Coal Development

Commenter I:Larry Johnson

Comment Excerpt Text:

The BLM director, Neil Kornze, has to confirm that the moratorium will last at least three years and impact some 50 pending lease applications, including applications submitted by Alton Coal Development back in 2004. 2004! This has a significant economic impact on Alton Coal, and I am sure on other operations, by bearing the cost of environmental analysis, but now can't proceed to a record of decision or final lease. It's hard to understand how the department is harmed by completing these pending leases. The leasing process includes NEPA, public comment, competitive bidding, confirmation that the bid meets fair market value and is not anti-competitive. Our pending lease applications have already met this ability for criteria of leasing under the Federal Mineral Leasing Act, the Federal Land Policy and Management Act, and the Surface Mining Control and Reclamation Act.

Comment Number: 00000347 _ Johnson _20160519-4

Organization I:Alton Coal Development

Commenter I:Larry Johnson

Other Sections: 8.4

Comment Excerpt Text:

Alton Coal requests that the secretary consider suspending the moratorium and allowing existing leases to be completed and awarded. Alton's LBA has been pending for more than 12 years and the environmental analysis is nearly complete. Allowing to complete and award these pending leases would allow those coal companies to meet their coal supply agreements and will return bonus bid and lease payment revenues to both the state and the Federal Government.

Comment Excerpt Text:

Given the serious concerns that have been raised about the federal coal program, and the enormous reserves of coal already under lease, the BlueGreen Alliance agrees with the BLM's decision to institute a pause on new coal leasing on public lands while this review is taking place. Future coal leases should benefit from all of the lessons learned and public comment gathered during the course of this programmatic review process.

Comment Number: 0002147_Anderson_20160621_BlueGreenAlliance-6

Organization I: BlueGreen Alliance

Commenter I: Kim Glas

Comment Excerpt Text:

Key to our support for this pause is the fact that companies that are already producing coal from existing federal leases have enough coal leased to be able to continue mining operations without interruption during the span of this program review and beyond. A comprehensive review of this broken system is needed. Nevertheless, as part of that review, the BLM should consider provisions to protect communities supported by existing mines.

Comment Number: 0002152_Bruse_20160518-18

Commenter I: Debbie Bruse

Comment Excerpt Text:

The pause on new coal leasing is not needed and market conditions will dictate a company's need.

Comment Number: 0002152_Bruse_20160518-7

Commenter I: Debbie Bruse

Comment Excerpt Text:

A three year moratorium on coal leasing and a PEIS review adds undue costs to the mining company, and is frankly a HUGE waste of taxpayer money. Market conditions will dictate the need for additional coal reserves on a company by company basis, as currently being seen in today's market. Low demand means less need and less capital for the purchase of a new coal lease. If the demand is not there, coal companies will not bid on the lease.

Comment Number: 0002160_Kot_20160629_SweetwtrCnty-16

Organization I: Sweetwater County

Commenter I: Wally Johnson

Comment Excerpt Text:

Sweetwater County strongly believes that the current moratorium on coal leasing and the Coal PEIS process should be halted and the existing federal coal leasing and regulatory programs should remain in place. If the moratorium remains in place and the PETS goes forward, we strongly believe that these federal actions will make it more costly to mine coal and produce electricity which, in turn, may cost employees their jobs and homes, drive up the cost of living and destroy our local communities.

Comment Number: 0002160_Kot_20160629_SweetwtrCnty-2

Organization I: Sweetwater County

Commenter I: Wally Johnson

Comment Excerpt Text:

Existing three year moratorium on federal coal leasing: Sweetwater County strongly opposes the Obama three year moratorium on federal coal leasing. Sweetwater County believes that the three year moratorium, when added to the seven years necessary to obtain required mining permits, will disrupt coal mining plans within our county and Wyoming for up to 10 years. If a coal mining company survives this 10 year period, and it successfully complies with all permitting requirements, mining still may not occur due to the increased mining costs caused by this Coal PEIS.

If this scenario occurs, coal mining may largely stop, federal coal resources would be left in the ground and the revenues generated by these resources would cease to flow to area residents, businesses and to all levels of government. This would be devastating to the economy of Sweetwater County and the State of Wyoming. Our position is supported by Senator Barrasso, who in recent comments regarding the coal leasing moratorium, stated:

"There seems to be no limit to the number of job-crushing regulations, executive orders and insults Secretary Jewell and President Obama will throw at America's middle class. This administration is in a full-scale war with coal communities and families. When rural America says President Obama has contempt for their lives and livelihoods, they mean decisions like today's announcement. A moratorium on federal coal leasing effectively hands a pink slip to the thousands of people in Wyoming and across the West employed in coal production."

Commenter I: David Schwend

Comment Excerpt Text:

The DOI's recent moratorium on federal coal leases will negatively impact funding for local schools, governments, and communities. When industry is regulated into bankruptcy or near bankruptcy it has a ripple effect into every part of the state's economy. Not only are coal miners, power plant workers and coal industry companies affected; equipment and part suppliers, manufacturers, railroads, truckers, steel manufacturers and a long list of service jobs are all greatly affected.

Comment Number: 0002389_Schwend_20160721-3

Organization I: Spring Creek Mine

Commenter I: David Schwend

Comment Excerpt Text:

In 2015 Spring Creek Coal Mine paid \$52 Million to the State of Montana for taxes and royalties and approximately \$20 Million to the federal government. We exported 3.6 Million tons of coal to Asia in 2015 and lost money. Cloud Peak Energy (CPE) as a whole lost \$204.9 Million and paid \$303 Million in taxes and royalties. CPE pays approximately \$0.39 for every dollar on taxes and royalties. How much more taxes does the government want coal companies to pay? 39% isn't enough? Or is the moratorium on coal a plan to hurt coal companies by taking time away from permitting of new leases to slow the process down even further and see what companies cannot make it through the leasing drought? Is adding to the taxes and export royalties an additional measure to ensure coal companies are not successful and the Federal Government's portion of the "keep it in the ground" campaign is? Isn't the moratorium (which is very unclear that it will be resolved in three (3) years), the longer permitting timelines advocated by the government, higher tax rate for exports, numerous new legislation backed by the current Administration, and potential change to the bonus bid process just the Federal Government's way to stop coal mining and coal electrical generation.

Comment Number: 0002391-1

Commenter I: Tom Tully

Comment Excerpt Text:

1) Coal leasing should be based on what's good for the public, not coal companies. This requires that the BLM decide where, when, and how much coal is leased, rather than allowing coal companies to dictate the terms. Because there is already more coal leased than can be mined in the near future, the moratorium on coal leasing recently enacted while the BLM takes time to revamp the federal coal program was a smart move by our federal government.

Comment Number: 0002439_Horian_20160721-1

Commenter I: Rose Haroian

Commenter I: Gene DiClaudio

Comment Excerpt Text:

Bowie is especially concerned about the statement in Order 3338 and in separate commentary to the press by the Secretary's Office that the expected duration of the leasing moratorium is not of concern, because "20 years supply" of coal is already under lease. Bowie is unsure of the data the Secretary's Office relied upon for this assertion, and it is a material oversimplification of the actual nature and state of the coal market. First, it is problematic to aggregate all federally leased coal together, because not all federal coal is the same. Federal coal varies widely in BTU, sulfur, ash, moisture, and similar characteristics, as well as geography. Critically, state-of-the-art coal-fired generating units are "tuned" to specific range of coal characteristics, and either cannot efficiently consume coal outside that range, or cannot do so without expensive retrofitting. As a result, as a practical matter there is not a single unified "coal market", but rather a wide array of sub-markets, each with its own, sometimes narrow, range of sources. Some of these sub-markets may have a fairly significant amount of coal already under lease, but others are much more supply constrained, and the length of the proposed moratorium may cause significant supply disruptions, particularly given the presently litigious and politicized state of federal coal leasing and permitting.

Commenter I: Jim Lyon

Comment Excerpt Text:

This is not the first time a pause has been imposed on new federal coal leasing to allow for thoughtful reforms to modernize the program. As the Secretary points out, two other comprehensive reform reviews and new leasing moratoriums of the coal program resulting in reforms have occurred: one in the late-1960s and the second in the early 1980s. (7) The Secretary's current halt on new coal leasing is a prudent measure that will allow for comprehensive reforms to be considered before placing new land under risk. The halt will have virtually no impact on coal mining or coal supply as there is a 20 year supply of coal already under lease. (8)

B. The Moratorium On Additional Coal Leasing Must Remain In Effect Until Implementation Of The New Leasing Framework

The moratorium on continued coal leasing, which should continue until a new regulatory system goes into effect, is also necessary and appropriate. Indeed, as the Secretary explained in Order 3338, because lease terms are for twenty years or longer, allowing new leases during this process “risks locking in for decades the future development of large quantities of coal under current rates and terms that the PEIS may ultimately determine to be less than optimal.” Order at 8. It is well-established that BLM is not required to lease public lands for energy development. See, e.g., *U.S. ex rel. McLennan v. Wilbur*, 283 U.S. 414 (1931) (upholding President Hoover’s oil leasing moratorium under the Mineral Leasing Act).

It is also evident that additional coal leasing is entirely unnecessary to meet domestic energy needs while this process is under way, as the Secretarial Order identifies that, on average, mines have 20 years of federal coal supplies (see chart below showing reserves for major coal producing companies at the time of the Order). Additionally, for mines that have fewer reserves on hand, the Secretarial Order provides for exceptions to the moratorium. In this context, it makes little sense to allow any new twenty-year leases at antiquated lease prices, with no consideration of the myriad issues that will be explored in the PEIS and addressed in the agency's coming revised regulations. A moratorium pending completion of a new leasing framework is entirely consistent with the approach taken by the Reagan Administration, which similarly halted issuance of new leases while the program underwent extensive review.

Organization I:Utah Office of the Governor

Commenter I:Kathleen Clarke

Comment Excerpt Text:

The BLM's decision to halt leasing while it reviews the program is an egregious violation of the agency's fiduciary duties to its beneficiaries, the citizens of the United States. On January 15, 2016, without consulting any western states to be impacted, the BLM unilaterally announced a review of its coal leasing program and a three year moratorium on federal coal leasing. The moratorium undermines a long-standing partnership between Utah and the BLM, who have worked together for decades on developing a successful coal leasing on federal land in the state.

BLM's coal leasing program should be reviewed without unjustifiably freezing new leasing and causing undue harm

and uncertainty to the industry. Under the Mineral Leasing Act, BLM is charged with maximizing economic recovery for coal mined on federal lands.¹ The moratorium violates this fiduciary duty since the BLM does not demonstrate any reason it cannot review an ongoing program. The BLM itself calculates that the program has produced \$12 billion dollars of royalties, rents, bonuses and other payments over the last decade. This flow of crucial revenues will be interrupted unnecessarily by the moratorium. The BLM also fails to present any evidence that anything has changed related to the program to justify an unprecedented one-size-fits-all national moratorium.

Violating public process under the Administrative Procedures Act² and other applicable law, the BLM's action also denied states and local governments the ability to provide meaningful data and input on the merits of the moratorium. The BLM failed to support the national moratorium with its own data or consultation with in-the-field experts.

Comment Excerpt Text:

Withdrawal or suspension of the leasing of federal coal acreage adjacent to a school section containing coal resources, therefore, has the unintended effect of sterilizing the coal resources within the school section. Loss of trust land coal resources harms public education and frustrates the intent and purposes of Congress in granting trust lands to the state. The current moratorium on federal coal leasing should immediately be lifted to facilitate the leasing and development of trust land and federal coal resources. Additionally, the BLM should coordinate with the SITLA to exchange BLM land for school sections so that school sections can be "blocked up" into mineable land blocks.

Comment Number: 0002487_Clarke_20160728_UtahGovOffice-6

Organization I: Utah Office of the Governor

Commenter I: Kathleen Clarke

Other Sections: 2

Comment Excerpt Text:

It is crucial that the BLM's coal leasing program review be appropriately limited. The BLM's proposal to impose climate-change mitigation costs on the coal industry is in direct conflict with the Mineral Leasing Act, which obligates the BLM to maximize the economic recovery for coal mined on federal lands.¹⁰ Along with not being authorized, the BLM's proposed approach would unfairly burden coal as opposed to other sources of carbon, and would likely be counterproductive to the BLM's stated goal of reducing global carbon emissions. In fact, the BLM's moratorium and proposed carbon penalty may actually increase global carbon emissions by decreasing the production and utilization of Utah's high-energy, lower carbon emitting coal, which would likely be replaced in domestic and global markets by inferior sources of coal. Reducing carbon emissions would be more effectively and appropriately pursued by increasing federal investment in cleaner coal technologies, and encouraging the production and export of Utah's superior coal into foreign markets.

Alternative B: Proposed Action (Preferred Alternative) Permanently Extending Lease Moratorium
Under this alternative BLM would permanently implement the coal leasing moratorium, allowing all existing leases to naturally sunset without extension. Under this alternative, assuming deployment from CCS, as noted by Carbon Tracker, "the potential production from existing leases is sufficient to meet projected demand in every year through 2040."⁶⁵ In this scenario, the number of leases are sufficient to meet demand for a range of plausible and high levels of CCS deployment: 450 with CCS deployment in 2020, 450 with widespread CCS deployment in 2030, and 450 with no CCS deployment through 2040.⁶⁶

Comment Excerpt Text:

DOI's estimate appears to be a nationwide figure which amalgamates all federal coal leases. However, the mines

in Wyoming account for 80% of all federal coal being produced today and BLM Wyoming figures show the average mine life for Wyoming coal mines is 16.4 years. See Wyoming Coal Mines- Estimated Mine Life (WY0-00914). Even this number is skewed by one mine, the Caballo mine, which is projected to last for 80 years. (Id.). And the 80 year projection cannot be relied upon because the Caballo mine is known to contain significant amounts of uneconomically mineable reserves. (Id.). Thus, DOI is overestimating the remaining life of existing mines, including those in Wyoming.

DOI has used its 20-year estimate to downplay the impact that the moratorium will have on coal production. Again, DOI is not telling the whole story. Assuming no legal challenges, the best timeline estimate for a new lease approval will likely require 13 to 15 years (3 year PEIS process; 2 years for rule/Resource Management Plan (RMP) revisions; 5 years for EIS development of same; 2 years for Record of Decision and lease sale; 3 years for state/federal OSMRE permitting). A 15 year time lag for post-moratorium new coal production cuts dangerously close to BLM's estimate that the mines in Wyoming that produce 80% of federal coal will continue for 16.4 years. But this best case scenario is not the most likely scenario because litigation is likely to occur. Unfortunately, the moratorium and PEIS process has created an uncertainty in the nation's thermal coal baseload fuel supply. Because the moratorium has stopped the coal leasing process while existing leases continue to produce, DOI has created a time lag in production that is not likely to be overcome once leasing resumes. Therefore, the BLM must consider ways to significantly expedite coal leasing once the moratorium is lifted.

1.5.2- Concerns with Order No. 3338- Sec. 6, Exclusions

The exclusions identified in Order No. 3338 appear designed to mitigate potential mine life conflicts; however, the emergency lease and lease modification provisions may be insufficient to sustain some mining operations. The DOI's calculation of tons of reserves in Wyoming is inaccurate. It is apparently based on total tons of coal leased nationwide. The more appropriate calculation of tons of coal reserves should be on the basis of minable tons within approved lease tracts. The DOI evaluation does not take into account the balancing of strip ratios across the mining reserve base (field average) and actions taken by BLM in the leasing process that impact those reserves ultimately leased. The BLM is required to lease in accordance with the public interest. Therefore, lease tracts include unrecoverable tons that lie under rail lines and extend to the 40 acre subdivision. The unrecoverable tons within these lease units include tons that are not economically recoverable, but have been added into the lease tract total tonnage evaluation and sale to prevent reserve sterilization.

Order No. 3338 also does not account for strip ratio variability (overburden thickness/coal thickness) and how strip ratio factors into lease modification requests and actions. As stated previously, a lease action often includes areas of high strip ratio and marginal coal in order to prevent sterilization of reserves. LBA and Lease by Modification (LBM) actions include both lower cover reserves in conjunction with marginal high cover reserves in an attempt to balance the strip ratio and recover the maximum coal tons from the reserve base. This action facilitated by the LBA/LBM process provides for maximum recovery and public benefit from the leased coal. In contrast, Order No. 3338, as established, will force operations into marginal reserves early in the mine life and create economic winners and losers based on policy rather than coal recovery and market conditions. Additionally, coal companies may choose to pay a penalty and bypass marginal reserves as they are simply too costly to mine without lower stripping ratio reserves available to offset the respective increased cost of mining. The public benefit from these reserves is compromised and is in contrast to BLM's public benefit mandate. The increase in the cost of coal will be passed onto the end consumer resulting in higher utility rates. The BLM must consider these factors now, as it relates to Order No. 3338, and in its PEIS.

Comment Excerpt Text:

From a nationwide perspective, the OIG report did NOT conclude that the program has resulted in loss of revenue. Instead, it found that updating certain agency policies would minimize certain hypothetical risks for the

undervaluation of the resource. The policy changes to guidance proposed by the GAO and OIG reviews are administrative, offering guidance to the BLM to assure the program's continued effectiveness and transparency. They do not call for this PEIS with its monumental and expensive consequences. The vast majority of federal coal leased and mined in the U.S. (80 percent in Wyoming) is being managed in an exemplary manner. The moratorium on new coal leases and lease modifications on these facts alone is unwarranted and should be lifted immediately.

Organization I: Office of Governor Matthew H. Mead

Commenter I: MATTHEW H. MEAD

Other Sections: 4.6

Comment Excerpt Text:

The PEIS process is having a disproportionate impact on Wyoming and time is of the essence for Wyoming and Wyoming mine workers. DOI has suggested that this review is temporary and time limited- three years. However, there is no written commitment by the DOI or the BLM to a three-year schedule. It regularly takes a minimum of seven to ten years to complete an Environmental Impact Statement in Wyoming. Interestingly the BLM's Solar Energy Development PEIS- considered a priority of the Obama administration- took more than four years to complete and the BLM is only now proceeding with updating its rules and regulations. The BLM needs to stop the PEIS, but at a minimum it needs to commit in writing what it has promised repeatedly, that the PEIS will be completed by January 15, 2019 and, completed or not, that the moratorium will expire on that date.

Comment Number: 0002495_Bucks_20160728-6

Commenter I: Dan Bucks

Comment Excerpt Text:

Secretarial Order 3338 contains all the reasons why the current systems are deficient and need to be replaced. The programmatic reviews in the 1970s and 80s set precedents for using the PEIS process to develop new practices and procedures. Interior's pause in leasing while the coal review is completed implicitly confirmed that the leasing process was flawed and could not be continued. Indeed, if the scope of the PEIS does not include work on improved administrative systems, Interior will undermine the credibility of the leasing pause. Critics will ask, "If the PEIS is simply an academic, analytical exercise of no consequence to operational policy and practice, why then was the pause imposed on leases? Surely, analysis can proceed while we get on with the real business of leasing and producing coal." The rationale for the leasing pause is reinforced if the scoping document makes an explicit commitment to develop through the PEIS a new leasing system to replace lease by application. By ceding substantial control of the pace and degree of coal leasing to coal producers and allowing them to self-assess royalties, Interior has denied itself the ability to guarantee a fair return to the public, to minimize and mitigate the external cost of coal production, or to fulfill other public purposes. The existing administrative systems are obstacles standing in the way of the goals of the PEIS. They are too infected by private control serving private interests to yield results that serve the public interest. These systems need to be replaced, and that vital work should be accomplished through the PEIS, with new systems ready to be implemented at its completion.

Comment Number: 0002500_Sweeney_20160728-1

Organization I: National Mining Association

Commenter I: Katie Sweeney

Comment Excerpt Text:

If the BLM is sincere in its goal to achieve a fair return for taxpayers, the BLM should lift the moratorium on federal coal leasing and abandon those proposals which would short change American taxpayers and raise energy costs across the nation. Instead of pursuing these destructive policies, the BLM should recommit itself to ensuring

the proper and expedient function of the federal coal leasing program on behalf of the public that it serves. Attached and incorporated in these comments is a report on the “Federal Coal Leasing Moratorium: An Examination of the Reasons Driving a Disruptive Policy” which analyzes the misguided rationales for the moratorium and policy proposals included in the PEIS that are designed to make federal coal uneconomic.

Comment Excerpt Text:

II. The Reasons Underlying the Moratorium and PEIS Rely on Market Distortions and Mischaracterizations of the Coal Leasing Process Which Would Decrease Coal Production and Return for Taxpayers

Many of the potential policy options listed in BLM’s PEIS Scoping Notice disguised as measures for ensuring fair return are actually market distorting policies designed to make federal coal uneconomic to mine which will result in denying communities, states and all Americans the twin-benefits of coal revenues and access to lower cost and reliable electricity.

Comment Number: 0002503_Hamman_20160729-1

Organization I: Lignite Energy Council

Commenter I: Tyler Hamman

Comment Excerpt Text:

Given the mine-mouth nature of lignite coal mines and electric generating facilities, mining companies in North Dakota have secured long-term supply contracts with their utility customers. As a result, mining companies secure the majority of leases needed to satisfy decades-long fuel supply contracts, as well as the surface area they intend to mine, before submitting an application for a mine permit from the North Dakota Public Service Commission (PSC). After these pieces have fallen into place, coal producers can begin mining activity and have developed the practice of pursuing a federal coal lease by accounting for an appropriate amount of lead time in their mine plan. In announcing the three-year moratorium on federal coal leasing, the Department indicated that it would not impact existing operations since there is enough coal already leased to maintain current production levels for 20 years[2]. Despite the relatively small amount of federal coal in North Dakota, the three-year moratorium can actually be more damaging since coal producers do not secure federal coal decades from production as is standard practice in areas of the West with significant federal coal reserves.

Other Sections: 4.6

Comment Excerpt Text:

Along with preparation of the EIS, the Secretary of Interior has imposed a de-facto moratorium on coal leasing pending completion of this review.

Part of the stated justification for these actions is reports resulting from review by the Government Accounting Office (GAO) and the DOI-Office of Inspector General (OIG) of the current coal program. Given, however, that the referenced reports stated that the current leasing program is sound and contributes significant benefits to the taxpayers, that the reports offered only modest recommendations for program improvements, and that in 2014 the BLM already developed new protocols, policy guidance, and a manual and handbook to implement the GAO/OIG recommendations, there is a reasonable basis to question the need and motivation for both the EIS and the leasing moratorium. It must also be noted that the proposed regulatory changes illegally conflict with and attempt to supercede existing law and regulation under SMCRA (30 U.S.C. 25), FLPMA (30 U.S.C. 1701), MLA (30 U.S.C. 181), MMPA (30 U.S.C. 21a), NEPA (40 U.S.C. 4321, and DQA (Pub. L. No. 106-554, 515).

Commenter I:Joe Stein

Comment Excerpt Text:

In the wake of a global climate crisis, we as Americans must maintain our current moratorium on Federal coal leases in order to meet our intended goals and prevent environmental disaster, paired with wise policy, emphasizing green subsidies. The extension of the current moratorium on coal will create jobs, lower greenhouse gas emissions, and show the world that America is once again a global energy leader. According to Sally Jewell, the current Secretary of the Interior, we already have 20 years' worth of coal supply at current production levels, at least for extraction. Because production levels are dropping, that stock will last longer and longer. We simply have no need for new coal plants. Removing the moratorium on Federal coal leases after signing on to the Paris Agreement, would be a step in the wrong direction at the most pivotal point in American energy history.

Commenter I:Bobbi Bryant-Salvato

Comment Excerpt Text:

The Alton Coal Mine, if permitted by BLM, will be a strip coal mine on 3,500 acres of public lands. Highway 89 will be the haul route of this coal. Highway 89, the Mormon Heritage Highway, is a small two lane highway that goes through the towns of Hatch and Panguitch. In the latest SEIS by BLM I quote, "adverse impacts of community and social well-being and tourism related business, population, housing and public safety and health" will result from permitting this mine. BLM has heard from more than 200,000 members of the public asking they not approve this mine. Truck traffic through these small towns will be estimated at up to 300 double tandem truck trips operating 24 hours a day 6 days a week. You can imagine the noise and road hazards.

The Alton Coal Mine – other impacts

About an hour north of where I live, in Kanab, Utah, is the Alton Coal Mine, built years ago on private land. For the past nine years, the BLM has been working on a proposal to lease 3,000 acres of adjacent public land to be used for open pit coal mining. While there is nothing we can do about coal mining on private land, we who live in

this area have watched for years the destruction that has already taken place to the surrounding ecosystem, and we fear the threat of far greater and more devastating damage to nearby public lands if they were to be opened up to coal mining, as is being proposed.

Comment Excerpt Text:

A "lek," or breeding ground, of the severely threatened sage grouse lies at the exact location of planned new coal expansion onto BLM land. Although the sage grouse species should have been listed for protection under the Endangered Species Act, it was not. Instead, an impractical plan has been agreed to by eleven western states to "manage" sage grouse habitat. This plan involves allowing key, essential sage grouse habitat to be taken over by coal strip--mining and other industrialization, while at the same time attempting to design new habitat, which, it is hoped, any sage grouse that survive may move on to.

This new habitat is being created by having machines crunch up miles and miles of beautiful native pinion and juniper trees, leaving the dead remains of the trees littering the ground, so that it is impossible even for a human to walk over them. It is hard to imagine the sage grouse doing their beautiful mating dance on top of broken, splintered trees. In some cases, nonnative grasses have been planted at these sites, which is ecologically inappropriate.

There is no proof that the sage grouse will move onto these miles and miles of destroyed trees, which do not in any way resemble sage grouse habitat. In the meantime, the habitat of all the native species who used to live there – the coyotes, the deer, the elk, the rabbits, the beavers, foxes, cougars, bobcats, and the many small mammal and avian species -- has been eradicated.

Organization I: Black Warrior River Keeper

Commenter I: Nelson Brooke

Other Sections: 16

Comment Excerpt Text:

A recent BLM lease (ALES-055199) of 160 acres was awarded to Narley Mine No. 3 utilizing the “emergency lease” qualification, under the premise that the 868,423 tons of recoverable federal coal were needed within a three-year timeframe to maintain an existing mining operation – the adjacent Narley Mine. Operated by Best Coal, Inc., Narley Mine No. 3 (surface mine) is permitted by the U.S. Army Corps of Engineers (NWP 21: SAM-2012-00615-CMS), the Alabama Surface Mining Commission (P-3954) and the Alabama Department of Environmental Management (NPDES: AL0075752). NPDES AL0075752 allows discharges through six sediment basins to an unnamed tributary to Trouble Creek, which flows into Trouble Creek, and then into the Locust Fork of the Black Warrior River in Jefferson County, AL. Sediment basins are allowed to be placed within streams in Alabama by utilizing a grandfather provision to exercise use of the old Nationwide Permit 21. This Corps permitting system is outdated and destructive – its use was discontinued in all other Appalachian coal mining states years ago. Sadly, its use has been allowed to continue in Alabama. It is stated that fill impacts would not be had by this operation on Trouble Creek, but there will be fill impacts to Trouble Creek’s tributaries. For this mine, SAM-2012-00615-CMS allows for the destruction and fill of 4,080 linear feet of intermittent streams and 7,106 linear feet of ephemeral streams. Headwater tributaries and their critical ecosystem functions should not and cannot be overlooked when considering the cumulative impacts of an operation within a watershed. Placement of fill and sediment ponds in drainages and tributaries is a key concern of Black Warrior Riverkeeper, and we believe this is a practice allowed by NWP 21 that should be expressly banned. These streams are headwater tributaries, and any impacts to them eventually have a downstream cumulative impact on the Locust Fork. A 100 foot Stream Buffer Zone cannot and should not be touted as a sufficient measure to protect water quality and aquatic species, as it is in the EA on page 46.

Comment Number: 0002505_Brooke_20160729-2

Organization I: Black Warrior River Keeper

Commenter I: Nelson Brooke

Comment Excerpt Text:

The June 2, 2014 EA (DOI-BLM-ES-0020-2012-0039-EA) performed by engineering firms PERC & MEC for this lease was inadequate for multiple reasons. Consultation with multiple state and federal regulatory agencies failed to adequately consider water quality and wildlife habitat impacts to the Locust Fork of the Black Warrior – both individually from this mine and cumulatively with numerous other active, reclaimed, and abandoned coal mines along this stretch of the river. Neither ADEM nor AMSC – the two state agencies with regulatory authority over coal mining in Alabama – perform cumulative impacts analyses when making permitting decisions. Their permitting systems do not adequately take into consideration downstream impacts of surface coal mines on receiving river basins, their habitat, their intended uses, or their actual uses.

Comment Number: 0002505_Brooke_20160729-3

Organization I: Black Warrior River Keeper

Commenter I: Nelson Brooke

Other Sections: 4.6

Comment Excerpt Text:

While the applicant states in the EA on page 48 that the ADEM NPDES permit “provides strict water quality restrictions that control the quality of water that will be allowed to be discharged into the nearby streams,” ADEM’s NPDES permits actually allow for rain event exemptions on pollutant limitations, essentially permitting coal mines to discharge sediment and heavy metals-laden water over spillways or through pipes into receiving streams during rain events. These unfortunate exemptions circumvent the intent of the Clean Water Act, and

place downstream waters and species in harm's way at times when pollutant limitations are needed most. ADEM's coal mining NPDES permits are designed to allow massive quantities of sediment to discharge into receiving waters during rain events. The idea touted on page 48 that sediment basins are adequate to trap sediment in runoff from coal mines cannot be trusted. There is a lot of talk in the EA about all the regulations and plans in place to protect the environment, but the reality on the ground is: strip mines in Alabama are overseen by lax regulations and minimal regulatory oversight.

A misleading representation of the NPDES compliance history of the applicant at its Narley Mine was provided as a justification for the lease in this EA. Such misinformation should not be taken lightly, and should be ample fodder for revocation of this lease. The EA states on page 48: "Best Coal, Inc. has not experienced a non-compliance discharge from any of its basins associated with the NPDES Permit AL0075752 since March 15, 2011." Upon a quick Black Warrior Riverkeeper review of NPDES Permit AL0075752 monthly discharge monitoring reports publicly available on ADEM's eFile database, we found this statement to be patently false. From March 15, 2011 to January 2012, Narley Mine had 217 violations of its NPDES permit – by exceeding limitations for toxicity and selenium.

On page 48 the following was stated: "In addition, there are no issues or concerns brought forth relating to the past mining operations in the area according to their past compliance records." Additionally on page 35 the following was stated: "Best Coal had tested the Narley Mine overburden and interburden to determine whether acid or other toxic-forming substances were present in amounts that might pollute water resources. The results indicated that toxicity issues with respect to the materials tested were minimal. The three overburden cores contained small amounts of acid-forming shale zones near one or more of the coal beds to be mined. The volume of this toxic material was small compared to the total volume of overburden. Excavation of the overburden would not necessarily mix the spoil thoroughly. Therefore, there is a possibility that pods of toxic shale might be positioned within the backfill where they could have some localized environmental effect. However, considering the volumes involved, that effect would be limited to a few patches of sparse vegetation, which could be mitigated with an application of agricultural lime." Taking these two items into consideration, it is of note that some of the NPDES permit violations at the Narley Mine were with respect to toxicity failures in their discharges. It is clear that the applicant's representation of operations at Narley Mine differ from the facts on the ground.

The stretch of the Locust Fork near Narley Mine No. 3 is classified as federal Critical Habitat under the Endangered Species Act for six species of freshwater mussels: Alabama moccasinshell (*Medionidus acutissimus*) [Threatened], Dark pigtoe (*Pleurobema furvum*) [Endangered], Orange-nacre mucket (*Hamiota perovalis*) [Threatened], Ovate clubshell (*Pleurobema perovatum*) [Endangered], Triangular kidneyshell (*Ptychobranhus greenii*) [Endangered], and Upland combshell (*Epioblasma metastrata*) [Endangered]. It is also known habitat for the following rare species: Black Warrior waterdog (*Necturus alabamensis*) [Candidate], Cahaba shiner (*Notropis cahabae*) [Endangered], Flattened musk turtle (*Sternotherus depressus*) [Threatened], and Plicate rocksnail (*Leptoxis plicata*) [Endangered]. Amazingly, Table 4 in the EA erroneously states about the Cahaba Shiner: "this species is only found in the main channel of the Cahaba River." Actually, the most robust population of the Cahaba shiner lives within the Locust Fork near this mine site. With such a clear mistake, it is hard to imagine that a Section 7 Consultation meaningfully took place, even though the U.S. Fish & Wildlife Service informed the BLM on 6/27/13 that Best Coal's contractor met consultation requirements. Unfortunately, without a serious cumulative impacts review, these species well-being and the habitat and water quality impacts from coal mining were not seriously considered through this process. The habitat assessment performed by MEC simply focused on the immediate area of the mine – an area already impacted by multiple activities over the years, but failed to survey areas immediately downstream that will be impacted by polluted runoff from the mine during operation, during reclamation activities, and well into the future beyond post-reclamation closure. Alabama is the number one state in the U.S. for aquatic biodiversity, and the Locust Fork is a key priority watershed for rare species habitat, reintroductions, and recovery. If the BLM's federal coal EA process were adequate, the importance of the

Locust Fork, its water quality, its aquatic habitat, and its inhabitants would not have been glossed over as it was here.

Commenter I:Pat Akers

Other Sections: 8.7

Comment Excerpt Text:

I wanted to hit on one particular issue, the comment in order No. 3338 that notes that about 90 percent of federal coal lease sales receive only one bid and that's typically from the operator of a mine adjacent to the new lease given to a large investment required to open a new mine. Commenters have questioned whether an accurate fair market value can be identified in the absence of a truly competitive marketplace. I will say that based on economics, the owner of the adjacent mine will always have an advantage over other bidders. This is due to the investment the operator has made in infrastructure and equipment that can be used to produce the efficient coal. His cost will be lower than the other bidder because of this investment. Other bidders will need to include this capital, which is hundreds of millions of dollars in their cost, and will need a return on that capital, which will reduce the amount they can afford to pay for the lease. To ensure that the adjacent operator does not take advantage of the Federal Government, the BLM handbook has a special set of valuation rules to determine the minimum bid for these situations. The BLM sets the minimum value in these situations by calculating the value of the mine without the adjacent lease and the value of the mine with the adjacent lease. And the difference between these two values is set as the minimum. This has the effect of transferring all of the profit above the 10 percent discount rate to the Federal Government.

Organization I: Taxpayers For Common Sense

Commenter I: Ryan Alexander

Comment Excerpt Text:

For the last 25 years coal companies have proposed tracts of land put up for sale by BLM through a lease-application process. Close to 90 percent of these sales have only a single bidder. The lack of competition for federal coal leases makes the process of determining fair market value for coal controversial. There are legitimate problems in continuing to value lease tracts that lack competitive appeal because it's to maximize profits for the bidder and not the taxpayer. Because of the lack of competition, comparisons for the purpose of appraisal are difficult.

Experts say uncompetitive leasing practices have cost taxpayers \$1 billion per year for 30 years, revenue that might have reduced deficits or kept our roads and schools in better shape.

Comment Number: 0000552-1

Commenter I: Thomas Gordon

Comment Excerpt Text:

In the Powder River Basin, in the last twenty years, the majority of leases received only one bid. If the bid does not reflect fair market value, the sale should be denied. Royalties are 12.5% of the fair market value and are the way our country receives money for its natural resource. Also, a common practice is for the coal company to buy coal through a subsidiary at the domestic rate and then sell overseas for a higher rate, cheating our country out of the additional royalties. Reuters found that two companies, Arch Coal and Peabody Energy, sold coal to India, South Korea, and Japan and have not paid their full royalties. Now these companies have shaky financial ground under them and have filed for bankruptcy. Also, there is currently a process for the coal company to request a royalty rate reduction. If the coal company can't pay the royalty, then it can't afford the lease

Comment Number: 0000552-3

Commenter I: Thomas Gordon

Comment Excerpt Text:

And to ensure the whole process is fair, no former coal company executives in the BLM or Department of the Interior should be allowed to be involved in the sales, processing, and oversight of leases.

Comment Number: 0000555-1

Organization I: US Senate

Commenter I: Cantwell

Comment Excerpt Text:

The fact that 90 percent of federal lease sales since 1990 had single bidders suggests that western coal markets are structurally non-competitive. The federal government readily leases tracts nominated by the mining company that submits the only bid. Confidential appraisals and sealed bids introduce an imperfect proxy for competition, but the government has too often been a passive auctioneer rather than a steward. No law requires the BLM to sell coal as requested and nearly at cost, turning the government into the supplier of first resort.

Comment Excerpt Text:

Federal coal operations cost taxpayers, states and local communities millions in lost revenue. Loopholes in policy allow coal companies to get by without paying their full royalties to the government for their use of public lands and federal coal. Royalties were set at 12.5 percent, yet companies often get away with paying as little as 4.9 percent. Loopholes in the government's coal program cost taxpayers and state governments more than \$1 billion a year in lost royalties—money that could be used for local schools and roads. As of 2012, loopholes in our guidelines had cost taxpayers over \$30b. Federal coal reform improves our air quality. During blasting operations, coal mines release significant amounts of air pollution, and make our air hazier, not to mention contributing to ozone levels.

A plan first, lease later process that includes greater coordination with adjacent federal land managers, similar to Master Lease Planning for oil and gas development, would minimize potential user conflicts and protect sensitive lands such as national parks, wilderness and critical wildlife habitat.

Comment Number: 0000822-1

Commenter I: Nicholas Nielsen

Comment Excerpt Text:

Changing the mechanism to decide which coal leases and how it is leased would be detrimental. If the goal of this EIS is to better the coal program, it will find that leases should be available as mining companies find them economically viable. The leasing process is already lengthy and time sensitive if limited further coal companies will financially not be able to withstand outage or be willing to invest the capital for leases. Is this the ultimate goal of this EIS? This will result in no royalty payments and no return to the taxpayers. On the other hand, if companies were incentivized and a royalty reduction was applied, mining companies could further maximize reserves by mining challenging areas and provide more return for taxpayers.

Comment Number: 0000824-1

Commenter I: Garrett Atwood

Commenter I: Jason Begger

Comment Excerpt Text:

Also, I would like the BLM and Department of Interior to look at possible overpayments. There isn't one bidder on these leases. The BLM sets the floor. If a company does not meet that floor price, the bid isn't awarded. So you're always bidding against the government automatically. So more likely than not, if it is a winning bid, it didn't hit that floor exactly. It was probably over.

So if the BLM sets their own disclosed price at 90 cents a ton and a bid comes in at 95 cents a ton, the government accepts the 95 cents. This is a premium of 5 cents a ton over the asking price. I would ask the BLM to go back and look at the overpayments that it made over the own valuation price that they set years and years ago.

Establish a True, Balanced Public Private Partnership (9)

A public private partnership is generally understood as a business venture between government and business designed to provide a service or good. The private vendor and the government enter into a contract in which the private sector accepts technical, financial and operational risks. Financing can be either wholly the responsibility of the private sector or supported by some combination of public and private resources. Government contribution to financing typically flows from in-kind contributions such as the transfer of assets, capital subsidies, revenue guarantees, tax breaks, regulatory streamlining or quasi-monopolistic markets. The private sector usually contributes its value with production efficiencies the government could not achieve. The combined package draws investment capital based upon a holistic evaluation of the quality of the partnership. The borrowing and the financial life of the investment is considered an off-balance-sheet activity for government, allowing it to use its balance-sheet resources for other public needs.

The adoption of an alternative model for the federal coal leasing system would rebalance the current partnership and allow it to address the conditions of a declining market. The product to be produced from the partnership would be coal, mined for the purpose of domestic consumption principally in the electricity sector.

Organization I: Institute for Energy Economics and Financial Analysis

Commenter I: Tom Sanzillo

Comment Excerpt Text:

The actual relationship between the coal industry and the federal government under the current system is not a functioning lessee/lessor relationship. It is instead an unbalanced public private partnership—one in which the private sector has the upper hand, determining where, when and how coal is mined, who it is sold to and at what price. Consequently, as the PEIS indicates, the government now support a lease payment system based on a fundamentally flawed valuation process, a royalty payment system in search of a rationale, and an antiquated annual rent payment.

Comment Number: 0002152_Bruse_20160518-11

Commenter I: Debbie Bruse

Comment Excerpt Text:

Yes the current leasing process is broken, but not because it is not fair to the public, it is broken because it takes too long, making long range planning difficult for coal companies.

Comment Number: 0002152_Bruse_20160518-12

Commenter I: Debbie Bruse

Comment Excerpt Text:

In general, and since the process to lease and mine coal is long, coal companies must nominate an approximate 10 year reserve thru the LBA process, well before they are down to 10 years of existing reserves. So when the LBA coal is finally available for mining, the mining company's machinery can seamlessly mine into the newly acquired coal lease. Mining occurs in long strips (hence the term strip mining) and the equipment must have this room in order to operate efficiently. If the reserves are dwindling and the dragline must continue to mine smaller strips, it is not efficient or cost effective. Continued Washington DC oversight, ensuing red tape and NGO lawsuits have the potential to unreasonably add years to this process.

Comment Number: 0002152_Bruse_20160518-13

Commenter I: Debbie Bruse

Comment Excerpt Text:

The BLM should not be deciding the tract size or configuration, as they do not have the best details of geology, geotechnical, environmental and land related impacts that the company will be facing when deciding the best tract option or configuration. The mining company literally can spend a year comparing all of the impacts that alternative lease tract configurations can have on each configurations value, when determining the optimum tract configuration to nominate.

Comment Number: 0002152_Bruse_20160518-16

Commenter I:Debbie Bruse

Comment Excerpt Text:

Market conditions will dictate the need for additional leasing and the coal companies should be making the decision of when to nominate and where based on a long process that most companies already go thru in order to identify the optimum tract configuration and maximize their return on investment. There is also already enough oversight by federal state and local agencies to manage temporary impacts to water, soil, vegetation and wildlife, and a review of impacts during the PEIS is not necessary.

Comment Number: 0002152_Bruse_20160518-5

Commenter I:Debbie Bruse

Comment Excerpt Text:

The current leasing process has historically taken a minimum of 8 years from Lease by Application (LBA) submittal for additional reserves until the company has the ability to mine the coal reserves. The current environment, in which Washington has taken away the regional BLM offices ability to make decisions without significant oversight, has not only added red tape, it has added more time to the already cumbersome and long process.

Comment Number: 0002152_Bruse_20160518-6

Commenter I:Debbie Bruse

Comment Excerpt Text:

There may be 20 years of coal currently available under lease, but mining companies must have this cushion, because the leasing process is getting more convoluted. The mining companies have no idea how long a lease, nominated today, will take to get thru the EIS and permitting process. Streamlining the Lease by Application process (the HOW) should be the priority for the BLM, not making it more cumbersome. The When and Where to lease should be up to the mining company making the decision based on their needs, estimated timing to get the lease thru the EIS and permitting process, and what works for their current pit configuration.

Comment Number: 0002154_Riordan_20160627-2

Commenter I:Michael Riordan

Comment Excerpt Text:

As I noted in my article and elsewhere, there was an inherent subsidy built into the previous coal-leasing policies, to encourage utilities' burning of low-sulfur thermal coal from western US mines, particularly in the Powder River Basin of Wyoming and Montana, to help reduce acid rain. That need is no longer evident, as the problem it attempted to address has been ameliorated and will eventually disappear as thermal coal use in the United States continues to decline.

Organization I: Center for Energy and Climate Economics Resources for the Future

Commenter I: Alan Krupnick

Other Sections: 7.1

Comment Excerpt Text:

The lack of competitiveness in the federal coal leasing market may limit the effectiveness of any carbon charge. Since most leases are granted in bids with only one bidder, bidders may simply reduce their bid by some amount of the carbon charge. Protections against such actions may be gained through evaluation of BLM's internal fair market valuation processes to ensure that climate costs are considered in those processes.

- The Administration's Interagency Working Group on the Social Cost of Carbon has released estimates for the social cost of carbon for agencies to consider in their programs.

- At the midrange SCC estimate (\$46/ton CO₂), the corresponding carbon charge would be over \$90/ton of coal, which far exceeds the average mine-mouth price of coal from the Powder River Basin (recently selling at around \$9.35/ton).

Streamline the leasing process

a. Takes too long to get a lease

i. Mine permitting – a company can only start the permitting process when the lease has been issued. Sometimes, the state, OSM, other various agencies throw up road blocks that takes time to sort out

ii. Leasing to companies with 10 years of reserves, it takes too long to get a lease, maybe 20 years of reserves at that location

iii. The delays in leasing are generally from the state office, not working on the application. The companies are paying cost recovery and a priority should be placed with the state office to get these done.

b. Shorten timeframes to get things listed in the Federal Register

i. The state office should be able to submit things to the general register to get published, leave it to the state office to check for proper format, content, etc.

Comment Number: 0002269_Holubec_20160715-3

Commenter I: Allen Holubec

Other Sections: 2

Comment Excerpt Text:

Cost recovery –

i. Change this in its entirety, charge a set amount depending on type of mine and application does not matter if a

new lease application or a lease modification.

ii. Again, it takes three or four months to get a cost recovery number, we need to streamline so a company know what it is going to cost for their own budgeting.

iii. This type of collecting cost recovery has been asked about. This is a cheaper, quicker method to do it, it is simpler.

iv. For Example;

1. Set amount - \$50k

2. Adder – underground - \$10k

a. Possibly add another \$5k for each new surface disturbance

3. Adder – Surface - \$20k

4. Adder – Acreage (TOTAL surface disturbance of a mine)

a. Up to 50 acres - \$5k

b. 50 to 100 acres - \$10k

c. 100 to 250 acres - \$15k

d. Add \$5k per each additional 150 acres

5. Adder – possibly an adder for leased tonnage or recoverable tonnage

6. Some cost recovery examples

a. New Lease Application (LBA) - Surface mine 1400 acres total disturbance

i. They would Pay

1. Set Amount - \$50K

2. Adder for Surface - \$20k

3. Adder for Acreage

a. First 250 acres - \$15k

b. Each additional 150 acres x8 or \$40k

c. Acres total - \$55k

4. Total amount for cost recovery - \$125,000

b. New Lease Application (LBA) – Underground mine with 75 Acres surface disturbance

i. They would pay

1. Set Amount - \$50k

2. Adder for underground - \$10K

3. Adder for surface disturbance - \$10K

4. Total amount for cost recovery - \$70K

c. Lease Modification (LM) – Underground with no new surface disturbance

i. They would pay

1. Set Amount - \$50K

2. Adder for underground - \$10K

3. No adder for Acres (no new surface disturbance)

4. Total amount for cost recovery - \$60K

7. Another method would be to have a different type of adder for tons in reserve, the bigger surface mines would end up paying more than a small underground mine.

8. Cost would be charged and processed against the accounts set up for the cost recovery as they are now. If the cost exceeds the listed amounts, the extra cost would be charged to the applicant at the time of the lease sale.

The applicant must have a separate check to pay the overages to the BLM before the lease sale and paid to the lease sale team. Any amount of the cost recovery dollars paid and not used would be refunded to the applicant at the time of the lease sale, before the lease sale by the lease sale team. If the company does not pay, they would be exempt from the leasing the parcel. Any company that bids on the lease parcel and wins would be required to reimburse the original applicant for the cost recovery, including any overage amount.

a. Invoicing to cost recovery account will be sent to the applicant quarterly for their information.

b. Work on the lease application cannot be stopped due to a deficiency of funds in the cost recovery accounts

Comment Number: 0002269_Holubec_20160715-4

Commenter I: Allen Holubec

Comment Excerpt Text:

Keep the industry nominated process,

i. This is much cheaper

ii. The BLM doesn't know what industry wants or needs

b. The Government needs to stay out of oversupply or market processes as the government cannot know what the industry needs or anticipate for the future

c. Bidding

i. Highest bid should exceed the estimated fair market value not just meet it

ii. Based upon recoverable coal not total coal reserves

d. Lease prohibitions

i. Not leasing to violators on OSM list

I. This list is supplied to the BLM at the time of the lease sale and taken into account at the lease sale not before and not after

ii. Not leasing to companies that have not met present or past reclamation requirements whether private or federal leases

iii. The violator list has to be updated not only by company but by personnel of that company.

I. For example; ABC Company (John Doe as president) gets put on the violator list. John Doe cannot start DEF Company to get a lease. Also John Doe's daughter cannot start DEF Company to get a lease for her father. (This is happening!)

e. Lease modification

i. the price paid for the bonus bid should be based upon the main lease bonus bid, adjusted for inflation plus 10%

Leasing of Coal

Coal producers enjoy an overly comfortable relationship with local BLM offices in many areas. This can result in excessively favorable treatment in terms of royalty reductions (see above); in the requirements for actual reclamation bonds; in arrangements for leasing when companies want to lease, rather than when there is maximum competition; by not recognizing the cost to the U.S. of holding the land for mining; by handing the federal administration of coal leases over to the states or counties; and by not holding companies accountable for infractions. Financial losses to the U.S. taxpayer add up. The overly comfortable relationship between BLM and coal producers also contributes to public perception of BLM complicity in 'crony capitalism' favoring large corporations; and lack of enforcement dramatically diminishes the public's perception of BLM's ability to professionally and competently manage these areas. BLM's reputation as a land manager will always be second or third rate as a result. Reforms should look at these cozy relations and bring BLM's management up to par.

Comment Excerpt Text:

Specific comments regarding the leasing of coal:

- How much coal leasing is required for U.S. energy requirements? Have those needs been met, except for mine extension requests? What criteria for leasing should be revised in relation to these questions?
- Reinstate "Coal Producing Areas" status on areas such as the Power River Basin, to ensure a larger view of coal

- production, competition, environmental impact, as well as reassertion of federal government control
- Require the use of the NEPA process, with public comment, as part of the “Coal Producing Area” decertification process
 - o Given the significant impact of methane on the environment, a Categorical Exclusion is not appropriate
 - To encourage competition, change the timing of lease auctions to a regular schedule such that companies may anticipate leasing and plan ahead
 - o Recognize that there is a cost to industry for the U.S. to hold off mining and integrate this cost into planning and bonus bids
 - Prohibit companies that have failed to perform in any manner in the past from obtaining leases, including mine extension leases
 - Provide detailed direction on the new rules, via Manual and Handbook (not Informational Bulletins nor Instructional Memoranda) to ensure that there is consistent implementation across the agency
 - o Provide monitoring and mentoring of those offices that may have been too close to industry in the past
 - o Clarify that BLM’s mission is to obtain fair market value and not subsidize the coal industry
 - Do not leave direction in a “draft” state for political expediency
 - Prohibit leasing or extensions to any entity related to entities that have not fully complied with science-based reclamation requirements on prior leases, including those who have negotiated diminished requirements through bankruptcy proceedings.

I believe the issue of how and when to lease is appropriate for a Programmatic EIS. However the issue of where to lease seems well beyond the scope of what can be considered in a national programmatic EIS. The level of detail that must be considered in determining where to lease is well in excess of what can be reasonably considered at the national level. The Grand Mesa, Uncompahgre and Gunnison National Forests have completed analyses on where to lease on those three individual national forests. I believe that is the appropriate level for where this determination should be made, not a national PEIS completed in Washington, D.C. The issues of how to lease and when to lease could reasonably be considered at the national level. I believe both issues should be accomplished as simply as possible. The current procedures seem more than adequate to me and if anything should be made simpler. Any changes in the current procedures should only be considered if they simplify and expedite the process.

Commenter I: Betsy Monseu

Comment Excerpt Text:

Delays related to the mine permitting process mean that permitting can take seven to ten years in the United States, far longer than other advanced economies with similar environmental standards. Permitting is facilitated by efficient, timely review and effective coordination between federal and state agencies. Delays add barriers and costs to mining, and are increasingly a disincentive to coal production. Some organizations and individuals have suggested the federal coal leasing program should be changed to address environmental concerns and climate impacts, but such reform is unnecessary. Leases already undergo multi-layered reviews prior to approval, and climate effects are already subject to review under the NEPA process.

Comment Excerpt Text:

The evidence, however, shows that instead of deciding whether there is sufficient demand for coal and designing tracts to maximize competition, the BLM defers to the mining companies, who—not surprisingly—design tracts to avoid competition. A report by mining consultant John T. Boyd Company that was prepared for XCEL Energy describes the current system this way: (5) Cited in Taxpayers for Common Sense, referenced above.

As a practical matter, most companies will attempt to define LBA tracts that, because of location or geometry, are of interest only to the nominating company. This minimizes competitive bidding on the tract, and may result in a lower cost lease. Where competition has existed for coal (mostly in the southern Gillette area but recently in the central portion of the coalfield) relatively high bonus bids in the range of \$0.90 – \$1.10/ton have resulted. BLM has, even in non-competitive cases, required “Fair Market Value” bids in this range, particularly in the Southern PRB

Comment Excerpt Text:

Decertification sidesteps the competitive system mandated by the FCLAA by eliminating the first step on which all the other procedures depend—drawing up a regional leasing plan. This makes the ad hoc LBA system the only system. Under the LBA system, the BLM does not set the level of coal that it leases by taking into account changes in the market, such as the recent decline in domestic demand for coal brought about by the dramatic

decline in the price of domestic natural gas, and the increase in the profitability of coal exports. Instead, it receives a request for a lease tract containing the amount of coal desired by the requester. It determines a fair market value floor for the tract currently being requested by identifying the most recent comparable lease and treating the sale price of that lease as a proxy.

The problem with this approach is that the most recent comparable tract that was leased is typically one that was tailored by the bidder to suit its own interests. That sale price, therefore, typically reflects the unsuitability of that tract for any other buyer. The fair market value of a lease determined in this artificial manner is typically a fraction of what the same coal would be worth if it were mined outside of the Powder River Basin. "Fair market value" determined with this downward bias sets the floor for evaluating the acceptability of bids. It therefore imparts a downward bias to the price ultimately paid for leases. The artificially-reduced lease price, in turn, lowers the price that the mining company charges to sell its leased coal to a broker. This reduces the amount of royalties collected, because royalties are calculated as a percentage of the price at which the mining company sells its coal to a broker. Using the price of a lease designed to be non-competitive as a proxy for the fair market value of the subsequent lease results in a rolling sequence of under-market valuations that shortchanges Federal and state governments and the public that they represent

UPHE agrees with Taxpayers for Common Sense that a resource as important as the PRB should not continue to be disposed of through sequential, single-bid, limited-interest tracks at far below their fair market value. Instead, the BLM should wait for times of adequate market demand to offer new leases and then aggregate a sufficient number of adjacent tracts to attract multiple bids from the incumbent mining companies, or even bids by new entrants to the PRB market. To encourage aggressive bidding, the BLM should experiment with specifying in the lease offer that only a certain percentage of tracts attracting the highest bids above the fair market value of the coal will be sold. Of course, these specific reforms should be instituted in the context of recertifying the Powder River Basin (and other Federal coal leasing areas, where justified) as an official Coal Producing Region in which regional planning that takes market conditions and environmental impacts into account is the first step in the leasing process.

Federal coal leasing takes too long, and is taking ever longer. For example, the applications for the proposed federal coal leases examined Wright Area Environmental Impact Statement were submitted in the years 2005-2006. The first lease sale of the leases did not occur until 2011. Leasing takes even longer under lands

administered by the United States Forest Service. For example, Bowie submitted the application for the Greens Hollow lease tract in 2005. As of this writing, a BLM Record of Decision for the Green Hollow tract has not yet issued, much less a lease sale.

Long leasing times have significant environmental and economic consequences. On the economic side, lengthy leasing processes increase administrative costs and require applicants to propose larger leases so as to ensure that leased reserves are not exhausted by the time the next round of leasing, permitting, and mine planning can be completed. This requires greater up-front bonus bid submissions, and longer times before that capital can be recovered. Economic pressure from large capital overhangs is one significant factor in the distress currently experienced by the coal industry. Quicker leasing would allow the issuance of smaller, more efficient lease tracts, allowing the industry to be nimbler in responding to economic trends and the needs of their utility and industrial customers.

Comment Excerpt Text:

Although it is pure window-dressing when cited by environmental activists, competition does play a key role in ensuring efficient energy markets and value to the nation's industrial coal consumers, electricity users, and ratepayers. Adequate supply means not only that there is adequate supply in each of the coal sub-markets, but also adequate supply to a reasonable range of coal mining companies. A coal sub-market cannot be competitive if all the coal of a particular type is in the hands of one or two suppliers. Thus, blanket statements about the aggregate amount of coal under lease are misleading if they do not account for how leasing is distributed among coal types, regions, and suppliers.

Comment Excerpt Text:

As suggested in Order 3338, one of the drivers for re-consideration of lease sale scheduling appears to be the leasing model employed for oil and gas leases. However, coal leasing is fundamentally different from oil and gas leasing. Oil and gas leasing is inherently about exploration, with wide lease-to-lease variation in whether significant exploitable reserves will be discovered, when they can be brought to market, and the rates that will make sense under current market conditions. In that environment, regular, systematic lease sales are an efficient development mechanism. In contrast, federal coal leasing typically occurs with relatively better quality information about the coal reserve, in the context of maintenance tracts intended to sustain production at an existing mine. Moreover, coal mines are far more capital-intensive than oil and gas drill rigs. An oil and gas lease is essentially about the location and development of a petroleum reserve; a coal lease is typically about the continued operation of an entire coal mine. It is thus that mine's specific status and needs that determine the appropriate timing and size of coal leasing, and there is no evidence that such assessment can be performed as well by federal committee as by the mining industry.

Bidding and Leasing Reform

The final panel focused on bidding and leasing reform.

Mary Ellen Kustin (Policy Director, Public Lands Project, Center for American Progress) discussed bid reform

recommendations, recognizing that reassessing the federal coal program will be difficult, but that change is necessary. From 1990 to now, about 90 percent of all coal lease sales had only one bidder. Kustin reviewed the three main objectives of the PEIS as described by BLM: (i) the appropriate lasting mechanism to determine how, when, and where to lease; (ii) how to account for the environmental and public health impacts of the coal program; and (iii) how to make sure tax payers are getting their fair share. Kustin detailed the Linowes Commission's investigation and focus on inter-tract bidding as a potential method to increase competition and allow for a better return for taxpayers. Inter-tract bidding introduces more competition into the process by having a ranking system for leases, in which not every lease makes the cut. The Linowes Commission said tracts could be limited for environmental or social reasons, as well. Kustin closed with some remaining questions: (i) is it preferable to auction coal amounts, as opposed to tracts; (ii) what administrative hurdles stand in the way of inter-tract bidding; and (iii) what is the best way to factor in a carbon budget into this process?

Dan Bucks (former Montana Director of Revenue) discussed the importance of developing a new leasing process to serve the public interest. Bucks noted that many of the ideas and solutions discussed at this workshop—which are generally related to integrating into federal coal decisions the consideration of external costs to society of coal production—cannot fit into Interior's existing leasing and royalty systems. For example, changing the amount of coal leased to account for climate change cannot occur in the lease by application system where coal companies decide what, when and where coal will be produced. Increasing royalties to price in external costs of coal can be undermined by corporate self-reporting of coal values through creative accounting. Thus, Interior should incorporate the development of new systems of leasing and royalty administration into its coal PEIS.

Bucks said it is time for Interior to take control of the leasing and royalty processes and move toward a more open and transparent process for managing federal coal. The secrecy of the current system, Bucks explained, undermines its integrity and effectiveness, so Interior should reassess its system to include more public participation. The fundamental flaw in the current coal leasing system, in his view, is that it is secret. Leasing by application allows coal company to drive leasing decisions; and minimum bids are set and not disclosed before bidding occurs, denying the ability of the public to participate in the process. Bucks also said that the royalty process is secret because of corporate self-reporting. Royalties should be viewed like a property tax, whereby Interior is the property assessor. Instead, Interior has delegated this authority to corporate self-reporting systems of self-assessment of the value of the coal. This breaks from the best reading of the relevant statutes. Interior should implement energy supply and regional landscape planning to decide when, where, and what coal to lease in order to maximize public value. Leasing by application should not be reinstated.

Bucks stated that Interior should also consider adopting an entirely open process modeled after Montana's Otter Creek coal tract sale. For example, proposed minimum bids can be made public and submitted for public comment, and Interior should be prepared to withdraw tracts from sale if minimum bids or environmental or social standards are not fulfilled by bids. Finally, Bucks warned that if royalty rates are raised without eliminating the self-assessment done by coal companies of the base valuation on which royalties are assessed, companies will find ways to lower the base valuation, hindering the efficacy of royalty rate reform. So, Interior must control the base valuation by assessing the value of coal based upon final delivered prices adjusted for heat content, quality of coal, and the location of the coal. This is a recommendation in the new CEA report. If Interior directly values the coal, it can control the base and make other effective changes, like increasing royalty rates to account for environmental and social costs.

Fix coal reclamation before opening up more land to coal mining. For decades, the federal coal program has opened up large areas of the arid west for mining. The requirements of existing law promise and require that land, water, and habitat be protected in the siting and operation of the mines, and fully reclaimed to demonstration standards after mining concludes. While it is primarily the job of the OSM and the states to regulate how coal mining and reclamation occur on federal lands, BLM should work with these sister agencies to ensure lands and waters are properly protected. As such, before BLM opens up more new coal leases for development, it should require that it be demonstrated by that reclamation is occurring contemporaneously and providing land reclaimed at a higher and better use and that water quality and water resources are protected, even if this means that new rules are promulgated under SMCRA to provide more assurances that reclamation and reclamation enforcement occur.

The basic structure for the federal coal leasing program established under FCLAA was set out in the 1979 and 1982 regulations, which are now outdated. (49) The process begins with the establishment of "coal production regions." (50) In designated federal coal production regions, the BLM carries out a four-stage leasing process: (1) land use planning; (2) regional leasing level planning; (3) coal lease activity planning; and (4) lease sale. (51) In areas outside coal production regions, the coal leasing process is simplified to expedite leasing, often with competition cut out of the process. As a practical matter this means that, contrary to the plain language of FCLAA and BLM rules, the coal industry – not the government – drives the coal leasing process. (52) In 1990, the PRB – despite

the fact that vast majority of federal coal leased comes from that region – was decertified as a coal production region. (53)

(49) 43 C.F.R. §§ 3400-3487.

(50) The rules do not define the term “coal production regions,” but the words seem self-explanatory. The meaning of the phrase “coal production region” is critical to the operation of the leasing program because the rules make clear that “[c]oal production regions shall be used for establishing regional leasing levels... .” 43 C.F.R. § 3400.5 (2011).

(51) For a more detailed description of the coal leasing process and the requirements of the MLA and FCLAA, see Mark Squillace, *The Tragic Story of the Federal Coal Leasing Program*, 27 NAT. DOT seems to now blithely accept the characterization of two key government reports by anti-leasing groups and rely on that in prominently highlighting the reports in the rationale for the moratorium. These two reports on coal leasing, one conducted by the DOT Inspector General (IG) and the other by General Accountability Office (GAO) however, did not identify systemic weaknesses in the current leasing system. Specifically, GAO did not repudiate its 2010 finding that the LBA method can achieve the objectives of ensuring fair return to the public. When the IG testified before Congress on her report, she confirmed that taxpayers are receiving a fair return from the federal coal program, and in many cases receiving more than fair market value. In fact, in the months after the reports were released, DOT informed members of the U.S. Senate that neither report identified concerns meriting a moratorium on federal coal leasing. While each report identified some inconsistencies in the application of guidance or documentation for decisions, BLM has since addressed those concerns. To date, the agency has published an Updated Coal Evaluation manual and handbook as well as seven instruction memoranda to its field offices in response to the modest suggestions by the IG and GAO.

Comment Excerpt Text:

With the advanced development of the coal regions, coal companies have sought new leases at roughly the rate of depletion of coal at existing operations as predicted by BLM when it shifted to the LBA leasing method. This reflects the reality that market changes and depletion drive the number of bidders for a lease, not the LBA process itself. Also, since 2003, total revenues from federal coal leases (bonus bids, royalties and surface rentals) amount to \$13.8 billion; lease revenues in 2014 were twice the amount in 2003; bonus bids have increased substantially; coal royalty revenue is 88 percent higher despite coal production increasing by only 2 percent; revenue per acre under lease has increased 40% despite lower coal prices recently. The facts dispose of any notion that the program is not continuing to ensure a fair return for taxpayers.

Alternatives To Address Direct Environmental Impacts

Once the PEIS properly characterizes the impacts of coal leasing in the areas where it occurs, BLM should consider and present an analysis of alternatives that will address those impacts, including:

a. New leasing framework

As noted, the Powder River Basin was “decertified” as a coal production region in 1990, and all other coal regions have been likewise “decertified.” This decision turned leasing into a non-competitive framework through the “Lease by Application” process. Rather than a process in which BLM acts proactively and leads decision making with respect to federal coal mining, mining companies apply for parcels to be leased and BLM responds to such applications. Under the Mineral Leasing Act regulatory framework, the “Lease by Application” (LBA) process was an exception to the rule of competitive, BLM-driven leasing, but it has now become the norm.

As a policy matter, the current company-driven LBA system must be replaced with a new national programmatic approach and this PEIS analysis should commence that work. A new leasing framework should be presented and fully analyzed that provides a basis to determine when, where, and how much federal coal, if any, might be considered for lease in leasing plans. The alternatives analysis of leasing plans should specify the amount, timing, and location of potential leasing activity, if any, that the Secretary of the Interior determines will best meet national energy needs, achieve GHG emission reduction targets, protect other uses and resources, and ensure a fair return to taxpayers over a five year period.

A useful model for this analysis and for when to lease can be found in the outer continental shelf (OCS) leasing framework. See 43 U.S.C. § 1344. That program consists of a national schedule of proposed lease sales indicating the size, timing and location of leasing activity that best meets national energy needs for the five-year period following plan approval. The plans also dictate tailored leasing strategies instead of defaulting to industry proposals as done with the current LBA approach BLM follows. A PEIS is completed for the five-year leasing schedule to gather public input and ensure proper environmental analysis and mitigation. The five-year lease schedule, which is reviewed by the Secretary annually, examines environmental and socio-economic considerations, landscape-scale approaches to mitigation, national energy markets and needs, production substitutes for the energy resources, and assurances for fair market value.

A useful model for this analysis and for where to lease can be found in the Western Solar Program, where BLM prepared a PEIS to identify the preferred locations for development and excluded development from high conflict and/or low potential areas. That PEIS also set out required design features to be incorporated where development is permitted, and a commitment to mitigating impacts that could not be adequately avoided or minimized. Parameters to guide the management of solar resources were also shaped by a robust economic and technical analysis, further ensuring that leasing contemplation would be in balance with market conditions.

BLM should also analyze what the elimination or retention of the Coal Teams would mean in terms of environmental impacts. The Coal Teams, while advisory in nature, have had substantial power in determining whether lease applications should move forward. Members of the Coal Teams, notably Governors of coal-dependent states, have inherent conflicts of interest, making them unable to balance the desire for more leasing and revenue from leasing with other considerations.

Under any approach, BLM must also incorporate expanded unsuitability criteria, including protecting environmentally sensitive areas and areas that may be suitable for renewable energy development. Through this

new leasing framework, regardless of whether it follows the OCS approach, BLM can protect local environmental conditions by making affirmative decisions about whether, where, and under what conditions mining may occur.

The statute directs the agency to “award [coal] leases . . . by competitive bidding,” id. § 201 (emphasis added), as a theoretical means to insure that the American people “receive fair market value of the use of the public lands and their resources” 43 U.S.C. § 1701(a)(9). Under BLM’s regulations, the agency is supposed to determine the “fair market value” [FMV] for the coal, and then consider various bids, accepting the highest bid above FMV from a qualified mining company. 43 C.F.R. § 3400.05 (defining Fair Market Value to mean “that amount in cash, or on terms reasonably equivalent to cash, for which in all probability the coal deposit would be sold or leased by a knowledgeable owner willing but not obligated to sell or lease to a knowledgeable purchaser who desires but is not obligated to buy or lease”); see also id. Part 3422. The regulations include a bid floor of “\$100 per acre or its equivalent in cents per ton.” Id. § 3422.1(b)(2).

In practice, however, there is typically only one bidder. For example, between 1990 and 2013 96 of 107 tracts leased (about 90 percent) involved only a single bidder in the bonus bid leasing auction. See GAO, *Coal Leasing: BLM Could Enhance Appraisal Process, More Explicitly Consider Coal Exports, and Provide More Public Information* (GAO 14-140) (Dec. 2013) at 16. (4) As a result of this and other factors, the agency has often failed to obtain FMV, and has sold federal coal for much less than a dollar a ton.

(4) This is largely due to the fact that most lease applications come from existing operators seeking to expand their existing mining operations, rather than new companies competing for new mines.

Restricting leasing eligibility

The Department of the Interior has significant discretion to reject a coal lease if, based on the Secretary’s assessment, it is not in the “public interest.” 30 U.S.C. § 201(a)(1) (authorizing coal leasing by the Secretary for lease tracts “he finds appropriate and in the public interest.”). BLM’s rules require that, “[a]n application for a lease shall be rejected in total or in part if the authorized officer determines that ... leasing of the lands covered by the application, for environmental or other sufficient reasons, would be contrary to the public interest.” 43 CFR § 3425.1-8. This provision is distinct from the screens BLM must apply to identify lands that are unsuitable or unacceptable for coal development, and is also distinct from BLM’s requirements to obtain “fair market value” for a lease.

Under this alternative BLM would establish additional criteria for determining the fitness of a coal operator as a buyer to ensure leasing is in “the public interest.” One principal restriction would be that an operator cannot obtain a new or modified lease where it owns a current mine – or combination of mines – that has more than 10 years of reserves. According to GAO, “[o]fficials from coal companies told us they typically submit new applications for federal coal leases to maintain a 10-year coal supply at their existing mining operations.” Yet, BLM

documents suggest that mines with pending lease applications in Wyoming have from 10.6 – 19 years of remaining recoverable reserves, based on the most recent annual production numbers available and, until BLM’s rejection of the West Jacobs Ranch LBA, the agency continued to make coal available for lease whenever coal companies apply. BLM must consider a reserve limit to ensure leasing is in the public interest.

Other criteria would preclude any new leases to any company that is out-of-compliance with SMCRA, Clean Water Act, Clean Air Act, or any other environmental requirements at any mine site they operate, particularly in regards to their reclamation and contemporaneous reclamation requirements. BLM should also assess whether the buying company has any history of environmental violations related to reclaiming current or past mines at any of its facilities.

Finally, eligibility requirements might include whether the company is operating an existing and viable coal facility, whether the company is financially healthy, and whether the operator is being diligent in developing existing leases.

Comment Excerpt Text:

The BLM must use the Programmatic EIS process to design a system of coal leasing that promotes competition among coal companies for federal coal leases. Competition is an essential part of any functioning market; without it, the program must compensate in various ways to achieve fair coal pricing. The lack of competition also leads to public skepticism that the federal coal program is not ensuring a fair return for these resources.

Comment Number: 0002470-2

Organization I: Taxpayer for Common Sense

Commenter I: Ryan Alexander

Comment Excerpt Text:

The BLM asserts that it does not simply accept a tract for leasing as described in an application, but rather uses: “... a wide variety of information, including geologic data that delineates the location, quality, and quantity of coal within a given area, to determine the most appropriate tract configuration that would encourage competition and help achieve maximum economic recovery of the resource.”⁵ Yet, most lease sales in the Powder River Basin (PRB) are for tracts adjacent to deposits already leased by a company.⁶ Moreover, the tracts are often of a size or design that precludes another company from economically mining them and bidding on them. The evidence is clear: The BLM, instead of deciding whether there is sufficient demand for coal and designing tracts to maximize competition and economic value, defers to industry, which, in turn, avoids competition and designs tracts to maximize company share value and strategic positioning in the market. This assessment is confirmed in a market analysis report prepared for XCEL Energy by the John T. Boyd Company, a mining and geological consultant:

-As a practical matter, most companies will attempt to define LBA tracts that, because of location or geometry, are of interest only to the nominating company. This minimizes competitive bidding on the tract, and may result in a lower cost lease. Where competition has existed for coal leases (mostly in the southern Gillette area but recently in the central portion of the coalfield) relatively high bonus bids in the range of \$0.90 – \$1.10/ton have resulted. BLM has, even in noncompetitive cases, required “Fair Market Value” bids in this range, particularly in the Southern PRB.⁷

We suggest considering a modified version of intertract bidding. Rather than hosting a lease sale with multiple tracts up for simultaneous bid, BLM could allow companies to bid on a fixed amount of mining credits. The winning bidders would gain the right to mine a certain amount of coal, as measured in dollars per BTU or dollars per ton. These bidders would then submit applications for the specific tracts of land on which they would like to mine the coal for which they have rights. This process would allow the BLM to better prioritize the fairest return available to taxpayers while allocating credits up to a pre-set carbon, BTU, or tonnage cap. The allocation of credits could also be weighted based on the companies' proven track records of reclamation, financial stability, and worker safety and compensation.

Commenter I:Nada Culver

Comment Excerpt Text:

The BLM should carefully analyze the current coal leasing system in the PEIS and develop new regulations to modernize the process, incorporating elements from the Solar PEIS and oil and gas Master Leasing Plans discussed above. The agency should terminate the LBA leasing system and replace it with a Western Regional Coal Leasing Program that incorporates some of the principles from the current regulations but is updated to reflect current knowledge and policy. This regional system should evaluate bidding on individual tracts with bidding on an amount of coal that the BLM has determined should be available for development. This leasing system should be consistent with the carbon budget recommendations we make elsewhere in these comments. This new system could be put in place based on five-year plans of development similar to the system used in Outer Continental Shelf oil and gas leasing. These plans of development should be designed to meet national program objectives and done from a Western Regional perspective, not a local one. The BLM should also abandon the use of Regional Coal Teams and instead determine regional leasing needs based on the BLM's expert analysis. The provisions for NEPA compliance should be maintained in the regional coal leasing program. In all cases this leasing system must ensure the federal government achieves a fair market value for the federal coal it leases.

BLM should use the PEIS to develop a new, multi-year approach for the leasing and development of federal coal in the West. This will likely require some new regulations but can be developed and subjected to NEPA analysis in the PEIS. Under a new approach, BLM would initiate new leasing activity based on market circumstances, progress on climate objectives and other considerations; determine where coal leases will be considered and

screen for potential conflicts; develop new methods for selling coal resources in collaboration with the industry and leading economic experts; enhance the assurances that potential lessees have the financial and technical capabilities to viably operate the lease in question for its anticipated duration; and issue leases for specific tracts.

Comment Excerpt Text:

In order to create a unified approach to coal leasing and to allow the BLM to manage the amount and timing of coal lease sales, the BLM should create a Western Coal Production Region based on the region as defined by the Energy Information Administration (EIA). EIA defines the Western coal region to include Alaska, Arizona, Colorado, Montana, New Mexico, North Dakota, Utah, Washington, and Wyoming. (11) According to the latest state-specific data from EIA's Annual Coal Report, of the coal produced in the United States in 2014, 54 percent was produced in the Western coal region, with Wyoming producing the lion's share: 73% of the coal mined in the Western coal region. (12) This region also encompasses 94 percent of the leases BLM had on record in 2015. (13)

(11) See U.S. Energy Information Administration, <http://www.eia.gov/tools/glossary/?id=coal>.

(12) See Table I in U.S. Energy Information Administration, Annual Coal Report 2014, March 2016. Available at <http://www.eia.gov/coal/annual/pdf/acr.pdf>. (Accessed July 26, 2016.)

(13) Cross Reference of BLM Coal Lease Serial Numbers and MSHA Identification Numbers, Feb. 3, 2015. BLM FOIA# 2015-00462. Mark Haggerty, Headwaters Economics, pers. comm.

Given significant differences in the geology, coal rank and quality, and mining conditions within the Western Coal Production Region, the BLM could consider special circumstances faced by mine-mouth power plant situations, where coal rank and value may be low, but the lack of transportation costs creates unique captive markets. Any exception process for mine-mouth plant situations would have to consider the climate change implications of extending leasing and operations of the plant and the socio-economic dislocations associated with continuing or restricting coal availability for the local community (as discussed in Section VIII).

For coal resources outside the western region, BLM should consider whether to create an eastern coal leasing region and apply new leasing approaches to those areas as well.

Comment Excerpt Text:

The BLM should significantly modify the orientation of the agency to the industry in reforming the federal coal program. As the dramatic, rapid changes in the coal industry over the past two years have shown, federal lands deserve a more objective arbiter of whether, where and when additional coal resources should be put on the block for development. To accomplish this, the BLM should assume a greater role in specifying the size and timing of potential leasing activity that the Secretary of the Interior determines will best meet national energy needs, achieve U.S. carbon emission reduction goals, and ensure a fair return to taxpayers.

Under this approach, BLM would set the total amount of coal resource available for sale by auction each year consistent with a 5-year plan. There is precedent within BLM and elsewhere with the Interior Department for such a program: the Bureau of Ocean Energy Management (BOEM) has a Five-Year Program for oil and gas

development. It establishes a schedule of oil and gas lease sales proposed for planning areas of the U.S. Outer Continental Shelf (OCS). The Program specifies the size, timing, and location of potential leasing activity that the Secretary of the Interior determines will best meet national energy needs. BOEM also has a leasing program for its off-shore renewable energy that incorporates a multi-phase leasing process. We recommend the BLM seriously consider the five-year planning process for use in determining how much and which coal resources should be made available on a shorter time horizon than afforded by the PEIS.

In these five year plans, the BLM could set production targets for the total amount of coal resource sales that would be needed to meet declining coal production demand from public lands. The BLM should also consider carbon performance for coal's allocated share of all federal lands energy under a "carbon budget" calibrated to leading domestic and international climate goals. Our views on the need for a carbon budget are discussed in section VI.E. of these comments.

Comment Excerpt Text:

To overcome the problems related to assuring a fair return for coal in a declining market dominated by incumbent mines leasing coal adjacent to their existing mines, BLM should develop an alternative bidding program for allocating federal coal in the Western Coal Production Region. BOEM has studied different auction systems for issuing renewable energy leases, easements, and rights-of-way on the OCS that may provide models for BLM to look at as it modernizes its coal leasing program. (14)

(14) BOEM issued a contract to Power Auctions, LLC to study different types of auctions for wind rights. The study has been published in three parts, and is available at the links below:

- Auction Design for Wind Rights
- Multiple Factor Auction Design for Wind Rights
- Comparison of Auction Formats for Auctioning Wind Rights

One approach to selling coal rights would have BLM auction coal resource allocations (or lease credits) rather than specific tracts for lease. BLM could specify the amount of coal made available for lease in terms of a total British thermal units (Btu) value, to establish basic parity among different areas within the leasing region. Because the quality of coal resource varies tremendously from one location to another, using a more static unit of measurement such as acres of land or tons of coal as the limit on the amount available for lease would disproportionately affect and disadvantage mines or companies producing lower quality coal. Btu content measures the heating value of the resource and therefore reflects the need for a larger amount of acreage or tons of coal to be developed to reach that limit in poorer quality areas. Additionally, leasing based on total Btu allows the BLM to easily track and measure potential GHG emissions from approved leases and compare that to the agency's climate targets or goals under the carbon budget discussed in section VI.E.

During this phase of the program, the sale of coal resource allocations (or lease credits) gives the successful bidder the right to subsequently seek BLM approval for the development of a leasehold. The lease credit does not grant the holder the right to construct any facilities; rather, the lease credit grants the right to develop a lease application and plan of development, which must be approved by BLM before the project can move on to the next stage of the process.

A coal resource allocation auction system would help to convey coal resource allocations (credits) to entities most likely to successfully develop the resources and to meet the statutory requirement to obtain a fair return on coal sales. It could also provide a mechanism for reducing the carbon consequences of the federal coal

program by putting BLM in charge of the pace and scale of coal allocation sales.

BLM should develop new auction formats to implement the new program and address important program performance goals. Performance measures developed by BOEM for its auction process for Wind Energy Areas (15) could be applied to BLM's approach:

15 <http://www.boem.gov/Renewable-Energy-Program/Regulatory-Information/RenewableEnergy-Auction-Formats.aspx>

- Economic Efficiency: The auction process should try to ensure that future federal coal sales are awarded to those who value the coal resource the most because these entities would likely be the most efficient at using the resource;
- Fair Return: BLM is statutorily required to obtain a "fair return" for coal resources.
- Program Efficiency: The coal auction process must be manageable for BLM to administer;
- Lease Boundary Flexibility: Within constraints fixed by BLM, the auction should allow bidders to apply coal allocations to the optimal lease areas;
- Competition: The auction process must be fair, and encourage participation from all interested bidders while minimizing the opportunity for collusion among bidders;
- Transparency: The auction process must be an open one in which bids are comparable and the reason why the winners won is clear;
- Neutrality: The auction process must ensure that all bidders are treated equally;
- Simplicity: The auction process must be easily understood and implemented, for both the bidders and BLM; and
- Consistency: The auction process should be applicable to the issuance of leases in a variety of contexts.

Issuing specific leases to exercise coal credits.

Once sold, the credits could then be applied to specific lease tracts in the Western Coal Production Area identified by the successful bidders from within lands made available to leasing by the BLM. Though the selection of tracts would look similar to what those companies would propose under the lease by application system, allocations would have to be within areas pre-screened by BLM and BLM would not have to determine the fair market value at this stage—it will have been determined at the auction stage. BLM would still have to determine the Btus contained within a specific tract, but the agency could do that in a public and transparent way since there would not be bidding on the specific lease tract.

Comment Excerpt Text:

In deciding how, when and where to lease, BLM decision-making should:

- Ensure that the screening criteria outlined in its regulations are fully applied when the BLM evaluates whether areas might be "acceptable for further consideration for leasing" as part of its development of resource management plans (RMP); these criteria can also be applied at the leasing stage to address current conditions and new information.
- Ensure the BLM's unsuitability criteria are fully applied at the leasing stage.
- Provide protections for lands with wilderness characteristics and Greater sage-grouse.

- Prepare a reasonably foreseeable development analysis of coal resources.
- Establish a regional leasing program that incorporates landscape level planning and more active BLM management, looking at examples such as the Solar PEIS and master leasing plans.
- Comply with NEPA and mitigation obligations to protect other resources and address other impacts, such as contributions to and effects of climate change.
- Address new and existing leases.
- Ensure that, in fulfilling these recommendations, the statutory and regulatory requirements that there will be “maximum economic recovery” from coal leasing and development need to be understood properly in the multiple-use context.

Organization I: Colorado Mining Association

Commenter I: Stuart Sanderson

Comment Excerpt Text:

The Notice also indicates that BLM will examine whether the current regulatory framework (lease by application, LBA) should be changed to provide a better mechanism or mechanisms to decide which coal resources should be made available and how the leasing process should work, based upon concerns that the current LBA method lacks competition.

However, the belief that competition among multiple bidders is the only way to produce a fair market value return is flawed. The facts are that mineral asset and lease sales do occur for fair market value with a single bidder. In determining fair market value under the existing lease process, BLM relies upon peer-reviewed analyses that include comparable sales. Any criticism regarding fair market value and the valuation process has to do with internal BLM valuation metrics and formulas, not the lack of bidders. All that said, BLM has already begun implementing a number of reforms designed to improve and standardize the valuation process, including the establishment of a Memorandum of Understanding with the Department's Office of Valuation Services.

Organization I: Colorado Mining Association

Commenter I: Stuart Sanderson

Comment Excerpt Text:

BLM is requesting comment on whether timing of lease sales should be revised, presumably in an effort to create more competition, and whether market factors should impact lease timing. However, the proposal to conduct lease sales at only set times, for example quarterly, has not worked in the past which is demonstrated by the failure of the regional lease sales method. Historically, scheduled lease sales were established based upon demand forecasts both nationally and regionally. However, under this framework uncertainties impacting supply and demand were not adequately addressed, and operator interest in leases were not accounted for, resulting in many tracts receiving little to no interest.

Comment Number: 0002488_Sanderson_20160728-12

Organization I: Colorado Mining Association

Commenter I: Stuart Sanderson

Comment Excerpt Text:

CMA contends that the current state of the coal industry, uncertainties in the regulation of the Coal Program, and the nature of how the coal regions are developed does not lend itself to a regional leasing method, or a method that only allows lease sales at set times. In general, coal operators apply for new leases at roughly their depletion rate. What this means is, they bid or lease only when they need to. Further, frequently there may only be one interested bidder, the company that has invested in the infrastructure to develop the mine, and is now

seeking to lease adjacent reserves; which is why LBA is the optimal method for leasing coal resources. Creating arbitrary demand through lease timing restrictions, or regional lease planning, fails to address operator interest in certain leases, and blindly assumes that regional planning and timing restrictions will result in increased competition and “fair return.” For the reasons discussed above, LBA must be carried forward.

Comment Number: 0002488_Sanderson_20160728-15

Organization I: Colorado Mining Association

Commenter I: Stuart Sanderson

Comment Excerpt Text:

The proposal to evaluate increasing the minimum bid allowed is out of touch in light of the “fair market value” requirements. CMA opposes any increase or change in minimum bid, and suggests BLM eliminate this proposed approach from detailed analysis because this provision does not apply.

Comment Excerpt Text:

Critics of the program point to rental and royalty rates, ignoring the substantial bonus bids paid by companies to acquire the lease. They also criticize the fact that leases may have a single bidder from an adjacent lease. Rather than presenting some problem with the process, or lack of competition, it should be expected that an operator already familiar with the lease area who has already invested significant infrastructure costs would be the bidder. The criticism also ignores the cumulative fees and taxes paid to federal, state and local governments to mine the coal. These cumulative fees, taxes, royalties, etc. have been estimated to consume 40 cents of every dollar received from the sale of the coal.

Organization I: Cloud Peak Energy Inc.

Commenter I: Andrew C. Emrich, P.C.

Other Sections: 2

Comment Excerpt Text:

BLM should continue with an applicant-driven application process for federal coal leasing. First, mine operators are in the best position to determine when the next tract of federal coal is needed to ensure its future mining operations. For example, Cloud Peak Energy has a unique understanding regarding its own business operations and is best positioned to determine the timeframe for acquiring additional coal leases. As it currently stands, Cloud Peak Energy determines the timing for obtaining additional coal leases based upon careful consideration of existing coal reserves, the nature and length of the comprehensive permitting process, and market conditions. Any other framework for issuing federal coal leases would fail to address the individual needs of each lessee and the optimal timeframe for acquiring additional coal leases. BLM should defer to each mining company’s knowledge and expertise concerning its own business operations, including the need for, and timing of, acquiring additional tracts of federal coal.

Organization I: Cloud Peak Energy Inc.

Commenter I: Andrew C. Emrich, P.C.

Other Sections: 2

Comment Excerpt Text:

BLM should retain the existing LBA process because its proposal to hold scheduled coal lease sales will not result

in increased competition for federal coal leases. The substantial up-front costs necessary to commence mining operations make the creation of competitive leasing conditions nearly impossible for periodic scheduled lease sales. See above at 7-8. Unless BLM identifies a lease parcel that is directly adjacent to an existing mining operation, it is unlikely that any coal company (let alone more than one company) would bid on the offered tract. See Attachment 5, BLM Petition Denial, at 4 (Jan. 28, 2011) (“Regional leasing is difficult where existing mines are competing in an open coal market, depleting their existing leases at market rates, and needing to replace reserves throughout a continuum of time”). And if BLM fails to offer parcels adjacent to an existing coal mine at a time that meets the economic and operational needs of the mine, that mine could be forced to prematurely close. Due to the substantial economic costs and additional regulatory burdens associated with closing and then restarting a coal mine, any premature mine closure would likely preclude the leasing and development of coal reserves adjacent to that mine in the future, thereby effectively wasting those federal coal reserves and denying the American taxpayers any revenue on the wasted federal coal. Finally, the use of scheduled lease sales would result in increased environmental impacts. BLM recently explained how the use of scheduled lease sales would result in greater environmental disturbance than allowing the expansion of existing mine operations. *Id.* (“leaving tracts unleased and undeveloped in between the existing Federal coal lease and the proposed production maintenance tract . . . would require significant additional disturbance and cost to mine independently” (emphasis added)).

Comment Excerpt Text:

Interior regulations establish the public interest basis for coal leasing: “[an] application for a lease shall be rejected in total or in part if the authorized officer determines that . . . leasing of the lands covered by the application, for environmental or other sufficient reasons, would be contrary to the public interest” (emphasis added).¹⁸ Up until now, BLM’s decisions to approve lease applications have been justified as serving the public interest because they offer competitive sales for meeting national coal demand,¹⁹ provide a reliable and continuous “supply of stable and affordable energy for consumers,”²⁰ and reduce U.S. “dependence on foreign energy supplies and [provide] significant socioeconomic benefits.”²¹ These interpretations of the public interest ignore two key aspects of the coal program: near-term health burdens imposed on American communities and long-term climate burdens on BLM land as well as all areas of the United States. Moreover, the BLM Records of Decision do not consider the Carbon Tracker finding that reserves from existing mines are sufficient to supply the transitional period for coal plants – thus, even the overly narrow public interpretation is deficient on its own terms. BLM should expressly consider health and climate change in the public interest as it undertakes the programmatic review, and it should reform the coal program to bring leasing decisions into alignment with these considerations.

The third statute enabling Interior to apply a carbon budget to its programmatic review is the Energy Policy Act of 2005, which establishes a basis for BLM to account for coal reserves in alignment with climate objectives.³⁵ The Act requires the Secretary of the Interior to “review coal assessments and other available data to identify . . . the extent and nature of any restrictions on the development of coal resources on Federal lands” (emphasis added).³⁶ Given the Carbon Tracker conclusion that BLM has leased more coal than it can afford to burn in a carbon consistent scenario, the large volume of non-combustible reserves should factor into Interior’s review of restrictions on coal resources. This mandate is also relevant for the U.S. Geological Survey, which is in the process of developing a national inventory of carbon in federal lands. As part of its inventory, the USGS “will establish a baseline and public database that accounts for carbon emitted from fossil fuels produced on public lands.”³⁷

The BLM must properly evaluate why the regional leasing system was abandoned in the 1980s in favor of the lease by application (LBA) process. To properly do this, it is important to evaluate the fiscal, technical, business and administrative advantages of the LBA process.

In 1979, the DOI promulgated new regulations significantly revising the coal management program. 43 C.F.R. Part 3400. The new regulations established two leasing mechanisms, regional leasing in coal production regions, which is agency-driven, 43 C.F.R. Part 3420; and LBA, which is industry driven, 43 C.F.R. Part 3425. Regional leasing intended to make government planning the primary emphasis in leasing decisions within defined coal production regions. The interest in regional leasing was nominal at best, and by 1990, the BLM decertified the nation's eight coal production regions and abandoned regional leasing in favor of LBA with support centered largely on "programmatic efficiencies associated with leasing by application, especially in a reduced regional coal market." See Decertification of the Powder River Coal Production Region, 55 Fed. Reg. 784 (Jan. 9, 1990); (WY0-00133 to 00134). BLM determined that LBA was the most efficient method to lease coal as that method is market driven and removes the need for predictive guesswork.

Comment Excerpt Text:

Furthermore, as noted above, the existing regulations have been set in place to clearly establish the LBA process as a competitive form of leasing, even if only one company offers a bid. The BLM sets an undisclosed FMV floor price and a company must meet or exceed BLM's valuation in order to receive the lease. Even if only one company submits a bid, they do not automatically receive the lease. There have been several instances that BLM's floor price was not met and a lease was not awarded. Since companies do not know the BLM floor price, it is fair to assume that acceptable bids exceed the BLM price. In those instances, the American public receives a premium - or more than FMV. As part of this scoping process, the BLM should consider this information and review prior LBA sales to better understand the amount of additional money paid over the years because the accepted bid price exceeded FMV.

The BLM must also consider the infrastructure costs and the minimum necessary investment to construct a new mine which would likely be required under a regional or scheduled lease scenario. Huge investments in property, plant, equipment and coal reserves ranging anywhere from \$500 million to more than \$3 billion are required to mine in Wyoming. Federal coal leases require extensive capital investments before an ounce of coal is mined and a relatively high level of financial risk in a volatile commodity-type market. Therefore, the successful bidders in the past consisted of major coal operators who could finance such ventures and have the technical and marketing expertise to be successful.

Table 1.3.2.1 below provides more complete and correct information as compared to Table 4 in the WEG report because it highlights the tracts for which more than one sale was held as well as sales for which there was more than one bidder. Table 1.3.2.1 illustrates that BLM held more than one sale and therefore, received more than one bid on 11 of the 27 tracts that have been leased since decertification of the PRB in 1990. Of these 11 tracts, 4 (36%) have had more than one bidder on the second sale. One tract had two bidders on the first sale. Therefore, only one bid has been received on 16 of the 27 tracts, or 59% of the tracts offered since decertification as compared to 81.5% of the tracts that received only one or no bid during the period of regional leasing between 1975 and decertification of the PRB in 1990. Further, all bids accepted by the BLM exceeded the FMV determined by the BLM. Clearly, the LBA process has not "severely diminished" competition for federal coal in the PRB.

The 1984 Linowes Commission report identified the complex property ownership patterns in the western U.S. as a major deterrent to having multiple competitors bid on a federal lease tract. (WY0-00258 to 00912). Specifically, the report states that "Due to ownership patterns... the Government seldom reaps the benefit of being able to offer all the mineral and surface rights needed for an entire economic mining unit. Were the Government to do so, it could guarantee to each potential bidder an opportunity to invest in a lease without uncertainty about whether additional private rights could be acquired, and at what cost, after the lease sale. Typically, however, economic mining units consist of private, State or previously leased federal coal interspersed with or adjacent to the federal lease tract. In other instances, the Government may own the coal mineral rights while a private party owns the surface." Linowes Commission 1984 - p. 155; (WY0-00428). Nowhere is this situation more evident than Wyoming's Powder River Basin. The Linowes Commission Report compares regional differences in federal coal and lists the Wyoming PRB as having only 11 percent of its acreage under a federal surface/federal coal ownership pattern. Linowes Commission 1984- p. 158 (Table 3); (WY0-00431). Conversely, 72 percent of the property ownership is non-federal surface/federal coal and 17 percent is non-federal or federal surface/non-federal coal. (See Map 1.3.3.1)

The Green River/Hams Fork Coal Region in southwestern Wyoming has a different surface/mineral ownership pattern with a much larger percentage (52 percent) in federal surface/federal coal ownership pattern with very little (3.5 percent) in non-federal surface/federal coal. According to the Linowes Commission Report, coal tracts offered in the Green River/Hams Fork and Uinta-Southwestern Utah regions had achieved the most bidding competition. See Linowes Commission Report 1984- p. 159; (WY0-00432) and (see also Maps 1.3.3.2 and 1.3.3.3).

Order No. 3338 suggests that the BLM's PEIS should examine where to lease federal coal and proposes as an

example the BLM's Solar PEIS (Western Solar Plan) which "amended land use plans across six southwestern states and established preferred locations for solar development." Order, p. 7. The BLM must consider its current and adequate regulatory process to examine preferred locations for coal development, including coal planning completed as part of the Resource Management Plan (RMP) process. The BLM's coal planning process includes, but is not limited to, a screen for coal development potential, unsuitability, multiple use and surface ownership consultation. In Wyoming, this was recently completed as part of the revision to the BLM's Buffalo RMP.

The use of twenty unsuitability criteria at 43 C.F.R § 3461.5 represent only one of five screens employed by BLM to determine "where and where not" to lease coal. The other four found at 43 C.F.R. § 3420.1-4(e)(1) through (4) are the principal decisions used to determine which lands are suitable for further consideration. These screening criteria have been and continue to be more than adequate to identify the most appropriate locations for federal coal leasing. If the BLM is intent on considering the Western Solar Plan, the BLM must consider that coal resource development is confined to the location of commercial quantities and qualities of coal. Solar resources are presumably more widespread across the landscape, which allows a greater degree of flexibility in establishing preferred locations for development.

Comment Excerpt Text:

DOI's estimate appears to be a nationwide figure which amalgamates all federal coal leases. However, the mines in Wyoming account for 80% of all federal coal being produced today and BLM Wyoming figures show the average mine life for Wyoming coal mines is 16.4 years. See Wyoming Coal Mines- Estimated Mine Life (WYO-00914). Even this number is skewed by one mine, the Caballo mine, which is projected to last for 80 years. (Id.). And the 80 year projection cannot be relied upon because the Caballo mine is known to contain significant amounts of uneconomically mineable reserves. (Id.). Thus, DOI is overestimating the remaining life of existing mines, including those in Wyoming.

DOI has used its 20-year estimate to downplay the impact that the moratorium will have on coal production. Again, DOI is not telling the whole story. Assuming no legal challenges, the best timeline estimate for a new lease approval will likely require 13 to 15 years (3 year PEIS process; 2 years for rule/Resource Management Plan (RMP) revisions; 5 years for EIS development of same; 2 years for Record of Decision and lease sale; 3 years for state/federal OSMRE permitting). A 15 year time lag for post-moratorium new coal production cuts dangerously close to BLM's estimate that the mines in Wyoming that produce 80% of federal coal will continue for 16.4 years. But this best case scenario is not the most likely scenario because litigation is likely to occur. Unfortunately, the moratorium and PEIS process has created an uncertainty in the nation's thermal coal baseload fuel supply. Because the moratorium has stopped the coal leasing process while existing leases continue to produce, DOI has created a time lag in production that is not likely to be overcome once leasing resumes. Therefore, the BLM must consider ways to significantly expedite coal leasing once the moratorium is lifted.

1.5.2- Concerns with Order No. 3338- Sec. 6, Exclusions

The exclusions identified in Order No. 3338 appear designed to mitigate potential mine life conflicts; however, the emergency lease and lease modification provisions may be insufficient to sustain some mining operations.

The DOI's calculation of tons of reserves in Wyoming is inaccurate. It is apparently based on total tons of coal leased nationwide. The more appropriate calculation of tons of coal reserves should be on the basis of minable tons within approved lease tracts. The DOI evaluation does not take into account the balancing of strip ratios across the mining reserve base (field average) and actions taken by BLM in the leasing process that impact those reserves ultimately leased. The BLM is required to lease in accordance with the public interest. Therefore, lease

tracts include unrecoverable tons that lie under rail lines and extend to the 40 acre subdivision. The unrecoverable tons within these lease units include tons that are not economically recoverable, but have been added into the lease tract total tonnage evaluation and sale to prevent reserve sterilization.

Order No. 3338 also does not account for strip ratio variability (overburden thickness/coal thickness) and how strip ratio factors into lease modification requests and actions. As stated previously, a lease action often includes areas of high strip ratio and marginal coal in order to prevent sterilization of reserves. LBA and Lease by Modification (LBM) actions include both lower cover reserves in conjunction with marginal high cover reserves in an attempt to balance the strip ratio and recover the maximum coal tons from the reserve base. This action facilitated by the LBA/LBM process provides for maximum recovery and public benefit from the leased coal. In contrast, Order No. 3338, as established, will force operations into marginal reserves early in the mine life and create economic winners and losers based on policy rather than coal recovery and market conditions. Additionally, coal companies may choose to pay a penalty and bypass marginal reserves as they are simply too costly to mine without lower stripping ratio reserves available to offset the respective increased cost of mining. The public benefit from these reserves is compromised and is in contrast to BLM's public benefit mandate. The increase in the cost of coal will be passed onto the end consumer resulting in higher utility rates. The BLM must consider these factors now, as it relates to Order No. 3338, and in its PEIS.

Comment Excerpt Text:

The LMU has been used to manage coal production from multiple federal, private and state lease tracts and to ensure timely development, continuous operation and diligent coal recovery. The LMU requires a coal operator to mine the diligent development tonnage (1% of the LMU reserve) from the defined reserve based on an average one in three year test. The coal operator must meet the continued operation requirement in an annual average amount of 1% of all the LMU reserves associated with the lease for all following years. The annual average amount will be calculated on a 3-year basis with the 2 preceding years. The coal operator is also required to post a bond to cover the LMU. When the LMU process was established, it was not envisioned to encompass the scale of the coal reserves of the PRB. The LMU process only has a mechanism to add new reserves into the LMU until a maximum of 25,000 acres/LMU is reached. There is currently no mechanism to remove leases (tonnage) that have been completed and released by the BLM from the LMU. This has resulted in LMU diligent development tonnage requirements only increasing. Under current regulation, any change to the LMU diligent development tonnage requirement is at the discretion of the authorized officer. Moving forward, this process would benefit from a formal and defined method for removing tons from the LMU. As part of the PEIS, consideration should be given to revising the LMU process to provide for reduction of the diligent development tonnage requirements associated with completed leases. See 30 U.S.C. § 202a and 43 C.P.R. § 3487.1.

The following points must be adequately considered in the event that BLM is still compelled to evaluate various leasing alternatives. As indicated in the BLM's own findings, the regional leasing process requires the agency to have adequate resources available in order to undertake and fund the required activities to bring federal coal leases to sale. This same situation is expected to be the case when considering scheduled lease sales as suggested in Order No. 3338 (p.7). By comparison, the LBA process requires the company nominating the lease to pay all costs associated with the federal coal leasing process including cost recovery fees for the time that BLM employees spend on the processing of the proposed lease. The BLM must calculate costs and consider the

availability of agency resources when determining which leasing alternative would provide the American public the greatest return.

1.2 Lease-by-Application Process -Wyoming Powder River Basin

In its December 2013 coal leasing evaluation, the GAO stated: "The Powder River Basin is the largest coal-producing region in the U.S., and all 10 of the top-producing U.S. coal mines are in the Powder River Basin, with 9 of these located in the Wyoming portion of the basin, according to [U.S. Energy Information Administration (EIA)] data. Coal in the Powder River Basin has less sulfur than eastern coals, making it attractive to utilities for meeting Clean Air Act requirements." U.S. GAO, Report to Congressional Requesters, Coal Leasing, BLM Could Enhance Appraisal Process, More Explicitly Consider Coal Exports, and Provide More Public Information, p. 10 (Dec. 2013) (GAO Report); (WY0-03626). Considering the critical role played by the abundant supply of federal coal mined in Wyoming to meet national energy needs and environmental requirements, BLM must properly evaluate the LBA process as it is implemented by BLM Wyoming.

Comment Excerpt Text:

In addition to coal quality and economic viability, the Interior Department should consider additional factors when deciding which already leased coal should be taken back, including the lease holder's record and ability to meet its mine reclamation obligations, whether the lease holder plans to export the federal coal, and other actions of the lease holder.

(8) <http://ieefa.org/wpcontent/uploads/2015/08/FederalCoalLeaseProgramDOIcommentsIEEFAug2015final1.pdf>
 Companies that have leased the most federal coal do not support US climate goals Federal coal production is dominated by three companies: Peabody Energy, Arch Coal, and Cloud Peak Energy. Although the Interior Department does not publicly report how much federal coal is extracted by each company, or from each mine, I submitted a Freedom of Information Act (FOIA) request to the Interior Department for this data. The results of that FOIA show that in 2014, Peabody Energy, Arch Coal, and Cloud Peak Energy together mined 407,914,000 tons of federal coal, accounting for 77% of the total federal coal production from all companies and subsidiaries that were reported in the FOIA results. (9)

(9) <http://www.greenpeace.org/usa/research/corporatewelfareforcoal/>

In addition, the FOIA data shows that federal coal accounted for the vast majority of each of those three companies US coal production in 2014: 88% of Cloud Peak Energy's total coal production, 83% of Arch Coal's, and 68% of Peabody Energy's total 2014 US coal production. In effect, the federal coal program has amounted to a major corporate welfare program for these three companies. This domination of federal coal production by a few coal mining companies reflects the Interior Department's past decisions that have allowed allowed the coal

mining industry itself to largely manage the development of federal coal.

As the Interior Department pursues reforms of the federal coal program in order to support US climate commitments, it is abundantly clear that these coal mining companies are not partners in this reform effort. Bankruptcy filings reveal that the two largest producers of federal coal, Peabody Energy and Arch Coal, have secretly funded organizations that seek to confuse the public about the threat of climate change. (10) (11)

(10)

<http://www.prwatch.org/news/2016/02/13049/bankruptcydocumentsindicatearchcoalfundingclimatedeniallegalgroup>

(11)

<http://www.prwatch.org/news/2016/06/13114/peabodycoalbankruptcyrevealsextensivefundingclimatedenialnetwork>

In order to help meet US climate commitments, the Interior Department will need to take active control of the management of our federal coal, including federal coal that has already been leased, instead of allowing coal mining companies to continue extracting federal coal without regard for the impacts on the climate of the mining and burning of federal coal.

Comment Excerpt Text:

Recommendation I. Through the PEIS, Interior should develop new public management systems to replace the coal lease by application and royalty self-assessment systems.

Secretarial Order 3338 raises a number of vital issues affecting the public that can be successfully resolved only within a framework where decisions are based on maximizing the welfare of society overall. Whether it be ensuring a fair return to the public for the coal they own, harmonizing coal production with climate change, reclaiming mined lands, preventing adverse effects on public health or helping coal communities and workers adapt to changing energy markets or other issues—their effective resolution requires public action in the public interest.

In analytical terms, the purposes of the coal PEIS as described in Secretarial Order 3338 fall into three categories:

1. Ensuring a fair return to the public on federal coal as required by law,
2. Reducing the external costs and impacts of coal production, including climate change, but also a host of other environmental and socio-economic concerns, and
3. Determining the future role of federal coal in relation to the nation's energy supply.

None of these purposes can be achieved through the existing structures for administering the coal program: the coal lease by application (LBA) process and the coal producer self-assessment method of collecting royalties.

Both these systems are the source of the problem of the American people being denied the fair return on coal required by law. The sources of the problem will not be its solution.

The LBA system allows companies to determine when, where and in what amounts federal coal can be leased. The companies propose small tracts adjacent to existing operations, resulting in more than 90% of leases having only one bidder. These non-competitive bids combined with company control of the timing of the leases, and the completely closed nature of the bid process produce lease payments consistently below fair market value, shortchanging the public by tens of billions of dollars over several decades. (1)

(1) Tom Sanzillo, "The Great Giveaway: An Analysis of the United States' Long-Term Trend of Selling Federally Owned Coal for Less Than Fair Market Value, Institute for Energy Economics and Financial Analysis, 20, (June 2012).

The long-term failure of the LBA system to achieve the fair return required by law is sufficient by itself to justify including in the scope of the PEIS the development of a new leasing process to replace it. However, it becomes absurd to leave in question the need to terminate and replace the LBA process given that it is incompatible with the full and effective consideration and mitigation of the public costs of coal production.

The LBA process allows coal companies to drive the leasing process based upon their own narrow calculus of private costs and private benefits—effectively disregarding public costs or benefits. Further, despite court orders

directing broad NEPA analysis of LBA tracts, the company-nominated tracts are simply too small to evaluate properly the cumulative external effects of coal mining on the broader environmental, social and economic landscape. Thus, in both conceptual and practical terms, lease by application excludes the proper consideration of large-scale issues of climate change, public health and other external costs of coal production imposed on society. Taking external costs into account adequately will require a new and fundamentally different system of lease decision-making, controlled by Interior but informed by active public participation and designed from the outset to weigh fully the public costs and benefits of coal production.

Comment Number: 0002495_Bucks_20160728-3

Commenter I: Dan Bucks

Comment Excerpt Text:

Recommendation 2. Interior's development work on new management systems should place a priority on (a) public control of public resources and (b) transparency and public participation.

The discussion above noted how current systems delegate decision-making to coal producers in ways that conflict with achieving the public interest in the management of federal coal. So one principle that Interior should apply in designing new management systems is to insure public control of public resources. That means that Interior, not the coal producers, should determine when, where and in what amounts coal leasing will occur. It also means that Interior, as the Mineral Leasing Act plainly authorizes, should assess directly the value of coal for royalty purposes, like a property tax, instead of allowing producers to self-assess the values, like an income tax. Compounding the problem of public decisions being over-delegated to private interests is the fact that much of this decision-making is secret and hidden from the public. So the public often knows only well after problems have occurred the price they paid for the shortcomings of these systems.

Throughout the history of federal minerals management, secrecy has been the common factor contributing to various scandals, crises or chronic failures to fulfill the law. Secrecy facilitated the Teapot Dome bribery scandal in the 1920s and the oil royalty in-kind debacle eight decades later. Secrecy, in the form of private recordkeeping of production, enabled producers to steal oil from federal lands and Indian reservations in the decades following WWII. Keeping minimum coal lease bids secret, combined with the alleged leaking of a minimum bid to some producer interests, contributed to the notorious 1982 sale of 1.6 billion tons of Powder River Basin coal at a price the GAO determined was 60% below fair market value. To this day, secret minimum bids for coal leases continue to facilitate leasing at amounts below market value. Secret royalty returns by coal producers hide from the public the royalty values and payments on the coal they own and enables persistent underreporting.

Another principle Interior should apply in the design of new management systems is to maximize transparency and public participation—ending the secrecy that plagues the current system. In general, Interior should allow access to information and secure public comment on pending decisions whenever feasible. In particular, that means setting minimum bids and lease boundaries in public, taking comment on proposals for both before soliciting proposals from the coal producers. It also means establishing the values of coal of different quality, heat content and distance for market for royalty purposes based on valid samples of market price data (both public and private), with the resulting composite values posted publicly for producers to use in calculating royalty payments and for the public to know what they are being paid. In this process, proprietary market price data is not released, as will be explained in greater detail later in the report. However, the value that is derived from a sample of proprietary data points would be released because that value cannot, in the normal course, be traced back to individual sales or producers. The value is a composite number that would be developed by Interior.

Based on the maxim "sunshine is the best disinfectant," transparency and public participation obviously improves the integrity of and accountability for coal decisions. Further, it enhances public understanding of those decisions. There are other benefits as well. The diverse issues Interior considers in coal decision-making involves complex information of diverse types, ranging from scientific and financial information to knowledge by citizens of a particular landscape or impacts that are occurring. Interior cannot capture through its own resources all of the reasonably relevant information that bears on particular decisions. Open processes that solicit ideas, information and expertise from the public can be of great aid to decision-making. The United States is an advanced capitalist society overflowing with financial expertise and information, including expertise and information about coal. If

Interior established minimum bids for leases through a public process, it would garner the benefit of this expertise and knowledge in its decision-making.

Comment Number: 0002495_Bucks_20160728-5

Commenter I: Dan Bucks

Comment Excerpt Text:

For similar reasons, lease by application is also an obstacle to determining on a public policy basis the extent to which federal coal should be supplied in response to the nation's energy requirements. The Secretarial Order suggests the PEIS should examine the role of coal in the nation's energy supply. (2) It is difficult to see how that task could be accomplished if the current system were left in place because LBA effectively allows coal companies to answer energy supply issues on their own terms separate from public policy considerations.

Comment Number: 0002495_Bucks_20160728-7

Commenter I: Dan Bucks

Other Sections: 8.7

Comment Excerpt Text:

Transparency and open participation would also connect Interior with the public they are to serve. Coal decisions are made privately with interaction at key points with coal producers whose interest is to minimize payments for the coal itself or for mitigating the external impacts of coal production. The current systems cut off Interior from the public that wants to help secure a fair return from coal and properly mitigate the public costs of its production. These systems are illogical. Privileged access is provided to parties whose interests often conflict with the public interest, while those who want to see the public interest served are kept out of the loop at key stages of decision-making. Adopting open, public processes of decision-making will logically align decision-making with the goals and interests that, under the law, ought be served.

Finally, the public simply has a right to know about the issues and decisions that affect them. Resource management decisions often have major impacts and typically involve choices among public values. The public should have access to such decisions as they are being made and not after the fact, when the impacts may not be mitigated or their values preserved.

Comment Excerpt Text:

Recommendation 3. Through the PEIS, Interior should develop a transparent and participatory coal planning and leasing process that (a) integrates and reconciles energy supply, environmental, social and long-term economic issues, (b) mitigates or reduces the public costs of coal production, and (c) secures a fair return for the public in lease payments.

This section and the following one outlines some working ideas for a new public management system that would be a focus of consideration during the PEIS. The PEIS could well discover and refine even better ways of applying the principles advocated in the prior section. The purpose is certainly not to suggest that these particular ideas must be implemented for they are the best of all available options. Rather their purpose is to provide helpful starting points for further analysis in the PEIS and to illustrate that it is feasible to adopt systems that conform to the principles of "public management in the public interest."

A new system of coal planning and leasing might well begin with a national analysis of energy supply and demand and the largest scale of external effects of coal use and production, especially climate change. The analysis would be updated periodically such as every 5 to 7 years and would be subject to public comments as it is conducted. It would be relevant to and used to support both the leasing and, as explained in the next section, the royalty system. For leasing purposes, this analysis would seek to answer the question, "How much federal coal should be

leased in the foreseeable future?” Answering that question would require addressing subsidiary questions related to estimates of the range of coal needed to supply energy demand, methods of minimizing the harmful effects of coal through substitution of other fuels or changes in technology for using coal, and other relevant issues. For adverse effects of coal production that cannot be eliminated through other means, the analysis could produce estimates of changes in royalties to compensate society for the social costs of carbon.

Once completed, the national analysis would yield a target level of coal to be leased broken down by coal production regions along with an accompanying target level of alternative, renewable energy that might be developed on federal land. Because the level of future coal production is likely to be less than in the past, Interior could also work with other federal agencies and state and local governments to develop strategies to assist coal dependent communities and workers in adjusting to changing energy circumstances. The thread of activity related to coal communities and workers would also be carried through to the regional and community level as a part of mitigating the socioeconomic impacts of the life cycle of federal coal production.

With the targets for both coal and alternative energy production from federal lands, a public planning process could then proceed within each coal production region. The end results of the regional planning process would be to prepare plans and boundaries for broad tracts for coal leasing, tracts of federal land for renewable energy development and mitigation strategies associated with both. Particular attention could be paid to develop tracts for future coal leasing large enough to meet two criteria. The tracts should be large enough to have the potential for attracting competitive bids to help attain a fair return for the public. They should also be of sufficient size to effectively evaluate the environmental and socioeconomic effects of additional development and develop associated mitigation strategies to minimize costs and maximize benefits associated with future development. In terms of methodologies, the regional planning process could draw on the policies, strategies and practices called for in Secretarial Order 3330, “Improving Mitigation Policies and Practices of the Department of Interior,” issued by Secretary Jewell in October 2013, and in the report of Interior’s Energy and Climate Change Task Force of April 2014, “A Strategy for Improving the Mitigation Policies and Practices of the Department of Interior.” Landscape-scale approaches to the development and conservation of resources could be applied as much as possible throughout the regional planning process. In addition, strategies that focus on natural resources should be supplemented by methods of evaluating how socioeconomic conditions and energy infrastructure in the region are affected by coal and alternative energy development. Addressing the needs of coal communities and workers and encouraging the efficient common use of energy transmission facilities by multiple sources of energy are among the topics that could be addressed in this process. The regional planning would be transparent and be assisted by active public participation throughout.

Interior would need to develop policies and practices around the timing of decisions to offer for leasing planned tracts for energy development. Timing decisions are significant for securing a fair return for the public as well as effectively implementing mitigation strategies for development.

Once offered for leasing, Interior should adapt for its use the transparent process used by Montana to lease its Otter Creek coal tracts. An appraisal process would yield a proposed minimum bid that would be subject to public hearings and comment. After the public process, Interior would decide and announce the minimum bid it had set for the tract and would proceed to solicit proposals for leasing. Although bids would be submitted in a sealed process, they would be opened and announced publicly. Decisions by Interior to accept bids, along with their terms and amounts, would likewise be released publicly.

This broad outline of public leasing process should be evaluated and refined through the PEIS. The development of a public coal planning and leasing process of this type should include:

- an evaluation of gaps in information sources,
- the need for new analytical tools to support the process,
- methods of coordinating the process with other public agencies and levels of government,
- procedures for effectively securing public participation in the process, and
- consideration of other tools and practices needed to enable the process to work effectively.

While the details need to be expanded and improved, this type of planning and leasing process should significantly enhance Interior’s ability to secure a fair return on lease sales for the public and minimize external costs on society from coal development.

Comment Excerpt Text:

2. Just Transition Alternative

The “Just Transition Alternative” is meant to both wind down the federal coal program in order to keep fossil fuels in the ground and to ensure an orderly, effective, and fair transition of workers and communities away from coal to more prosperous and sustainable economies. The “Just Transition Alternative” is defined by the following key components:

1. An end to federal coal leasing: Consistent with authorities and discretion under the Mineral Leasing Act, the Just Transition Alternative imposes a permanent pause on the leasing of federal coal. The primary basis for adopting this permanent pause would be to ensure the protection of the public interest and the interests of the United States. Such justification for an end to leasing is clearly supported by the Mineral Leasing Act.

This pause would apply to all competitive leases (including all leases by application, including emergency leases, as defined by 43 C.F.R. § 3425.1-4) and lease modifications. We further believe there is ample justification for applying a permanent pause to other forms of non-competitive leasing, such as preference right lease applications and lease exchanges. With regards to lease exchanges, the BLM has clear authority to reject exchanges that are not in the “public interest.” 43 C.F.R. § 3435.4(a); see also 43 C.F.R. § 3436.0-2(b) (related to alluvial valley floor exchanges) and 43 C.F.R. § 2200.0-6 (generally related to exchanges). With regards to preference right lease applications, the BLM has the authority to reject such applications where there does not exist “commercial quantities” of coal. 43 C.F.R. § 3430.5-1(a)(1). Given the dismal state of the coal industry and the overwhelming climate costs that coal imposes on society, it would be dubious at best to claim that any commercial quantities of coal exist where there are preference right lease applications. Accordingly, the BLM has the authority to reject such applications. (20)

Furthermore, to ensure an orderly end to federal coal leasing, the BLM and the Department of the Interior should issue a rule or guidance requiring that as land management planning is undertaken pursuant to 43 C.F.R. § 1610, et seq., that all lands within a resource management area that are not currently leased for coal, be made unavailable for leasing. The authority to impose such direction is set forth at 43 C.F.R. § 3420.1-4(e), which gives the BLM broad discretion to “eliminate additional coal deposits from consideration to protect other resource values.” 43 C.F.R. § 3420.1-4(e)(3).

(20) The only preference right lease applications that exist are in northwestern New Mexico, where Arch Coal, which is currently bankrupt, has the rights to acquire 21,000 acres of leases. Legislation was introduced in the U.S. House of Representatives that would allow the Secretary to retire these preference right lease applications. See HR-1820, available online at <https://www.congress.gov/bill/114th-congress/house-bill/1820/text>. If this legislation is passed, there would be no additional preference right lease applications requiring action. We support this legislation and urge the Secretary of the Interior to encourage its passage in the U.S. Senate and adoption into law.

Putting a permanent pause on leasing will not destroy the U.S. economy or otherwise endanger our energy security. As a recent report looking at leasing in the Powder River Basin found, existing leased reserves in the Powder River Basin are sufficient to meet demand and effectively contribute to limiting temperature increases.

(21) This report is instructive as the Powder River Basin is the largest coal producing region in the United States and imposes the greatest influence on energy supply and demand in the nation. If an end to federal leasing can be justified in the Powder River Basin, it can be justified for federal leasing elsewhere in the U.S.

21 See Exhibit 11, Fulton, M., D. Koplou, R. Capalino, and A. Grant, “Enough Already: Meeting 20C PRB Coal Demand Without Lifting the Federal Moratorium,” Report Prepared for Energy Transition Advisors, Earth Track, and Carbon Tracker Initiative (July 2016), available online at <http://www.carbontracker.org/report/enough-already-2c-powder-river-basin-coal-demand-federal-moratorium/>.

2. Increased royalty rates and rentals: Coal is exacting a tremendous toll on our nation, costing our society

billions in climate damages, adverse health impacts from air pollution, and water contamination. Royalty rates from production on existing coal leases and rentals on existing leases must be increased to begin to recoup the costs of these externalities, which are currently shouldered by the public.

Although royalty rates are normally imposed through new leasing, we recommend that the Interior Department and BLM incorporate higher royalty rates into existing leases as existing leases are readjusted pursuant to 43 C.F.R. § 3451.1. To accomplish this, we urge the amendment of 43 C.F.R. § 3473.3-2(a)(1) and (2) to incorporate increased royalty rates for both surface and underground mining. As leases are readjusted, these royalty rates must be applied to existing leases pursuant to 43 C.F.R. § 3451.1(a)(2).

Increasing royalty rates has been recommended by the White House as both a means to generate revenue and address the costs of environmental externalities, including carbon costs. (22)

(22) See Exhibit 12, Executive Office of the President of the United States, “The Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to Taxpayers” (June 2016), available online at https://www.whitehouse.gov/sites/default/files/page/files/20160622_cea_coal_leasing.pdf.

Furthermore, royalty rate reductions should not be approved. Currently, royalty rate reductions are routinely granted as companies claim poverty or difficulty in mining with little apparent scrutiny as to whether the reductions are justified. In Colorado, for example, BLM officials have approved royalty rate reductions to facilitate methane venting and most recently proposed to approve a retroactive royalty rate reduction for a mine that was not even producing coal. (23) See Exhibits 13 and 14.

Similarly, we urge Interior and BLM to amend 43 C.F.R. § 3473.3-1(a) to raise rental rates for federal coal leases. Currently, rental rates are set at \$3.00 per acre, a figure that has not been adjusted since 1979, if not earlier. This rental rate not only has failed to be adjusted to account for inflation, but fails to account for the fact that some leases may be of small acreage, yet yield significant amounts of coal. Rentals should reflect the value of the lease, which depends on the amount of coal a lease contains. In accordance with 43 C.F.R. § 3473.3-1(a), any increased rental rate must be applied to any readjusted coal lease.

3. Existing leases that are not producing must be canceled: Where a lease is not meeting continued operation requirements under 43 C.F.R. § 3483.1(a)(2), it is subject to cancellation pursuant to 43 C.F.R. § 3452.2. Where a lease is not meeting continued operation requirements, BLM and the Interior Department should make clear that cancellation of the lease must be pursued. To this end, discretionary avenues for avoiding cancellation should be prohibited. Thus, lease suspensions under 43 C.F.R. § 3483.3 and payment of advanced royalties in lieu of continued operation under 43 C.F.R. § 3483.4 should be barred.

The justification for imposing such direction is very clear. Currently, BLM regularly grants lease suspensions and allows payment of royalties in lieu of continued operation with no assessment of whether such actions are appropriate or in the public interest. BLM appears to be under the impression that lease suspensions or advanced royalties are somehow mandated, and that the agency has no choice but to approve company requests. An egregious example of this is with regards to Arch Coal’s Carbon Basin Lease in southern Wyoming (No. WYW-139975). Arch acquired this lease with the aim of developing a mine to fuel a proposed coal to liquids facility. However, this coal to liquids facility has never materialized or even shown any promise of materializing. Most recently, the Wyoming Department of Environmental Quality terminated the permit for the proposed facility.

(24) Nevertheless, since 2010, Arch has failed to meet continued operation requirements. The BLM has allowed Arch to maintain its lease, however, by routinely allowing the company to pay advanced royalties in lieu of continued operation. (25) These decisions appear to be pro forma in nature, and do not reflect any consideration as to whether it is appropriate or remotely in the public interest to accept advance royalties in lieu of continued operation.

(24) See Exhibit 15, Wyoming Department of Environmental Quality, “Permit Termination, Medicine Bow Fuel and Power Coal to Liquid Project” (June 27, 2016).

(25) See Exhibit 16.

Furthermore, where an existing lease is not producing, yet is part of a producing logical mining unit, BLM and the Interior Department should use their discretion to modify the boundaries of logical mining units to eliminate the non-producing lease and facilitate its cancellation. BLM has such discretion under 43 C.F.R. § 3478.1.

Cancelling leases that are not producing will serve the goal of preventing any potential future development of

existing leases and contribute to an orderly end to the federal coal program.

4. Accounting for carbon costs in coal management: It should be made clear, whether through new rules or guidance, that carbon costs must be analyzed, assessed and disclosed as federal coal management decisions are made. Such decisions are most likely to include mining plan modifications issued pursuant to the Mineral Leasing Act, 30 U.S.C. § 207(c), and the Surface Mining Control and Reclamation Act (“SMCRA”), 30 C.F.R. § 746, and lease readjustments. It is imperative that the BLM and Interior maintain close accounting of the carbon emissions and costs resulting from its coal management actions, to ensure full transparency around these emissions and costs, and to meaningfully act to address these emissions and costs. Particularly given that, pursuant to authorities under the Mineral Leasing Act and SMCRA, the Secretary of the Interior has full discretion to disapprove mining plans authorizing the development of leased federal coal, it is imperative that carbon emissions and costs factor into and influence such decisionmaking.

5. Reclamation must be guaranteed: To ensure an orderly end to the federal coal program, full and final reclamation must be guaranteed within a reasonable timeframe. We urge two regulatory changes to ensure this occurs.

First, Interior should amend regulations at 30 C.F.R. §§ 816.100 and 817.100 to provide clarification and specificity around contemporaneous reclamation. Current rules are vague and fail to ensure that reclamation proceeds in a manner that is as “contemporaneously as possible” with mining in accordance with 30 U.S.C. § 1202(e). These regulations should be amended to make clear that the success of contemporaneous reclamation must be measured based on a comparison of Phase III bond release acres, as defined under 30 C.F.R.

§ 800.40(c)(3), with disturbed acres and ensure that reclamation proceeds at a 1:1 rate, in other words for every acre disturbed, one acre should be fully reclaimed to meet Phase III bond release standards.

Second, just as current BLM rules require diligent development of federal coal, these rules should also require diligent reclamation. To this end, Interior and BLM should consider rule changes to ensure that nonproducing coal leases are fully reclaimed within two years of failing to meet continued operation requirements and set deadlines for the full reclamation of federal coal leases that are no later than 2035. This reclamation deadline should be established by rule and incorporated into lease terms as leases are readjusted.

Finally, Interior should amend self-bonding regulations at 30 C.F.R. § 800.23, and any other regulations, as appropriate, to prohibit self-bonding whenever publicly owned coal is permitted to be mined. This will ensure that, as coal companies continue their decline, that American public resources are fully protected and fully guaranteed to be cleaned up.

6. Prioritizing transition: Above all, the BLM and Interior must make transition away from coal a foremost goal as the federal coal program comes to an end. To do this, the agencies should not only explicitly commit, to the extent possible, their leadership, resources, and expertise to ensure that workers and communities receive the support and assistance they need to transition to more sustainable and prosperous economies. Among the actions that Interior and BLM can and should undertake to ensure transition:

- Work to secure Congressional authorization to direct increased royalty and rental payments toward worker and community support. Under NEPA, agencies are required to rigorously explore and objectively evaluate reasonable alternatives “not within the jurisdiction of the lead agency.” 40 C.F.R. § 1502.14(c). Here, although BLM and Interior may not be able to direct royalties toward transition support, they can recommend that Congress pass legislation that provides such authorization.

- Establishing an Economic Transition Fund, which would be sustained by an increase in reimbursement fees charged by the Interior Department when processing coal-related applications. Under the Federal Land Policy and Management Act (“FLPMA”), Interior has authority to recover reasonable costs associated with its coal management program and to appropriate and spend such monies. Specifically, FLPMA provides the Secretary of the Interior with authority to “require a deposit of any payments intended to reimburse the United States for reasonable costs with respect to applications,” including coal lease application. See 43 U.S.C. § 1734(b). Such payments are “authorized to be appropriated and made available until expended” by FLPMA. Id. Funds from the Economic Transition Fund should be directed toward transition-oriented initiatives.

-Prioritizing support and assistance to help communities transition. In addition to securing funds and making them available, the Department of the Interior can play a key role in helping direct communities to support, steering resources to support conservation and research projects in or near communities, encouraging renewable energy development on public lands. Such leadership could be conveyed through a Secretarial Order that simply makes it an overarching priority of the Interior Department to advance transition

Overall, the Interior Department and BLM must move to keep our publicly owned coal in the ground. However, keeping coal in the ground should not mean that we turn our backs on the workers and communities that have been dependent on coal for so long. Embracing an alternative that ensures “Just Transition,” in other a fair, compassionate, and orderly transition away from coal, is the most effective way to both protect our climate and help our nation effectively move to more sustainable economies and reliable and affordable means of energy production.

Comment Excerpt Text:

The LEC believes that in order to ensure the best return to the taxpayer, the Department needs to analyze the leasing program to find ways to streamline leasing and uphold its statutory mandate to manage public resources for the greater good. The subtitle of the Mineral Leasing Act explicitly states that it is “an act to promote the mining of coal...” and mandates that “no mining operating plan shall be approved which is not found to achieve the maximum economic recovery of the coal within the tract[3]” (emphasis added). While the Department might maintain that it is adhering to the letter of this and other federal laws to promote federal mineral development, the status quo is certainly a gross violation of the spirit of these statutes.

Coal producers in North Dakota are faced with a years-long and costly analysis process, with little guarantee of success or return on investment in pursuing federal coal leases. In addition, with respect to the lignite industry, the federal government has limited options to lease coal due to the small number of producers who are able to mine the lease. Therefore, the lease-by-application process should run in parallel with resource recovery and protection plans, mine plan reviews, and other analysis to expedite the leasing process. Similarly, the federal leasing process must work in concert with state permitting agencies to ensure that a mine plan can be implemented without years-long delays to lease federal coal parcels within the mine area.

Organization I: Utah Citizens Advocating Renewable Energy

Commenter I: Stanley Holmes

Comment Excerpt Text:

While the PEIS evaluates the merits of regional leasing versus leasing by individual application, UCARE suggests that the BLM act systemically to adjust royalty rates to reflect the per-unit costs of harm to the public from the negative externalities resulting from coal development. Alternatively, damage-specific "adder" fees might be exacted for individual externality costs.

Comment Number: 0020031_Parkins_20160722-1

Excerpt Text:

First, I'd like to state that the current Lease by Application process works very well and is an efficient way for the BLM to determine which tracts to delineate for leasing. In the past the BLM attempted to identify tracts they felt were good candidates for leasing nominations and wasted time, effort and money to develop interest in tracts that mining companies were not interested in mining. Many of these tracts were identified twenty-five (25) years ago or more and have lain dormant since then waiting for interest. With the current Lease by Application program, only those tracts that have a proponent will undergo the expense to move them forward and there is a good history of these tracts moving to leases.

Comment Number: 0020031_Parkins_20160722-14

Other Sections: 2

Comment Excerpt Text:

It is important for the BLM as part of their strategic planning process to determine the nation's needs on BLM coal lands and to incent mining companies to mine BLM coal lands so that taxpayers receive income on these assets. The BLM or the Department of the Interior should have an obligation to review the expected depletion of coal resources in the United States and understand how this might change the need to lease BLM coal lands. Minimum levels of leasing activity should be set as guidelines to ensure that there are adequate coal resources under lease and actively being mined to keep the nation properly supplied with this key strategic resource and to lessen the possibility of damaging energy price spikes such as occurred in the 1970's, 1980, and to some degree in the first decade of this new millennium.

Comment Number: 0020031_Parkins_20160722-2

Comment Excerpt Text:

Reforms that should be implemented are required time lines for action by the BLM to move the leases forward in a timely fashion. If the allotted time passes the process should move forward with the assumption that no further input is needed.

Comment Number: 0020031_Parkins_20160722-4

Other Sections: 2

Comment Excerpt Text:

The BLM's core mission is to maximize returns to taxpayers. In line with this mission, the BLM should be charged with ensuring that adequate coal lands have been leased to maintain a reliable supply of this low cost energy for the nation's coal fired power plants and future energy needs. This requires a review of the coal under lease to active operations and the likelihood that additional economic reserves will be available to these active operations to prevent an interruption to this important fuel for the nation's energy security. Should shortfalls which might

potentially interrupt a mine's operations or cause a mining operation to bypass BLM coal lands, an expedited process for leasing should be developed to ensure coal lands are not lost due to bureaucratic delays.

Comment Number: 002003I_Parkins_20160722-5

Comment Excerpt Text:

In my opinion the best way to increase competition for BLM coal leases is to provide a reliable process by which proponents can obtain BLM coal. Leasing BLM coal is a very lengthy process without a reliable outcome. This adds risks and cost to any mining company that may be interested in the coal lands and will at some point lower the value to the BLM

Comment Number: 002003I_Parkins_20160722-6

Other Sections: 2

Comment Excerpt Text:

Reducing up-front costs to those parties interested in leasing coal lands from the BLM might also be a way to increase competition. At the moment few companies can afford to acquire BLM coal lands unless there is already an active operation adjacent to these lands because of the high cost of entry to develop a new mining operation. BLM could consider delaying collection of Bonus Bids until mining is initiated on the leases and allow a royalty credit for the capital cost to establish a mining operation on BLM grounds as a means to incent more parties to express interest. They could also increase the period of time over which a Bonus Bid must be paid from the current 5 years to a greater period such as 7 years or 10 years, or the ability to suspend payments in the event of a delay in receiving permits to mine or operate. Additionally, if the Operator is unable to recover the tons advertised by the BLM when the tract is bid a refund of the appropriate Bonus Bid amount when the resource is better defined and permitted would reduce the risks to the Operator which would incent higher bids.

Comment Excerpt Text:

there are a variety of legislative reforms that should further be analyzed. These include:

Bonus Bid Reform for Maintenance Tracts

Bonus bids under competitive leasing are required under the FCLAA, and are intended to: (a) provide a mechanism for choosing among qualified bidders, (b) incentivize diligence in production, and (c) compensate

taxpayers for the disposition of federal natural resources. Diligence is independently achieved by the federal diligence regulations and requirements, and taxpayers can be equally or more effectively compensated by payment of federal royalties. Bonus bids were also an effective tool in the 1970s when there were more frequent greenfield coal mine starts, and remain useful for any future greenfield proposals.

Comment Excerpt Text:

Third, the PEIS should examine more express and firm deadlines for the various steps in lease processing, including NEPA proceedings. Presently, the only deadlines are various statutory and regulatory minimums. There are very few maximums. Consequently leasing processes can drift for months or years, only coming to a head when the applicant is approaching a supply crisis. Firmer regulatory timelines will not only greatly facilitate planning by the mine operators, they will assist the Department of Interior (Department) in securing necessary appropriations to adequately staff the BLM and other offices to meet those deadlines. At this stage of scoping Bowie will not propose any specific timelines for any particular steps in leasing, but simply requests that this be an express subject of analysis, discussion, and recommendation in the PEIS.

Comment Number: 0020056-14

Organization I: Bowie Resource Partners, LLC

Comment Excerpt Text:

NMA accurately describes the problems associated with rigid, centralized coal leasing. As suggested in Order 3338, one of the drivers for re-consideration of lease sale scheduling appears to be the leasing model employed for oil and gas leases. However, coal leasing is fundamentally different from oil and gas leasing. Oil and gas leasing is inherently about exploration, with wide lease-to-lease variation in whether significant exploitable reserves will be discovered, when they can be brought to market, and the rates that will make sense under current market conditions. In that environment, regular, systematic lease sales are an efficient development mechanism. In contrast, federal coal leasing typically occurs with relatively better quality information about the coal reserve, in the context of maintenance tracts intended to sustain production at an existing mine. Moreover, coal mines are far more capital-intensive than oil and gas drill rigs. An oil and gas lease is essentially about the location and development of a petroleum reserve; a coal lease is typically about the continued operation of an entire coal mine. It is thus that mine specific status and needs that determine the appropriate timing and size of coal leasing, and there is no evidence that such assessment can be performed as well by federal committee as by the mining industry.

Comment Number: 0020056-6

Organization I: Bowie Resource Partners, LLC

Commenter I: Gene DiClaudio

Comment Excerpt Text:

Long leasing times have significant environmental and economic consequences. On the economic side, lengthy leasing processes increase administrative costs and require applicants to propose larger leases so as to ensure that leased reserves are not exhausted by the time the next round of leasing, permitting, and mine planning can be completed. This requires greater up-front bonus bid submissions, and longer times before that capital can be recovered. Economic pressure from large capital overhangs is one significant factor in the distress currently experienced by the coal industry. Quicker leasing would allow the issuance of smaller, more efficient lease tracts, allowing the industry to be nimbler in responding to economic trends and the needs of their utility and industrial customers.

Comment Number: 0020056-7

Organization I: Bowie Resource Partners, LLC

Commenter I: Gene DiClaudio

Comment Excerpt Text:

Slow leasing and large leases also have environmental consequences. The greater the gap between lease application and lease issuance, the more likely that environmental analyses will require updating by both BLM and later OSMRE in mine planning, causing further delays. Similarly, large leases inhibit the ability of the mining companies and regulators to respond to developing environmental information.

BLM must consult their files for compliance with the regulatory citations above to reveal that any attempts to engage in speculation have been properly dealt with. BLM also needs to review their lease records regarding diligent development to conclude that diligence has occurred in the vast majority of leases, and where it has not, the proper remedies were applied. In short, the BLM needs to conclude and to publish the findings that the 1976 statutory fixes to speculation were successful. Further fixes are unnecessary.

Comment Excerpt Text:

I. The federal coal leasing program is a rigorous, cumbersome, very lengthy, and therefore a very costly program that sets a high bar for those who would choose to participate.

The federal coal leasing program requires considerable capital to participate thereby discouraging some otherwise interested and qualified companies from participating. Participation requires up-front investments of millions-to-over a billion dollars for significant periods of time before a return is ever realized. This severely limits the number of entities interested in or even capable of participating in the program.

Leasing federal coal is only one piece of a much larger program that is designed to provide a financial return on the coal to the American taxpayer. For the American taxpayer to realize the full value of the coal, it must be not only leased, but also mined and sold. In Wyoming, for example, it can typically take five to seven years to successfully acquire a lease for federal coal. At the point of being identified as the successful lessee, a bidder on federal coal will have invested millions of dollars with no return on the investment. At least another three-to-five years are still required to obtain permits and other authorizations before the coal can actually be mined and sold. During those “permitting” years the mining company will invest many millions more, with no return.

By the time the first ton of coal is authorized to be mined, at least ten years will have typically passed. The coal lessee will have invested a staggering sum of money including the bonus bid on the lease. So the American taxpayer will have begun to realize a return on the resource, but the coal lessee will not have realized any return on the enormous investment.

The size of this investment is critical. On a lease of 500 million tons of coal (for example), the investment when the final permit is issued could be in excess of \$650 million. Most of that is in the form of the lease bonus bid which gets distributed to the federal government and the affected state. There are not too many companies that are willing to risk an investment of that magnitude for at least ten years, with no near-term return on the investment.

Moreover, the size of the lease, and therefore the size of the investment, is a function of the time it takes to acquire the next lease. If it takes 10 years to navigate through the leasing/permitting process, a company must always ensure it has more than 10 years of reserves in order to survive the uncertainties of the program. In other words, because of the length of time it takes to negotiate the process, few entities can afford to participate.

Comment Excerpt Text:

If, the BLM concludes that the foregoing explanation requires fixing, then the BLM must also conclude that increasing royalties or fair market value of the coal will not be the fix to the absence of competitiveness. In fact, the BLM should conclude that increasing royalties or fair market value will further exacerbate the perceived problem. Instead the agency needs to evaluate ways to dramatically cut the elapsed time between applying for a lease and obtaining all authorizations to mine the coal. This will have the added benefit of accelerating the full return on the resource to the American taxpayer.

To reduce the elapsed time, BLM must consider the consolidation of leasing and permitting processes into the hands of fewer agencies. They must evaluate means for eliminating the overlapping requirements and redundant processes. And finally they must consider revising processes that have become attractive as delay tactics by those opposed to coal leasing and mining. Too much of the process today serves not to enhance the leasing process, but instead to facilitate unending delay to the process at increasing cost to the American taxpayer.

Comment Excerpt Text:

The cost of obtaining a federal coal lease represents only a portion of the investment required to mine coal. In order to mine coal for commercial purposes, an operator needs access to mining, processing, maintenance and transportation facilities, equipment and personnel. This means hundreds of millions of dollars of investment in facilities, equipment and employees.

Taken in combination with the cost of the coal, these up-front investments represent the billion-dollar ante required to participate in the federal coal leasing process.

The majority of this ante occurs prior to mining a single ton of the coal in a new proposed lease tract. The significance of this is not only the sheer magnitude of the investment, but also the risk associated with the investment. This may be the greatest fact that limits the number of entities who may have the desire to participate in the process. It also discourages speculation in federal coal leases, contrary to claims in recent articles on this subject.

Comment Excerpt Text:

My testimony will focus on one aspect of this report -- the need to involve local community stakeholders in long-term planning structures, particularly in planning strategies to manage economic transition at the end of the life of a mine. And all mines do, at some point, come to an end. SDSG is an accredited validator for the extractive industry's transparency initiative and also conducts assessments for governments under the intergovernmental forum on mining minerals, metals, and sustainable developments. These initiatives work toward greater transparency of revenue in the mineral sector, but also work to maximize social and economic benefits that may result from the wealth created by the sector. We've learned many lessons through this and other work. But, some of the key themes include the following. First, social and economic planning must be integrated into the mine permitting process and should include ongoing consultation with local community stakeholders. Social and economic impacts must be addressed on the same level as environmental impacts and should be part of an integrated environmental and social impact assessment and management plan. Second, community stakeholders must be consulted in the development of mine closure plans and activities. Mine closure planning should begin early in the life of the mine and should include plans for post-closure economic transition for mining communities. Third, government revenue for mining is optimized when managed at the local level by multi-stakeholder Boards with expenditures based on long-term objectives and ongoing consultation with local communities.

The BIM should be in firm control of when, where and how coal federal coal is leased, not coal companies as is currently the case. The agency should only lease when:

- It can ensure areas for lease are low conflict and away from important wildlife, water, air, and protected lands. Also that coal mine methane is captured.
- Coal companies have demonstrated less than 10-years of reserves available
- Coal Companies meet measurable and enforceable standards for reclaiming mined lands. The scope of the review should be expanded to include OSM
- Taxpayers will get a fair return for coal sold. That means cutting out captive transactions, substantially raising minimum bids, and eliminating royalty rate reductions.

Commenter I:Michael Burger

Comment Excerpt Text:

Professor Mark Squillace started the panel with a presentation about reclamation liabilities under the Surface Mining Control & Reclamation Act (SMCRA). SMCRA requires companies to restore the area (including soils, hydrologic conditions, and all other resource values) to pre-mining conditions, which is a very costly endeavor. SMCRA also requires performance bonds to ensure the clean-up will take place, but it allows companies to self-bond. Regulatory criteria for self-bonding are relatively stringent, but still not enough to provide a real financial assurance that

the companies will be able to reclaim the land. One key problem is that the the Office of Surface Mining, Reclamation & Enforcement (OSMRE) has allowed parent companies that aren't eligible for self-bonding to meet SCRMA requirements by creating a subsidiary company that is eligible for self-bonding. When the parent

company goes bankrupt, the subsidiary does as well. Professor Squillace concluded by noting that there are some enforcement activities going on right now: compelled by complaints by WildEarth Guardians, OSMRE has issued notices to states re: violations of SMCRA, but the states have responded alleging that there is no violation, and OSMRE has not yet taken further action.

He also discussed how the problems with self-bonding became apparent in bankruptcy proceedings, citing the Alpha Natural bankruptcy as an example. Regulators had allowed Alpha to self-bond over \$650 million of its reclamation obligations in West Virginia and Wyoming. The same regulators eventually agreed to a bankruptcy reorganization plan in which Alpha was allowed to split into two companies, one with its most valuable assets and other with remaining high liability assets and no clear plan as to how it will satisfy its reclamation obligations (some money was set aside for reclamation, but not enough to cover all of the costs). Morgan said that the regulators reached this agreement because they were “negotiating with a gun to their head” – that is, the threat of Alpha filing for Chapter 7 liquidation and all of the costs going to the public.

Bonding

- i. Self-bond – do away with this, this enables the companies not to have a pot in the game using “funny accounting”
- ii. Use outside bonding company only
- e. Require concurrent reclamation
- f. Operator may get bond money back for achieving stages of reclamation
 1. 50% of bond returned for final grading (including topsoil)
 2. 25% of bond back for planting
 3. 25% of bond held for the mine until 5 planting seasons have been achieved AND positive vegetation growth has been achieved

Comment Excerpt Text:

Coal producers must be required to post real bonds as insurance guarantees to cover real anticipated costs of land reclamation, cleanup, and environmental remediation. The practice of "self-bonding" by companies must be ended. Self-bonding assumes that coal companies will act in good faith to fulfill promises and obligations to clean

up. However, with recent trends and bankruptcies in the coal industry, coal companies cannot be relied on to fulfill promises and obligations; either clean-up will not happen, or taxpayers will bear billions of dollars in toxic and contaminated mine cleanup costs. Self-bonding has continued even when coal companies lack the assets to cover anticipated cleanup costs. For example, shortly before Peabody Energy filed bankruptcy, Wyoming reduced Peabody's cleanup obligation by \$138 million, thus ensuring that taxpayers will bear cleanup costs. Reforms need to end this flagrant subsidy to coal producers and its consequences.

- Reform the bonding process to ensure bonds are adequate to cover the remediation necessary, and fully up-to-date
 - o Self-bonding should be prohibited as this practice has been and is being abused by companies
 - o No leniency on reclamation bonds should be allowed due to bankruptcy or poor market conditions; the public should not take on the risks a company takes in the course of business
- Use the BLM National Operations Center to assist BLM Offices and local communities in understanding the transition away from coal based economies, in finding grants and other resources that can help to mitigate economic/social impacts, and dealing with negative or hostile reactions
- Place a "community reclamation" bond or a trust fund for community redevelopment to be used after a mine closes
- In creating this bond, the company should consider ways to ensure communities do not rely solely on the mine for economic stability (contrary to historical coal mining practices)

Comment Excerpt Text:

The holding of bonds by the coal companies for reclaiming mined lands, "selfbonding", is not a satisfactory means of assuring compliance with adequate reclamation of the devastation done to the land and the surrounding communities. It is too easy for any company to simply walk away from such an obligation as part of a declared bankruptcy. A better, externally monitored and assured, method of adequate amounts of money being set aside should be included in future lease agreements.

Comment Excerpt Text:

All over the west, the dismal rate of reclamation takes a toll on state and local coffers, as well as land health and wildlife. In Wyoming, where self-bonding is allowed, none of the recently bankrupt coal companies seem able to pay for the reclamation that is required by law and that was supposedly ensured by the self-bonding process. These strip-mined lands need to be reclaimed and the taxpayers are forced to pay the debt of coal companies who walk away. In Montana, South Dakota, and Wyoming, only 10% of strip-mined lands have been able to reestablish native species and achieve phase III bond release. Taxpayers are on the hook when coal companies walk away from their obligations.

Comment Excerpt Text:

Again, these failures are exacerbated and made more urgent by the precarious position self bonding has put the public in, with underwater companies no longer likely good for their bonds. According to a recent survey, more than \$3.6 billion in self-bonding obligations were reported by states. (167) The state with by far the highest amount of reclamation obligations backed by self bonded was Wyoming (63% of bonds for a total of \$2,138,201,079), where a vast amount of federal coal resides. Other states with federal coal, like Colorado (57% of bonds for a total of \$117,000,000 in obligations), have a substantial amount of reclamation obligations backed by self-bonding.

(167) Interstate Mining Compact Commission, Self-bonding Survey, available at <http://imcc.isa.us/Self%20Bonding%20Survey.pdf>.

It is important to note that many of these self-bonds are held by subsidiaries of companies, like Arch Coal and Peabody Energy Company, that do not themselves even qualify for self-bonding by virtue of their current insolvency and financial woes. (168) While these subsidiaries are technically structured in a manner that does qualify them for self-bonding, the fact they are backed by insolvent parents demonstrates how tenuous this bonding structure is. With parent companies in bankruptcy, it is highly unlikely the subsidiary companies will be able to fulfill the obligations of their self-bonds, as has been indicated in recent bankruptcy filings. In essence, assets – which have likely proved overvalued particularly as companies' worth has crashed – are obligated first to creditors, with little to none left over to satisfy bonding obligations. This means that the taxpayers are at extreme risk of being left holding the bag for high reclamation and clean-up costs.

(168) For examples, at the end of 2014 before declaring bankruptcy, Arch Coal had a ratio of total liabilities to net worth of 4.05 and Peabody had a ratio of total liabilities of net worth of 3.84, both well in excess of the permitted equal to or less than 2.5. Similarly, Peabody's reported self-bonding has exceeded 25% of its net worth repeatedly since at 2003 (e.g., 37.9% in 2003, 37.9% in 2004, 30.8% in 2005, 26.4% in 2006, 25.8% in 2012, 34.6% in 2013, and 49.9% in 2014. Fix coal reclamation before opening up more land to coal mining. For decades, the federal coal program has opened up large areas of the arid west for mining. The requirements of existing law promise and require that land, water, and habitat be protected in the siting and operation of the mines, and fully reclaimed to demonstration standards after mining concludes. While it is primarily the job of the OSM and the states to regulate how coal mining and reclamation occur on federal lands, BLM should work with these sister agencies to

ensure lands and waters are properly protected. As such, before BLM opens up more new coal leases for development, it should require that it be demonstrated by that reclamation is occurring contemporaneously and providing land reclaimed at a higher and better use and that water quality and water resources are protected, even if this means that new rules are promulgated under SMCRA to provide more assurances that reclamation and reclamation enforcement occur.

End the practice of leasing to companies that are self-bonded. While allowed in some states, the financial woes of the coal industry make the practice of self-bonding extremely risky and greatly increase the likelihood that the public will be left holding substantial mine clean-up costs. It is critical that the public not be left responsible for these costs. As such, BLM should not allow leases for companies that are not adequately bonded by a third party surety, even if relevant states allow for such bonding. However, it is important that bonding reforms that can be made now to better protect the public from the liabilities of failed reclamation move forward now and not wait for or depend upon the PEIS or reform process.

The Office of Surface Mining, Reclamation, and Enforcement estimates that there is more than \$3.6 billion in outstanding self-bonded reclamation liability in the United States.

Our concern is that U.S. taxpayers will be left with the bill for restoring public lands and waters damaged by mining. Updates to the federal coal leasing program should provide certainty that the private corporations that profited from public coal will repair damages to public lands and waters, and that the burden would not be shifted to taxpayers. The DOI's Inspector General should conduct an audit of the self-bonding program and its use to ensure companies have adequate funds or assets to cover the full cost of reclaiming lands and waters after mining. In doing so, the DOI should also seek independent review of bond amounts by hiring a consultant familiar with mine reclamation costs. This review is especially important for bonds held by the federal government for federal lands and minerals.

Comment Excerpt Text:

Many coal companies "self-bond" to meet reclamation bonding requirements, meaning the company's reclamation commitment is backed only by the company's name and overall financial health, not by sureties or specific pledges of collateral. While it is technically allowed under federal and some state laws, self-bonding is an option, not a requirement. With declining coal company revenues and increasingly decreasing demand for coal, self-bonding practices are becoming more and more risky for State and Federal governments, and concerns will only grow. See, e.g., *Can Coal Companies Afford To Cleanup Coal Country?*, Washington Post, Apr. 1, 2016 (discussing concerns). Across the nation, \$3.5 billion in reclamation liabilities are covered only by self-bonds. Thus, as noted in the Scoping Notice, in recent years some companies mining federal coal resources have sought to shed their reclamation obligations in bankruptcy proceedings. See, e.g., *In re Alpha Natural Resources, Inc.*, No. 15-33896 (KRH) United States Bankruptcy Court, Eastern District of Virginia, Richmond Division (Aug. 3, 2015).

The PEIS should disclose the amount of reclamation liability for federal coal leases that are covered only by self-bonds, disclose the status of those bonds and the financial health of the companies, and disclose any reasonably foreseeable impacts and risks associated with self-bonding practices. This analysis is necessary for all lands overlying leased federal coal, regardless of ownership status, but it is especially important for federal public lands, as self-bonding presents additional risks to the Federal government as the owner and manager of those lands.

Comment Excerpt Text:

While BLM regulations require that operators be adequately bonded to fund eventual reclamation activities, see 43 C.F.R. Part 3474, as noted, BLM does not independently evaluate the sufficiency of bonding and leaves such analysis for post-leasing permitting from state environmental agencies and OSMRE.

While determination of the amount and type of reclamation bonding may ultimately come from another agency, as part of its leasing decision, BLM should consider the current bonding status of a mine. As discussed above, one of the bonding methods often allowed is “self-bonding,” which poses the risk of making taxpayers subsidize reclamation obligations should a company financially fail. See, e.g., Patrick Rucker, Arch Coal asks U.S. Bankruptcy Court To Ease Its Cleanup, Reuters, Jan 11, 2016 (reporting that the company asked the Judge to set aside 75 million for cleanup that is estimated to cost more than \$450 million).

To address this concern, under this alternative BLM should consider no longer awarding leases to any company that is self-bonded, regardless of the current financial condition of the company. BLM has this discretion – irrespective of federal and state reclamation bonding requirements – to ensure leasing is in the public interest.

BLM should also consider raising its own bond amounts, to insure adequate coverage of bonus bids, royalties, and other payments. This is especially important given the risk of frequently idled mines and current trends of mines laying off workers and decreasing production. In today’s market conditions, no mine is “too big to fail” and BLM must insure protection of taxpayers.

Comment Excerpt Text:

Requiring bond release for previously mined lands

Under this alternative BLM would consider management options for new leases – or modification or renewal of existing leases – that incorporate bond release requirements. For example, BLM might require that a company may not obtain a new or modified lease until at least 50% of its current leased acreage has been released from bond. BLM might also not permit additional leasing for mines where reclamation has not been completed after waiting for the required 10 year period, meaning reclamation at that site cannot be demonstrated. Undermined Promise II at 42. These requirements should be accompanied with measurable and enforceable objectives to ensure contemporaneous reclamation standards are met.

While reclamation of mining operations is regulated by OSMRE under SMCRA, BLM can also play a role in helping to meet SMCRA’s commitment to ensure coal mines are reclaimed in a complete and timely fashion that

restores disturbed land, water and habitat features to their pre-mining integrity and productivity. This is especially important in the context of acreage of federal surface lands, including National Grasslands, occupied by mines, as BLM has a regulatory obligation to meet a “multiple use” mandate for federal lands and prevent “undue and unnecessary degradation of the lands.” 43 U.S.C. §§ 1701(a)(7), 1732(b).

Comment Excerpt Text:

In recent years, coal companies have qualified for self-bonding in ways that were not anticipated by the original self-bonding rules promulgated in 1983, 18 by the Office of Surface Mining Reclamation and Enforcement (OSMRE), the regulatory authority created by SMCRA. Specifically, large coal companies have used the financial statements of subsidiaries to prove they have the assets available to cover reclamation costs.¹⁹ The practice evolved from a provision in the original rule that allowed operators to post self-bonds using the financial statements of their parent companies. The idea was that a parent company’s financials would support any reclamation liabilities if a producer abandoned a mine. But the same analysis cannot be applied to subsidiaries. (18) 30 C.F.R 700-999

Comment Excerpt Text:

SMCRA’s self-bonding option has proven inadequate to protect taxpayers for three reasons:

1. When a reclamation liability is bonded – whether by surety, collateral bond or self-bond -- Generally Accepted Accounting Principles allow the related liability to be carried “off balance sheet.” The reclamation liability is not shown on the balance sheet and does not increase total liabilities and the debt-to-equity ratio of the company. As a result, the company appears financially stronger than if these reclamation liabilities were carried on the balance sheet. Off-balance sheet accounting is not a great concern when an independent surety company has analyzed the permittee’s ability to pay and put its own assets at risk or when the permittee has pledged specific, identifiable assets to secure its performance. In both cases, the liability can be satisfied even if other assets carried on the balance sheet become unavailable. When a self-bond is used, the permittee avoids recording a balance sheet liability simply by making a self-serving promise and nothing more. In effect, the permittee distorts the reporting of its financial position by eliminating a liability without affecting the asset side of its balance sheet or shifting potential liability to an unrelated third party.

2. The value on which regulators rely when companies self-bond is always subject to the volatility of the coal market. The circumstances most likely to lead to an inability of the permittee to pay reclamation cost – a drop in the value of mining properties and assets and a drop in profitability – generally render a self-bond inadequate. In addition, current regulatory requirements depend on financial statements to assess the financial health of companies. The assets are not market-to-market, which means that the balance sheet may reflect value that does not exist under prevailing market conditions.

3. Regulators, in theory, can require surety or collateral when a company’s financial performance deteriorates. But that remedy often is not practical because the company’s ability to secure third-party surety

bonds or letters of credit evaporates rapidly. Similarly, liquid assets that might be pledged as collateral can be exhausted as the company experiences negative cash flow. Moreover, the value of illiquid mining assets (the mineral properties and mining equipment) also declines. In effect, in a coal market collapse, regulators depending on self-bonding will be unable to force a substitution of third-party guarantees or rely on company-owned assets to meet the liability. Taxpayers are left to pay for the reclamation costs.

Finally, in the event of a bankruptcy, there is no requirement that a company's promise to pay for reclamation costs through a self-bond will get any higher priority than other creditor claims. Frequently, the same assets used to signify the health of a subsidiary for self-bonding purposes are also posted as collateral to cover debt carried by its parent company. They are, in a sense, "double-pledged." The difference between the pledges, however, is that the parent company's creditors have claim to the assets in a bankruptcy while the regulatory agency does not.

Comment Excerpt Text:

One issue that has become increasingly significant relative to bonding is the question of "self-bonding." While this issue apparently applies to the OSMRE reclamation bonds, particularly as administered by the states, the BLM should consider this bonding issue in the PEIS. Self-bonding allows companies to avoid posting sureties as bonds and to instead rely on their company's paper net worth to provide assurance of reclamation capabilities. But this has become increasingly problematic as the average share value for publicly traded coal companies has plummeted more than 80 percent in the past two years (4) and as more than half the nation's production capacity is now in bankruptcy proceedings (5), leaving significant question as to whether self-bonded companies will have the capability to meet their reclamation obligations leaving taxpayers exposed to significant financial liability. This must not be allowed to happen. A promise to pay should not be allowed to substitute for a bond. Self-bonds are reported to now cover about \$3.75 billion in reclamation obligations in nine states.

(4) Based on performance of Dow Jones U.S. Coal Index as of July 28, 2016, available at <https://www.google.com/finance?cid=4931635>.

(5) Kuykendall, Taylor and Ashleigh Cotting. "Companies recently filing bankruptcy produce more than 2/3 of PRB Coal." SNL <https://www.snl.com/InteractiveX/Article.aspx?cdid=A-36118340-12086>.

This is a highly risky approach to ensuring reclamation obligations are met and it should not be allowed to continue. Under BLM's bonding regulations the BLM is allowed to set bonding levels sufficient to "assure that the lease bond covers reclamation within a permit area" where the OSMRE tells the BLM that reclamation costs need to be covered because of the lack of a state program. 43 C.F.R. § 3474.3(b)(1). Given the failure of self-bonding, the BLM should strongly consider modifying this regulation to allow it to put in place reclamation bonds where self-bonding has previously been used to guarantee reclamation. The BLM should fully consider in the PEIS whether self-bonding should be permitted on federal lands, and in our view it should not be permitted. The PEIS should provide that the BLM will not lease to self-bonded companies, and if rulemaking is needed to implement this decision it should be initiated. This is the best way to ensure federal lands are reclaimed, as required by SMCRA.

Recommendations: The BLM should carefully consider needed bonding levels in the PEIS, both bonds to ensure compliance with lease terms and conditions, and bonding to ensure reclamation. If needed, bonding amounts should be increased. Assuring environmental protection objectives are achieved and that the companies faithfully meet their lease obligations should be guiding themes. The BLM should put in place a prohibition on the use of self-bonding to meet reclamation bonding requirements on the federal mineral estate.

Comment Excerpt Text:

While the Notice only discusses the issue of self-bonding in terms of concerns raised by stakeholders (81 FR 17724), and does not specifically identify proposed approaches or modifications to self-bonding, CMA believes it is inappropriate to consider the issue of self-bonding under the PEIS due to the recent proposed rule, by the Office of Surface Mining Reclamation and Enforcement (hereinafter OSMRE).

The current economic challenges facing some companies have led to the speculative conclusion that companies will not reclaim their operations in the face of financial difficulties, an assumption that is not borne out by the facts. In fact, as our comments on the OSM Stream Protection Rule demonstrate, mining operations in the West continue to reclaim lands in accordance with statute and have an outstanding record in avoiding off site impacts. Even companies seeking the protection of the bankruptcy laws have continued to mine and reclaim in accordance with the laws. Moreover, only companies that meet the stringent criteria for self-bonding may qualify.

CMA contends that changes to the reclamation bonding program conflict with the statutory language of SMCRA that specifically provided for self-bonding, and gives States primacy over reclamation bonding. As such, States are responsible for ensuring adequate financial assurances cover reclamation costs. To that end, States are highly invested in adequate implementation of a self-bonding program. BLM should not interfere with the States' ability to regulate coal resources or to apply their discretionary authority over the bonding of such operations.

Comment Number: 0002488_Sanderson_20160728-23

Comment Excerpt Text:

SMCRA authorizes several methods for ensuring reclamation through bonding. SMCRA section 509(c) specifically provides for self-bonding:

“The regulatory authority may accept the bond of the applicant itself without separate surety when the applicant demonstrates to the satisfaction of the regulatory authority the existence of a suitable agent to receive service of process and a history of financial solvency and continuous operation sufficient for authorization to self-insure or bond such amount or in lieu of the establishment of a bonding program, as set forth in this section, the Secretary may approve as part of a State or Federal program an alternative system that will achieve the objectives and purposes of the bonding program pursuant to this section.”

Any changes to self-bonding must be in compliance SMCRA. Because SMCRA expressly provides for self-bonding, it is outside BLM, and DOI's authority to eliminate or even revise self-bonding as it would take an act of Congress to amend the explicit self-bonding provisions under SMCRA.

Further, the issue of self-bonding is already being considered by OSMRE under the proposed rule issued in May of 2016 (See 81 FR 31880). As such, revisiting the issue of self-bonding under the PEIS is again duplicative, unless the analysis is limited to cumulative effects to the Coal Program.

Comment Excerpt Text:

The leasing moratorium as proposed will adversely impact the bonding of reclamation liability. Surety company third party bond instruments and banking institution letters of credit are largely dependent on a company's ability to produce product and secure revenue. Capital requirements for surety bonds or letters of credit are ranging from 22% to 50% of the face value of the bond instrument in the present marketplace for a company with a life of mine greater than 10 years.

The moratorium as proposed will have a negative impact on these types of financial instruments and the ability for an operator to obtain them. When a company's reserves are limited (<10 years), the ability of the company to generate revenue is also compromised. The ability to secure reasonable and affordable financial assurance instruments will become increasingly difficult.

Commenter I: James Tyson
Comment Excerpt Text:
Self-bonding has allowed some of the country's largest coal companies to avoid putting aside cash, bonds, or

other securities to cover future mine cleanup costs. Instead, self-bonding allows the company to use its own assets as collateral. Being that 26 coal companies have declared bankruptcy over the past few years, and over half of Colorado coal companies are self-bonded. This presents major concerns when considering the future of the lands on which they operate and the communities supported by their jobs.

Organization I: Arch Coal

Commenter I: Keith Williams

Comment Excerpt Text:

The Mineral Leasing Act is subtitled an act to promote the mining of coal and requires the department to achieve the maximum economic recovery of coal on federal lands. As you know, the single biggest source of federal coal is the Powder River Basin in Wyoming where Thunder Basin's mines are located. The PRB royalties, taxes, and fees approach 40 percent of the selling price of the product. Few industries anywhere generate such a high percentage of value. It's hard to see how anyone could argue that 40 percent is not an exceptional return for the American public, and arguments to the contrary are disingenuous

Comment Number: 00000108_Opfer_ 20160517-2

Comment Excerpt Text:

But increasing the royalty rate definitely will affect the revenues available to federal and state governments and consequently their capacity to deal with the coal industry's economic and environmental legacies, including the need for unemployment benefits, job retraining, and economic diversification. "Once again, I would like to call your attention to a study called 'Mineral Tax Incentives, Mineral Production and the Wyoming Economy' by Shelby Gerking, William Morgan, and Mitch Kunce dated December 2000, University of Wyoming. "This study as well as subsequent work by some of the same authors considers the interrelationships between coal producers, railroads, and the electric utilities. Although the study is approaching 20 years old, its conclusions regarding the market power of railroads, the goal of facility regulation and the negligible effect of taxes is still relevant when considering coal valuation, royalty rates, and lease rates. "The interrelationships between coal mining,

transportation and utility regulation mean that lower mining costs don't necessarily translate into cheaper power costs for the ultimate consumer

Comment Number: 00000112_Lundvall_20160517-1

Rates paid on federal coal leases are extensive. Over the last ten years, coal companies in the state have paid in excess of \$3 billion in funds that directly impact schools with \$2 billion of that coming from lease bonus payments.

Comment Number: 00000115_Chafee_20160517-1

Organization I: Jack's Truck & Equipment

Commenter I: Richard Chafee

Comment Excerpt Text:

It's my understanding that the taxes being paid by the mine companies to mine and sell coal add up to a rate of 39 percent. That leaves the remaining 61 percent to be used to cover business expenses, which would hopefully be under that amount. If so, there would be a profit to the company for doing the mining which would be subjected to another 39 percent income tax. Then all the mining employees who are paid income out of the company expenses would also pay their respective income taxes, their Social Security tax, and their Medicare tax. Additionally, if you consider the sales tax that's paid on goods purchased by the mines' employees and the fuel taxes paid on the fuel they purchase, it makes a person wonder how much of every dollar actually does not end up being a tax. As a U.S. citizen, I do not think this is fair. I think we the people are being grossly overtaxed and so are these mines.

Comment Excerpt Text:

The report, looking at coal royalty payments across the United States on federally leased lands from 2008 to 2012, suggests that the Federal Government is not receiving a fair return for taxpayers. They calculated the average, current effective rate of royalty payments of 4.9 percent, but that's without bonus payments. This is short of the statutory 12.3 percent and lower than the effective rates paid by oil and natural gas. As we look at how to structure or restructure these payments in a time of great change, I think it's unfortunate that we're sending inaccurate price signals to the market, even though it's been very disruptive for the lives of many of the people and the families sitting behind me. It's not good for us or for anyone to be sending false signals and encouraging things that are not being appropriately paid for. The estimate of this report estimates that taxpayers lost \$850 million in royalty payments between 2008 and 2012. There are several things we could do. We could do the valuation at the point of sale rather than the mine. We could reduce the amount of deduction for transportation. Research they've done suggested that money they might -- small amounts of money that might be used could be made up for and federal taxes back -- Utah, they estimate, would be -- in state taxes would gain over \$920,000. And the effects on coal production would be minimal, 0 to 1 percent.

Winter is shorter, warmer, we're receiving less snowfall. And it's having a real impact on skiers like me and our communities here depend on our winter sports economy. The outdoor recreation industry in Utah alone generates 12 billion annually and supports 122,000 jobs, which is one in every ten jobs. So our public lands are really important to us. And I'm speaking at this hearing to ask that the coal industry pays the fair market rate for these lands and not at a discounted rate as it currently can.

Comment Number: 00000347 _ Johnson _ 20160519-1

Organization I:Alton Coal Development

Commenter I:Larry Johnson

Comment Excerpt Text:

Two contentions are brought forward by the secretary for raising royalty rates. One, these rates do not compensate the public for the removal of coal and externalities associated with its use. And, two, the federal coal sales representing nearly 41 percent of the total domestic production artificially lowers market prices, further reducing the amount of royalties received. On the contrary, this is significant evidence that the current royalty rates do provide a return on American public, around \$1.2 billion in 2012 alone. And reports from the Inspector General's office and government accounting office investigating the Federal Coal Program do not propose an increase in America.

Comment Excerpt Text:

I wanted to hit on one particular issue, the comment in order No. 3338 that notes that about 90 percent of federal coal lease sales receive only one bid and that's typically from the operator of a mine adjacent to the new lease given to a large investment required to open a new mine. Commenters have questioned whether an accurate fair market value can be identified in the absence of a truly competitive marketplace. I will say that based on economics, the owner of the adjacent mine will always have an advantage over other bidders. This is due to the investment the operator has made in infrastructure and equipment that can be used to produce the efficient coal. His cost will be lower than the other bidder because of this investment. Other bidders will need to include this capital, which is hundreds of millions of dollars in their cost, and will need a return on that capital, which will reduce the amount they can afford to pay for the lease. To ensure that the adjacent operator does not take advantage of the Federal Government, the BLM handbook has a special set of valuation rules to determine the minimum bid for these situations. The BLM sets the minimum value in these situations by calculating the value of the mine without the adjacent lease and the value of the mine with the adjacent lease. And the difference between these two values is set as the minimum. This has the effect of transferring all of the profit above the 10 percent discount rate to the Federal Government.

The BLM should be working to maximize the return to the public rather than giving what is essentially a subsidy to the coal industry, even though it could be used to help the communities affected most by the decline in the coal mining industry

Comment Number: 0000073_Reavey_20160517-2

Organization I:

Commenter I: Richard Reavey

Comment Excerpt Text:

Furthermore, with federal coal selling at historic lows, miners being forced out of their jobs, coal producers in bankruptcy, and PRB coal delivering 40 percent of the selling price in taxes, fees, and royalties, there is no economic justification for an increase in royalty or leasing rates. Instead Secretary Jewell has repeatedly stated that royalty and leasing rates should reflect the administration's climate objectives. If so, she should seek amendment of the Mineral Leasing Act in Congress because Congress has the authority to impose new taxes, not the Secretary. There's no economic justification for royalty and leasing rate increases. So any attempt to impose new increases on the basis of the administration's climate objectives is a social cost, a carbon tax, a climate tax, or whatever else she would like to call it, is illegal. Attempting to keep it in the ground by imposing taxes and fees that discourage the maximum economic recovery of coal is illegal.

Comment Number: 0000074_Alexander_TaxpyrComnSense_20160517-2

Organization I: Taxpayers For Common Sense

Commenter I: Ryan Alexander

Comment Excerpt Text:

Interior also undervalues federal coal when it is sold. The coal companies often sell coal to assist (unintelligible) and then turns around and sells it for a much higher price. Interior collects royalties on the lower price. According to the Energy Information Administration, these captive sales accounted for more than 30 percent of coal sales in Wyoming and Montana in 2013.

They should be asking for economically and environmentally safe ways to obtaining maximum coal extraction rates which would in turn provide an increased return of revenue while protecting the environment. If the BLM and other government agencies believe that increasing royalties causing coal to stay in the ground will benefit the environment, they are honestly mistaken. The cost of reducing emissions are enormous.

BLM also has a responsibility to obtain the best price possible for the coal belonging to the public. It will need to look beyond the various flimsy corporate veils until it finds the first arm's length transaction between the mine operator and the coal buyer. When the coal was being set up for leasing here in the Bulls, the mine president came to the hearing and handed over an armload of financial records to BLM. I wondered which set of books they were. The justification for the lease price was kept totally secret, as were the means by which BLM determined if the price was adequate. Somehow, that did not seem like the way for the public's business to be conducted.

Commenter I:G Doddings

Comment Excerpt Text:

Fair Return - In evaluating "fair return" the analysis must consider all components of return and economic benefits from leasing and production of the resource including bonus bid payments, rents, royalties, AML feed, Black-lung taxes, state and local property taxes, sales taxes, employment taxes, local/regional/state/national benefits of low-cost reliable power from coal for businesses and utility rate-payers. Advocates of increasing coal royalties point to the Headwaters Economics Report as support for their contentions, however, information compiled from the Energy Information Administration (EIA) by Senator Ron Wyden (D-Oregon) indicates that coal operators have paid much higher royalties (does not take into account bonus bid and rental payments) than indicated by the Headwaters work. It must be noted that BLM policy includes setting "fair market value" for proposed lease sales.

Comment Number: 0000749_Doddings_20160623-2

Organization I:

Commenter I:G Doddings

Comment Excerpt Text:

Market Conditions - Excessive regulation, discriminatory government policies, artificially low natural gas prices resulting from over-supply, and export barriers have resulted in very weak coal markets. Decreases in coal production, extensive layoffs, coal company bankruptcies, and significant adverse economic and social impacts on affected communities and regions have been the direct consequence of these conditions. These are very real and immediate impacts which must be considered in any objective analysis. The current coal program includes provisions (royalty rate reduction) which can be used to reflect and adjust for adverse geologic, mining, and other conditions. The potential exists to also include market conditions as an adjustment factor.

Comment Excerpt Text:

The current effective tax rate on each ton of federal coal mined is 39% of gross, including royalties, bonus bids, AML tax and black lung tax. In a time when we've seen nearly all of the publicly traded coal companies file for bankruptcy in the face of an onslaught of onerous environmental litigation and regulation from the federal bureaucratic leviathan, which has driven up costs and driven down demand for coal, it is absolutely deceitful for the Interior Department to suggest that coal companies are not paying enough, or that the taxpayers are not receiving a return on their resources. Even without the nearly 40% tax rate, the affordable energy that the poorest among us enjoys is a tremendous benefit to our local, state and national economy. I would suggest that along with the impacts of burning coal on the environment, the positive cumulative impacts for all who utilize electricity for work and leisure be analyzed. Affordable energy is the backbone of our economy, but our current president, does not seem concerned about the citizens of this nation.

Comment Excerpt Text:

The first, the low royalty rate and minimum bid for surface mine coal as well as the lack of competition during the bidding process. The way that the Department of the Interior determines the value of federal coal and the mine, rather than at the point of end use, which shortchanges taxpayers and effectively subsidizes coal production

Comment Number: 0001106_CORNELISON_20160621-1

Organization I:City of Hood River, OR

Commenter I:Peter Cornelison

Other Sections: 11

Comment Excerpt Text:

The City of Hood River urges the Department of Interior to do three things: Update the coal royalty rate for fossil fuels extracted on public lands; number two, help diversify those rural economies and create new jobs and investments where the coal miners will be displaced; and number three, tighten the bonding requirements for coal. As we've heard, there's huge scars on the land. We're not sure the coal companies have the wherewithal financially to recover that. That needs to be inspected.

Comment Number: 0001111_VON FLATERN_WY state senate_20160621-1

Organization I:Wyoming State Senate

Commenter I:Michael Von Flatern

Comment Excerpt Text:

The Federal Coal Program provides revenues to federal and state governments totalling \$13.8 billion since 2003. So for an example, the Powder River Basin in Wyoming, which produces over 80 percent of the coal reserves on federal lands, local governments and the federal government receive almost 40 cents on every dollar, 12 and a half percent royalty to the federal government, that's 12 and a half percent. That's not 12 and a half cents on a ton.

So the current price is approximately \$11 for a ton of coal. So you take the \$11 and you look at the 40 -- almost 40 percent, and you get \$4.28 of every ton of coal that they produce goes to the government, either the local government or the federal government. The federal government is getting 12 and a half percent or roughly \$1.75 or \$1.50 of that ton, not 12 and a half cents a ton. 12 and a half percent.

Comment Number: 0001115-1

Organization I:Wyoming Infrastructure Authority

Commenter I:Jason Begger

Comment Excerpt Text:

So I'm going to talk specifically about all the taxes that are paid on a ton of coal. You've got the 12 percent federal royalty, you have 7 percent Wyoming state severance tax, the LBA payments, which somebody said earlier was 12 cents. Well, if you look at the BLM website, they were 1.35 for the Belle Ayr lease a couple years ago, which is ten times the 12 cents that was stated, but at current spot prices last week it was at \$8.80 per ton. That was about a 15 percent tax for the OBA. You got 4.4 percent gross proceeds tax, you got 28 cents per ton abandoned lineman -- abandoned mine lands funds, you also have your property taxes on your equipment,

buildings, facilities, property taxes on production, sales tax on all the equipment and materials, and you know, a 6 percent sales tax on a \$3 million haul truck is a significant amount of sales tax. Altogether coal pays an effective tax rate of over 40 percent. To put that in perspective, when we filed our taxes, look at our own individual effective tax rates, usually it's about 15 percent. So the coal industry pays two and a half to three times more taxes than individuals do. I think that's a pretty good rate of return for the government and taxpayers as a whole throughout all those.

Comment Number: 0001117_LANDEN_WY state senate_20160621-1

Organization I: Wyoming State Senate

Commenter I: Bill Landen

Comment Excerpt Text:

We have chosen to invest those funds in our future, specifically the future of our kids. Payments -- coal lease bonus payments and all the subsequent tax revenues generated by the coal program are used almost exclusively in my state to help us fund the K through 12 education system. Over the past 15 years Wyoming has invested more than \$3.5 billion in school facilities. As chairman of our school facilities committee, I am proud to say that coal lease bonuses have paid for more than 70 new schools across our state and have assisted in modernizing an additional 35 while maintaining the rest. More than \$815 million in coal lease money has been spent on major maintenance alone over that same time period. Beyond those lease payments the coal industry provides mineral royalty payments and severance and ad valorem taxes, much of which goes to pay the teachers in the operation of those schools. Roughly 16 percent of our K through 12 funding in Wyoming can be attributed to tax revenue derived from the coal program. And of course, the industry provides jobs for moms and dads of the kids who are in those schools. Not just jobs in the mines, but in all the support industries throughout the four-state region. I'm not certain how the federal government spends the revenue derived from coal, but I do know that in Wyoming we have used that money to invest in our future. The school facilities we put on the ground will last for generations to come. I would argue today that we are receiving a fair return for this resource as evidenced by the state of Wyoming. We hope you will reinstate the leasing program

Comment Number: 0001121-1

Commenter I: Larry Gussin

Comment Excerpt Text:

So the issue for Americans is less fair return on coal and much more developing policies that enhance, not block, U.S. opportunity. Making coal pay its way levels the playing field for energy IT, for solar, even for nuclear. Doing the opposite by continuing to subsidize coal leases will help send this opportunity to other countries.

Comment Number: 0001129-1

Organization I: Institute for Energy Economics and Financial Analysis

Commenter I: Tom Sanzillo

Other Sections: 2 8.9

Comment Excerpt Text:

Our proposal for how this program would work is outlined in detail below and contains the following major elements:

- Planning for new coal offerings set by DOI based on accurate analysis of coal reserves and demand.
 - Financing for the coal industry provided by a combination of private sector borrowing, and public sector asset transfers of coal, revenue and market guarantees, and regulatory streamlining.
 - Coal prices set by a committee made by a federal-state coal price Commission, with a pricing structure that takes into account the need to maintain affordable and reliable electricity and to adjust to changing market conditions.
 - Eliminating the self-bonding system for coal mine reclamation, replacing it with a program in which coal producers and the federal government share responsibility for clean-up and in which royalty payments are set aside to cover liabilities (and to provide for pensions for coal miners).
 - Regular bi-annual external audits of the program by the inspector generals of the Department of Energy and the Department of the Interior.
-

Organization I: Institute for Energy Economics and Financial Analysis

Commenter I: Tom Sanzillo

Comment Excerpt Text:

The “fair market value” design used by the federal government has run its course. And although the type of public-private partnership we recommend here may be controversial, the federal coal lease program is clearly in need of a new paradigm. Proponents and opponents of the public-private model, as well as neutral third parties (16) all agree that sound planning, a skilled public sector negotiating team, good financial advice and openness will be critical elements of success.

Comment Number: 0002145_Buchanan_20160513_IEEFA-24

Organization I: Institute for Energy Economics and Financial Analysis

Commenter I: Tom Sanzillo

Comment Excerpt Text:

The program design in place to insure that taxpayers received a fair market value of federal coal on federal land has been weak decades. The program assumed that private sector competition would create a fair price. However, there has been no competition. The program had no oversight for 30 years. Recent reviews found that U.S. taxpayers have lost millions, if not billions, of dollars as a result of low valuations for the leases.

Comment Number: 0002145_Buchanan_20160513_IEEFA-25

Organization I: Institute for Energy Economics and Financial Analysis

Commenter I: Tom Sanzillo

Comment Excerpt Text:

The current fair market value system places control of the mine selection, timing, extraction process, distribution, sales and price in the hands of coal producers rather than in the hands of the federal owners of the land.

Comment Number: 0002145_Buchanan_20160513_IEEFA-26

Organization I: Institute for Energy Economics and Financial Analysis

Commenter I: Tom Sanzillo

Comment Excerpt Text:

Despite the substantial findings of the weaknesses in this fair market value process, the coal industry has adopted a position that there are no problems. The PEIS also accurately describes the current state of the nation's coal market and the PRB's role in it. Looking ahead, there will be a declining demand for coal for America's domestic electricity needs. The PRB will nevertheless play an important role in coal production as part of an uncertain, new norm for coal use in the U.S.

Comment Number: 0002145_Buchanan_20160513_IEEFA-29

Organization I: Institute for Energy Economics and Financial Analysis

Commenter I: Tom Sanzillo

Comment Excerpt Text:

When the current fair market leasing program was first envisioned, policy-makers may have had an honest aspiration that the system would foster a competitive coal market in the West. Public officials essentially turned over the program to the coal industry as a way to address many of the perceived and real complications of more regulated decision-making.

It is time to abandon the pretense that the rules of the fair market lease program are designed to create a fair market return for the taxpayer. Program implementation over the last 30-plus years has resulted in a steady supply of low cost coal provided by relatively healthy coal companies. But the situation has now changed dramatically and the objectives of the program are no longer being achieved.

Comment Excerpt Text:

Phase Out the Fair Market Leasing Program

Although the fair market value program was supposed to encourage competition, in fact quite the opposite has occurred. (8) In fact, leases under the BLM's program typically have only one bidder. This lack of competitive bidding is evidence that the federal government may not be receiving a fair market value for its coal. In addition,

the fair market equivalent pricing used by BLM is suspect because the price-setting mechanism was not independently reviewed for 30 years. The lack of internal controls is pervasive. When external reviews have finally taken place over the last few years, BLM has adopted a position of “evasive cooperation,” that is, avoiding transparency while appearing to cooperate. The DOI Inspector General concluded in 2013 that the Secretary of the Interior had such limited control over the operations that it was unlikely that needed reforms could be implemented.

Ken Gillingham discussed coal mined from federal lands and the royalties charged for that extraction. He noted that 42% of thermal coal sold in the U.S. is “federal coal” and that such coal had out-competed other sources on price for decades. Gillingham then explained several of the reasons that the Department of Interior is reviewing its coal leasing program and planning to issue a programmatic environmental impact statement to update that program: royalties charged for coal are 1/6th its market price and many times below the Social Cost of Carbon (in contrast to other fossil fuels, for which royalties are closer to what charging the SCC would yield); 90% of auctions have a single bidder because they are generally for continuations rather than new leases; and most bids for those leases are near the (confidential) minimum bid. Gillingham then noted that charging royalties equal to the SCC would effectively keep federal coal in the ground and suggested that charging 20% of the SCC—because royalties are split with states—could provide a revenue stream for programs that ease the pain of a transition away from coal.

Organization I: Energy Policy Network

Commenter I: Kelly Mader

Comment Excerpt Text:

If the BLM looks to climate change considerations as a basis for determining that taxpayers are not receiving fair market value from the sale of coal, it ignores the regulation of coal combustion as stationary sources under the Clean Air Act. This approach – if taken by the BLM - serves to subject coal as a resource to (1) ever increasing financial requirements upon extraction and (2) ever more stringent air quality regulation upon combustion. The ultimate result is the elimination of coal from the resource mix altogether. No other resource faces the combination of regulatory burdens upon both extraction and combustion in the way that coal does, and thus coal cannot economically compete in resource planning processes or in the organized electricity markets.

Comment Excerpt Text:

It would seem that the coal industry is already paying more than their fair share of taxes at 39%, no other industry pays this high of a rate. Matter of fact wind and solar are subsidized by the government, how many years have we been subsidizing solar and it still can't reliably provide our electricity. I have to feel that this moratorium is nothing but another way to stop coal production by closed minded people that fail to see the good things that are being done and realizing that there are good people that will be destroyed if the naive "Leave it in the ground" mentality wins. The taxes from coal supports our schools, roads and communities.

Comment Number: 0002173_Quick_20160622-1

Commenter I: Kendra Quick

Comment Excerpt Text:

There have been some comments that "Taxpayers are not receiving a fair return from the leasing of federal coal". This statement is far from the truth. Rates paid on federal coal are excessive and further increasing taxes and royalties will reduce investment, lower government (federal and state) revenues, and will result in a decreased return on investment for taxpayers.

Comment Number: 0002173_Quick_20160622-2

Commenter I: Kendra Quick

Comment Excerpt Text:

The Federal coal program provides revenues to federal and state governments, totaling \$13.8 billion since 2003. An example of this is in the Powder River Basin (PRB) of Wyoming wherein the BLM controls over 80% of the coal reserves on federal lands. In the PRB the government receives almost \$0.40 on every dollar of coal sold. This represents a tax of approximately 40%.

Comment Number: 0002173_Quick_20160622-5

Commenter I: Kendra Quick

Comment Excerpt Text:

If the Federal government is interested in maximizing the return on investment for taxpayers, it would incentivize development of federal coal by reducing royalties and other fees, improve the permitting processes to be more efficient and base the bonus bid on the amount of coal that is actually recoverable.

Comment Number: 0002173_Quick_20160622-6

Commenter I: Kendra Quick

Comment Excerpt Text:

We have heard many comments that the 12.5% royalty on coal mined is not high enough. Federal coal lessees effectively pay a considerably higher royalty rate than paid on state or private lands because coal companies are required to pay bonus bids. The paying of bonus bids rarely occurs for private coal. When you combine the majority of bonus bids with the royalty rate, the effective rate is 22%.

Comment Excerpt Text:

It's long overdue that the coal leasing system represents the public interest rather than those of the coal companies. Lease prices need to reflect the actual value of the coal and must include the environmental costs of extracting and burning it. The huge subsidies the BLM has been providing coal companies have produced untold permanent environmental damage and padded the obscene compensation of coal company executives at the expense of taxpayers.

Comment Excerpt Text:

Coal mining on public lands is threatening clean air and water, endangering wilderness areas and putting our climate at risk. The lease system fails to look at the many threats coal mining poses. Right now, we're allowing coal companies to mine on our public lands for pennies on the dollar. It's beyond justification to think that coal companies are allowed access to the land that's set aside for you and me – to destroy the land and the surrounding ecosystem, for profit, only to pay a fraction of market value back to the public for it.

Commenter I: Allen Holubec

Comment Excerpt Text:

Royalty Rate Reduction (RRR) –

a. Export coal

i. This is the main direction of coal sold. Not to a holding company elsewhere in the U.S. but where the coal is actually used.

I. Montana coal is sold to a holding company in Ohio; the coal is put on a train in Montana to a port on the west coast for further resale to China.

ii. A Company is not eligible for the RRR if they export more than 25% coal sales yearly

b. Not available if you are or have been habitually late in reporting and paying royalties

c. Not available to companies that have not met present or past reclamation requirements whether private or federal leases

d. Use mainly to allow for Bypass Situations (category 1) and Area Wide (category 5)

i. Allow limited - Extension of Mine Life (category 2) use only in dire emergencies and this goes away year by year until they are at the original rate (max 5 years)

ii. Remove - Financial Test, Unsuccessful Operations (category 3) not because they have acidic water which causes them to use Stainless steel fittings, which has been successfully used to get a royalty deduction.

iii. Remove - Financial Test, Unsuccessful Operations (category 4) maybe they should not be mining

6. Royalties -

- a. How can the royalty rates be equal to offshore Oil & Gas royalty rates, you are comparing apples to oranges (Oil & Gas to Coal)
- b. Raising the rates will shut down mines
 - i. Basic economics - cost jobs and hurt communities
 - c. Royalties charged only when leaving the company as a whole.
 - i. Require the mine to supply a company Table of Organization that shows all relationships between the mine, the parent company and any subsidiary/sister companies. If coal is sold to a sister company within the parent company, that coal must have royalties based upon coal sold outside of the parent company as a whole.
 1. Montana coal is sold to a holding company in Ohio; the coal is put on a train in Montana to a port on the west coast for further resale to China.
 2. This is the oldest game in the book.
 3. A company owns a mine under a separate name / holding company. This mine only sells the coal to a subsidiary of the parent company and pays the royalties on the coal sold. This other company then sells the coal to outside buyers at a higher (normal price) and then saves the difference in royalty payments.
 4. This is happening all over.
 - a. I have personal experience of this, As a Plant Engineer at a private company, we sent out request for bids for coal to burn. One company sent the bid back saying they don't do outside sales. The company only sells to a holding company which handles all coal sales, which is the only company willing to purchase this coal. This holding company pays rock bottom prices for the coal and then resells the coal again overseas for a substantial gain in profits. This Holding company is owned by the same parent company that owns the mine. The company I worked for was offering prices higher than what the holding company was paying the mine for the coal.
 - b. Secondly, the same mine, since they could only sell the coal at or near a loss, they applied for and received Royalty Rate Reductions because of pricing concerns.
 5. The Engineers performing the Inspections and Product Verification will be able to do this work as part of their normal duties and forward the Information to the ONRR.
 - a. The Coal Inspectors can get and verify bills of Lading for the coal being shipped and compare to corporate structure.

Comment Excerpt Text:

The federal coal program currently subsidizes the coal industry and production by not including externalities when considering fair market value, by inconsistently appraising coal, and by reductions in minimum bids, bonus bids and royalties. These subsidies to coal producers need to end, to ensure that coal producers and not taxpayers bear the true external costs of mine development and production. The price of coal should reflect its actual costs in the broader energy marketplace, so that renewable energy can compete fairly. The program needs to adopt policies and practices that incorporate and internalize the full, real costs of mining and production and require coal producers to bear costs, without subsidies and externalizing costs to taxpayers, to local communities, and to future generations.

Specific comments on fair market return

- Raise the royalty percentages to reflect environmental costs, particularly the cost of methane emissions, including reparations following extreme weather events due to climate change, using modern economic tools such as the Social Cost of Methane and the Social Cost of Carbon
- The minimum bid or bonus bids should not be lowered to offset royalty increases as these recompense the U.S. for different components of federal land ownership and leasing
- Royalties should be based on an index pricing system for coal, like the ones for oil and gas, that reflect the market price of coal
 - o Regulations should have:
 - A built-in mean of adjusting royalty rates at regular intervals to avoid the perception that the adjustments are excessive when, in fact, they are appropriate
 - A built-in means of adjusting the minimum bid, the bonus bid, and royalties for inflation
 - BLM should work closely with the Office of Natural Resources Revenue and Office of Valuation to ensure Fair Market Value and execute systematic, regular, vigorous reviews of valuation
 - Regulation reforms need to stop coal companies from cheating on royalties by gaming the system through “captive” sales to subsidiaries in order to lower the sale price and the amount of royalties owed
 - Reforms should encourage innovation in the capture of methane through significant royalty rebates or reductions based upon the amount of methane captured (The coal industry needs incentives to step up innovation of new technologies to remain competitive)
 - Regulations must place greater scrutiny on any reductions in minimum bids, bonus bids, or royalties
 - o Provide public notification of such reductions and rationale for the reduction
 - o Provide an avenue for public comment on these reductions or create a review process outside BLM, such as with the Office of Valuation
 - o If a reduction is performance related, such as for methane capture, provide documentation of actual plan and accomplishment

Royalties paid by the coal companies are at most twothirds what are being paid by offshore oil companies and well below that paid for gas and oil leases on federal lands. This royalty practice has been unchanged in 30 years! The impacts of using coal from public lands on our health and our environment should be calculated into the royalty rates.

Comment Number: 0002282_Bradford_20160719-2

Commenter I: David Bradford

Comment Excerpt Text:

It seems to me that there is already a fair return on the coal mined on federal lands. As stated in the Notice in the Federal Register, the 4.3 billion tons of coal mined on federal land, from 2006 to 2015 resulted in \$9.55 billion in revenue to the United States. These revenues are also shared with the states and provide significant revenues to those states, the counties and the municipalities in those states. In addition, the coal mines generate significant revenues through property taxes and payroll taxes. These revenues should also be considered in the PEIS. Any decision to increase the cost of operations of the coal mines needs to evaluate the potential loss of revenues to the U.S., affected states, counties and municipalities due to the loss of jobs and property taxes. This is an absolutely critical issue. Here in Delta County, Colorado, the policies that the Obama Administration have implemented for coal mining have caused two of the three coal mines to close with the loss of over 1,000 jobs to our community. This is causing a multiplier effect of reduced economic activity and job losses throughout our community. Any decision to increase the royalty rate needs to analyze the potential impact of decreased revenues to all affected government entities.

Comment Excerpt Text:

Decertification sidesteps the competitive system mandated by the FCLAA by eliminating the first step on which all the other procedures depend—drawing up a regional leasing plan. This makes the ad hoc LBA system the only system. Under the LBA system, the BLM does not set the level of coal that it leases by taking into account changes in the market, such as the recent decline in domestic demand for coal brought about by the dramatic decline in the price of domestic natural gas, and the increase in the profitability of coal exports. Instead, it receives a request for a lease tract containing the amount of coal desired by the requester. It determines a fair market value floor for the tract currently being requested by identifying the most recent comparable lease and treating the sale price of that lease as a proxy.

The problem with this approach is that the most recent comparable tract that was leased is typically one that was tailored by the bidder to suit its own interests. That sale price, therefore, typically reflects the unsuitability of that tract for any other buyer. The fair market value of a lease determined in this artificial manner is typically a fraction of what the same coal would be worth if it were mined outside of the Powder River Basin. "Fair market value" determined with this downward bias sets the floor for evaluating the acceptability of bids. It therefore imparts a downward bias to the price ultimately paid for leases. The artificially-reduced lease price, in turn, lowers the price that the mining company charges to sell its leased coal to a broker. This reduces the amount of royalties collected, because royalties are calculated as a percentage of the price at which the mining company sells its coal to a broker. Using the price of a lease designed to be non-competitive as a proxy for the fair market value of the subsequent lease results in a rolling sequence of under-market valuations that shortchanges Federal and state governments and the public that they represent

Comment Excerpt Text:

Selling coal to captive affiliates has not changed how PRB coal is mined or the markets into which it is sold. It has simply reduced royalties below what the mining company would pay if its first “sale” were a true sale, rather than a shell transaction between the mining company and itself. The shell game has this effect on coal royalties because the ONRR personnel tasked with determining whether a captive transaction was based on an arm’s-length price must make that determination based on complex formulas employing an array of alternative benchmarks, each of which is an imperfect market proxy that is subjectively chosen and is easily manipulated.(9) As a result, in captive transactions, ONRR often ends up basing royalties on prices that are well below the true market price of the coal

Comment Number: 0002326_Moench_20160724_UtahPhysicHealthyEnviron-I5

Organization I:Utah Physicians for a Healthy Environment

Commenter I:Malin Moench

Comment Excerpt Text:

In determining the value of the coal to which royalties will be applied, the ONRR’s analyst chooses from five alternative benchmarks. These include using comparable sales, the income approach, and “netback pricing.” Netback pricing starts with a price charged downstream (typically the sale by the marketing affiliate) and deducts eligible costs. The ONRR’s process of determining if a sale is an arm’s-length sale or not, and determining whether the contract price reported to the agency is fair when no market transactions exist, is unwieldy and costly to administer, and provides a loophole that can be used to minimize the amount of royalties owed. (Headwaters Economics, 2015, at 9.)

Extensive reliance on shell transactions with affiliates, and allowing transportation, washing, and similar preparation costs to be deducted from sale prices before calculating royalties are at odds with international commercial norms. Pacific markets, such as Indonesia and Australia, do not allow many of the subsidies currently in place under the U.S. system.

Comment Number: 0002326_Moench_20160724_UtahPhysicHealthyEnviron-I8

Organization I:Utah Physicians for a Healthy Environment

Commenter I:Malin Moench

Comment Excerpt Text:

The ONRR has proposed reforms that consist of closing the captive transaction loophole. In making this change, ONRR would treat the price of the first arm’s length sale as the true market price of coal, but after

transportation and other eligible costs are deducted. However, that partial reform would still allow non-affiliated brokers to an important role in the PRB coal market. In those instances, the rulemaking would do little to bring royalties up to 12.5% of the true (gross) market price required by the Federal Coal Leasing Act Amendments. To the extent that severed coal needs to be washed and transported to the end-user, these disadvantageous economic characteristics are reflected in the price of the lease by which the mining company obtains the coal in the first place. To use those very same factors to artificially deflate the market value of that severed coal (the value that the end user places on it) before applying the royalty is to credit the mining company twice for the same disadvantageous economic characteristics of the leased coal.

Comment Excerpt Text:

The role of brokers must change. As Headwaters Economics notes in its whitepaper, the rise of the Powder River Basin (PRB) as the largest supplier of the nation's coal has dramatically increased the role of affiliate and non-affiliate brokers. Its mines are huge and are far from most energy markets so that most of the coal must be shipped by rail to end users. This creates an opportunity for midstream exchanges through brokers. PRB coal is typically sold (and valued) when it is loaded into trains at the mine. Brokers buy coal from these massive mines, and seek out the highest market price. The current regulatory structure bases royalties on the price of the first sale, whether it occurs at the mine mouth or at the doorstep of a distant end user. If the first sale occurs at the mine mouth, the sale price can be far below the price at which coal is sold to end users, such as power plants on the East Coast or in South Asia. If the first sale occurs at the mine mouth, the lease yields much lower royalty collections than if it occurs at the doorstep of a distant end user. (Headwaters Economics, at 10.)

This approach to royalty valuation does not provide a fair return on Federal coal. This approach results in large Federal subsidies of coal lease holders and their customers because it yields royalty collections that are far below the 12.5% of true market value that is required by statute. To end the subsidies that have evolved under the BLM's current leasing approach, it is essential to apply the Federal royalty at the final point of sale to an end user for both domestic and export sales. Otherwise, non-affiliated brokers in the PRB market will still be able to buy coal at the mine mouth at a discounted price that reflects the low royalty payment made by the mining company. Such brokers would still enjoy a cost advantage over a mine that sells its coal directly to an end user and pays royalties on the full price of the sale to the end user. Federal and state royalties avoided are the primary source of the broker's profit and is the broker's primary reason for being. To capture these profits, mining companies in the PRB have established elaborate networks of affiliated brokers.

Comment Excerpt Text:

Transparency would end the need to rely on proxies and benchmarks to calculate "fair market value." Currently, the Energy Information Agency publicly provides information showing the final sales price for Federal coal. ONRR auditors could use this information to calculate and verify royalty obligations. This would eliminate the need for ONRR analysts to estimate a true market price through subjective analysis of proxies and benchmarks that are inherently inaccurate. Relying on the price of the final sale is the only straightforward and transparent way to determine the true market price at which mining companies sell their coal. This straightforward reform would make the administratively burdensome and inherently unreliable royalty assessments that ONRR currently makes unnecessary. It would also make it more likely that DOI will actually collect the 12.5% royalty on the true market value of coal that the law requires.

Comment Excerpt Text:

It should be noted that \$15.59 is less than half of the average end-user price of Federally-leased coal (\$34.43). Consequently, the average effective royalty rate for Federally-leased coal (4.9%) is less than half of the rate required by statute (12.5%). The low “sale” price, and low effective royalty rate that is currently collected for Federal coal generally, reflects the fact that most Federal coal revenue is from PRB coal that is “sold” at the mine mouth. PRB coal sells for an average of \$13 a ton. This is one-fifth to one-fourth of the price of privately-sourced Appalachian coal, which is the next largest source of coal in the United States.

Comment Excerpt Text:

Under the current leasing process, the direct economic costs and benefits of leasing Federal coal are obscured behind a cloak of confidential data and analysis in which ONRR personnel use subjective judgment to select from a set of imperfect proxies or benchmarks for true market value. The necessary first step in estimating the direct economic costs and benefits of leasing Federal coal is to base the estimate on transparent, objective data. Once the direct effects are estimated, they can be balanced with the wider social objectives that the statutory framework says are supposed to guide the use of this public resource. Ironically, the procedural framework for taking this approach is already in place--it just isn't used. The nation's Federal coal leasing laws (MLA and FCLAA) require the BLM to conduct coal leasing within a framework of regional planning. The purpose of that planning is to balance a wide range of social objectives that are affected by the way that the public's mineral resources are used.

Organization I:Utah Physicians for a Healthy Environment

Commenter I:Malin Moench

Comment Excerpt Text:

It must also assess royalties based on final sale prices to end-users. The current 12.5% royalty rate for coal is the lowest royalty rate allowed under current law. It is lower than the 18.75% charged for offshore oil and gas production, and lower than the rates charged by many key Western states, including Wyoming, New Mexico, Colorado, and Utah. Although the Bureau of Land Management (BLM) has the statutory authority to increase the royalty rate, it has not done so. It should exercise its authority to bring the royalty rate for coal up to the rate paid by owners of offshore oil leases.

Comment Excerpt Text:

BLM officials reduce effective royalties below the statutory rate in three ways:

- 1) The BLM applies royalties to the price that the mining company receives from the first sale of its coal to another entity. It calls this the “first arms-length transaction” and presumes that it is the true market price. If the first sale is to the mining company’s own affiliate/subsidiary, the BLM still treats such a “sale” as having occurred at the true market price if its Office of Natural Resource Revenue (ONNR) finds that the price is the same as it would have been if the sale had been at arm’s length. The first “sale” is often made at the mine-mouth to the mining company’s own affiliate, rather to a power plant or other end user, such as a broker that exports the coal. In most cases, there is no economic or business reason to record a sale before the coal reaches the power plant, except to reduce the nominal price of first “sale” in order to avoid paying the full royalty amount that would have been owed if the sale had been recorded when it was delivered to the end user (the power plant).
- 2) The BLM can reduce the royalty rate to as low as 2 percent of the sale price if a mine becomes unprofitable due to unfavorable conditions—such as limited access to coal or a decrease in its quality.
- 3) Mining companies can deduct transportation and washing costs from the sale price before applying the royalty. This translates into an allowance for the full cost of transporting federal coal from the mine mouth to a remote point of sale or to transport the coal to a distant wash plant.

Shell transactions with affiliates are also used by PRB coal companies when selling coal to foreign buyers. A Reuters investigation in 2012 noted that PRB coal sells for an average of \$13 per ton domestically, but sells for up to 10 times that price in Asian markets. Because royalties currently are applied to “sales” to captive affiliates at \$13 a ton at the mine mouth, and later sold to Asian customers at up to 10 times that price, some PRB coal companies can make four times as much profit when they sell to Asian markets than if they sell the same coal domestically, despite the high cost of transporting coal to Asia. The federal coal leasing program has a track record of providing a fair return to the taxpayer through requiring that no tracts be leased at less than fair market value. At the same time the program has facilitated cost effective mining by allowing mining companies to nominate tracts for bidding that are adjacent to existing mines. In addition, this approach allows mining to be concentrated thereby reducing patchwork surface impacts and facilitating reclamation. Our members derive significant benefits from this approach.

Comment Excerpt Text:

There has been a complaint with the coal leasing program that we don't pay our fair share for federal leased coal. So what does that mean? In Powder River Basin, we will take an average coal mining sale price of about 11 bucks. So, the lease acquisition tax which we have to bid on for fair market value is usually about a dollar and the federal royalty we pay on top of that after we have already mined it which most of the mines around powder basin pay the full amount of the leased royalty. The federal royalty is about a \$1.38 of that 11 bucks. On top of that, we also have state severance taxes for 58 cents, a county tax for 50 cents, a black lung tax for 55 cents and an AML tax for 28 cents. That AML tax is abandoned mine land tax we have been banking into a fund since 1977 to make sure that tax payers aren't left with the responsibility of the claiming this mining and this is in addition to our own federal lease obligations that we pay each year. So altogether that is about \$4.28 of the \$11, or 39% and I think if you have seen the news lately, you have seen that companies that are going bankrupt and I think that that's enough. We are paying more than our fair share. You can have 10% of something or 20% of nothing if you don't want to let us to mine federal coal anymore.

Comment Number: 0002364_Morris_20160721-1

Commenter I: Thomas E. Towe

Comment Excerpt Text:

I am very concerned that the coal companies not be allowed to take advantage of the system. Generally royalties of 12 1/2 % of the mine mouth value of the coal is considered a reasonable royalty, although there are times when a bonus can be added by proper bidding procedures. My concern is that the coal companies should not be allowed to avoid the full payment of the expected royalty by selling to a subsidiary at below market value at the mine site and letting the subsidiary make the profit when the coal is sold later in the process of delivering the coal to the ultimate utility company. As a result some coal companies do not pay anywhere near 12.5% royalty; some have placed the true payment closer to 4%. I call that cheating the system and I say that needs to end.

Comment Number: 0002395-2

Commenter I: Thomas E. Towe

Comment Excerpt Text:

Third, there is nothing wrong with giving the agency in charge the right to reset the fair market value. The Internal Revenue Service and the State Departments of Revenue do this all the time. In other words, when a taxpayer sells or purchases products from itself, i.e., a subsidiary, it is not an arms' length transaction. If it is not an arm's length transaction, it very likely will not reflect the fair market value. In the tax world, the Internal Revenue Service or the tax agency has full authority to reassess the number when it is not a full arms' length transaction. This same thing must be authorized in the determination of royalty payments.

Comment Excerpt Text:

As western mountain communities, we represent nearly 200,000 permanent residents and millions of annual

visitors. Coal extraction and use as a fuel source poses a number of costs currently unaccounted for in federal coal program. Onsite, these costs include air pollution from exploration, development, and transportation to and from the mine site; fugitive methane emissions; habitat disruption; noise pollution; and water contamination. From the perspective of our mountain communities, the coal's contribution to climate changes poses the greatest cost. Economic, public health, and environmental damages from catastrophic wildfire, floods and reduced snowpack are some of the threats we face.

Failing to account for coal's contribution to these costs in federal coal leases shifts them onto taxpayers -- and in our case, at a time when our towns are shouldering the financial burden of climate impacts and proactive adaptation. In the face of climate change, it is time to modernize the federal coal program to accurately account for its costs to communities, taxpayers and the environment while supporting a transition to a more sustainable and resilient economy.

Increased royalty rates will only result in depressed revenue for our schools and roads with little, if any, positive impact on the environment. Increased rates would also have a detrimental effect on our local economy, which would be seen in decreased state revenue, lost jobs and increased electricity prices for consumers.

Comment Number: 0002448_FoleyHein_20160727-1

Organization I:Institute for Policy Integrity

Commenter I:Jayni Foley Hein

Comment Excerpt Text:

The current coal leasing system does not foster the competition needed to earn fair market value. In the Powder River Basin, for example, coal companies minimize competition by nominating coal tracts adjacent to their existing mines. This is why the vast majority of recent coal lease bids have only one bidder. Multiple bids, Huber explained, arise only when two mines expand towards the same tract and both have an economic interest in developing that tract. Huber concluded by explaining that the coal leasing program is susceptible to two problems: (1) incumbency, since the repeat players are often able to engineer the process to their own benefit, and (2) information asymmetry, since coal producers understand prevailing coal market conditions better than federal land and resource appraisers.

Jayni Hein (Policy Director, Institute for Policy Integrity) discussed how fair market value should be understood from a social welfare maximizing perspective, including accounting for the climate, environmental and social costs of coal production. Hein recently published the report *Priorities for Federal Coal Reform*, which highlights recommendations intended to help modernize the program so that it can provide maximum net benefits to American taxpayers. The report details how the programmatic review should identify opportunities to increase revenue, reduce greenhouse gas emissions, and align federal land management with U.S. climate change goals. In effect, the current program subsidizes coal production, as the public bears the burden of mitigating and adapting to many externality costs, including greenhouse gas emissions—the effects of which will continue to be felt decades from now. Given its capacious statutory mandates, including its duty to manage federal resources “in the public interest” and for the benefit of future generations, Interior should conduct a regular strategic planning process every five to eight years, and as a threshold inquiry, do a “net social value” calculation to determine whether leasing any coal tracts would be net socially beneficial. This is akin to how Interior’s Bureau of Ocean Energy Management (BOEM) conducts its five-year program analysis and makes a threshold “net social value” inquiry. Interior should lease coal only when doing so provides net benefits to the public, and ideally, leasing decisions should be calibrated to maximize net benefits. If net social value is positive, leasing may be desirable, but Interior

should set an appropriate royalty rate and use an appropriate base valuation to calculate royalties owed. It should seek to calibrate the royalty rate in order to maximize social welfare. A social welfare-maximizing framework is consistent with 30 years' worth of presidential directives to agencies to maximize the net social benefits of their policy choices. Hein also discussed how the legislative history of the relevant statutes (the Mineral Leasing Act of 1920, Federal Land Policy and Management Act, and Federal Coal Leasing Amendments Act) are consistent with a social welfare-maximizing framework, and that it would be reasonable to raise royalty rates to recoup at least some of the externality costs of coal production, transportation, and consumption. Otherwise, the government prioritizes short-term revenue and coal company profits over long-term public value and welfare.

Nathan Richardson (Assistant Professor of Law, University of South Carolina School of Law; Visiting Fellow, Resources for the Future) concluded the fair market value discussion, focusing on BLM's authority and broad discretion to regulate and govern the leasing process, including its charge to manage resources for "multiple use." Richardson stated that no new legislation is required for most of the reforms that have been suggested, including the ability to use environmental charges (using the Social Cost of Carbon) and/or increasing royalty rates to account for market failures. This authority is strengthened because the federal government is a landowner in the coal leasing process—not simply a regulator.

Comment Excerpt Text:

Royalty Rate Scenarios and Effects on Production, Revenue, and Emissions

The second panel focused on analyzing royalty rate scenarios and the effects on production, revenue, and emissions.

Mark Haggerty (Headwaters Economics) began by saying that the focus ought to be on the community perspective—how the royalty program affects what happens in coal-producing states and communities. Using a partial equilibrium model, Haggerty and Headwaters Economics found that there is a gap between the net delivered price of cost (the market price minus allowable transportation and washing costs) and the mine mouth price of coal, and if the federal government captured that lost value, it would modestly increase the cost of the coal royalty program to the coal lessee (by about \$0.28 per ton of coal, on average, across the coal program). This would result in revenue gains, but very little increased cost to the producer, and very little impact on federal coal production. Headwaters also analyzed the effect of increasing royalty rates to 16.67% or 18.75%, to make the program consistent with rates used by states and for federal offshore oil and gas leasing. It found that royalty rates could be increased and still have only a small impact on production, and a small impact on substitution between federal and non-federal coal. Finally, Haggerty noted that it would be useful to have more analysis on state utilization of coal revenue; there may be benefits to creating a natural resources trust rather than having annual distributions. In the question and answer session, Haggerty stated that the natural resources trust concept may require legislative action. In prior work, Headwaters also modeled the effect of a royalty rate increase on state severance tax revenue.

Comment Excerpt Text:

A recent study has concluded that introduction of higher royalty rates would reduce carbon dioxide emissions of coal even with demand side policies, like the Clean Power Plan, in place. (127) This would be in part due to the induction of substitution of lower carbon emitting fuel and energy sources for coal. (128) The study finds significant reductions in CO₂ emissions with the imposition of royalty rates that internalized carbon pollution costs by reflecting the social cost of carbon in the royalty rate. (129) While scenarios vary depending on demand side policy, with strong CPP implementation a carbon adder to royalty rates as low as 20% of the SCC could further lower carbon emissions by between 59 and 25 million metric tons in 2020 and by 39 and 10 million metric tons in 2030 depending on CPP implementation schemes. (130) The reason for the larger near term increase in emissions reductions is that the increased costs of coal will speed near term investment in lower carbon fuel sources including renewables. (131) The effects of a royalty rate increase without the CPP is also quite substantial. If the CPP is not implemented, a royalty rate at or equal to 100% of the SCC would result in carbon emission reduction equal to 70% of those that would have been achieved by the CPP as currently designed. Modernize the federal coal royalty system and increase rates to ensure a fair public return for the publicly held resource. The mineral royalties system is out of date, out of touch, and inequitable. The current rate of 12.5% serves as a below market subsidy that must be ended. It is also inconsistent with what federal offshore mineral royalty rates are set at, 18.75%. In many of the western states that BLM assesses the rate of 12.5% for oil, gas and coal produced on federal land parcels, the states themselves charge significantly higher rates ranging from 16-19% for the energy resources on state parcels. Moreover, due to manipulations of the system, many coal companies are paying effective rates that far below 12.5%. This structure must be modernized and adjusted to match comparative fair market rates and ensure a maximum return of revenue to the taxpayers for the value of their resources. It must also be adjusted to internalize significant costs being borne by the public-at-large. Loopholes allowing companies to escape high royalty rates by manipulating the sale price through less than arms' length transactions need to be closed, as reflected by the recent rule change by the Office of Natural Resources Revenue.

Proposed Royalty Rate Increases Will Reduce Public Returns on Federal Coal Development

Proponents of a royalty rate increase point to reports prepared by the Inspector General’s Office (“IG Report”) and Government Accountability Office (“GAO Report”) examining fair market value returns under the existing Federal Coal Program. They claim that increasing royalty rates will provide state and federal government with additional revenue. To be clear, however, neither report proposes any increase in the current royalty rates. To the contrary, the IG Report confirms that royalties collected at current rates provide “substantial net benefits” to American taxpayers. Neither report suggested that adjusting current royalty rates will further BLM goals of increasing returns or fair market value to the public.

(a) Reduced Coal Revenues from Decreased Production

There is no empirical evidence to support the notion that increasing federal coal royalty rates will increase federal coal revenues. Further, proponents of a royalty rate increase fail to consider the impact a royalty rate increase will have on other public benefits derived from the federal coal program.

Proponents of a royalty rate increase make the simplistic assumption that federal coal revenues will increase with a royalty rate increase. They assume that coal demand and production will remain constant notwithstanding increasing production costs and greater regulatory burdens. Even if coal demand declines, proponents of a royalty increase claim that higher rates will make up for decreased sales volume. First, this position makes unfounded economic assumptions. In actuality, increasing federal royalty rates will reduce federal coal production. Secondly, this position disregards broader economic and social impacts of federal coal development. Public benefits of federal coal development are not limited to royalty revenues.

Coal production on public lands under existing conditions is experiencing an unprecedented decline. Burdens of increasing royalty rates will deter investment in federal coal reserves by increasing costs of production, further depressing demand, and very likely increasing the price per ton. Without factoring in proposed royalty increases, the Energy Information Administration (“EIA”) projects coal production to decline to levels last seen in the late 1970s, with production in the West hardest hit. Last year coal production fell 22.7%. An estimated 18 GW of electric generating capacity was retired in 2015, more than 80% of the retired capacity was conventional steam coal.” Since reaching a high point in 2008, coal production in the United States has continued to decline. Coal production in 2015 is expected to be 10% lower than 2014, the lowest level since 1986.

Coal production in Utah experienced similar impacts on a statewide basis. In 2015, 78% of Utah’s electric generation was fueled by coal. A large share of Utah’s coal is mined from federal lands. Eighty percent of coal mined in Utah is extracted on public lands under federal leases. Moreover, three-fourths of all coal mined in Utah is consumed in-state primarily for electric power generation. However, recently, Utah has experienced declines in the local market for steam coal due to the impacts of federal environmental regulation. Utah coal producers have already experienced decreased demand due to the early retirement of coal-fired electric generation facilities. EPA’s air quality restrictions on existing coal-fired power plants forced the early closure of the Carbon Plant and the Regional Haze federal implementation plan could retire additional units of coal-fired generation owned by PacifiCorp.

While the market is constrained, mining costs are increasing at underground operations in Central Utah. Several mines in the Carbon/Emery County area are encountering difficult mining conditions and have had to go deeper to recover federal coal reserves. The easy to reach reserves have been exhausted. In this regard, PacifiCorp’s Deer Creek Mine which operated on federal coal leases in Emery County was shut down last year due to geologic and safety conditions. The Deer Creek underground operation provided the mine-mouth supply for Huntington Power Plant. Other mining companies, including UEI have re-evaluated geologic and economic conditions with respect to operations on federal lands. In some cases, reserves of poor quality or those presenting difficult underground mining conditions or safety concerns have caused operators to seek federal lease royalty readjustments below 8%. In other circumstances, UEI and other Utah mining operations are considering relinquishment of federal coal leases due to geologic, safety and poor market conditions.

Given current market conditions, and challenging geologic conditions in the Central Utah coal fields, any increase in federal royalty rates for coal could trigger lease relinquishments or further disinvestment. Increasing the royalty rate will increase the costs of production which may well reduce the development of coal reserves on federal land. As evidenced by a spate of bankruptcies and reorganizations during the past two years, many coal companies are already operating on razor thin margins, walking a fine line between continuing existing operations and shuttering entire mining operations.

Contrary to BLM’s proposal, there is no evidence to suggest that increasing federal royalty rates will not reduce

Utah's coal production. Based on the impacts of current market conditions, it is virtually guaranteed that demand for federal coal reserves will decline if royalty rates are dramatically increased. Moreover, given current price sensitivities in the market, it is likely that increased royalty rates will not make up for lower federal coal production in the future. It is therefore, likely, that royalties generated from federal coal in Utah will actually decrease despite a higher royalty rate.

Comment Excerpt Text:

Beyond employment, federal coal production gives rise to additional benefits in rural economies. Coal revenues generated by federal royalty payments are split evenly between the state and federal governments. In Utah, federal lease royalty revenues are allocated to infrastructure maintenance and development in rural Utah communities under the Community Impact Fund. Revenues are also allocated to education, rural economic development, and rural community building projects. Reduced federal coal production would reduce the State's share of these funds. Rural communities would not only be forced to confront increasing unemployment, but would also have to find a new source of revenue to fund public works and community development programs.

2. There is No Rational Basis to Justify Raising the Coal Royalty Rates to the Federal Offshore Oil and Gas Royalty Rate

BLM states that raising federal coal royalty rate to 18.75% would "be consistent with the royalty rate for Federal offshore oil and gas." BLM does not, however, state why consistency is required, or even desired, between two different commodities, produced in different geographic regions, using different technologies, that are sold in two different markets. Moreover, the BLM does not explain how consistency between two divergent commodities promotes coal development consistent with the mandate of the MLA. Moreover, BLM does not indicate how or to what extent 18.75% royalty rate will impact coal production, and by extension, revenues generated by coal royalties allocated to states.

3. Royalty Rate Reductions are Critical to Federal Coal Development

BLM suggests that royalty reductions may not be necessary, or that royalty reductions, somehow, deprive the American public of a fair rate of return on the federal coal program. BLM points to reduced royalty rates below 8% as evidence of a failure in the Federal Coal Program. UEI contends, however, that royalty rates below 8% are evidence that current royalty rates are too high.

Notwithstanding proposals to increase federal royalty rates, existing royalty rates can render federal coal development uneconomic. As stated above, in the Central Utah coal field, easy to reach coal reserves have been exhausted. Many mining companies, including UEI, are now forced to reevaluate geologic and economic conditions on federal leases. In some circumstances, continuing operations are dependent on reducing the royalty

rate below 8%. In other circumstances, however, mining companies including UEI are forced to consider relinquishment of deferral coal leases due to geologic issues, safety concerns, and poor market conditions.

BLM's decision to allow for royalty rate reductions is critical to ongoing federal coal production. Under 30 U.S.C. §209 the Secretary may reduce royalty fees "whenever in his judgment it is necessary to do so in order to promote development, or whenever in his judgement the lease cannot be successfully operated under the terms provided therein." In this way Congress allowed the Secretary discretion to set reasonable royalty rates that account for specific mine conditions, coal quality, and general market trends to maximize federal coal recovery.

The decision to reduce royalty rates is made on a case by case basis after careful examination of a number of factors including geologic and engineering conditions beyond a federal lessee's control. The lessee is required to demonstrate that a royalty reduction is necessary, and that recovery without a royalty reduction is uneconomic. More importantly, however, the Secretary must determine that a royalty reduction promotes federal coal development or maximum coal recovery. Eliminating royalty reductions in the name of increasing overall coal lease revenues may have the opposite effect. Without royalty reductions a lessee may have no option but to relinquish a federal lease rather than to expand uneconomic operations.

Comment Excerpt Text:

In sum, there is no justification for royalty rate increases for underground mining operations on federal coal leases. Empirical evidence demonstrates that increasing federal royalty rates will render many underground coal operations uneconomic. Coal producers may be forced to halt production and to relinquish federal leases rather than continue to operate on public lands at a loss. Proposed increases in federal coal royalty rates will have significant impacts on rural communities that have come to depend on jobs and revenue generated by federal coal leases. UEI requests that the BLM consider these impacts and ensure that its assessment is based on objective economic considerations and its mandate to promote federal coal development under the MLA. In this regard, royalties should remain at 8% or less for coal produced by underground mining methods.

Comment Excerpt Text:

It is very likely in today's marketplace that an increase in federal coal royalty rates could lead to a significant curtailment in federal coal sales and consumption - a net lose-lose scenario, especially in North Dakota where the federal coal tracts will be bypassed and left in the ground forever. In a bypass situation, there are no winners. A valuable resource gets left behind and the impacts to the area are greater because of the added activity to mine around the pocket of federal coal. Where both volumes and the future right-to-mine royalties are lost, both federal and state receipts associated with the leasing program could diminish appreciably. In addition, energy costs would increase in areas where coal remains the dominant fuel source for power generation - particularly

the industrial heartland. It seems imprudent and unwise to saddle American manufacturers with higher energy costs at a time when the economy is still struggling to return to more robust growth. Since it is highly unlikely other nations will adopt policies discouraging the use of their most affordable, reliable, and abundant natural resources, and policy which discourages the use of federal coal reserves will put American citizens and industry at an immediate disadvantage with their competitors around the world.

Should the Department decide to reform the federal coal program, we strongly encourage DOI to take steps to make coal leasing and production on public lands more competitive, not less. We encourage the DOI to focus on a Fair Market Value ("FMV") approach to achieve the maximum value for these public resources. Unless abandoning the principles in a free market economy, by focusing on FMV, the BLM will avoid strange results that come from extremes such as extremely high or extremely low value. This value also flows with the coal via the reliable and low cost electricity available to all its businesses, farmers, citizens and visitors.

Federal coal operations cost taxpayers, states and local communities millions in lost revenue. Loopholes in policy allow coal companies to get by without paying their full royalties to the government for their use of public lands and federal coal. Royalties were set at 12.5 percent, yet companies often get away with paying as little as 4.9 percent. Loopholes in the government's coal program cost taxpayers and state governments more than \$1 billion a year in lost royalties - money that could be used for local schools and roads. As of 2012, loopholes in our guidelines had cost taxpayers over \$30b.

Comment Excerpt Text:

the current price per ton of coal in PRB is approximately \$11.00. The 12.5% federal royalty results in a tax on this price at \$1.38. The average price of the lease acquisition fee (bonus bid) adds another \$1.00. Two more federal taxes are levied on this ton of coal, the AML tax of \$0.28 per ton and the Black Lung Excise Tax of \$0.55 per ton. Finally, this ton of coal is also taxed through the state severance tax and the county tax applicable in the PRB, at a rate of 5.3% and 4.5% respectively, adding another \$1.08 in taxes. In total, this amounts to \$4.28 in taxes on every \$11.00 worth of coal sold, an effective tax rate of 39%

The Economics Of Federal Coal Leasing

I. Competition, Fair Market Value, And Fair Return Issues

The final major impact issue that must be addressed in the PEIS is restructuring the lease payment system to more accurately compensate the American taxpayer for the value – and cost – of the coal resources being leased. While it can be accomplished in several ways, as discussed below, in our view the most important element to be added to these payments is incorporating environmental harms caused by the full life-cycle of the GHG emissions associated with leasing. By taking those costs into account, along with other changes, the PEIS provides an opportunity to explore appropriate reforms in the leasing system.

Comment Number: 0002467_Fettus_20160728-28

Organization I: Natural Resources Defense Council

Commenter I: Geoffrey Fettus

Comment Excerpt Text:

As discussed below, the agency’s failure to actually obtain fair market value, combined with reliance on fee reductions, have cost taxpayers billions in revenue. These problems are further exacerbated by the fact that a federal coal lease has an initial term of twenty years, and may be extended for an additional ten years – allowing

up to thirty years of mining based on fee schedules and conditions set decades earlier. See 43 C.F.R. §§ 3475.2, 3425.5.

Moreover, the agency also has not at all endeavored – in the bidding process or the other junctures where the government is compensated for access to federally-owned coal – to account for the numerous external costs associated with coal, such as the cost of carbon emissions associated with coal mining, transportation and combustion. As we will discuss, this is one of the central tasks now faced by the agency.

Comment Excerpt Text:

The final principal problem that must be addressed in the PEIS is the amounts charged for access to exploit federally leased coal. As the CEQ regulations provide, where – as here – a federal agency action has important economic effects, those issues must be thoroughly addressed. 40 C.F.R. §§ 1508.8; 1508.14; 43 C.F.R. § 146.420(d); BLM NEPA Handbook at 54.

Outdated federal coal revenue policies distort U.S. energy markets and undermine the Nation's climate change goals. They do so because the federal coal leasing program provides an unfair advantage to companies mining PRB coal, where more than 85% of all federal coal comes from. Coal from the PRB is significantly undervalued and sells for less than one-third of the price of Appalachian coal, even when accounting for Appalachian coal's higher Btu content.

Comment Excerpt Text:

To date, BLM has relied on an initial bonus bid, lease rentals, and royalties to comprise what little return on the value of the coal accrues to the taxpayer. The PEIS must explore not only readjusting the amount of compensation for each of these aspects of leasing, but also additional compensation approaches that will not only insure a fair return for federally leased coal, but will also address the environmental externalities – and particularly GHG emissions. Coal lease pricing can also be utilized to properly incentivize the use of coal resources in our Nation's fuel mix, allowing for appropriate levels of coal while insuring that coal emissions do not hinder the Nation's ability to meet its GHG emission reduction goals.

One principal issue the PEIS must address is the fact that, in practice, there is very little competition for coal leases, with almost 90% of lease sales involving only a single bidder – often the operator of the adjacent (or expanding) mine. This lack of competition poses significant challenges to accurately setting FMV and therefore the initial bid cost. However, even in the absence of a competitive market, BLM can create policies and procedures that will return a fairer amount of revenue for the public. Because of the amount of federal coal that is leased, recent government reports have shown that raising bid amounts a mere penny can bring in up to \$7 million of additional revenue in the average Wyoming PRB lease sale. In short, every penny counts.

A second issue concerns the royalty rates for coal production, which do not currently either provide a fair return or cover the myriad externalities of coal production – including GHG emissions. Under existing royalty policies, coal companies also exploit loopholes, and subsidies, deductions, and royalty rate reductions lower the effective royalty rate to approximately 5% overall. In addition, companies are sometimes selling coal to their own subsidiaries, paying a royalty based on this depressed price, and then reselling the coal on the market at higher prices. (10) Moreover, since this coal represents more than 40% of domestic coal production, artificially low royalty rates bring artificially low market prices.

(10) Although the Office of Natural Resources Revenue recently issued new regulations that touch on some of these issues, 81 Fed. Reg. 43,338 (July 1, 2016), the PEIS should explore the extent to which companies can continue to exploit these loopholes. Among other concerns, sales may still be structured to avoid royalty payments.

Commenter I: Geoffrey Fettus

Comment Excerpt Text:

As noted, many concerns have been raised about whether BLM is obtaining accurate FMV in leasing federal coal. (28) Although BLM endeavors to determine FMV, numerous reports have demonstrated that the fact that there is often only one bidder for a lease, along with other limiting factors, result in billions of dollars in losses to taxpayers. See, e.g., Tom Sanzillo, *The Great Giveaway: An analysis of the costly failure of federal coal leasing in the Powder River Basin at 9* (stating the U.S. Treasury has lost roughly \$28.9 billion in revenue from coal leasing below FMV).

(28) BLM determines FMV with one of two methods: the comparable sales approach (in which sale prices from similar properties in prior transactions are used to determine value) and the income approach (in which an estimate of annual costs and revenues is used to determine value).

BLM has a statutory mandate to “award leases [through] competitive bidding.” 30 U.S.C. § 201 (emphasis added). The regulatory framework must be modified to achieve this statutory directive.

Comment Excerpt Text:

As noted, there are several problems with the current royalty rate structure that must be addressed in the PEIS to provide taxpayers with a fair return and to address the economic externalities of federal coal leasing. The PEIS must also explore eliminating the royalty rate reductions, and deductions for transportation and coal washing, that has even further reduced the return on federal coal leases.

As discussed above, royalties may be the most appropriate place to couple leasing prices to the social cost of carbon, since an operator only pays royalties for the coal extracted. As the recent White House Report explained, “royalty reform [can] provide a fair return to taxpayers while simultaneously reducing the environmental effects of coal extraction and combustion.” White House Report at 3.

Because the environmental and social externalities from coal production vary with the amount of coal produced, one sensible approach would be to recoup those costs through royalties that cover: (1) the cost of production-related environmental externalities; (2) the cost of transportation-related externalities, including CO₂ emissions; (3) uncompensated infrastructure demand (e.g., water, power, processing facilities); and (4) any foreseeable “waste” of the resource, such as vented or flared methane associated with coal production. See Hein and Howard at 20.

Alternatives To Address Fair Return For American Taxpayers

The alternatives necessary to address fair return overlap with those considered to address climate change impacts, since – particularly in the context of a royalty “adder” – the fees collected will principally compensate the taxpayer for the climate change impact associated with the coal produced. However, additional alternatives to consider include:

a. Basing lease sales on actual FMV

As noted, numerous investigations have documented how BLM fails to obtain FMV for coal leases or otherwise collect coal leasing income commensurate with the value of the coal and its myriad externality costs. Leases with a single bidder, market manipulations, unreasonable deductions, royalty and rent reductions, and other factors have led hundreds of millions, or more, in lost income. For example, one Report found that, had coal valuation actually been based on market value, the royalty collections for just the five year period from 2008 – 2012 would have been \$850 million higher, an average of \$170 million per year.

Under this alternative, to address this concern BLM would make fair return a threshold criterion for when and whether to offer new leases and accept bids. New leases would be offered only when FMV can be achieved and royalty and rent reduction are not required to make the lease economical or commercially viable. Leasing would also only be permitted when the federal coal brought to market will not reduce the price of coal on the national market, will not contribute to overproduction, and will not lead to resource hoarding or speculation. Approaches to consider include:

- Establishing minimum bids for each coal region that take into account regional economic, geologic and engineering variables, and assessing the projected income from each individual lease to be offered based on unique variables.
- Raising the minimum bid to \$1 per ton, the average market price of coal during the Obama Administration. (29)
- Considering the market value for coal based on sale prices of coal with similar characteristics, from both Federal lands and non-Federal lands. White House Report at 18. Where it is difficult to find such comparative prices, prices could alternatively be calculated on an energy-equivalent basis to reflect the fact that the heat rate of the coal is a determinant of its value in the coal power plant. Pricing this way would permit comparisons to the payments collected from Federal leases for natural gas and oil on public lands. (30)

(29) Nidhi Thakar, *Modernizing the Federal Coal Program*, Center for American Progress 5 (December 9, 2014), available at <https://cdn.americanprogress.org/wp-content/uploads/2014/12/FederalCoal.pdf>.

(30) As the recent White House Report on these issues explains:

After adjusting for the heat content of coal, the royalty rate being paid by surface PRB coal is roughly one third of the royalty rate paid for natural gas on Federal lands (on an energy-equivalent basis), even though they are both subject to a 12.5 percent royalty rate on their respective reported sales prices (before deductions). It could be appropriate to adjust the royalty rate directly to reflect an adjustment for heat content, or to include a Btu-adjusted royalty “adder” on top of the base royalty rate. In other words, the royalty owed would be 12.5 percent of the revenues plus an additional payment in dollars per Btu. Similar adjustments would be possible for sulfur content and other characteristics, but the heat content adjustment is likely to be among the most important. White House Report at 19; see also *id.* at 4 (“If royalty payments are based on the price of nearby regional coal on a per-Btu basis, after it is fully phased-in, this would add up to \$290 million more to State and Federal coffers annually. Maximizing royalty payments would bring in as much as \$3 billion more to State and Federal coffers annually once fully phased-in”).

- Creating an inter-lease bidding process in which BLM makes multiple sites available for bidding simultaneously, and then subsequently decides which bids to accept based on site location and the amounts bid.

· Incorporating “option value” into the bid amounts – i.e., the informational value of delay associated with federal leasing. As the D.C. Circuit recently explained in considering option value in another context, “[t]here is therefore a tangible present economic benefit to delaying the decision to drill for fossil fuels to preserve the opportunity to see what new technologies develop and what new information comes to light.” *Center for Sustainable Economy v. Jewell*, 779 F.3d 588 (D.C. Cir. 2015).

As outlined in Hein and Howard, under this approach, at the bidding stage, BLM would be compensated for both the estimated market price of the coal to be leased, as well as the option value of mining coal, as both of these are fixed costs.

The option value of coal leasing includes not only the uncertainties associated with future coal prices, but numerous other factors about which BLM may obtain additional information. As outlined by Hein and Howard, these include:

- o uncertainty about the magnitude of risk from externalities, such as methane emissions, particulate matter emissions, and potential aquifer overdraft; as a recent example, methane leakage from natural gas gathering facilities was recently found to be 8 times higher than prior EPA estimates;
- o uncertainty about the development rate of pollution-prevention technologies, as well as technologies that may better protect worker safety;
- o uncertainty with respect to the cost of externalities, including the social cost of carbon and the social cost of methane;
- o uncertainty about competing uses of federally-owned lands, such as the potential and need for renewable energy siting;
- o uncertainty with respect to coal reserve estimates, which may affect the long-term availability and price of accessible coal; and
- o uncertainty with respect to climate sensitivities, such as climate conditions that may exacerbate the damaging effects of air or water pollution, or consequences for land values near production sites Hein and Howard at 18.

Setting royalties based on price comparisons

Under this alternative royalty payments would be based on nearby regional coal prices, nationwide coal prices, and the price of natural gas, which is a close substitute for coal in the electricity market. All three prices would be expressed in terms of dollars per one million British Thermal Units (MMBtu) to account for differences in heat rates of different types of coal (and natural gas). See White House Report at 3.

Setting royalties to maximize revenue

Under BLM’s current scheme the agency charges low royalty rates, and then further reduces royalties as necessary to encourage development. See, e.g. 43 C.F.R. § 3485.2(c)(1) (“The authorized officer may waive, suspend, or reduce the rental on a Federal lease, or reduce the Federal royalty,” where doing so serves “the purpose of encouraging the greatest ultimate recovery of Federal coal . . .”). This approach served an earlier era where the agency’s objective was to maximize the production of federal coal as an energy source.

As the foregoing discussion of climate change impacts demonstrates, this should no longer be an aim of BLM’s

approach to federal coal leasing. To the contrary, royalty rates should be used to both generate maximum income and help align coal development with GHG emissions reduction goals.

Accordingly, under this alternative BLM would explore the maximum royalty rates it could charge in order to obtain the most revenue for taxpayers, and consider the extent to which those rates would reduce GHG emissions. It would also consider eliminating royalty rate reductions. Given that there may be a royalty rate too high to attract coal companies, the rates charged under this alternative are likely to differ from the rates that would apply by simply incorporating all GHG externality costs into a royalty adder.

Increasing leasing transparency and public disclosure

As noted, multiple reviews over the years have shown BLM officials leasing federal coal for less than FMV, improperly reducing royalties, and otherwise allowing access to federal coal without full return to taxpayers. Among the structural flaws that allow these problems to occur is the secrecy surrounding these decisions.

BLM should amend its regulations to provide for transparency and public disclosure throughout the leasing process. This would include determining FMV, the bid process itself, and the establishment of rent and royalty rates. By forcing BLM officials to “show their work,” the public will be in a position to both monitor BLM decision-making and insure that the public receives a fair return for coal resources.

e. Changing lease terms

Under this alternative, BLM would consider changing lease terms to control the amount of coal produced, by putting annual coal production limits in coal leasing contracts. Like the Carbon Budget alternative, this would allow BLM to control the upper limit of federally leased coal, and therefore to begin to address the GHG emissions associated with the federally leased coal fuel cycle.

BLM would also consider incorporating into coal leases the authority to adjust rental and royalty fees over time, particularly if leases are going to continue to be given for decades-long periods. Providing additional flexibility in pricing would allow BLM to insure that coal leases continue to advance national objectives in the future based on new information that might not be available at the time of the original lease.

The BLM must use the Programmatic EIS process to design a system of coal leasing that promotes competition among coal companies for federal coal leases. Competition is an essential part of any functioning market; without it, the program must compensate in various ways to achieve fair coal pricing. The lack of competition also leads to public skepticism that the federal coal program is not ensuring a fair return for these resources.

At a minimum, the BLM could improve transparency by collecting data from the field on a monthly basis. Each month, each state office should report the number of royalty rate reduction requests it has received, the number of requests granted and the justifications, and the volume anticipated to be valued at the reduced rate. In the past, the BLM has been reluctant to disclose any data because of lessees' concerns about trade secrets. But these aggregate numbers would not disclose any confidential data about individual mines and should be made publicly available on BLM's website. The data would provide an essential baseline for understanding the impact of royalty rate reductions upon taxpayer revenue, and would be consistent with the Department of the Interior's Extractive Industries Transparency Initiative. The impact of policy decisions regarding rate reductions could then be evaluated based on publicly available data.

In its report, the CEA suggests coal valuation could be considered "under a framework analogous to property taxes," in which "the market value for coal should be based on sale prices of coal with similar characteristics, from both Federal lands and non-Federal lands."¹³ This concept was proposed at a congressional hearing by Dan Bucks, the former Director of the Montana Department of Revenue: "Interior can address these root causes if it returns to the plain language of the federal Mineral Leasing Act that calls upon Interior to directly value coal—just as a property tax assessor directly values homes and businesses. Instead of following the property tax model called for in the law, Interior has instead delegated initial valuation to companies through an income tax approach that opens the door to abuse and underreporting."¹⁴

The leasing process generally used by the BLM does not obtain fair market value for taxpayers. Competitive bids are seldom generated, and studies indicate that the resulting losses for taxpayers are substantial. Congress enacted the Federal Coal Leasing Amendments Act of 1976 (FCLAA)¹ to require competitive bids and to specify that no bid may be accepted that does not represent fair market value. The act also established diligent development requirements to reduce speculation and to institute minimum royalty rates. BLM's FCLAA implementing regulations² require the Secretary to delineate tracts for leasing from among those lands classified for coal leasing. Tracts are to be of a size the Secretary "finds appropriate and in the public interest and which will permit the mining of all coal which can be economically extracted..."³ Tracts are then offered for lease at sales held either on the motion of the Secretary or upon the request of any qualified applicant. The Secretary must award leases by competitive bidding, except for certain sales expressly authorized to be negotiated sales.

The Inspector General (IG) examined 45 lease sale modifications since 2000 and concluded that \$60 million had been lost by those adjustments.⁸ The BLM faulted that conclusion because the IG had valued the coal in the additional lease areas at the same rate as the main leases to which additional deposits were added. This conflict highlights the need for further review and guidance on valuing coal deposits, both for lease modifications and for maintenance tracts. The BLM argued that the coal should be valued at a lower rate because there was no competitive interest – one choice for valuation. If coal is being added to an existing lease because it is by definition coal for which there is no competitive interest, determining its value to the company requesting it might be appropriate – a second valuation alternative. The IG proposed yet a third alternative-- valuing the coal at the same rate as the lease being modified.

Headwaters Economics estimated that royalty rate reductions have reduced total royalty payments by roughly \$294 million on all leases sold between 1990 and 2013. Their report notes that these leases only accounted for roughly one-third of the amount of coal produced during this period, and that the remainder is from leases sold prior to 1990. If losses from royalty rate reductions are consistent with older leases, the total cost of reduced royalty rates is “closer to \$860 million from 1990 to 2013, or about \$37 million annually (in 2013 dollars).”²⁶ (26) Headwaters Economics, “An Assessment of U.S. Federal Coal Royalties,” January 2015. During the Programmatic EIS, the BLM should look for mechanisms that will introduce more transparency into the process of determining FMV for lease sales. The BLM should review the process in the State of Montana, which releases its FMV calculations for public review and comment before lease sales.

Because lease modifications and most LBA lease sales are not competitive, it is imperative that the BLM establish the correct Fair Market Value (“FMV”) for federal coal. The process of determining the FMV for a lease tract is shrouded in secrecy. The data and methodology the BLM uses to determine FMV are not publicly available. Bids are sealed. The public has no idea what the coal is worth or how it was valued.

In the absence of a competitive system, accurate determinations of coal values are critical to the revenues realized by the government. “Value” or “fair market value” enters into the lease sale and management processes

at several points, and serves as the basis for evaluating lease sale bids and lease prices paid, which, in turn, influence coal prices and calculations of royalty revenues. Final lease sale values can then be used as comparable for estimating values of new tracts. Thus, when value estimates are low, it is possible to lock in a system of continuing undervalued leases.

The process of developing fair valuations for tracts, especially in a noncompetitive system, can be both difficult and controversial. Regulations, agency guidance, and state office practices affect how value and FMV are determined. Appraisals involve subjective valuations of the elements that comprise the value of a property. There are legitimate problems with attempting to apply the same valuation processes used for competitively bid leases to lease tracts that genuinely lack competitive appeal.

In the case of Montana's 2010 lease sale of the state-owned Otter Creek tracts, the Montana Department of Natural Resource Conservation (DNRC) contracted with Norwest Corporation to prepare an appraisal of the FMV of the tracts.⁹ Norwest used BLM's Handbook H-3070-1, Economic Evaluation of Coal Properties, to calculate the value of the coal as \$0.0539 per ton, or \$30.8 million using the Comparable Lease Sales Approach. Using the Income Approach, Norwest placed the value at \$0.0652 per ton, or \$37.3 million. Norwest noted that these values were lower than similar federal lease sales because of the lack of existing mining equipment and rail service at Otter Creek. The DNRC released the Norwest valuation to the public and requested public comment in advance of the lease sale. The DNRC then used the appraisal and public comments to design a minimum bid package to secure fair market value for the coal leases. The winning bid by Ark Land Company, a subsidiary of Arch Coal, approved on March 18, 2010, was \$85,845,110 – significantly higher than the initial appraised FMV.¹⁰ Exposing all of this information to public review contributed to the higher bid the state received and certainly provided a more transparent process that could be used as a model for federal lease sales.

During the Programmatic EIS, the BLM should consider increasing the royalty rate to 18.75 percent for federal coal production, as this royalty rate would ensure that the taxpayers are recovering a fair share of the market value of the resource and not favor one energy source over another. The federal government currently charges a royalty rate of 18.75 percent for offshore oil and gas production, and many states charge similar or higher rates for state-owned oil and gas.

The industry has argued at times that the taxes that coal companies pay to local, state, and federal governments should offset the royalties they pay for the right to mine and sell federal coal. Just because the coal industry pays taxes, like every other industry, does not mean it should not pay fair market value for federal coal. Private landowners charge royalties on the market value of private coal, in addition to whatever taxes the companies might pay. Taxpayers, the owners of federal resources, should also charge market-based royalties.

Comment Excerpt Text:

The process used to determine the value of federal coal for calculating a royalty is also done in secret, and is largely controlled by industry. The Office of Natural Resource Revenue (ONRR) released its final rule governing the valuation of federal coal on June 30.¹¹ The updated rule is certainly an improvement, but TCS is disappointed that well documented problems with coal valuation were not eliminated. Numerous studies, including a recent report by the Council of Economic Advisers (CEA),¹² have demonstrated how coal companies manipulate the current valuation system to reduce royalty payments. Valuation of the minerals is a key component of the leasing process.

Comment Excerpt Text:

Here again, more transparency is the answer. TCS recommended ONRR consider an index price system for coal similar to the one used for oil and gas valuation.¹⁵ The CEA suggested possible models using average coal prices, regionally or nationally, to set the value of federal coal. Similarly, transportation deductions, “can be based on easily observable indices of coal transportation costs per rail mile, rather than on self-reported cost numbers according to the CEA report.”¹⁶ TCS also believes the deduction for washing coal should be eliminated. The deduction has proven susceptible to abuse and is generally a cost of doing business that should be borne by industry.

 Comment Excerpt Text:

In addition to analysis of phasing out coal leasing on public lands, HCCA encourages the BLM to carefully consider royalty rate structures, abuses and potential adjustments as part of the development of the PEIS. The BLM's PEIS website states that "[t]he review . . . will take a careful look at issues such as . . . how to ensure American taxpayers are earning a fair return for the use of their public resources." Royalty rate abuse at the West Elk Mine in Gunnison County exemplifies the need to examine this issue. The West Elk mine is operated by Mountain Coal Company (MCC), which is a subsidiary of Arch Coal. For years MCC has been the beneficiary of reduced royalty rates for two coal leases at the West Elk mine. MCC is currently seeking the renewal of its royalty reduction from the BLM, a request that would cut by 37.5% the royalties that would otherwise go to federal, state and local taxpayers.²⁴ This reduction would continue to deprive Gunnison County of money that it would otherwise receive.

²⁴ Letter of W. Koontz, Mountain Coal Co. to R. Welch, BLM (Sep. 4, 2014).

Despite this request for continued royalty payment reduction, Arch Coal paid its executives \$8 million in bonuses in January, 2016, one business day before Arch declared bankruptcy.²⁵ That's approximately the same amount that the State estimated in 2012 that Colorado taxpayers would lose under Arch's previous royalty relief request for the same leases.²⁶ The hypocrisy is staggering: Arch Coal's executives received bonuses one day before bankruptcy that equal the amount of royalty payments that did not remit to taxpayers for the use of a public resource. Arch has the wherewithal to mine these leases without reducing the payments that Gunnison County taxpayers deserve under law. In fact, it's doing so right now.

(25) See B. Hulac & D. Brown, ClimateWire, Arch Coal paid execs \$8M in bonuses on eve of bankruptcy (Mar. 16,

2016). See also J. Panank, Wall St. J., Arch Coal Paid \$29M to Insiders in Year Before Bankruptcy (Mar. 11, 2016), available at <http://www.wsj.com/articles/arch-coal-paid-29m-to-insiders-in-year-before-bankruptcy-1457721786> (last viewed July 28, 2016).

(26) Letter of Gov. J. Hickenlooper to L. Bagley, Colorado BLM (Aug. 10, 2012) ("The estimated loss in revenues to the

State of Colorado would be \$1,575,000 each year over the term of this reduction").

Under the current federal coal program, Gunnison County taxpayers were shortchanged to line the pockets of coal executives. This exemplifies the need for federal coal leasing reform, to address and correct abuses of the system. If we are to continue mining coal in Colorado, communities must get their fair share of royalties. Otherwise, mining executives will continue to shortchange our communities and leave us with the difficulties of transition.

 Organization I: Western Colorado Congress
 Commenter I: Emily Hornback
 Comment Excerpt Text:

The Mountain Pact has compiled data from various reports that show small changes to the leasing program, such as increasing royalties by \$2.50/ton, can create \$910 million in additional revenue by 2020 from federal coal resources. In Colorado alone, revenues could rise by \$20 million, half of which can go back to the states where the mining took place to be reinvested in communities, supporting programs such as the Delta County Economic Development group. To the degree possible PEIS must then look for ways to ensure this revenue is reinvested in communities to help us break from the boom and bust cycles of fossil fuel extraction.

Comment Excerpt Text:

Federal coal is lower value on average compared to non-federal coal. Federal coal makes up more than 43 percent of total U.S. production, but only 20 percent of total coal production value nationally in 2014. The average price of all U.S. coal valued at the mine was \$34.83 per ton in 2014.¹⁸ The average price of federal coal at the mine was only \$17.40 in the same year.¹⁹ Federal coal production value is a relatively smaller share of total U.S. coal production value for several reasons:

-Federal coal on average is of relatively low value (in terms of heat content), sub-bituminous coal, resulting in a lower average price per ton.

-Because of its relatively low heat content, federal coal is disproportionately utilized in domestic electricity generation markets where delivered prices are lower compared to other markets. Of total U.S. coal production, 81 percent is utilized for domestic electricity generation, about 12 percent is exported, and the rest, about 8 percent, is used in a variety of commercial and industrial uses, including steel production. About 98 percent of coal produced in Wyoming, which accounts for the large majority of federal coal, is used in the domestic electricity generation sector.²⁰

-The large majority of federal coal mined in the Powder River Basin in Wyoming and Montana is more remote from markets and has higher transportation costs resulting in a discount at the mine and restricted access to higher value markets. For example, international exports of coal used for electricity generation declined between 2002 and 2012 in Wyoming, but increased for the U.S. as a whole from about 10 million tons to more than 50 million tons annually.²¹

-Federal coal mining is relatively efficient compared to non-federal coal resulting in lower mining costs. Lower mining costs have allowed Western coal producers to gain market share by selling coal at lower costs. Montana and Wyoming rank second and first, respectively, in average coal production per employee hour (28 and 17 tons per employee per hour, respectively compared to fewer than 3 tons per hour in Kentucky and West Virginia).²²

-Federal leasing and royalty policy are also responsible for lower production value. Federal lease sales are uncompetitive, potentially limiting bonus bids received for federal coal and allowing companies to sell coal at lower prices. Through captive transactions at the mine and through "take-or-pay" contracts, companies may be able to further lower the gross value of coal upon which they pay royalties.²³

Policy decisions made by states can increase or decrease dependence on coal tax and royalty revenue. State and local governments often utilize fossil fuel revenue, including from coal, to offset (or lower) taxes on individuals and other economic sectors, which has the effect of increasing dependence on fossil fuel revenues. Different policy choices, including investing fossil fuel revenue in permanent funds and limiting the use of volatile fossil fuel revenue on annual governmental operating budgets, can create greater resilience to changes in coal revenue streams.⁴¹

Comment Excerpt Text:

Demand for coal in domestic electricity generation markets depends on the relative price of coal, natural gas, and renewable energy sources over time. With increased price competition from these other sources, coal utilization has become less predictable from year to year. For example, coal accounted for 33 percent of total generation in 2015, but EIA projects coal could supply between 28 and 40 percent of electricity generation in 2040.²⁸ Uncertainty about how much coal will be burned in the future-whether more or less than current levels-stems from price competition between coal and natural gas, and the relative volatility of natural gas prices compared to coal.

Recommendations: The BLM should raise royalty rates on federal coal production to ensure the public receives fair market value from its coal. An “adder” could be placed on royalties that applies to externalities from coal production, such as emissions of the GHG methane. The PEIS should fully analyze mechanisms for increasing the royalty rate, such that any subsequent rulemakings to change the rates can rely on this analysis.

Organization I:The Wilderness Society

Commenter I:Nada Culver

Comment Excerpt Text:

The BLM should highlight the need for the coal program to provide a fair return to taxpayers and use it as an overarching consideration in the PEIS. BLM should adopt changes that will ensure this goal is met in analyzing each aspect of the program, including as recommended in further detail below. At a minimum, this includes showing fair market value is being achieved for each element of the program. However, since fair market value is a technical standard, we recommend that, overall, the program should ensure there is a fair return to taxpayers.

The BLM should carefully analyze bonus bids that are being paid for coal leases and rental rates that are paid on leases in the PEIS and determine how those should be increased to ensure that the government receives fair market value from federal coal production. Bonus bids that have been paid by sole bidders in LBA sales should receive special attention.

Royalties must be paid on coal that is produced from federal coal leases. 30 U.S.C. § 207(a). Royalty rates are nominally 12.5 percent on coal mined from surface mines and 8 percent from underground mines. Unfortunately, however, the current effective rate of royalty payments is only 4.9 percent of the value of the coal that is mined—just \$ 1.70 per ton. (3) It has been estimated that taxpayers have been shortchanged by nearly \$ 30 billion over the last three decades due to limited royalty, bonus bid, and rental payments from the federal coal program. Part of the reason for these low royalty payments is the availability of subsidies and deductions that lower the royalty rate. In total, because of these problems, Americans are not receiving the fair market value of their coal.

Comment Excerpt Text:

The consequences of letting industry set the pace, scale and location of lease sales have been well documented. Numerous independent audits and third party reviews from 1980 to 2014 have found that the program does not provide a fair return to taxpayers, concluding that “There is no evidence that the BLM receives a market price for the coal,” (7) “weaknesses in the current sale process . . . could put the Government at risk of not receiving the full value for the leases,” (8) and the BLM “does not obtain fair market value for taxpayers. It seldom generates competitive bids, and studies indicate that the resulting losses are substantial.” (9)

BLM does not adequately limit lands open to development to appropriate lands. As we outlined in Section IV. B., BLM does not fully consider the full range of multiple-use values during land use planning. An example of this problem in practice is the Buffalo RMP under which “All coal lands are open to exploration, subject to multiple use constraints, resulting in zero acres closed to coal exploration and 4,775,136 acres open to coal leasing. . . .” (10)

(7) Institute for Energy Economics and Financial Analysis, “The Great Giveaway: An analysis of the costly failure of federal coal leasing in the Powder River Basin,” June 2012.

(8) U.S. Department of the Interior Inspector General’s Report, “Coal Management Program, U.S. Department of the Interior,” June 2013.

(9) Taxpayers for Common Sense, “Federal Coal Leasing: Fair Market Value and a Fair Return for the American Taxpayer,” September 2013.

(10) Buffalo Resource Management Plan Final Environmental Impact Statement, 2015, p. 123.

To address these problems, BLM should consider replacing the existing LBA leasing system with a modern approach that creates mechanisms to ensure a fair return, ensures any new leasing is based on a full consideration of other resources, and provides BLM with tools to achieve national policy priorities such as combating climate change.

Comment Excerpt Text:

There is no economic justification for raising royalty rates, lease payments, or any of the other costs or fees related to leasing and developing coal on federal lands. The domestic coal industry is suffering relentless regulatory and administrative attacks from the current administration and fierce competition from other domestic fuel sources coupled with depressed international prices. These regulatory and economic challenges have led to an unprecedented number of coal company bankruptcies. In 2015, Cloud Peak Energy paid over 33% of its gross annual revenue to federal, state, and local governments in royalties, production-related taxes, rents,

and lease payments. At current market prices, these governmental payments on coal production comprise approximately 41% of the sales price for a ton of federal coal. This economic burden is substantially higher than what companies pay to develop non-federal coal in the United States or to develop coal in other countries such as Canada, Australia, India, and China. Under any reasonable metric, coal producers pay much more than their fair share when developing coal from federal lands in the United States.

Comment Excerpt Text:

Increasing the royalty rate will lead to a decrease in the FMV for lease bonus payments. Although the bonus bid and royalty rate are derived from distinct statutory mandates, each cost directly influences the other. BLM's Coal Evaluation Handbook acknowledges that: (1) the royalty rate of the lease influences the amount of economically recoverable coal within a lease tract; and (2) the amount of economically recoverable coal within a lease tract influences the FMV of the lease. Any increase in the royalty rate will decrease the amount of coal that may be recovered economically and depress the FMV of the proposed lease tract.

Comment Excerpt Text:

Discouraging coal development is clearly the goal of anti-coal activists. However, this objective is contrary to 100 years of federal mineral policy and there is no statutory support for such a radical change. Any attempt by BLM to increase royalty rates or other leasing costs to further the anti-coal agenda would be a clear violation of federal law and policy. The Department of the Interior is not authorized to impose any new or additional taxes, fees, or penalties on coal production. Any effort to raise the royalty rate with the intention of lowering federal coal production volumes to achieve the administration's climate objectives, or promote renewable energy growth, would violate the law. Such efforts would constitute a new revenue measure, which can only be established by Congress.

Comment Excerpt Text:

There is no legal support for making federal coal leasing more difficult and costly. The statute that governs federal coal leasing on federal lands—the Mineral Leasing Act (“MLA”)— encourages federal coal leasing and requires BLM and coal producers with federal leases to achieve maximum economic recovery of the underlying coal estate. Any proposal that makes development of federal coal prohibitively expensive, or which limits coal production to advance other non-statutory goals, is unlawful. The current administration's anti-fossil fuel agenda violates the MLA and 100 years of law and policy encouraging a robust federal coal leasing program as a fundamental means of providing inexpensive and reliable energy to Americans.

Comment Excerpt Text:

The Secretary's determination of whether maximum economic recovery will be achieved is based on the economics of developing the particular coal reserve. See 43 C.F.R. §§ 3480.0-5(21), and 3484.1(b). The Secretary must consider the direct costs the lessee incurs in mining the reserve, with consideration given to "existing proven technology; commercially available and economically feasible equipment; coal quality, quantity, and marketability; safety, exploration, operating, processing, and transportation costs." Id. § 3480.0-5(21); see also id. §§ 3482.1(c) and 3487.1(c) (listing the information informing the Secretary's maximum economic recovery determination).

With regard to royalties, the royalty rate of a federal lease is a direct cost the Secretary must consider in making a maximum economic recovery determination. Current regulations governing maximum economic recovery provide that "profitable portions of a leased Federal coal deposit must be mined." Id. § 3480.0-5(21) (emphasis added). The royalty rate on the federal coal directly influences the coal's profitability. BLM's revised Coal Evaluation Handbook recognizes the connection between the royalty rate and maximum economic recovery:

[Maximum economic recovery] is an economic test based on when the direct mining, beneficiation, and royalty and tax costs for producing the next unit of coal into a marketable condition, are equal to the value derived from the sale of the same unit of coal. Said another way, the revenue from the sale of each incremental ton of coal must meet or exceed the direct costs to mine, transport, beneficiate, and pay royalty and taxes incurred to produce the next incremental ton of coal mined. [Maximum economic recovery] is achieved at the point where economically recoverable reserves become uneconomical.

Comment Excerpt Text:

Neither BLM nor any other entity has provided any factual support for the contention that the federal coal program fails to provide a fair return to the American people. Instead, BLM's review of the federal coal program is driven by the current administration's energy policies and the clamoring of various environmental activists. To be sure, the depressed market conditions and recent bankruptcies filed by coal producers are due in part to the deliberate efforts of the current administration and environmental organizations to shut down the U.S. coal industry. These anti-fossil fuel agendas provide no basis for arbitrarily increasing costs to coal producers under the MLA or any other federal statute.

BLM's programmatic review of the federal coal program should not be used as another weapon in the ongoing assault on the U.S. coal industry. Such an approach does not provide a legally-supported or rational basis for BLM's contemplated increase of costs associated with coal leasing, including bonus payments or royalties. Cloud Peak Energy urges BLM to review the federal coal program and its fair return to the American public based upon objective, reliable data and factual information, not the current agenda to shut down the domestic coal industry. A fair review of BLM's own FMV analyses for recent lease sales in the Southern Powder River Basin will reveal that bonus and royalty payments provide a fair return to the American people.

Comment Excerpt Text:

Moreover, attempting to determine the FMV of coal reserves that are not economically recoverable leads to unreliable value estimates. According to BLM's Coal Evaluation Handbook, "[a]n income approach analysis predicated on the recovery of coal reserves that are not economically recoverable will yield unreliable estimates of value." Id. BLM must understand that the contemplated changes to the federal coal program (i.e., increased

royalties or other leasing costs) would perpetuate the very problem identified by BLM; accurately determining the FMV of federal coal leases.

Before considering any changes to the federal royalty rate, BLM should first assess whether the newly revised Coal Evaluation Handbook has increased, or at least, more accurately represented the FMV, for federal coal reserves at the leasing stage. The Coal Evaluation Handbook has already implemented new guidance to ensure BLM's receipt of FMV for federal coal leases, including the requirement that BLM take into account current market factors such as "Economic and Domestic Coal Market Data" (i.e., supply and demand, coal prices, market expectations) and "Specific Lease Tract Economic Data" (i.e., markets for specific coal, quality of coal – btu content, sulfur, ash). *Id.* at 3-6 – 3-9. These newly informed FMV analyses may fairly resolve any issues BLM or the auditors found with BLM's FMV determinations and make clear that any increase in the royalty rate or other leasing costs is unwarranted.

Comment Excerpt Text:

In 2015, Cloud Peak Energy paid over 33% of its total revenue to federal and state governments in the form of bonus payments, production-related taxes, and royalties. Put another way, approximately 41% of the current sales price of each ton of federal coal goes to federal, state, and local governments. This is more than a "fair share" of the coal's economic value; especially when all risks associated with production, marketing, and reclamation are taken by the producer. Any increase in the royalty rate would substantially burden U.S. coal companies and frustrate their ability to develop federal coal reserves.

Not only do coal companies need to manage increased costs of labor, increased costs of regulatory compliance, and increased production costs, but they must constantly use current cash flow to invest in lease bonus payments and mining equipment and facilities to ensure the continuation of their business. In an environment where companies such as Cloud Peak Energy must spend such a high percentage of their total revenue on mandatory payments to the federal, state, and local governments, it is no surprise that there has been a significant number of recent U.S. coal company bankruptcies. Cloud Peak Energy is unaware of any other industry in the United States that is forced to operate under such an economic burden.

Comment Excerpt Text:

Under the current regulatory regime, BLM always receives FMV for federal coal leases. The existing coal leasing program requires that BLM carefully and confidentially determine the FMV of federal coal leases in advance of each lease sale. Pursuant to federal law, BLM must issue the lease to the highest bidder, as long as the bid meets or exceeds the FMV as established by BLM and the bidder satisfies the other legal criteria for holding a federal coal lease. BLM cannot accept any bid unless it meets or exceeds the predetermined FMV. The current bidding process ensures that BLM will always receive at least FMV for each and every federal coal lease, and the strong probability is that BLM will receive more than FMV for each lease.

Comment Excerpt Text:

Raising the federal coal royalty rate above 12 1/2 % will discourage leasing and development of federal coal in

favor of state or private coal available at a lower royalty rate. Congress has consistently declared that America's energy policy includes the significant development of domestic coal reserves. Congress sought to "encourage the maximum ultimate recovery of the coal deposits in the leasable lands of the United States," by imposing diligent development and maximum economic recovery requirements. Hearing Before the Subcomm. on Mines and Mining, 94th Cong. 133 (1975). The current royalty rates have been established to encourage greater production volume. Raising the royalty rate to discourage federal coal development directly contravenes the congressional mandate to encourage the maximum economic recovery of federal coal. BLM has no legal authority to consider extraneous issues, such as the social cost of carbon, in its maximum economic recovery determination. If the costs of mining federal coal deposits (including royalty rates, lease payments, etc.) become so high that mining the federal coal reserves becomes uneconomical altogether, federal coal will simply not be mined. Raising the federal coal royalty rate to a level that renders the mining of federal coal uneconomical is wholly inconsistent with Congress' directive to the Secretary of the United States Department of the Interior to manage the federal leasing process in order to achieve maximum economic recovery of federal coal.

Alternative C and D: Social Cost of Carbon and Royalty Rate Increases

This alternative would internalize the cost of carbon based on federal social cost of carbon estimates reflecting the "worldwide incremental damage from climatic change brought about by an additional metric ton of CO₂ emissions."⁶⁷ This price is sensitive to discount rates. A midrange price for the year 2020 is \$46 per ton of CO₂.⁶⁸ Similarly, BLM may consider royalty rates as a means to reform the federal coal program. Increased royalty rates can also include royalty carbon adders, which "directly incorporates a carbon price into the royalty paid on federal coal sales, reflecting its climate costs."⁶⁹ Interior should analyze these decision alternatives and compare them against the criterion of budget compatibility – whether the reformed alternatives are consistent with federal climate change targets, as illustrated by the 450 Scenario.

Furthermore, as noted above, the existing regulations have been set in place to clearly establish the LBA process as a competitive form of leasing, even if only one company offers a bid. The BLM sets an undisclosed FMV floor price and a company must meet or exceed BLM's valuation in order to receive the lease. Even if only one company submits a bid, they do not automatically receive the lease. There have been several instances that BLM's floor price was not met and a lease was not awarded. Since companies do not know the BLM floor price, it is fair

to assume that acceptable bids exceed the BLM price. In those instances, the American public receives a premium - or more than FMV. As part of this scoping process, the BLM should consider this information and review prior LBA sales to better understand the amount of additional money paid over the years because the accepted bid price exceeded FMV.

Table 1.3.2.1 below provides more complete and correct information as compared to Table 4 in the WEG report because it highlights the tracts for which more than one sale was held as well as sales for which there was more than one bidder. Table 1.3.2.1 illustrates that BLM held more than one sale and therefore, received more than one bid on 11 of the 27 tracts that have been leased since decertification of the PRB in 1990. Of these 11 tracts, 4 (36%) have had more than one bidder on the second sale. One tract had two bidders on the first sale. Therefore, only one bid has been received on 16 of the 27 tracts, or 59% of the tracts offered since decertification as compared to 81.5% of the tracts that received only one or no bid during the period of regional leasing between 1975 and decertification of the PRB in 1990. Further, all bids accepted by the BLM exceeded the FMV determined by the BLM. Clearly, the LBA process has not "severely diminished" competition for federal coal in the PRB.

The 1984 Linowes Commission report identified the complex property ownership patterns in the western U.S. as a major deterrent to having multiple competitors bid on a federal lease tract. (WY0-00258 to 00912). Specifically, the report states that "Due to ownership patterns... the Government seldom reaps the benefit of being able to offer all the mineral and surface rights needed for an entire economic mining unit. Were the Government to do so, it could guarantee to each potential bidder an opportunity to invest in a lease without uncertainty about whether additional private rights could be acquired, and at what cost, after the lease sale. Typically, however, economic mining units consist of private, State or previously leased federal coal interspersed with or adjacent to the federal lease tract. In other instances, the Government may own the coal mineral rights while a private party owns the surface." Linowes Commission 1984 - p. 155; (WY0-00428). Nowhere is this situation more evident than Wyoming's Powder River Basin. The Linowes Commission Report compares regional differences in federal coal and lists the Wyoming PRB as having only 11 percent of its acreage under a federal surface/federal coal ownership pattern. Linowes Commission 1984- p. 158 (Table 3); (WY0-00431). Conversely, 72 percent of the property ownership is non-federal surface/federal coal and 17 percent is non-federal or federal surface/non-federal coal. (See Map 1.3.3.1)

The Green River/Hams Fork Coal Region in southwestern Wyoming has a different surface/mineral ownership pattern with a much larger percentage (52 percent) in federal surface/federal coal ownership pattern with very little (3.5 percent) in non-federal surface/federal coal. According to the Linowes Commission Report, coal tracts offered in the Green River/Hams Fork and Uinta-Southwestern Utah regions had achieved the most bidding competition. See Linowes Commission Report 1984- p. 159; (WY0-00432) and (see also Maps 1.3.3.2 and 1.3.3.3).

Comment Excerpt Text:

The GAO also expressed concern about some BLM offices not utilizing comparable value valuation methodologies in conjunction with the income approach to estimate FMV of the leases offered. They did however point to the fact that the BLM Wyoming office utilizes both approaches and actually goes a step further to numerically adjust its comparable sales using the results of the income approach. GAO Report, p. 30; (WY0-03646). Wyoming coal mines produce over 80 percent of the federal coal reserves mined in the U.S. Therefore, in the PEIS analysis, BLM must consider that 80 percent of the federal coal being mined in the U.S. is already being valued by BLM Wyoming based on something better than the GAOs recommended valuation methodology. The PEIS reviewing the federal coal program must consider that, upon completion of the GAO and OIG reviews, the BLM took action to resolve the identified concerns. The changes in guidance and policy that were the outcome of the GAO and OIG reviews (listed below) are basically administrative in scope, offering guidance to the BLM for assuring the program's continued effectiveness. The OIG report did NOT conclude the program has resulted in loss of revenue. Instead, it found that updating certain agency policies would minimize certain hypothetical risks for the undervaluation of the resource.

Comment Excerpt Text:

The Council also refer to "asymmetric information" such as transportation and washing expenses that the Council claims may be inflated because the expenses are self-reported by the coal company. Please note that the federal government, specifically Office of Natural Resources Revenue, contracts with the Wyoming Department of Audit to perform FMR audits of mineral companies including coal companies. These audits verify not only the production volume and sales price of the mineral but also the allowable expenses claimed by the producer for both federal royalties and state severance taxes. Since these asymmetric charges are verified under audit, it is highly unlikely that they could be inflated. Once again, we note that Wyoming produces 80 percent of the coal produced under federal lease. Therefore, a vast majority of the asymmetric costs in the federal coal program are verified under audit.

Comment Excerpt Text:

The Council recommends assessing royalties based on the "true observable market value" of coal. This sounds like an easily defensible change to valuation of the product, however it ignores the sales of the product that are conducted at the mine mouth such as captive mines where the consumer of the coal (a power plant) is located at the mine mouth. There are no transportation or washing costs at these mines so royalty charges would be significantly less than transported coal. This would provide a competitive advantage for having the power plant adjacent to the mine. Basing royalties on the heat value of coal is not a viable concept as BTU value is already priced by the market. The BLM must consider these facts in its PEIS.

Comment Excerpt Text:

It can take years from the point a particular tract is nominated for lease to the point where a lease is awarded during the LBA process. For example, the North and South Porcupine LBAs in the Wyoming PRB were nominated for lease in 2006. Despite the fact that these two tracts were simple maintenance tracts designed to extend the life of existing mines-as opposed to being used to start up new mines-the leases were not awarded until six years later in 2012. See Notice of Competitive Coal Lease Sale, Wyoming, 77 Fed. Reg. 22607 (April 16, 2012) (South Porcupine); (WY0-00916 to 00917); Notice of Competitive Coal Lease Sale, Wyoming, 77 Fed. Reg. 31385 (May 25, 2012) (North Porcupine); (WY0-00919 to 00920). Once a lease is awarded, companies must acquire the necessary permits to actually mine the lease in accordance with OSMRE and Wyoming regulations. This process can take an additional four to five years. It is common for a decade to pass from the time in which a lease is nominated until it is permitted and approved to be mined. It is critical for the BLM to consider the impact of changing market prices and environmental regulations and timelines from the time coal is leased until it is actually mined. BLM should also conduct time value of money analyses to determine the true value of the LBA since the money is paid many years prior to actual production, which is when a company would actually receive the first returns on its investments.

Using the Porcupine LBAs as an example, the total cost for lease application processing and the NEPA evaluation was more than \$1.4 million and paid over the years 2007 - 2010. The total bonus bid for the Porcupine South and North federal coal lease tracts was \$1,239,302,175. Of the total, \$744,000,000, or 60 percent had been paid prior to the date the mine received final federal mine plan approval in 2012 and could begin removing coal from the tract, thus generating revenue.

Figures 2.5.1 and 2.5.2 below compare Wyoming coal prices (nominal) versus Wyoming PRB bonus bids for the period of January 1991 through December 2012. Since the inception of the LBA process in Wyoming in 1991, annual average coal bonus bids have risen from \$0.1364/ton to \$1.19/ton- an increase of 872 percent. During this same period (Jan. 1991 -Dec. 2012) coal market prices increased from \$8.06/ton to \$14.15/ton (8800 BTU product)- an increase of 175 percent. Coal prices dipped to a low point of \$5.40/ton in 1999. The percent increase from this low point to the price for 8800 BTU product as of Dec. 2012 (\$14.15/ton) was 262 percent. This information illustrates the fact that the bonus bids have substantially outpaced the price of coal over the past 20 years. The American public has received substantial value from bonus bids, taxes, royalties and fees from its federal coal and affordable, reliable energy as well.

In developing estimates for FMV for the federal coal program, it is necessary for the BLM to incorporate into its analysis methods the inescapable fact that international trade does not always operate under free market principles. Market supply and pricing manipulations, as well as currency manipulation; by sovereign governments and sovereign owned/controlled companies, such as current and past actions of the Organization of the Petroleum Exporting Countries and recent dumping of steel by China, exemplify the inability of global markets to be relied upon to operate under free market principles. This reality, over lengthy periods of time during which numerous non-free market manipulations are highly reasonable to be expected, must be incorporated into the BLM's review and consideration of any FMV methodology changes, especially those that diminish national security, economic stability and social wellbeing

Comment Excerpt Text:

"The BLM receives revenue from coal leasing in three ways: (1) a bonus that is paid at the time BLM issues a lease; (2) rental fees; and (2) production royalties. The royalty rates are set by regulation at a fixed 8 percent for underground mines and not less than 12.5 percent for surface mines. All receipts from a lease are shared equally with the state in which the lease is located."

Since 1992, the State of Wyoming and the federal government have been the recipients of substantial revenues due to federal coal bonus bids alone. During the 20 year period from 1992 to the last lease sale in 2012, bonus bids from federal coal leased in Wyoming have totaled more than \$5.4 billion.

Order No. 3338 completely ignores that federal coal bonuses, royalties and rentals are but a portion of the federal, state and local payments by coal companies to the significant benefit of the American public. The BLM must evaluate the total of bonus bids, rents, royalties and taxes imposed regardless of who is collecting those fees in determining whether the American public is receiving a fair return from coal leasing and production. Not only do companies pay federal mineral royalties (FMR), bonus bids and rents to the federal government, they also pay corporate income taxes, state sales and use taxes, ad valorem taxes, Abandoned Mined Land fees and black lung excise taxes. Table 2.1 provides a detailed listing of all federal, state and local taxes, fees and royalties paid by coal operators in Wyoming for 2014 and 2015.

Comment Excerpt Text:

Current royalty rates are above market, and if increased will only result in decreased production and return on investment for the American public. For example, in the Wyoming PRB which produces 80 percent of federal coal in the U.S., the government (local, state, federal) receives almost \$0.40 for every \$1.00 of coal sold. The following illustration is based on the current price per ton of coal in the PRB which is approximately \$11.00 per ton.

* 12.5% Federal Mineral Royalty- \$1.38

* Lease Acquisition Fee (bonus bid)- \$1.00

* Abandoned Mine Land - \$0.28/ton

* Black Lung Excise Tax- \$0.55/ton

* State Severance and Local Ad Valorem Production/Property Taxes (5.3% and 4.5% respectively) - \$1.08

total, this amounts to \$4.29 in royalties, taxes and fees on every ton of coal sold at current rates- an effective rate of 39%.

Further, federal coal leases pay considerably higher royalty rates than paid on private coal. Private royalty rates on coal produced in the Midwestern and Eastern U.S. generally range from 3 to 8 percent and in limited cases may reach 10 percent. Royalties paid for private coal leases in Wyoming are also less than the federal coal royalty rates. Additionally, bonus bids are unique to federal coal leases and are rarely if ever paid on private leases. When the federal bonus bid is combined with the federal royalty rate, the effective royalty rate is 22 percent. BLM must consider the full extent of taxes, royalties and fees levied on federal coal mined in Wyoming. Further, the BLM needs to analyze how royalties, combined with other taxes and fees levied on coal production, have an impact on the profitability of the resource.

The federal government sets "fair market value" and is guided by the following definition: "Fair market value means that amount in cash, or on terms reasonably equivalent to cash, for which in all probability the coal deposit would be sold or leased by a knowledgeable owner willing but not obligated to sell or lease to a knowledgeable purchaser who desires but is not obligated to buy or lease."

43 C.P.R. § 3400.0-S(n)

The FMV is an undisclosed lease price set by BLM. Both the price and the exact process used to set the price are secret to protect the integrity of the process to ensure the greatest return for the American public. Consider the following comparison which is relevant regardless of whether there is only one bidder or multiple bidders for a federal coal lease tract. If this were Las Vegas, BLM would be the house. BLM has never accepted a bid at or below FMV. That means the American public consistently receives more than FMV. Some are calling for the BLM to give away the house advantage. That is akin to robbing the house, and therefore robbing the American public of fair market returns. Furthermore, if those advocating keeping coal in the ground are successful, the American public receives no return, let alone a FMV. The BLM must consider this in its PEIS.

In considering what factors to include when evaluating the fair return to the American public, and to include when developing estimates of FMV, it is incumbent upon the BLM as responsible stewards of the American public's assets, to pursue a holistic approach that includes much more than the question, "Are the bonus bids, rents, and royalties received under the Federal coal program successfully securing a fair return to the American public for Federal Coal, and if not what adjustments could be made to provide such compensation?" The BLM has the obligatory responsibility to thoroughly evaluate and consider the net national environmental, economic, security and social impacts and benefits for the numerous ramification outcomes for changes to the federal coal program.

It is therefore essential that the BLM consider all coal-related benefits received by the American public when determining fair return to the American public in its evaluation of the federal coal program. It is also essential for BLM to provide a fair and balanced review of impacts associated with all forms of energy, not just coal.

The PEIS is also an opportunity for Interior to reevaluate the washing deduction in a larger economic and policy context. Washing activities are, in fact, simply the last step in extracting coal and placing the commodity in a marketable condition. There is no clear justification for allowing this deduction. It is a potential source of producer abuses that the CEA report notes is a "poorly observable cost." More importantly, it is inconsistent with valuing coal as a commodity in the marketplace because it takes the point of valuation back to a stage where coal is not yet a commodity.

Once gathered, market price data for different types and quality of coal would be validated to ensure the data reflects arm's length sales and is otherwise reliable. The validated data would then be placed into statistical models used in property valuation contexts to produce market values for coal. Such models applied well are administratively efficient and produce values at a high level of accuracy and reliability. The models also can be used to produce values for coal of a type and quality for which market data is not readily available through adjustments from the value of coal of different type and quality, for which data is available. If necessary, such values can be further tested using other financial and economic analytical methods. Transportation deduction allowances are more likely to be established based on traditional accounting analysis, but statistical techniques may also be applicable in some instances. Interior should test statistical modeling and other analytical techniques using market price data during the PEIS. Ideally, by the latter stages of this process, Interior would have sufficient

tested a direct valuation system to implement it soon after the completion of the PEIS.

The market values for coal and transportation deductions generated under a direct valuation system would be posted publicly as would the lease by lease payments of royalties based on those values, achieving openness and transparency for the royalty process. This is possible, in part, because, as in property tax valuation systems, these publicly established values and payments cannot be considered proprietary. Underlying market price data used in the modeling may, in many cases, be proprietary and would continue to be fully protected from disclosure. Again, this occurs in property tax administration. Confidential data used to value property is protected, but the publicly established values and payments based thereon are fully public. The methods of generating the values of coal do not allow tracing back from the public values to producer financial records. If rare and unique circumstances exist where such might occur, the values in those case could be protected. However, that would be a rare exception and not a general rule.

Direct valuation would equitably and reliably achieve a fair return for the taxpayers based on the true market value of coal adjusted for heat content, quality and location of coal. For the first time ever, the standard of value laid out by (?) the Mineral Leasing Act would be attainable. Undue producer influence over royalty values and payments and distortions of royalties caused by producer inefficiencies and managerial shortcomings would end. Direct valuations would finally enable the public to know what they are being paid in royalties they own. Transparency would operate over time to help ensure the integrity of the royalty process in ways entirely unattainable at present in a system where royalty values and payments are kept secret. Public trust and confidence in the coal royalty system would increase.

Comment Excerpt Text:

The PEIS should consider whether discretionary royalty rate reductions, which subsidize the production of marginal coal that impose external costs on society, is justified. Further, if discretionary rate reductions are allowed, the decision-making surrounding such reductions should be made fully public. The PEIS should be used to evaluate the details of transparency for selective rate reductions if such reductions are not eliminated entirely. There is, as has been noted, a substantial body of work and discussion of increasing royalty rates or adding fees per ton of coal to compensate society for the climate change impacts of coal and potential other public health and environmental effects of coal. The recommendations for a new public coal planning and leasing system and public royalty system establish an infrastructure within which Interior can secure public and expert participation in decision-making processes to adopt and adjust over time royalty rates and fees. Further, the extensive information generated out of the public planning and leasing and public royalty systems will greatly enhance the ability of the public and experts in civil society to engage these issues at a higher level than is possible under the closed systems of administration that need to be replaced. Finally, robust public leasing and royalty systems would prevent the intent of any potential increases in royalty rates or fees to be undermined by greater efforts by producers to reduce standard lease and royalty payments further below fair market value levels to help offset the costs of the higher rates or additional fees.

Comment Excerpt Text:

In the same vein, the PEIS should also prepare for a fundamental change in the royalty system. The current system, administered like an income tax, allows coal producers to self-assess the value of coal for royalty purposes. Historically, some producers have used sophisticated methods to underreport coal values. Recent rules adopted by the Office of Natural Resources Revenue (ONRR) requiring valuation of coal at the first arms-length sale will help reduce producer underreporting of coal values arising from below market sales to captive affiliates. There is no doubt that these new rules represent a major step forward in improving the current royalty process, and Interior is to be commended for making these changes. However, despite those improvements, the

royalty system still does not reliably guarantee a full and fair return to the public. Substantial loopholes remain that allow coal producers to underpay royalties through inflated deductions or exclusions.³ As long as coal producers are allowed to self-assess coal values, they have a financial incentive to understate those values.

(3) Isaiah Peterson, “Devaluing Coal: Reasons for Restructuring How Federal Coal is Valued,” *Georgetown Journal of Law and Public Policy*, 2015, 13(1): pp 165-180.

The companies will find ready assistance in these efforts from the large industry of experts who help corporations avoid income taxes by shifting profits among national and state taxing jurisdictions through complex transactions and legal structures. Accountants and attorneys well-versed in profit shifting readily translate those methods into royalty avoidance techniques. Indeed, the royalty avoidance through below market coal sales of coal to captive affiliates is a simplified version of methods corporations have long used to shift profits earned in the United States to tax havens overseas—a problem the IRS has failed to solve after 50 years of trying. As long as companies self-assess values for royalties, Interior will never catch up to the ever more creative royalty avoidance strategies that spread from the world of taxation to infect royalty administration. No amount of selective loophole closing will ever overcome the incentives for and ingenuity of companies to avoid full and fair royalty payments. Thus, royalty self-assessment is inherently incapable of guaranteeing the public the fair return on coal required by law. Certainly, audits of royalty returns can correct a number of underreporting problems. But audit resources are often always too scarce and even under the best of circumstances will not correct all the shortcomings in the original reports. Further, audits may come several years after returns are filed, leaving some facts difficult to determine, producing conflicts with producers over ambiguities and resulting in partial settlements. Self-assessment combined with return auditing is “a second best solution” compared to the system recommended in this report.

As long as companies can undercut the proper valuation of coal for royalty purposes, the self-assessment system will prove ill-suited to the goal of adjusting coal production to the realities of climate change. Several experts have proposed raising royalty rates or adding per ton royalty amounts to compensate the public for the cost of climate change and other environmental effects. (5) However, increases in royalty rates will also increase the incentive for coal companies to undervalue coal. Unless the system of self-assessment is replaced with a system that ensures the integrity of the royalty base, the objectives to be served by higher royalty rates or added royalty fees will only be undermined by more aggressive efforts to underreport coal values in the calculation of the royalties. That is true even if higher royalties take the form of physical fees per ton. While these fees might not be avoided directly, they will be undercut indirectly by companies “compensating” themselves for the higher fees through increased underreporting of the “percentage of value” portion of royalties. Any effort to compensate or protect the public for the impacts of climate change or other environmental factors with higher royalties will only be significantly undermined by the system of corporate self-assessment of royalties.

Comment Excerpt Text:

Transparency and open participation would also connect Interior with the public they are to serve. Coal decisions are made privately with interaction at key points with coal producers whose interest is to minimize payments for the coal itself or for mitigating the external impacts of coal production. The current systems cut off Interior from the public that wants to help secure a fair return from coal and properly mitigate the public costs of its production. These systems are illogical. Privileged access is provided to parties whose interests often conflict with the public interest, while those who want to see the public interest served are kept out of the loop at key stages of decision-making. Adopting open, public processes of decision-making will logically align decision-making with the goals and interests that, under the law, ought be served.

Finally, the public simply has a right to know about the issues and decisions that affect them. Resource

management decisions often have major impacts and typically involve choices among public values. The public should have access to such decisions as they are being made and not after the fact, when the impacts may not be mitigated or their values preserved.

Comment Excerpt Text:

Recommendation 4: Through the PEIS, Interior should adopt a transparent process of setting royalty rates, directly valuing and collecting royalties on coal production, and regular reporting to the public royalty payment by lease in order to achieve a fair return for the public and ensure the integrity and accountability of the royalty process. Further, the PEIS should reevaluate the deduction for coal washing.

As noted earlier, Interior is to be commended for its recent strengthening of coal royalty rules to eliminate some sources of producer underreporting of coal values. However, those rules do not eliminate other sources of underreporting associated with inflated deductions and exclusions from coal value. More importantly the entire structure of the self-assessment system used for royalties—patterned after income taxes—is vulnerable because it encourages companies to underreport royalties and invites continuing efforts to import income tax avoidance strategies into the royalty arena. In addition, the system of self-assessment is secret, so the public is denied knowledge of what it is paid for coal in royalties on each lease and is unable to assist with ensuring that it receives a fair return on federal coal.

All of these problems could be remedied by Interior directly valuing the coal for royalty purposes as the Mineral Leasing Act clearly authorizes. (8) Such a system would be modeled after property tax administration and would not be subject to the kind of defects inherent in the income tax-style, self-assessment system. Moreover, the final values, as established by Interior based on statistical analysis of market price data, would be public, even while proprietary data received from companies would remain confidential.

The Mineral Leasing Act specifies that “a lease shall require payment of a royalty in such amount as the Secretary shall determine of not less than 12 1/2 per centum of the value of coal as defined by regulation.. .” A plain reading of the law is that it charges Interior with the duty and responsibility of determining the value of coal.

A recent report by the Council of Economic Advisors recommends adopting this approach of direct valuation based on market prices and approach and outlines how it would work:

Under a framework analogous to property taxes, the market value for coal should be based on sales prices of coal with similar characteristics, from both Federal lands and non-Federal lands. Under such a framework, the most appropriate price to use would be the market price for coal with similar characteristic in the region of coal extraction. (9) Council of Economic Advisors, June 2016, p 8.

The report further stated: There is strong economic support for setting coal lease royalty terms based on the final delivered price of coal, less adjustments for the heat content, quality, and location of coal. These adjustments are crucial to make sure coal is assessed on its true economic value.

Similarly, establishing lease royalty terms based on relevant (adjusted) market prices for comparable coal or coal substitutes is important to ensure a fair return to the taxpayer. The relevant market price could be the average price of nearby regional coal, the price of nationwide coal, or the price of a substitute in the electricity dispatch orders: natural gas. *Id.*, p 4.

Direct valuation makes it possible to eliminate all underreporting associated with creative accounting by producers—including inflated deductions and exclusions that are not remedied by even the newly adopted ONRR rules. Further, it removes all incentives for producers to continuously explore and employ new accounting methods and legal structures for royalty avoidance purposes. It contains the additional benefit to the coal companies, Interior and the public of not delaying disputes over royalty payments up to eight years down the road long after production occurs. Disputes will be minimized and addressed upfront, soon after the time of production for which current payments are made. That enhances the certainty of the royalty for all parties and yields substantial administrative efficiencies.

David Hayes, former Deputy Secretary of Interior, speaking at the recent New York University Institute for Policy Integrity Federal Coal Workshop on June 29, 2016, expressed support for Interior directly valuing coal,

noting that coal is a commodity and, as such, it should be feasible to determine its value. This idea that the value of coal for royalty purposes should be based on the value of the commodity in the marketplace also reveals a further difference between the direct valuation approach vs. producer self-assessment. Direct valuation yields a value for coal in the market (adjusted to the mine via the transportation deduction). Producer self-assessment yields a value for coal to the producer. As such producer self-assessment, besides all the other problems already cited, makes the royalty values and payments dependent on the managerial performance, market acumen and operational efficiency of the producer. The public should not be shortchanged because producers fail to secure the full value of its coal in the marketplace or use inefficient transportation methods, yet the self-assessment system. From an economic perspective, as reflected in CEA report, direct valuation yields royalty payments that reflect the true value of coal as a commodity in the marketplace—which is the standard of the Mineral Leasing Act.

In terms of securing adequate data for the periodic modeling of market price data, Interior should continue requiring information reporting on coal sales from producers of federal coal. Interior could also gather market data from the Energy Information System and from state sources. In his NYU workshop remarks, Hayes noted state electrical utility commission records contain a wealth data on coal purchase prices that Interior could use in the valuation process. The same is true of state coal severance tax records, especially for non-federal coal. Interior should systematically identify, test and develop key sources of market price data for use in direct valuation during the PEIS. Interior should also create the administrative systems to collecting and validating the data during the PEIS

In a direct valuation system, Interior would also develop the cost of the allowable transportation deductions based on the most efficient means of transport. Again, the PEIS process should be used to identify public and private sources of data, starting with the Surface Transportation and continuing producer reports, for accomplishing this task. Transportation deductions are retained to adjust the value of coal back to the mine and take the location of coal out of the valuation equation as noted by the CEA report.

2. Just Transition Alternative

The “Just Transition Alternative” is meant to both wind down the federal coal program in order to keep fossil fuels in the ground and to ensure an orderly, effective, and fair transition of workers and communities away from coal to more prosperous and sustainable economies. The “Just Transition Alternative” is defined by the following key components:

1. An end to federal coal leasing: Consistent with authorities and discretion under the Mineral Leasing Act, the Just Transition Alternative imposes a permanent pause on the leasing of federal coal. The primary basis for adopting this permanent pause would be to ensure the protection of the public interest and the interests of the United States. Such justification for an end to leasing is clearly supported by the Mineral Leasing Act.

This pause would apply to all competitive leases (including all leases by application, including emergency leases, as defined by 43 C.F.R. § 3425.1-4) and lease modifications. We further believe there is ample justification for applying a permanent pause to other forms of non-competitive leasing, such as preference right lease applications and lease exchanges. With regards to lease exchanges, the BLM has clear authority to reject exchanges that are not in the “public interest.” 43 C.F.R. § 3435.4(a); see also 43 C.F.R. § 3436.0-2(b) (related to alluvial valley floor exchanges) and 43 C.F.R. § 2200.0-6 (generally related to exchanges). With regards to preference right lease applications, the BLM has the authority to reject such applications where there does not exist “commercial quantities” of coal. 43 C.F.R. § 3430.5-1(a)(1). Given the dismal state of the coal industry and the overwhelming climate costs that coal imposes on society, it would be dubious at best to claim that any commercial quantities of coal exist where there are preference right lease applications. Accordingly, the BLM has the authority to reject such applications. (20)

Furthermore, to ensure an orderly end to federal coal leasing, the BLM and the Department of the Interior should issue a rule or guidance requiring that as land management planning is undertaken pursuant to 43 C.F.R. § 1610, et seq., that all lands within a resource management area that are not currently leased for coal, be made unavailable for leasing. The authority to impose such direction is set forth at 43 C.F.R. § 3420.1-4(e), which gives the BLM broad discretion to “eliminate additional coal deposits from consideration to protect other resource values.” 43 C.F.R. § 3420.1-4(e)(3).

(20) The only preference right lease applications that exist are in northwestern New Mexico, where Arch Coal, which is currently bankrupt, has the rights to acquire 21,000 acres of leases. Legislation was introduced in the U.S. House of Representatives that would allow the Secretary to retire these preference right lease applications. See HR-1820, available online at <https://www.congress.gov/bill/114th-congress/house-bill/1820/text>. If this legislation is passed, there would be no additional preference right lease applications requiring action. We support this legislation and urge the Secretary of the Interior to encourage its passage in the U.S. Senate and adoption into law.

Putting a permanent pause on leasing will not destroy the U.S. economy or otherwise endanger our energy security. As a recent report looking at leasing in the Powder River Basin found, existing leased reserves in the Powder River Basin are sufficient to meet demand and effectively contribute to limiting temperature increases.

(21) This report is instructive as the Powder River Basin is the largest coal producing region in the United States and imposes the greatest influence on energy supply and demand in the nation. If an end to federal leasing can be justified in the Powder River Basin, it can be justified for federal leasing elsewhere in the U.S.

21 See Exhibit 11, Fulton, M., D. Koplow, R. Capalino, and A. Grant, “Enough Already: Meeting 20C PRB Coal Demand Without Lifting the Federal Moratorium,” Report Prepared for Energy Transition Advisors, Earth Track, and Carbon Tracker Initiative (July 2016), available online at <http://www.carbontracker.org/report/enough-already-2c-powder-river-basin-coal-demand-federal-moratorium/>.

2. Increased royalty rates and rentals: Coal is exacting a tremendous toll on our nation, costing our society billions in climate damages, adverse health impacts from air pollution, and water contamination. Royalty rates from production on existing coal leases and rentals on existing leases must be increased to begin to recoup the costs of these externalities, which are currently shouldered by the public.

Although royalty rates are normally imposed through new leasing, we recommend that the Interior Department and BLM incorporate higher royalty rates into existing leases as existing leases are readjusted pursuant to 43 C.F.R. § 3451.1. To accomplish this, we urge the amendment of 43 C.F.R. § 3473.3-2(a)(1) and (2) to incorporate increased royalty rates for both surface and underground mining. As leases are readjusted, these royalty rates must be applied to existing leases pursuant to 43 C.F.R. § 3451.1(a)(2).

Increasing royalty rates has been recommended by the White House as both a means to generate revenue and address the costs of environmental externalities, including carbon costs. (22)

(22) See Exhibit 12, Executive Office of the President of the United States, “The Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to Taxpayers” (June 2016), available online at https://www.whitehouse.gov/sites/default/files/page/files/20160622_cea_coal_leasing.pdf.

Furthermore, royalty rate reductions should not be approved. Currently, royalty rate reductions are routinely granted as companies claim poverty or difficulty in mining with little apparent scrutiny as to whether the reductions are justified. In Colorado, for example, BLM officials have approved royalty rate reductions to facilitate methane venting and most recently proposed to approve a retroactive royalty rate reduction for a mine that was not even producing coal. (23) See Exhibits 13 and 14.

Similarly, we urge Interior and BLM to amend 43 C.F.R. § 3473.3-1(a) to raise rental rates for federal coal leases. Currently, rental rates are set at \$3.00 per acre, a figure that has not been adjusted since 1979, if not earlier. This rental rate not only has failed to be adjusted to account for inflation, but fails to account for the fact that some leases may be of small acreage, yet yield significant amounts of coal. Rentals should reflect the value of the lease, which depends on the amount of coal a lease contains. In accordance with 43 C.F.R. § 3473.3-1(a), any increased rental rate must be applied to any readjusted coal lease.

3. Existing leases that are not producing must be canceled: Where a lease is not meeting continued operation requirements under 43 C.F.R. § 3483.1(a)(2), it is subject to cancellation pursuant to 43 C.F.R. § 3452.2. Where a

lease is not meeting continued operation requirements, BLM and the Interior Department should make clear that cancellation of the lease must be pursued. To this end, discretionary avenues for avoiding cancellation should be prohibited. Thus, lease suspensions under 43 C.F.R. § 3483.3 and payment of advanced royalties in lieu of continued operation under 43 C.F.R. § 3483.4 should be barred.

The justification for imposing such direction is very clear. Currently, BLM regularly grants lease suspensions and allows payment of royalties in lieu of continued operation with no assessment of whether such actions are appropriate or in the public interest. BLM appears to be under the impression that lease suspensions or advanced royalties are somehow mandated, and that the agency has no choice but to approve company requests. An egregious example of this is with regards to Arch Coal's Carbon Basin Lease in southern Wyoming (No. WYW-139975). Arch acquired this lease with the aim of developing a mine to fuel a proposed coal to liquids facility. However, this coal to liquids facility has never materialized or even shown any promise of materializing. Most recently, the Wyoming Department of Environmental Quality terminated the permit for the proposed facility. (24) Nevertheless, since 2010, Arch has failed to meet continued operation requirements. The BLM has allowed Arch to maintain its lease, however, by routinely allowing the company to pay advanced royalties in lieu of continued operation. (25) These decisions appear to be pro forma in nature, and do not reflect any consideration as to whether it is appropriate or remotely in the public interest to accept advance royalties in lieu of continued operation.

(24) See Exhibit 15, Wyoming Department of Environmental Quality, "Permit Termination, Medicine Bow Fuel and Power Coal to Liquid Project" (June 27, 2016).

(25) See Exhibit 16.

Furthermore, where an existing lease is not producing, yet is part of a producing logical mining unit, BLM and the Interior Department should use their discretion to modify the boundaries of logical mining units to eliminate the non-producing lease and facilitate its cancellation. BLM has such discretion under 43 C.F.R. § 3478.1.

Cancelling leases that are not producing will serve the goal of preventing any potential future development of existing leases and contribute to an orderly end to the federal coal program.

4. Accounting for carbon costs in coal management: It should be made clear, whether through new rules or guidance, that carbon costs must be analyzed, assessed and disclosed as federal coal management decisions are made. Such decisions are most likely to include mining plan modifications issued pursuant to the Mineral Leasing Act, 30 U.S.C. § 207(c), and the Surface Mining Control and Reclamation Act ("SMCRA"), 30 C.F.R. § 746, and lease readjustments. It is imperative that the BLM and Interior maintain close accounting of the carbon emissions and costs resulting from its coal management actions, to ensure full transparency around these emissions and costs, and to meaningfully act to address these emissions and costs. Particularly given that, pursuant to authorities under the Mineral Leasing Act and SMCRA, the Secretary of the Interior has full discretion to disapprove mining plans authorizing the development of leased federal coal, it is imperative that carbon emissions and costs factor into and influence such decisionmaking.

5. Reclamation must be guaranteed: To ensure an orderly end to the federal coal program, full and final reclamation must be guaranteed within a reasonable timeframe. We urge two regulatory changes to ensure this occurs.

First, Interior should amend regulations at 30 C.F.R. §§ 816.100 and 817.100 to provide clarification and specificity around contemporaneous reclamation. Current rules are vague and fail to ensure that reclamation proceeds in a manner that is as "contemporaneously as possible" with mining in accordance with 30 U.S.C. § 1202(e). These regulations should be amended to make clear that the success of contemporaneous reclamation must be measured based on a comparison of Phase III bond release acres, as defined under 30 C.F.R. § 800.40(c)(3), with disturbed acres and ensure that reclamation proceeds at a 1:1 rate, in other words for every acre disturbed, one acre should be fully reclaimed to meet Phase III bond release standards.

Second, just as current BLM rules require diligent development of federal coal, these rules should also require diligent reclamation. To this end, Interior and BLM should consider rule changes to ensure that nonproducing coal leases are fully reclaimed within two years of failing to meet continued operation requirements and set

deadlines for the full reclamation of federal coal leases that are no later than 2035. This reclamation deadline should be established by rule and incorporated into lease terms as leases are readjusted.

Finally, Interior should amend self-bonding regulations at 30 C.F.R. § 800.23, and any other regulations, as appropriate, to prohibit self-bonding whenever publicly owned coal is permitted to be mined. This will ensure that, as coal companies continue their decline, that American public resources are fully protected and fully guaranteed to be cleaned up.

6. Prioritizing transition: Above all, the BLM and Interior must make transition away from coal a foremost goal as the federal coal program comes to an end. To do this, the agencies should not only explicitly commit, to the extent possible, their leadership, resources, and expertise to ensure that workers and communities receive the support and assistance they need to transition to more sustainable and prosperous economies. Among the actions that Interior and BLM can and should undertake to ensure transition:

- Work to secure Congressional authorization to direct increased royalty and rental payments toward worker and community support. Under NEPA, agencies are required to rigorously explore and objectively evaluate reasonable alternatives “not within the jurisdiction of the lead agency.” 40 C.F.R. § 1502.14(c). Here, although BLM and Interior may not be able to direct royalties toward transition support, they can recommend that Congress pass legislation that provides such authorization.

- Establishing an Economic Transition Fund, which would be sustained by an increase in reimbursement fees charged by the Interior Department when processing coal-related applications. Under the Federal Land Policy and Management Act (“FLPMA”), Interior has authority to recover reasonable costs associated with its coal management program and to appropriate and spend such monies. Specifically, FLPMA provides the Secretary of the Interior with authority to “require a deposit of any payments intended to reimburse the United States for reasonable costs with respect to applications,” including coal lease application. See 43 U.S.C. § 1734(b). Such payments are “authorized to be appropriated and made available until expended” by FLPMA. Id. Funds from the Economic Transition Fund should be directed toward transition-oriented initiatives.

- Prioritizing support and assistance to help communities transition. In addition to securing funds and making them available, the Department of the Interior can play a key role in helping direct communities to support, steering resources to support conservation and research projects in or near communities, encouraging renewable energy development on public lands. Such leadership could be conveyed through a Secretarial Order that simply makes it an overarching priority of the Interior Department to advance transition

Overall, the Interior Department and BLM must move to keep our publicly owned coal in the ground. However, keeping coal in the ground should not mean that we turn our backs on the workers and communities that have been dependent on coal for so long. Embracing an alternative that ensures “Just Transition,” in other a fair, compassionate, and orderly transition away from coal, is the most effective way to both protect our climate and help our nation effectively move to more sustainable economies and reliable and affordable means of energy production.

A. The LBA Method Achieves the Sale of Coal at Fair Market Value

Critics of the LBA method assume, without any explanation, that in the absence of multiple bidders, lease sales are not capable of producing bonus bids at fair market value. Their premise presumably is that competition among more bidders will bid the transaction value up to what economists may refer to as the fundamental value. This might be true in theory, but in reality many mineral asset and lease sales are successfully transacted for fair market value with a single buyer.

The absence of more bidders for federal coal leases does not reflect that leases are being offered at less than fair market value, but instead reflects the restructuring of the industry and the advanced development of the coal

regions within federal lands. There are fewer mines and fewer coal companies today than during the period when the regional leasing process commenced in the 1980s. As one would expect, interest in leasing now arises primarily from companies with nearby existing operations seeking to replace coal reserves at roughly their depletion rate. The prohibitively high cost of developing new open-pit mines of the scale necessary to be profitable in the Powder River Basin (PRB), where the vast majority of leased federal coal is produced, creates a barrier to market entry that will be unaffected by any change away from the LBA system.

However, this thinner pool of potential bidders has not prevented BLM from identifying accurately the fair market value of coal for a lease sale. The aim of fair market value is finding the transaction price that would most likely be negotiated between a typical buyer and seller each having reasonable but not absolute knowledge of the reserve. Comparable sales produce fair market valuations because they measure transaction values. The comparable sales method is the preferred method of valuation by professionals when reliable market and sales data are available. BLM relies upon peer-reviewed analysis that uses comparative sales. The successful bonus bids under the LBA leasing method have increased at a rate outpacing the increase in coal prices. The most recent bonus bids for coal leases in the Powder River Basin (PRB) are 700 percent higher than those in 1990.

Furthermore, abandoning the LBA method of leasing and returning to centralized or regional lease sales is unlikely to attract more bidders or yield higher bids. The earlier system of scheduling lease sales based upon national and regional demand forecasts failed with many tracts receiving one or no bids. The Department's earlier leasing framework was built around centralized planning whereby leasing targets and schedules were established to match the forecasted demand and production estimates by the Department of Energy. The purpose of the centralized process was to meet the nation's energy needs and foster competition in lease sales.

However, the regional coal leasing experience using an established schedule limiting when coal will be leased depended on perfect foresight in anticipating coal demand and leasing interest and produced dismal results. Because of the great uncertainties surrounding a wide range of factors affecting demand and supply—nationally and regionally—the exercise produced rapidly changing targets year over year. The current structure of the coal industry and advanced development of the coal regions suggests an even lower probability that centralized or regional leasing will yield better results than the LBA method.

B. The Effective Royalty Rate for Federal Coal is Above Market and Should Be Retained or Reduced to Maximize Return for Taxpayers

Claims that federal royalty rates (12.5% surface mines; 8% underground mines) do not provide a fair return are equally inaccurate, and fail to consider that federal rates are substantially (30%-65%) higher than the prevailing rates for private coal in the East. Moreover, private coal lessees rarely, if ever, pay bonus bids or surface rentals—a fact completely ignored by the groups on whose information DOI relied in imposing for the leasing moratorium. As an example, for the Powder River Basin (PRB) in Wyoming which produces 80% of the coal on federal lands, the government receives almost 40 cents on every dollar of coal sold. To illustrate the above market rate; the current price per ton of coal in PRB is approximately \$11.00. The 12.5% federal royalty results in a tax on this price at \$1.38. The average price of the lease acquisition fee (bonus bid) adds another \$1.00. Two more federal taxes are levied on this ton of coal, the AML tax of \$0.28 per ton and the Black Lung Excise Tax of \$0.55 per ton. Finally, this ton of coal is also taxed through the state severance tax and the county tax applicable in the PRB, at a rate of 5.3% and 4.5% respectively, adding another \$1.08 in taxes. In total, this amounts to \$4.28 in taxes on every \$11.00 worth of coal sold, an effective tax rate of 39%.

Despite this reality, organizations providing the supporting rationale for the coal leasing moratorium misuse data and create deceptive metrics for their claim that coal producers do not pay the royalty on the market value of the coal. The Mineral Leasing Act (MLA) imposes a production royalty on coal, oil, and gas based upon the value as reflected by the sales price of the commodity at the mine or well. Opponents of federal coal leasing use artificial constructs such as “gross market price” or “full value” by adding to the commodity price the transportation costs incurred by buyers. They advocate moving the point of valuation for calculating the royalty from the sales price received by the coal producer to the point of its use by the buyer. The result is not a production royalty on the market price of the commodity, but rather a federal tax on two separate transactions: coal sales by the coal producer and transportation services provided by the railroads to the coal buyer. This artificial construct fundamentally misconstrues what a royalty is in the first place, and if adopted as the metric would only serve to drive down production and deny taxpayers a fair return for the development of public resources.

In the same vein, a royalty rate that would include a so-called “externality adder” for the consideration of nebulous climate change impacts could no longer be considered a royalty. By changing the rate to include a “cost” derived for purported externalities the royalty would no longer reflect a share of a portion of either the minerals or their value which is the very purpose and meaning of a royalty. Oddly, an externality-based adder would decrease the value of the minerals by making them less economic to mine and sell (i.e., less valuable). DOI previously rejected a similar concept when it denied a 2011 petition by WildEarth Guardians to include an ill-conceived externality adder.

C. Coal Exports Are Not a Valid Basis for Reevaluating Valuation Regulations or Royalty Rates

As part of the PEIS process, BLM appears to be considering arguments raised by the Center for American Progress (CAP) that current leasing and royalty valuation regulations do not capture the true value of coal exports. This argument suffers from the same fundamental error as its arguments for using the total delivered cost to domestic consumers as the market price of the commodity. CAP asserts that PRB coal sold in the export market sells for five times more than it does domestically. This distortion is premised on ignoring the substantial costs of transporting coal to the terminal, having it loaded on a vessel and shipped overseas, which can be more than six times the mining cost for PRB coal.

Coal exports have never comprised a significant share of coal production from western states with federal coal lands. During the zenith of U.S. coal exports, exports from Colorado, Montana, Utah and Wyoming were 4 percent of the total production in those states. In general, Western U.S. coal is at a significant disadvantage in the seaborne steam coal market. The four largest importers of coal, China, Japan, India, and Korea are substantially closer to the two largest exporters of coal, Australia and Indonesia, both of which enjoy low mining costs. Currently, the vast majority of exports of Western coal must go through Canadian, U.S. Gulf Coast or Great Lakes ports which represent significant transportation and logistics costs, placing the Western mines at a competitive disadvantage. Future Western coal exports are dependent on the development of port capacity on the U.S. West Coast. The development of port capacity on the West Coast would be beneficial to Western coal exports by increasing market access. However, this really is of no moment to the proponents of the moratorium who are actively lobbying against such development efforts because they would prefer to see the coal remain in the ground.

The relatively small portion of western coal exported precludes potential exports from serving as a basis to value new coal leases. The value of increased coal exports would be captured in the royalty which is based upon the price of the coal sold at the mine. Charging federal royalties on the total cost of exporting coal as CAP and others advocate will shift exports to private coal where royalties are paid on the basis of F.O.B. mine price and decrease return for taxpayers on the development of federal coal.

III. DOI Data Exposes the Contrived Nature of the Reasons Underlying the Moratorium and Show that the Federal Coal Program is Working

The performance of the federal coal leasing program as reflected in DOI's own data exposes the contrived nature of the reasons offered for the leasing moratorium and programmatic review. Previous concerns about speculative holding of leases without production resulting in the enactment of the Federal Coal Leasing Act Amendments (FCLAA) in 1976 have been addressed successfully—the number of leases decreased and coal production increased. Since 1990, both the number of leases and the amount of acreage under lease have decreased substantially (35%).

With the advanced development of the coal regions, coal companies have sought new leases at roughly the rate of depletion of coal at existing operations as predicted by BLM when it shifted to the LBA leasing method. This reflects the reality that market changes and depletion drive the number of bidders for a lease, not the LBA process itself. Also, since 2003, total revenues from federal coal leases (bonus bids, royalties and surface rentals) amount to \$13.8 billion; lease revenues in 2014 were twice the amount in 2003; bonus bids have increased substantially (700 percent in the PRB); coal royalty revenue is 88 percent higher despite coal production increasing by only 2 percent; revenue per acre under lease has increased 40% despite lower coal prices recently. These facts dispose of any notion that the program is not continuing to ensure a fair return for taxpayers.

I) "Fair return to taxpayers"

As described above, federal coal represents a relatively small proportion of a mine area in North Dakota. While pursuing these comingled parcels is the most efficient way to mine, coal producers do have the option in many cases to simply bypass a federal coal tract if a lease cannot be obtained in a timely manner. The practical effect of bypassing a tract essentially sterilizes that reserve – it would never be feasible to go back and mine. The rate of return to American taxpayers if their resource is left in the ground is and will always remain zero. According to the most recent figures from the State Auditor, North Dakota received over \$1 million in federal coal royalties in 2013. Half of these funds are shared with the three coal-producing counties, all of which have populations under 10,000. In another scenario where it might be difficult to isolate a federally-owned coal tract and an entire area needs to be mined around, the inability to secure a federal coal lease could represent a takings of comingled non-federal coal reserves.

Royalty rates must increase: Coal is exacting a tremendous toll on our nation, costing our society billions in climate damages, adverse health impacts from air pollution, and water contamination. Royalty rates from production on existing coal leases must be increased to begin to recoup the costs of these externalities, which are currently shouldered by the public. Your Interior Department should do everything possible to ensure increased royalty revenue is directed toward helping coal-dependent communities transition from coal.

Fair Return - in evaluating "fair return", the objective discussion or analysis must consider all components of return and economic benefits from leasing and production of the resource including bonus bid payments, rents, royalties, AML fees, Black-lung taxes, state and local property taxes, sales taxes, employment taxes, local/regional/state/national benefits from mine employment and employee benefits, and the economic benefits of low-cost reliable power from coal for businesses and utility rate-payers. Advocates of increasing coal royalties point to the Headwaters Economics Report as support for their contentions, however, information compiled from the Energy Information Administration (EIA) by Senator Ron Wyden (D-Oregon) indicates that coal operators have paid much higher royalties (does not take into account bonus bid and rental payments) than indicated by the Headwaters work. It must be noted that BLM policy includes setting "fair market value" for proposed lease sales.

Comment Excerpt Text:

Fair Return - Coal royalty rates and their basis are established by statute, are not subject to BLM discretion, and can be changed only by Congress. The inaccurate assertion by some opponents of coal that current rates do not provide a fair return is based on a very narrow and selective interpretation of "return", and does not take into account the full scope of the economic revenues and benefits generated by coal leasing and production. These include; lease bonus bid payments, production royalties, severance taxes, abandoned mine reclamation funding, property taxes, sales taxes, long-term employee wages and benefits, purchases of goods and services, the associated economic multiplier in coal communities and regions, charitable contributions, and very important but often overlooked, the significant benefits of low-cost, reliable electric power provided by coal for all business and residential utility ratepayers. The suggestion that lease payments should include an "add-on" levy to address related externalities, is disingenuous, ignores the significant and widespread benefits already provided, would increase costs and decrease returns to the government and public, and would potentially drive operations out of business, eliminating ongoing sources of funding for both social and environmental programs.

3. The PEIS Should Examine the Environmental and Economic Impacts of Failing to Require Coal Producers to Pay for Coal's True Costs. Structural failures of the federal coal leasing program that undervalue coal and fail to recognize its costs not only are inconsistent with the statutory requirement to garner a fair return for U.S. taxpayers, they unreasonably catalyze the environmental impacts of mining and burning coal where otherwise it may be uneconomic to do so. While BLM should identify a preferred alternative that ends federal coal leasing altogether, the PEIS also should examine opportunities to ensure that coal producers pay adequate royalties and also internalize the environmental consequences of their activities.

The PEIS Should Evaluate Options for Ensuring that Royalties are Paid on Coal's Full Value Although ONRR enacted needed reforms to federal coal valuation for purposes of collecting royalties, additional reforms are essential to ensure royalties are paid on coal's full value. Sierra Club and Earthjustice previously urged such changes in comments on ONRR's proposed rule, which are incorporated here by reference. 278 In further reforms applicable to existing coal leases (and to the extent BLM continues leasing, to future coal leases), ONRR should eliminate the royalty distinction between arm's-length and non-arm's-length transactions and instead calculate royalties for all federal coal based either on the final sale price to a power plant or other end user, or applicable market prices. Indeed, the White House acknowledged that it would be appropriate to base the market value of coal on market prices for coal with similar characteristics. 279 This would eliminate disputes over whether initial sales are in fact arm's-length transactions, eliminate the current benchmark approach, and provide industry, ONRR, and the public with greater certainty and clarity around the amount of royalties owed. More fundamentally, basing the valuation on final market prices would ensure that royalties are paid on the full value of all federal coal. By additionally eliminating or limiting transportation deductions and doing away with allowances for coal washing, ONRR can ensure that American taxpayers obtain a fair return on a public resource.

277 Id. at 43,338. 278 See Sierra Club & Earthjustice, Comments on Proposed ONRR Rule: Consolidated Federal Oil and Gas and Federal and Indian Coal Valuation Reform, Docket No. ONRR-2012-0004 (May 8, 2015), attached as Ex. 51. 279 White House Fair Return Report, at 18. 73

The PEIS Should Evaluate Options for Internalizing the Social and Environmental Costs of Coal Mining By Increasing Royalty Payments on Federal Coal. An essential component of ensuring a fair return to American taxpayers for public resources is ensuring that the full social and environmental costs of mining federal coal—currently borne by impacted communities—are paid by coal producers. The June 2016 White House report also recognized the important objective of “addressing unpriced environmental externalities” in generating revenue from the coal leasing program. 280 Such externalities include water pollution, land degradation, and climate-forcing methane pollution from coal mining; emissions from transportation to coal markets; emissions of harmful air pollutants and greenhouse gases from coal combustion; and “severe water pollution” from disposal of coal combustion waste. 281 Incorporating the costs of these externalities in the price of coal not only maximizes public revenues, it discourages the imposition of these unacceptable environmental and social harms by reducing the volume of coal that may be economically mined. The PEIS should evaluate these options.

Comment Excerpt Text:

c. The PEIS Should Evaluate Options to Eliminate Royalty Rate Reductions. As discussed, the Secretary of the Interior “may” reduce the royalty for coal leases for the purpose of encouraging the greatest ultimate recovery of federal coal, and in the interest of conservation of federal coal and other resources, whenever it is necessary to promote development, or when the lease cannot be successfully operated under its terms. 43 C.F.R. §§ 3473.3-2(e), 3485.2(c)(1). Because such royalty relief encourages the production of coal that would otherwise not be economic, and thus results in more coal production that would otherwise occur, royalty rate reductions are generally not in the public interest, and we therefore recommend that BLM adopt policy that will eliminate the granting of royalty rate reductions. At a minimum, it is reasonable for BLM to evaluate an alternative that eliminates royalty rate reductions because the Secretary has the discretion under the law to deny every request for such reductions. The Interior Department and BLM have made clear that the agencies intend to address royalty rates through, and even before the completion of, the PEIS process. The PEIS scoping notice recognized that royalty rate reductions were controversial. 283 The notice further directs 280 Id. at 3. 281 Id. at 28. 282 See *infra* Section III.B. 283 Notice of Intent, 81 Fed. Reg. 17,720, 17,724 (Mar. 30, 2016) (“Stakeholders also criticize the Federal coal program for obtaining even lower returns through certain types of leasing actions, such as lease modifications, and through royalty rate reductions, which may result in royalty rates as low as 2 percent.”); see also Secretarial Order 3338, at 4 (Jan. 15, 2016) (making same observation). 74 that the PEIS “will address whether the bonus bids, rents, and royalties received under the Federal coal program are successfully securing a fair return to the American public for Federal coal, and, if not, what adjustments could be made to provide such compensation.”284 “To address concerns about fair returns to taxpayers, the BLM is considering evaluating the following approaches: ... [including] Limit the use of royalty rate reductions.”285 A fact sheet issued contemporaneously with the Secretarial Order directed that BLM would act on royalty reductions before the PEIS was complete: “in the near term, the BLM will issue guidance that ... [c]larifies the process through which the BLM may consider requests for royalty rate reductions.”286 Royalty relief is controversial because it is common, because it has deprived taxpayers of hundreds of millions of dollars, and because its very purpose is to encourage coal mining that might not otherwise occur. Figures from 2014 indicated that BLM had granted royalty

rate reductions on more than one-third of all federal coal leases sold since 1990.²⁸⁷ A recent report estimated that royalty rate reductions permitted coal companies to retain nearly \$288 million that otherwise taxpayers would have received. ²⁸⁸ The widespread use of royalty rate reduction is in large part responsible for the effective royalty rate in many states being far below the statutory minimum of 12.5% for surface mines and 8% for underground mines. As noted above, the General Accounting Office concluded in 2013 that the effective royalty was 6.9% in Utah and 5.6% in Colorado. ²⁸⁹ “The lower reported rates are largely a function of the rate reductions offered for coal extracted from federal leases in these states.”²⁹⁰ 284 81 Fed. Reg. at 17,725; Secretarial Order 3338, at 7 (Jan. 15, 2016) (directing that PEIS will address royalties). ²⁸⁵ 81 Fed. Reg. at 17,726. ²⁸⁶ Department of the Interior, Fact Sheet: Modernizing The Federal Coal Program (Jan 16, 2016) at 3, available at http://www.blm.gov/style/medialib/blm/wo/Communications_Directorate/public_affairs/news_release_attachments.Par.47489.File.dat/Coal%20Reform%20Fact%20Sheet%20Final.pdf (last visited July 28, 2016). ²⁸⁷ M. Haggerty & J. Haggerty, An Assessment of U.S. Federal Coal Royalties, HEADWATERS ECONOMICS (Jan. 2015) at 8 (“Royalty rate reductions occurred on at least 30 out of 83 leases (36 percent of leases) offered for sale since 1990.” (emphasis added)), attached as Ex. 52, and available at <http://headwaterseconomics.org/wphw/wp-content/uploads/Report-Coal-Royalty-Valuation.pdf> (last visited July 28, 2016). ²⁸⁸ See id. at 14 (Figure 4, showing loss of value due to royalty rate reductions); id. at 15, Table 3 (Estimated Value of Royalty Rate Reductions, Federal Coal Leased Since 1990) (estimating nearly \$288 million total in royalties lost due to royalty rate reductions since 1990). ²⁸⁹ General Accounting Office, Coal Leasing: BLM Could Enhance Appraisal Process, More Explicitly Consider Coal Exports, and Provide More Public Information, GAO-12-140 (Dec. 2013) at 24-25 (Ex. 48). ²⁹⁰ M. Haggerty & J. Haggerty, An Assessment of U.S. Federal Coal Royalties (Ex. 52), at 8. ⁷⁵ Other experts, using a modified definition, concluded that the effective royalty rate was no greater than 8% in some states and may be less than 1% in others, apparently in part due to royalty rate reductions. ²⁹¹ Analysts have criticized the impacts of royalty rate reductions, alleging that they “distort the energy market by subsidizing coal production, even when it is uneconomical. It is not rational for the federal government to support uneconomical coal production; this runs counter to its ‘fair market value’ mandate.”²⁹² Others have stated that the “need for royalty reduction is no longer justified” because the original intent of such reductions was to cushion the blow of the 12.5% royalty rate set by Congress in 1976.²⁹³ Two examples from Colorado illustrate how rate reductions can be subject to abuse, reinforcing that BLM must consider eliminating royalty rate reductions in its PEIS. First, in late 2015, BLM’s Colorado State Office proposed approving a royalty rate reduction for a lease on the Oxbow mine. However, the mine was idled and being demolished, so the reduction would be retroactive for coal already mined, and could in no way encourage future mining. It would simply result in a check to Oxbow for coal already mined. The proposed decision was close to final; a draft was forwarded to Colorado’s governor for review. ²⁹⁴ When media reported on the proposed decision, which would have resulted in a significant payout to billionaire mine owner Bill Koch while encouraging no new mining, BLM ultimately (and belatedly) denied Oxbow’s request. ²⁹⁵ Because the royalty rate reduction could not possibly have impacted Oxbow’s then-terminated operations, any award of royalty relief would have violated the law, regulations and policy governing rate reductions. The fact that BLM even considered this request demonstrates how prone to abuse rate reduction requests can be. Second, Colorado BLM is currently weighing and may shortly approve a proposal to reduce the royalty paid by Arch Coal’s West Elk mine on two leases the company is already mining. There is little evidence that Arch cannot operate the mine without the subsidy of a rate ²⁹¹ Id. at 17, Figure 6 (concluding effective royalty rate for federal coal leases for the years 2008-2012 at between 0.7% and 7.8% depending on the state). ²⁹² J. taxpayer due to subsidize Koch-controlled mine, Reuters (Jan. 2016), attached as Ex. 56, and available at <http://www.reuters.com/article/usa-koch-coal-idUSL2N14W1JJ20160112> (last visited July 28, 2016). reduction. In fact, Arch has operated the mine for the last 19 months without royalty relief while the request has been pending. 296 Further, Arch Coal has told its shareholders that West Elk is a “lower cost” mine, and the company’s reports indicate that West Elk is among Arch’s most profitable mines when comparing the operating margin per ton of coal mined. 297 Arch also continues to pay its executives millions every year, far in excess of what it is likely to save from gaining a royalty rate reduction, casting further doubt on whether the rate reduction is necessary. 298 All of these are factors that BLM should weigh in evaluating the application for a royalty rate reduction. But there is no evidence that the agency has considered anything other than Arch’s representations that mining in the area is made more difficult by adverse geologic and engineering conditions – conditions that have not, apparently, cut into Arch’s ability to profit from the coal at issue or to pay its executives huge salaries. Colorado BLM’s willingness to entertain such a royalty rate reduction request, apparently without investigating the mine’s or the company’s financial status, further demonstrates that such reductions are prone to abuse and may be awarded even when they are unlikely to not meet the criteria established by law. BLM should address such issues in the PEIS by evaluating whether eliminating royalty rate reductions is appropriate to ensure a fair return on coal mined and that coal is not mined if it is not economic to do so.

Comment Excerpt Text:

The PEIS Should Evaluate the Program’s Structural Flaws that Fail to Generate a Fair Economic Return The Mineral Leasing Act authorizes leasing of mineral resources on public lands only where the federal government recovers, at a minimum, the “fair market value” of coal. 30 U.S.C. § 201(a)(1); see also FLPMA, 43 U.S.C. § 1701(a)(9) (requiring that “the United States receive fair market value of the use of the public lands and their resources unless otherwise provided for by statute”). The Department of the Interior and the state where the coal was mined share the revenues from federal coal leasing. 246 These revenues come from two primary sources: a one-time “bonus bid” payment based on the “fair market value” of the coal, and royalties on the sale of coal that is mined. 247 As discussed below, structural flaws in the existing federal coal leasing program with respect to both bonus bids and royalties currently prevent BLM from satisfying its statutory obligation to garner a fair return for American taxpayers. This is particularly true when the full costs, including social and environmental costs, of mining and burning federal coal are properly taken into account. The PEIS must evaluate the environmental impact of current bonus bid and royalty rate structures that fail to internalize social and environmental costs, and, in any alternative BLM studies that allow for future leasing, examine options to meet and exceed the “fair market value” requirement, considering the true costs of coal. 248 I. Bonus Bids Do Not Reflect the True Value or Costs of Federal Coal. 245 Sophia Yan, China plants to cut 1.8 coal and steel jobs supra note 238. In 2013, more than 25 percent of all federal coal produced in Montana and Wyoming was shipped overseas. In 2014, nearly 30 percent of all Montana coal sales were for export; Thomas Power, Comments on the Greenhouse Gas Impacts of Modeling of Coal Flows in the Millennium Bulk Terminals Longview SEPA Draft Environmental Impact Statement, June 2016 (Ex. 46). Increasing the price to reflect its true value in the international marketplace would be an important step toward ensuring that coal companies do not reap windfall profits while preventing the country from meeting its urgent goals. 246 See Bureau of Land Management, Coal Operations, available at http://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy.print.html (last visited July 28, 2016). 247 Annual rent of \$3 per acre makes up a negligible portion of federal coal-leasing revenue. See 43 C.F.R. § 3473.3-1. 248 As recognized in the White House in June 2016 report on potential coal royalty reform options, the NEPA “environmental review process can also provide for the consideration of environmental externalities” not currently captured by royalty rates on federal coal. White House Fair Return Report, at 28 n. 16. 67 The first source of revenue from federal coal is a one-time “bonus bid” payment, which as discussed, must equal or exceed the “fair market value” of the coal tract (in dollars per ton), at the time the coal is leased. 43 C.F.R. § 3422.1; see also 30 U.S.C. § 201(a) (“No bid shall be accepted which is less than the fair market value, as

determined by the Secretary, of the coal subject to the lease. Prior to his determination of the fair market value of the coal subject to the lease, the Secretary shall give opportunity for and consideration to public comments on the fair market value.”). BLM uses an appraisal to determine fair market value, which may be based either on an assessment of comparable leases with appropriate adjustments, or financial modeling that accounts for estimated annual revenues and expenses (the so-called “income approach”). 249 In a competitive lease sale, BLM does not disclose the fair market value to bidders. (In fact, BLM has refused to publically disclose the fair market value amounts and supporting analyses even after coal sales, citing FOIA exceptions for trade secrets and deliberative process materials.) Bids below the appraised value must be rejected. In Wyoming, bonus bid payments have ranged in recent years from \$0.85-1.35/ton. 250 Bonus bid payments have been lower in Montana, between \$0.18 and \$0.30/ton. 251 Numerous scholars and critics have observed that BLM has failed to obtain the full measure of revenue required by law by undervaluing the fair market value of the coal at the bonus bid stage. In a 2012 report, Tom Sanzillo argued that BLM’s “fair market value” assessments systematically ignore market forces that should drive a higher price for Powder River Basin coal, including depletion of central Appalachian coal reserves, diminishing accessibility of Powder River Basin coal, and expanded coal export opportunities. 252 This undervaluation of coal resources is perpetuated by over-reliance on the “comparable sales” approach in BLM appraisals. Sanzillo concluded that BLM’s undervaluation of fair market value has translated into below-market bonus bid payments. Further, undervaluing fair market value has the indirect effect of depressing market prices for Powder River Basin coal, which translates into artificially low royalty payments. 249 See Bureau of Land Management, *Economic Evaluation of Coal Properties (H-3070-1)*, available at http://www.blm.gov/pgdata/etc/medialib/blm/wo/Information_Resources_Management/policy/blm_handbook.Par.29194.File.dat/h3070-1.pdf (last visited July 11, 2014). 250 See Bureau of Land Management, *Successful Competitive Lease Sales Since 1990, Wyoming*, at http://www.blm.gov/wy/st/en/programs/energy/Coal_Resources/coaltables.html (last visited July 7, 2014). 251 See Bureau of Land Management, *Successful Competitive Lease Sales Since 1990, Montana*, available at <http://www.blm.gov/mt/st/en/prog/energy/coal/tables.html> (last visited July 28, 2016). The lower market value of Montana coal may reflect longer distances to domestic coal plants, higher production costs (i.e. higher strip ratios), and the lower quality of some Montana coal. The upper end of this range was a 2012 bonus bid payment for the Signal Peak Mine near Roundup, Montana, which is an underground mine that is outside of the Powder River Basin. 252 See Tom Sanzillo, *THE GREAT GIVEAWAY: AN ANALYSIS OF THE UNITED STATES’ LONG-TERM TREND OF SELLING FEDERALLY-OWNED COAL FOR LESS THAN FAIR MARKET VALUE* (June 2012), attached as Ex. 47. 68 Many of Sanzillo’s conclusions were repeated and amplified in subsequent reports by GAO. First, GAO noted in a December 2013 report that about 90 percent of coal-lease auctions in recent years involved only a single bidder, thus failing to generate competition that could yield higher bonus bids. 253 In a separate report from June 2013, GAO found that in determining the minimum bid amount that is supposed to reflect the fair market value of leases, “BLM does not fully account for export potential.”²⁵⁴ The report further cited troubling inconsistencies in BLM’s “fair market value” determinations and recommended that BLM seek an independent peer review of its coal valuation practices. 255 In addition, the report observed that BLM often fails to prepare an appraisal or otherwise document “fair market value” for lease modifications, potentially resulting in a below-market return for this coal. 256 Similarly, GAO criticized the practice of some state BLM offices (not including the Wyoming office) of relying exclusively on comparable lease evaluations in determining fair market value, thereby ignoring market trends. GAO recommended that fair market value estimates account for “small but growing” export activity. Finally, GAO criticized lack of transparency in appraisal process. 257 The Center for American Progress (“CAP”) also has critiqued the lack of competitive leasing practices resulting from the decertification of the Powder River Basin as a coal producing region. 258 CAP argued that “[d]ecertification has effectively given coal companies control over the federal leasing process, allowing them to select which tracts to lease, rather than having to follow a regional leasing plan where the secretary of the interior controls the process ... result[ing] in diminished competition, reduced environmental review of proposed coal leases, and lax oversight.”²⁵⁹ Undervaluation of federal coal resources is a particularly acute problem in the context of lease modifications. Since 2005, BLM has been authorized to expand coal lease tracts by up to 253 Government Accountability Office, *Coal Leasing: BLM Could Enhance Appraisal Process, More Explicitly Consider Coal*

Exports, and Provide More Public Information, GAO-14-140 (Dec. 2013), attached as Ex. 48. 254 Office of the Inspector General, U.S. Dep't of the Interior, Coal Management Program, Report No. CR-EV-BLM-0001-2012, at 7 (June 2013), attached as Ex. 49. 255 Id. at 9. 256 Id. at 14. 257 Government Accountability Office, Coal Leasing: BLM Could Enhance Appraisal Process (Ex. 48). 258 Center for American Progress, Federal Coal Leasing in the Powder River Basin: A Bad Deal for Taxpayers (July 29, 2014), attached as Ex. 50. 259 Id. at 2. 69 960 acres without a competitive bidding process. See 30 U.S.C. § 203(a)(3)(A). 260 And although regulations direct BLM to lease these tracts for fair market value, 43 C.F.R. § 3432.2(c), coal sold through lease modifications is generally much cheaper than coal sold through competitive bids. For example, BLM's most recent lease sales were sold in 2012 for approximately \$1.10 per ton, and over the past six years, the sale price of competitive coal leases has ranged between \$0.71-1.35 per ton. 261 By contrast, the sale price of Powder River Basin coal lease modifications issued between 2006 and 2012 has ranged between \$0.06-0.10 per ton. 262 The Inspector General has criticized these sales, finding that "BLM might not be obtaining a fair return for lease modifications," and that the 45 lease modifications issued since 2000 may have resulted in as much as \$60 million in lost revenues. 263 For all of these reasons, the Obama administration has conceded that the federal coal leasing program "ha[s] not fostered an efficient, competitive system that provides a fair return to the taxpayers." 264 And these problems are not new. Congress adopted the Federal Coal Leasing Amendments Act of 1976 in part to address concerns at the time that, "[r]ather than initiating a leasing program based on knowledge of existing Federal coal reserves, national energy needs and environmental considerations, the Department normally leased those portions of Federal coal lands for which industry interest was expressed." 265 This resulted in a situation in which "72 percent of these 'competitive' sales had less than two bidders, not really reflective of a competitive environment" and "the public [wa]s being paid a pittance for its coal resources." 266 That underpayment of bonus bids is such an enduring problem likely reflects problems inherent in the coal leasing structure—including "asymmetric information" and a "thin bidding 260 Coal lease modifications can be even larger if the original coal mine is encompasses multiple lease tracts. This was the case in High Country Conservation Advocates, where BLM sought to expand the West Elk coal mine through two separate lease modifications that totaled approximately 1701 acres. 2014 WL 2922751 at *4; see also Environmental Assessment for the West Elk Coal Lease Modifications Application at 3 (June 2012), available at http://www.blm.gov/pgdata/etc/medialib/blm/co/information/nepa/uncompahgre_field/ufo_nepa_documents0.Par.96415.File.dat/12-13 (last visited July 28, 2016). 261 Bureau of Land Management, Successful Competitive Lease Sales Since 1990, Powder River Basin, Wyoming (updated Aug. 2013) available at http://www.blm.gov/style/medialib/blm/wy/programs/energy/coal/comp_lease-1990.Par.55365.File.dat/SuccSales080813.pdf (last visited July 28, 2016). 262 See Letter from Deputy Inspector General M.L. Kendall to U.S. Senator Ron Wyden at 7-9 (Nov. 15, 2013). 263 Office of the Inspector General, U.S. Dep't of the Interior, Coal Management Program, Report No. CR-EV-BLM-0001-2012, at 13 (Ex. 49). 264 White House Fair Return Report, at 2 (emphasis added). 265 H.R. REP. 94-681, 11, 1976 U.S.C.C.A.N. 1943, 1947. 266 H.R. REP. 94-681, 17, 1976 U.S.C.C.A.N. 1943, 1953. 70 pool"—that are not easily overcome. 267 For this reason, as described below, reforms to the manner in which the government collects royalties on coal production, including increasing royalty rates, may be the most appropriate way to garner a fair return to taxpayers and ensure that the federal coal leasing program reflects this Nation's policies demanding decreasing reliance on fossil fuels, particularly coal, for domestic energy production.

2. Royalties on Coal Production Fail to Generate a Fair Return to Taxpayers. Other than bonus bid payments, the second primary source of federal income from coal leasing is royalties paid on the revenue generated from the sale of the coal, based on the price obtained at the first point of sale. 43 C.F.R. § 3473.3-2.269 Royalties comprise the majority of the revenue from federal coal leases—nearly two-thirds of the total revenue over the period

from fiscal years 2003 to 2012.²⁷⁰ Minimum royalty payments are 12.5% of the coal value for surface mines and 8% of the coal value for underground mines. 43 C.F.R. § 3473.3-2(a). However, the Secretary of the Interior may reduce the royalty for any given mine “whenever he/she determines it necessary to promote development or finds that the lease cannot be successfully operated under its terms.” Id. § 3473.3-2(e); see also id. § 3485.2(c)(1) (same).²⁷¹ In addition, the Secretary may establish a different royalty rate—including a higher rate—at the time a lease is readjusted, id. § 3473.3-2, i.e. after the initial 20-year lease term and every 10 years thereafter, id. § 3451.1(a)(1). The federal coal leasing program fails to generate a fair return for American taxpayers from royalties, just as it fails to do so from bonus bids. The GAO reported that BLM has reduced royalty rates to “enable continued operations in cases where mining conditions may be particularly challenging and costly, or to enable expanded recovery of federal coal.”²⁷² GAO calculated the effective royalty rates for the top federal coal producing states in 2012 at: 267 White House Fair Return Report, at 11. 268 Id. at 11-12 (recognizing challenges with bonus bid reform, but concluding “royalty payments assessed on the production of coal have the potential to bring the return to the taxpayer” in line with Administration objectives to increase returns to taxpayers). 269 Among the four states with the most production from federal coal leases—Colorado, Montana, Utah, and Wyoming—the average prices for coal originating in these states in 2011 were \$39.88/ton in Colorado, \$16.02/ton in Montana, \$33.80/ton in Utah, and \$13.56/ton in Wyoming. GAO Report, at 14 (citing EIA’s 2011 Annual Coal Report).²⁷⁰ Government Accountability Office Report, at 23. 271 An application for a royalty reduction “shall contain a detailed statement of expenses and costs of operating the entire mine, the income from the sale of coal, and all facts indicating whether the mine can be successfully operated under the Federal rental and royalty provisions fixed in the Federal lease or why the reduction is necessary to promote development.” 43 C.F.R. § 3485.2(c)(2)(ii).²⁷² Government Accountability Office Report at 24-25. 71 Wyoming – 12.2%; Montana – 11.6%; Utah – 6.9%; and Colorado – 5.6%.²⁷³ When the average effective royalty rate is calculated based on the average delivered market prices that sellers receive for federal coal, that rate drops to only 4.9%.²⁷⁴ In addition to low effective royalty rates, other structural flaws have yielded royalty payments that do not reflect the coal’s true value and costs. First, royalties historically have been paid on the coal’s price at the first point of sale, for which the coal is almost certainly undervalued. As the White House recognized in its June 2016 report on the economics of federal coal leasing, “there is an incentive for companies to reduce reported coal sales prices in order to minimize the royalty payments owed and companies have employed several tactics to lower the selling price of coal without losing revenue.”²⁷⁵ Recognizing problems with its past approach to coal valuation, the Office of Natural Resources Revenue (“ONRR”) in July 2016 finalized reforms to its methodology for valuing coal for purposes of calculating royalty payments, establishing the value based on the first arm’s-length transaction.²⁷⁶ These adjustments prevent companies from selling coal in captive transactions to subsidiaries at artificially low prices, paying royalties on that initial sale price, and then having the subsidiary re-sell in the open market for much higher prices without an additional royalty. Although ONRR’s reforms closed an important loophole in royalty collections procedures, the rule did not solve the problem of underpayment. First, ONRR did not set the point of valuation at the final sale to a power plant or other end-user of the coal, thus precluding any taxpayer return on the potentially substantial profit garnered after the first point of sale. Second, ONRR allows unlimited allowances for coal washing and transportation, which can significantly diminish the coal’s calculated value. Third, the rule did not modify royalty rates in a manner to account for the environmental externalities of coal production. Thus, as ONRR recognized, its rulemaking “takes steps toward ensuring that the valuation process for Federal and Indian coal resources better reflects the changing energy industry while protecting taxpayers and Indian assets, its scope is not broad enough to address the many concerns the commenters raised. For that and other reasons, the U.S. Department of the Interior (Department) recently launched a comprehensive review to identify and evaluate potential reforms to the [f]ederal coal program in order to ensure that it is properly structured to provide a fair return to taxpayers and reflect its impacts on the environment, while continuing to

²⁷³ Government Accountability Office Report, at 25. While most mining in Wyoming and Montana is surface mining that is subject to the 12.5% default minimum royalty, more underground mining occurs on federal leases in Colorado and Utah, which is subject to the 8% default minimum royalty. See id. at 12. ²⁷⁴ White House Fair Return Report, at 8 (citing M. Haggerty and J. Haggerty, Headwaters Economics, An Assessment of U.S. Federal Coal Royalties: Current Royalty Structure, Effective Royalty Rates, and Reform

Options (2015), attached as Ex. 52). 275 White House Fair Return Report, at 2. 276 Office of Natural Resources Revenue, Final Rule, Consolidated Federal Oil & Gas and Federal & Indian Coal Valuation Reform, 81 Fed. Reg. 43,338 (July 1, 2016). 72 help meet our energy needs.”277 In other words, ONRR deferred to this PEIS to evaluate effective reforms to provide a fair return on federal coal.

Further, the value of coal to the American people isn't just royalty revenue — the value of high paying jobs and reliable, affordable energy has to be taken into account as well. Increases in coal prices induced by higher royalty rates will flow through to the electricity market due to reduced production on federal lands. The states that rely on coal for the bulk of electric generation consistently enjoy lower electricity rates. Whatever incremental revenue the Department believes it will obtain from increasing the coal royalty rate will be at the expense of American businesses and families paying higher utility bills. The federal coal program has generated tens of billions of dollars of value for the American people in recent decades and additional billions of dollars for Colorado state and local governments and school districts, to the benefit of all the state's citizens. It's simple: I oppose new taxes that will only serve to drive coal further to the edge, will deprive public schools of an important source of revenue from federal leases, and ultimately increase electricity rates for hard working families.

The push by NGOs to "Keep It in the Ground" and seek "Coal Reform" have again caused a huge waste of taxpayer dollars by forcing the Bureau of Land Management to conduct a multi-year Programmatic EIS process and support the effort by the Department of the Interior to increase the cost of coal leasing and royalties. As a result, it will be even more expensive to operate a coal mine and subsequently raise the price of electricity for all consumers. It's a disastrous combination for everyone, from the miners whose jobs have been lost and are in jeopardy, to the ratepayers that will pay more each month for electricity and the communities that will have to go without the vital taxes and royalty dollars generated by coal mining.

The federal coal program has been a tremendous success story that has generated tens of billions of dollars of value for the American people in recent decades. If DOI must take action, we strongly encourage the department to take steps to improve the return to the American public by making coal on public lands more competitive, not less.

I oppose increased coal royalties and new taxes on our electricity.

Requiring coal producers at existing mines to pay royalties on coal production that reflect all of coal's costs

Comment Number: 0003018_MasterFormR-I

Comment Excerpt Text:

It is the fiduciary responsibility of the Department of Interior (DOI) under the Mineral Leasing Act to maximize the return on federal coal, and to do so, we need to find policies that keep federal coal competitive in the market place. We have already seen a series of policies over the past several years designed to increase electricity prices and degrade the reliability of the nation's electricity supply by inducting the closure of coal baseload power plants – the backbone of our electric grid. But given these constant attacks on coal from this administration and its allies, we can only conclude that royalty rate increases and expensive leasing reforms have nothing to do with determining a fair share for taxpayers and everything to do with a political agenda.

Comment Excerpt Text:

I write today to voice my grave concerns with increasing coal royalty rates. Raising taxes on coal will add stress to coal markets and ultimately decrease the revenues accruing to the public. Simply put, a ton of coal never sold due to uncompetitive prices produces no revenue.

Too, American taxpayers are receiving more than owners of private coal. The federal royalty rate is above the prevailing royalty rates for private coal. As compared to private coal leases, federal coal rates are, in many cases, forty percent higher than the prevailing rate for private coal.

Federal lessees pay non-recoupable bonus bids, an additional upfront payment made prior to mining. Bonus bids are rarely if ever included in leases of private coal. Bonus bids are a significant expense. Over the last decade, lessees have paid over \$4.2 billion in bonus bids before any coal is even mined.

States and local communities also benefit from coal leasing and royalties. In 2014 Colorado coal producers paid nearly \$40 million in federal royalties, rents, and bonus payments. Almost half of this comes back to the State and is distributed to local communities, the State Public School Fund, the Higher Education fund, and the Water Conservation Board Construction fund.

The BLM can best carry out its responsibility to ensure that American taxpayers receive a fair return on the coal resources managed by the federal government by encouraging the growth of the coal industry and removing impediments to leasing coal.

It concerns me that the DOI is modifying the current coal leasing program, including increasing the royalty rate on federal coal. While, on the surface, this may seem like a plan to increase revenue, it is obvious that it will in fact have the opposite effect and be harmful to our economy.

As royalties increase, so will the price of coal. An industry such as this is very dependent on the price of the product, so as the prices increase, the amount of coal being sold will decrease due to market factors. Eventually this will trickle down to less coal being mined and less revenue going to the taxpayers and back into our communities. Not only will this damage local economies, but the increased energy prices will stress the lower and middle class nationwide.

It is obvious to me that the ultimate goal of raising royalty rates on federal coal is not to increase revenue, but to instead put more stress on the already burdened coal industry.

The price used in determining royalty payments must continue to be determined at the mine loading point. This process gives appropriate consideration to geography and the location of BLM coal lands with respect to the market for the coal. The net back price at the coal load out correctly values the coal no matter where or how the product is used. There have been many comments in the press about the price received for coal exported. This value must be reduced by the cost to transport the coal to the port and port charges as a minimum before the price upon which royalties are calculated is determined. Many times the transportation and port charges are greater than the price received at the mine by a mining company.

Comment Excerpt Text:

The current method to determine fair market value is in need of improvement. In circumstances where there is more than one adjacent active mining operation one method is used, and in circumstances where there is not another likely bidder, a different process is used.

First, the circumstance where there is more than one adjacent mining operation provides the best definition of a Competitive Bid that I can imagine, and the process to determine fair market value in addition to an open bid process seems redundant at best. In the fairest definition possible the fair market value is determined by the value that these operators or another party might be willing to bid. The only concern the BLM should have in this circumstance is whether there is risk of default on the payments. When this is the case a Fair Market Analysis should not be required at all.

In the circumstance where there is only one adjacent active mining operation, the BLM implements a different process. A study is conducted to estimate the mining cost, realization and capital expenditures for the mine to complete mining in their existing reserves and this is used as a "BASE CASE" analysis from which an incremental analysis is conducted estimating the mining cost, realization and capital required to develop into the proposed

lease. All of the advertised reserves are assumed to be mined, and an "ALTERNATIVE CASE" is developed. An incremental analysis is conducted with a discount rate of 10% and the amount of the "fair market value" of the Bonus Bid is determined by the amount that will result in an NPV(IO) of zero.

Other Sections: 2

Comment Excerpt Text:

Keeping the process for a mining company to request a royalty reduction when unforeseen geologic circumstances are encountered or reserves are in deep cover is important to reduce the risk to the operator when these conditions are encountered and incent the recovery of BLM coal. Were this not the case operators would be less likely to attempt to mine areas with geologic risks or deep cover which would in turn reduce payments to taxpayers.

Comment Number: 0020031_Parkins_20160722-9

Comment Excerpt Text:

I work in the underground mining industry and have found that as a general rule the BLM rates are higher than can be negotiated with private owners. Some rates with private owners have been as low as 4% or less without any "Bonus Bid". In Utah SITLA leases lands at the same rate as the BLM, but generally allows a "pay as you go" Bonus Bid which is reduced if the estimated reserves are not present.

Organization I: Bowie Resource Partners, LLC

Commenter I: Gene DiClaudio

Comment Excerpt Text:

Equally importantly, the Secretary's stated concerns about fair return and fair value are at odds with an overly-constrained federal coal supply. Although it is pure window-dressing when cited by environmental activists, competition does play a key role in ensuring efficient energy markets and value to the nation's industrial coal consumers, electricity users, and ratepayers. Adequate supply means not only that there is adequate supply in each of the coal sub-markets, but also adequate supply to a reasonable range of coal mining companies. A coal sub-market cannot be competitive if all the coal of a particular type is in the hands of one or two suppliers. Thus, blanket statements about the aggregate amount of coal under lease are misleading if they do not account for how leasing is distributed among coal types, regions, and suppliers.

Comment Excerpt Text:

Under today's market conditions, WMA does not believe that an increase to the royalty rate is justified. In addition to data or analyses that justify a change to the royalty rate, BLM must also consider information that justifies no change to the royalty rate. As part of the scoping process, consider that duplications, redundancies and delays in the current leasing process, as described earlier are all very costly and serve to erode the return to the American taxpayer. BLM should evaluate how the true cost of the typical ten-year leasing/permitting process compares to the return from royalties, bonus bids and taxes.

Comment Excerpt Text:

WMA believes calculation of Fair Market Value (FMV) should reflect the current market for the commodity given the realities of the economic conditions. Pre-sale FMV should allow for extraction costs so that the final cost for the generation of electricity is reasonable and affordable. FMV should also be calculated with the goal of ultimately finding a qualified lessee for the coal tract. Artificially increasing the FMV and raising costs above what is economical to mine is counter-productive and contrary to the Agency's charge of managing the responsible development of the resource as mandated by the Mineral Leasing Act.

Organization I: Wyoming Mining Association

Commenter I: Jonathan Downing

Comment Excerpt Text:

BLM rules require the agency to develop fair market value estimates prior to each proposed lease sale. Over nearly three decades the fair market value was not challenged as being deficient until certain organizations determined that coal mining and use were no longer acceptable to them. Because the true fair market value figures are held confidential by the agency, it is curious that some organizations can claim that fair market value has been too low and that they can actually calculate how much the American taxpayer has been short-changed. These claims are clearly based on assumptions and should not be interpreted by the BLM to be factual.

Comment Number: WO_CoalPEIS_0002437_Downing_20160727_WyMineAssoc-9

Organization I: Wyoming Mining Association

Commenter I: Jonathan Downing

Comment Excerpt Text:

BLM's scoping evaluation must reveal that the claim made by detractors that the fair market value is not providing an adequate return on the resource, cannot be substantiated. The results of the evaluation will verify that the fair market value issue needs to be put to rest. And the rules do not need to be fixed.

Organization I:Office of Congressman Scott Tipton

Commenter I:Brian Meinhart

Comment Excerpt Text:

I want to start off with the first concern, whether or not the public is receiving a fair return on public resources. When the Department conducted its listening sessions back last August, we agreed then, and we still agree, that that's a fair question to ask on its face. But, we do disagree that the premise with which DOI is asking this question. We, we think that that's definitely misguided. Much of the conversation surrounding this question seems to imply that the coal industry is raking in record profits while Joe Taxpayer is left with nothing more than a token return. Last March, the Secretary gave a speech in which she said that, "most Americans would be surprised to know that coal companies can make a winning bid for about \$1 a ton to mine taxpayer-owned coal". Now, surely that -- it sounds like that can't be fair. And you know, naturally that would be why she later suggested raising the royalty rate might be an option. Even the Interior Office of the Inspector General and the Government Accountability Office agree that the Federal Coal Program needs reform. Right? We're going to take a look at the accuracy of the Secretary's statements in that. First, Secretary Jewell's statement does not indicate what the market value for a ton of coal is. If coal is worth \$1,000 a ton, then yeah, a return of \$1 would surely be a giveaway. But, the recent spot price for a ton of Wyoming's Powder River Basin coal, which we've already seen is over 80 percent of the Federal coal resources, is \$8.80.

Comment Number: 000001202_Meinhart_20160623-2

Organization I:Office of Congressman Scott Tipton

Commenter I:Brian Meinhart

Comment Excerpt Text:

Second, the bonus payments received for [indiscernible] which the Secretary was referring, represent only one portion of the revenues generated by Federal coal production. And it's a smaller proportion of that. In Federal -- in fiscal year 2015, bonus payments for all Federal coal leases totaled just over \$454 million. The royalties, on the other hand, totaled over \$757 million for that same period. While those revenues do return to the Federal Treasury, the Secretary did not mention those. And it doesn't end there. You also have to include the State royalties and severance taxes. There is applicable County taxes. They're often in the form of an ad valorem or property tax. There are other Federal taxes, like the abandoned land mines tax, the black lung excise tax. Those are 2.8 percent and 5.5 percent respectively. If we were to take kind of a Colorado or local illustration here, we could say that maybe the spot price for a ton of coal is about \$20. Most of the mines here locally are underground. So, we would say that the royalty rate is currently -- would be 8 percent. You can have the State severance tax, which in Colorado would be about 3.8 percent. You've got the EML. You have the excise tax. The actual tax rate is actually closer to 20 percent. And then, you add the local taxes on top of that. Those are used for K through 12 education, road and bridge departments, other [indiscernible] infrastructure, healthcare facilities. The list goes on and on. In Colorado, those payments totaled \$16.6 million in 2014. And we can throw the rental payments, which were \$1.35 million, on top of that. So, it becomes very clear that the actual return to the public is much higher than \$1 per ton. So, when you view the Secretary's statements in that context, they start to look a little bit misleading.

Comment Excerpt Text:

So, the question at hand here is whether or not reforms are necessary to the royalty program, particularly from a taxpayer perspective? And I've heard some folks talk about, you know, there's a 12.5 percent royalty rate; and that seems to be adequate. Of course, nobody pays a 12.5 percent royalty rate. There are deductions and subtractions from that. And the actual affective royalty rate is closer to 5 percent. Some of those deductions are absolutely valid. But, some of them are engineered specifically to avoid paying the royalty rate. And an analysis by the Council of Economic Advisors that came out just this week, showed that there are ways to get at some of those clear, uneconomic, avoidance schemes. Like captive transactions where we see 42 percent of sales in the Wyoming Powder River Basin, for example, are between affiliates at below market rates that are conducted specifically to avoid paying the affective royalty rate due to taxpayers. Or take it and pay contracts that are designed with utilities. And so, I think we can reform the royalty system in a way that will raise at least another \$300 million in revenue while not depressing the current coal industry.

And the BLM should begin by making -- taking steps to raise the royalty rate for coal. Royalties aren't taxes. They're the share of the revenue sale of the public's coal that we all own. And that's our share, and we should be making sure we're getting it.

Comment Number: 000001265_ SmithC_20160623-1

Commenter I: Casey Smith

Comment Excerpt Text:

Unfortunately most major coal companies are already in Chapter 11 bankruptcy proceedings. My question for you is how can an increase in a royalty percentages possibly ensure that Federal coal leases are being utilized at the benefit of the taxpayers? Which brings me to number 2 is wouldn't it make more sense to consider lowering royalty rates to a level in which Federal coal remains competitive with the private lease market? A comparative pricing market will generate more revenue in the form of sales, bonus bids, for the taxpayers; rather than driving

the market price to private leases and unfortunately abroad. Number 3 is BLM should reassess the efficiency and streamline the Federal Coal Leasing Program and remove any unwarranted delays in the leasing process that are financially hurting the return to the taxpayers. And then, number 4, BLM should reorganize and reconvene the Royalty Policy Committee that was disbanded so long ago and include a group represented by the public and private sector.

Comment Number: 000001266_Spehar_20160623-1

Commenter I: Jim Spehar

Comment Excerpt Text:

My recommendation should there be a royalty increase is that these new funds be earmarked to assist coal communities in the inevitable transition of their economies.

Comment Excerpt Text:

I think it's necessary for, for the lease program to at least recoup the cost that we're talking about when we're extracting the resource. Very often we see that, yes, there are royalties paid. But, are we seeing the full cost recovered for the taxpayer? I, I think it's only fair that not only do they pay the royalties, they also pay the administrative costs.

Comment Number: 00001273_Grange_20160623-2

Commenter I: Jordan Grange

Comment Excerpt Text:

One of the stated reasons for implementing a moratorium on Federal Coal Leasing Program was to determine if the U.S. taxpayer was receiving a fair return on the resource. According to the Office of Natural Resource Revenue, in the last 10 years, the BLM had generated nearly \$10 billion from Federal co-leases, via lease bonuses, rental fees, and royalties. Coal has paid the Federal Government more, more royalties, lease bonuses, and rental fees, than another other type of electrical generation. Thus, producing more of a return to the U.S. taxpayer than solar, wind, nuclear, geo-thermal, biomass, and hydro-electric, combined.

Comment Number: 00001273_Grange_20160623-3

Commenter I: Jordan Grange

Comment Excerpt Text:

According to the Energy Information Administration, in 2014, alone, the government subsidized wind energy with \$5.9 billion, solar with \$5.3 billion, natural gas with \$2.3 billion, nuclear with \$1.6 billion, and coal with \$1 billion. Now, compare that to the percent of electricity generated from each industry. Again, according to the Energy Information Administration, in 2014, coal generated 40 percent of the nation's power, natural gas 26 percent, nuclear 26 percent. Wind, wind and solar generated a whopping combined total of 3.3 percent of the nation's power. Yet, wind and solar spent \$11.2 billion in subsidies and generated very little in royalties, lease bonuses, and rental fees. How is it that any self-respecting, intelligent individual, corporation, or entity can say coal royalties do not generate a fair return to you as taxpayers

Comment Number: 00001275_Earl_20160623-1

Commenter I: Taylor Earl

Comment Excerpt Text:

According to the U.S. Energy Information Administration, or EIA, \$13.2 billion dollars in government subsidies were spent on wind and solar from 2010 to 2013. All of this, and wind and solar power still only accounts for less than 5 percent of America's total energy production. How is this a fair return for taxpayer's money? One the other hand, there's been nine and a half billion in revenue collected by the United States since 2016, from the Coal Leasing Program.

Comment Number: 00001279_Phillips_20160623-2

Commenter I: Tom Phillips

Comment Excerpt Text:

Here in Colorado, the Federal royalty on coal is just \$0.23 per ton. Whereas, the sales price was over \$30 per ton in 2014. If the Federal royalties on coal were on a par with Federal oil and gas, the royalty would be almost \$4 per ton, not \$0.23. This low royalty rate is a subsidy, or give-away, to the coal industry. Given the current and future poor economics of coal, it is highly unlikely that further coal company bankruptcies will occur.

Comment Number: 00001279_Phillips_20160623-4

Commenter I: Tom Phillips

Comment Excerpt Text:

Royalties for coal should also be right to a level equal of those collected on [indiscernible]. Taxpayers should not be subsidizing one of the highest carbon fuels in the world

Organization I: The Wilderness Society

Commenter I: Joshua Mantell

Comment Excerpt Text:

Two, federal taxpayers are not receiving their fair share for the use of their land and resources. Right now coal companies are paying effective royalty rate of 4.9 percent according to one study, and 90 percent of coal leases have a single bidder since 1990. We need to raise the royalty rate for surface mined coal, and raise the minimum bid so that we are receiving what is due.

Comment Number: 0000843_Seltweiger_PennFuture-3

Organization I: Penn Future

Commenter I: Larry Seltweiger

Comment Excerpt Text:

Government and independent investigators say American taxpayers are being short-changed because of the Federal Coal Program's flaws. These include inconsistencies in estimating coals, fair market value and failure to consider value of exporting the coal. A 2012 independent report estimates that U.S. Taxpayers have lost nearly 30 billion in revenue over the last 30 years because BLM has failed to get fair market value in the coal mined just in the Powder River Basin.

Comment Number: 0000844_Hanna_TCS-1

Organization I: Tax Payers for Common Sense

Commenter I: Autumn Hanna

Comment Excerpt Text:

Coal is a central part of our nation's energy mix and over the last decade, the BLM managed leases that produced approximately 4.3 billion tons of coal, resulting in \$9.5 billion in revenue collections by the United States. These funds are an important source of revenue for the country. And while the Department of Interior is legally required to provide a fair return to taxpayers for the development of the coal we all own, the leasing program has been plagued with problems. Further, it fails to meet the goals set forth during the last review under the Reagan Administration. In 2013 my organization released a study on fair market value of federal coal. We found that the current coal program was in need of significant reform and responsible for billions in taxpayer losses. For example, by supplanting the competitive system envisioned by Congress more than 40 years ago, the current Lease by Application system has failed taxpayers. The system improperly distorts the valuation of lease tracts, brings in significantly reduced bids, and shrouds crucial information in secrecy.

There's little, if any, competition under the leasing program. Incredibly, the Government Accountability Office found that 90 percent of lease sales in the Powder River Basin from 1990 to 2013 has only one bidder. The game is essentially rigged: under the current system, individual companies often draw the tracts for leasing themselves. In the absence of competition, the BLM must accurately calculate the fair market value of federal coal. Here, too, the BLM has failed.

Before determining the fair market value, the Secretary of Interior must provide an opportunity for public comments. But it is impossible to provide feedback when the BLM refuses to share its valuation data or methodology. Final lease sale numbers are often undervalued and can be used as comparables for new tracts, locking in a rolling system undervalued leases and taxpayer losses.

Commenter I: Autumn Hanna

Comment Excerpt Text:

Finally, changes in the marketplace must be considered when calculating fair market value since coal exports to foreign markets have more than doubled in the last ten years. As we detailed in our comments to DOI last year, coal valuation at the initial point of sale may not truly capture the value of the taxpayers' resource.

If we do decide to continue coal leasing, there must be increased royalties. Coal companies should have to pay the full cost of their activities

Comment Number: 0000854_Doyon_20160628-2

Commenter I:Michelle Doyon

Comment Excerpt Text:

Taxpayer protection reforms are needed. Federal coal royalty rates are far below the 18.5 percent from offshore oil and gas and have not changed in 30 years. BLM should raise royalty rates and close loopholes that allow companies to avoid paying agreed upon royalty rates. Artificially low coal leases directly affect energy production competition and this low cost is undercutting renewable resource development

Comment Number: 0000864_Szollosi-2

Organization I:National Wildlife Federation

Commenter I:Frank Szollosi

Investigations in 2012 when exports were high found that coal companies in Wyoming and Montana underpaid for federal coal by \$40 million, using the domestic price calculated royalties for the coal they exported instead of the much higher price in Asia. It is critical that BLM consider the role of export markets as an element of determining fair market valuation for federal coal.

Commenter I:John Barrasso

Comment Excerpt Text:

The Administration should also help coal producers access international markets. Three proposed coal export terminals in Oregon and Washington await federal permits. Last week, the Army Corps of Engineers brazenly rejected a coal export terminal without even determining the impacts of the project and whether these impacts could be mitigated.

If the Administration wants a greater return on federal coal, it should reverse the Corps' decision immediately. It should also ensure that the permitting process for coal export terminals is completed in a timely manner. These facilities would allow producers to export federal coal to Asia and offset declining sales in the United States.

Attached please find a report on exports of federal coal. The report details the dynamics of export economics since 2009: the inflation of the coal export bubble in 2009; the massive and highly profitable exports of federal coal during the height of the international coal boom; and the deflation of that bubble. The report argues that BLM must consider export economics when renewing the federal coal leasing program. (see attached report "Unfair Market Value II: Coal Exports and the Value of Federal Coal")

Organization I:Sightline Institute

Commenter I:Clark Williams-Derry

Comment Excerpt Text:

First, the first comment is that for the most part, the Bureau of Land Management has ignored the unique dynamics of coal export markets when setting federal coal prices. There is a very different dynamic that you find in the U.S. market and domestic markets, and even though there's ample evidence that -- that coal companies highly value the ability to export coal, the BLM has not paid attention to those values and that economic value when setting the coal prices

Comment Number: 0000603_Williams-Derry_Sightline Institute_20160621-3

Organization I:Sightline Institute

Commenter I:Clark Williams-Derry

Comment Excerpt Text:

The second major conclusion of this report is that coal exports have gone through a boom period from 2010 through 2014. During that time the states of Colorado, Wyoming, Utah, and Montana exported roughly 100 million tons of coal combined. Much of that was from specific identifiable export-oriented coal mines, many of which rely either exclusively or heavily on federal coal.

And even in the middle of that boom, the Bureau of Land Management did not pay attention to the unique dynamics of coal exports and the fact that the federal coal that was exported could receive far higher profits on export markets than it could in domestic markets

Comment Number: 0000603_Williams-Derry_Sightline Institute_20160621-4

Organization I:Sightline Institute

Commenter I:Clark Williams-Derry

Comment Excerpt Text:

And the last major point is that that boom period has ended and that we are now in a period when coal companies are retrenching and pulling back from exports. The -- still there are financial economic techniques hinging on what's called the real options valuation, which is described in the report, which can help set a value on federal coal and it's higher than coal's been leased for in the past.

Commenter I:C. Thomas Shaefer

Comment Excerpt Text:

Especially onerous is the practice of mining coal from U.S. land and exporting it for combustion abroad. Though the U.S. government cannot make energy policy for other nations, it can deny those nations access coal from our public lands. Some argue that international buyers who are unable to buy U.S. coal will simply buy from other nations, allowing those nations to reap profits that might have been ours. Of course, the same rationalization can be applied to commerce in illegal drugs or nuclear weapons. Sometimes we must make decisions on the basis of what is right, rather than what generates the most short-term profit.

The reports by both the Inspector General, and the GAO note the recent rise in exports of PRB coal to Asia and its growth potential. Both reports have concluded that in making fair market value determinations, it is essential that the BLM consider not just the domestic demand for thermal coal (which is currently flat, due to the competition of low-priced domestic natural gas), but the robust demand and the substantially higher prices that can be obtained for PRB coal sold in the Asian market. (GAO Report, 2013 at 7; IG Report at 7.) UPHE agrees that legitimate assessments of the fair market value of 20-year leases of PRB coal cannot be made without factoring in the dominant factor that will drive future demand—the potential for export, and the growth of that potential, that can be expected over the life of such leases

Comment Excerpt Text:

As noted earlier, continuing to subsidize PRB coal has the potential to alter the economics of exporting coal to South Asia. Subsidizing the price of PRB coal will artificially make exporting this coal to China and India profitable where it would not otherwise be. If China and India can count on a long-run supply of underpriced coal from the United States, it will increase their use of coal to generate electric power and raise the odds that they will rely on

coal rather than renewable forms of energy as both of these countries race to industrialize. This would undermine the commitment that the Administration secured from China in 2015 to cap its reliance on coal after the year 2020.

(8) Economists Thomas M. Power and Donovan S. Power estimate that with this new infrastructure in place, the projected delivery cost of PRB coal to China will be approximately \$77.16 per ton. (Power,M., et al, 2013 at 22.) The price of thermal coal shipped to the industrial southeastern region of China has fluctuated between roughly \$70 and \$135 per ton over last five years. Id. at 20, Table I.

Taking into account transportation costs and other fees and charges, the mine-mouth price of PRB coal could be as high as \$53.93 per ton--a fourfold increase from the current price—and still be competitive with benchmark delivery prices in China and various Asian markets. While international coal prices have declined in recent years, the completion of ports along the American West Coast would still make PRB coal exports viable at all but the lowest recent prices of coal in southern China. See Center for American Progress, 5 Things You Should Know about Powder River Basin Coal Exports, August 18, 2014, available at <http://www.scribd.com/doc/237152057/5-Things-You-Should-Know-About-Powder-River-Basin-Coal-Exports>.

Organization I: Bowie Resource Partners, LLC

Commenter I: Gene DiClaudio

Comment Excerpt Text:

although the impact of major federal actions on conditions outside the United States is generally excluded from NEPA, it is worth noting that the export of federal coal saves lives and promotes human welfare. Federal coal, especially coal that is attractive for export, is often of substantially higher quality and lower ash and sulfur than alternative coals that overseas facilities might consume. Developing nations typically cannot afford the sophisticated and expensive pollution controls required of U.S. facilities, and thus burning cleaner coal can produce immediate and dramatic improvements in emissions. In addition, U.S. coal mines are far safer than many overseas mines. For its part, Bowie has an outstanding safety record. To the extent Bowie (and other operators) export federal coal, lives are saved

Coal exports

With domestic demand for coal shrinking because of aging coal plants, concerns about air pollution and the global climate, and low natural gas prices, the coal industry is eyeing Asian power markets as a way to dramatically boost their bottom lines. The very companies that BLM is selling our coal to – Peabody, Arch, and Cloud Peak – are developing export terminals with the intent to export more and more federal coal to U.S. competitors like China and India.

The EIS should disclose impacts associated with exporting federal coal. This includes increased rail traffic and corresponding traffic congestion impacts (with associated costs to local communities), the necessary building of port facilities, and the corresponding impacts those facilities create. The BLM should also assess the financial impacts of coal exports, including increases in energy costs for domestic consumers and depletion of strategic federal energy reserves.

The PEIS should also consider the environmental and socio-economic impacts that come with exporting federal coal. For example, exporting millions of tons of coal from the Powder River Basin, or even a small fraction of that

amount, would necessitate massive export infrastructure – such as ports in Washington and Oregon if destined for Asian markets. Those impacts, which have never been incorporated or analyzed by the BLM, must be examined in the PEIS. See letters from Washington and Oregon (raising these concerns).

In addition, the dozens of coal trains needed to haul federal coal from federally supplied mines to ports would have dramatic and costly impacts on local traffic and infrastructure. The cost to communities in mitigating those coal trains congestion and public safety impacts easily adds up to hundreds of millions.

The GAO report "Freight Transportation: Developing National Strategy Would Benefit from Added Focus on Community Congestion Impacts," (September 2014) found that freight related traffic congestion in communities resulted in delays and congested road conditions for passenger and emergency response vehicles. Addressing those problems is costly and federal funding that is currently allocated for state and local transportation agencies does not align with those needs. Communities are left on their own to foot the bill for costly rail congestion related infrastructure. (See attachments).

Coal trains hauling export coal also put other commodity shippers and passenger rail at a competitive disadvantage as detailed in Heavy Traffic Still Ahead (attachments). In terms of alternatives, the principal alternative to be considered here is whether BLM should ban or otherwise dis-incentivize the export of federally leased coal.

he PEIS should also consider whether allowing coal development for export is consistent with BLM's often stated objective to sell federal coal to private companies "to meet the nation's energy needs." (31) Allowing leasing for export contradicts this purpose and need, by sending our domestic energy supply overseas.

(31) See Final Environmental Statement for the Wright Area Coal Lease Applications at I-17; see also Record of Decision for the North Porcupine Coal Lease Application at I0 (stating the federal coal program "provides a reliable, continuous supply of stable and affordable energy for consumers throughout the country" and helps to "reduce our nation's dependence on foreign energy supplies").

The PEIS process provides BLM both an obligation and an opportunity to make an informed and conscious decision as to whether it is consistent with its statutory obligations to subsidize increased coal consumption in China by committing to the long-term availability of relatively inexpensive Powder River Basin coal for export purposes. The most detailed study to date of the market, consumption, and resulting greenhouse gas consequences of Powder River Basin coal export to China assessed the interaction of coal prices, Chinese demand and capacity, combustion and transportation impacts, and concluded that PRB coal exports to China would (a) lower coal costs for southeastern China coastal markets, increasing the incentive for long-term investment in coal-fired generation, and (b) discourage Chinese investment in efficiency and low-carbon energy sources.¹⁴⁶ The Power export study also noted that, because clean energy technologies are a growing market, and coal mining and shipping mature industries with relatively low employment potential, a policy of subsidizing raw coal export undermines U.S. investment and economic advantage in less carbon-intensive and more employment-intensive clean energy technologies.¹⁴⁷

The focus, nationally, should be on implementation of reasonable measures that make the impact of coal less over time. Over the decades Emery County power plants have implemented measures on emissions that has resulted in emissions being reduced to less than 1%. The US is the leading innovator in more efficient utilization of coal resources, and will continue to be in the future. The federal government should partner with industry to enhance the efficiency. For instance, creating a market atmosphere friendly to coal fired electrical generation here means the resource is used here in the US where it is considerably more efficient (cleaner, greener) than in other nations that are entirely less efficient in their practices.

The Notice indicates that the PEIS will address concerns made by stakeholders concerning whether leasing decisions should consider actual and/or projected exports of domestic coal, if so, how; and the mechanisms needed to evaluate export potential (81 FR 17726). This proposal is out of touch and fails to consider that export of coal is very low and costly for operators. The amount of coal exported is so low that the value would not yield valid statistical results of potential export. Therefore, until better shipping infrastructure is developed for coal producers in the West, thereby increasing export potential, further analysis regarding export forecasts or the appropriateness of export considerations in leasing decisions should be eliminated from detailed analysis.

Comment Excerpt Text:

As part of its PEIS review, BLM proposes to evaluate the extent to which actual and projected coal exports should be considered when making coal leasing decisions. Given the unpredictable nature of American coal exports, it is hard to see how BLM could at the leasing stage meaningfully predict the nature and terms of any export arrangement and how that information would be useful in making a decision on whether to lease any particular tract of federal coal. For example, at the leasing stage, BLM lacks the ability to accurately value future coal exports. Even BLM itself has recognized this fundamental limitation: “During the coal leasing EIS process, it is uncertain who might purchase future PRB coal, how it would be used, and where the coal might be transported to.” West Antelope II EIS, at 4-105 (2009).

The factors that influence coal export potential are highly complex and dynamic. The GAO Report and IG Report provide a useful example of one such factor: the fluctuating demand for coal exports. Both reports, published in 2013, discuss the need to consider the increase of exports as part of BLM’s FMV determination. See IG Report at 7-8; GAO Report at 36-39. The IG Report provided that 125 million tons of coal was exported in 2012, which represented a 100% increase in coal exports since 2007. IG Report at 7-8. Similarly, the GAO Report provides that “coal exports have increased in recent years—particularly exports to Asia and Europe . . .” GAO Report at 2-3. And in 2012, the United States saw an increase in coal exports of 54% over 2010 exports. *Id.* at 3.

And while the IG Report and GAO Report propose to increase the significance on coal exports in BLM’s FMV determination, more recent trends demonstrate why such a proposal would be ill-advised. In January of 2016, the U.S. EIA estimated that total coal exports for 2015 dipped down to 77 million tons of coal, which would represent a 21% decline from the previous year. Attachment 9, U.S. EIA, “Coal Production and Prices Decline in 2015,” (Jan. 8, 2016). Moreover, since coal exports peaked in the second quarter of 2012, coal exports have steadily declined. Attachment 10, U.S. EIA, “Quarterly Coal Report” (June 15, 2016). In fact, coal exports have declined for twelve quarters in a row. *Id.* The recent downturn in coal exports due to unpredictable international factors is a prime example as to the risk of trying to meaningfully evaluate the coal export potential at the leasing stage—especially when calculating FMV—given that BLM may make a leasing decision 5-10 years before coal is produced and sold from the lease parcel.

BLM should not consider environmental impacts associated with coal exports in its review of the federal coal program. For instance, BLM lacks certainty regarding the international demand for federal coal, the availability of adequate transportation to global markets, and the sophistication of emissions controls. To be sure, there is far less information available concerning the environmental impacts from coal exports than is known about the environmental impacts from domestic coal transportation and combustion. BLM should not account for any potential federal coal exports in its analysis of the environmental impacts associated with the federal coal program.

Comment Excerpt Text:

Coal is a fungible commodity, and its value is based upon the location, class and quality. This is no different than other commodities such as oil, wheat, gold or cotton. The price of commodities are based upon the physical location of the particular grade. Therefore the international coal index, the Newcastle price, is based upon bituminous coal located in Newcastle, Australia and the PRB 8800 price is based upon 8,800 BTU subbituminous coal located in the PRB. For the purposes of royalties and taxation, federally leased coal value should be based upon its physical location. Two rail cars of PRB coal at the mine are indistinguishable and should be valued the same, regardless of whether or not it is destined for a customer in Illinois or South Korea. The BLM does not apply a different valuation for natural gas that is destined for an international market. The BLM needs to consider how it values other federally owned minerals and apply the same standard to coal.

The BLM needs to factor in all of the costs incurred to transport coal to location. Coal sales are consummated at the point at which the coal is loaded into the transport vehicle. This is known as Freight on Board sales. For most domestic coal sales, this occurs when the coal is loaded into the train at the mine. For export sales, the sale occurs when the coal is loaded into the ship at a terminal. Therefore, coal companies must pay for and incur all of the various costs to transport the coal to the shipping location. These costs include paying the railroad to ship the coal, terminal fees for the company to pay the terminal to unload the trains and load the ship, sales agent fees, and demurrage if a ship is delayed in loading, vessel surveys, and export customs fees. Similar to other commodities, discounts for quality and distance are applied. Since sub-bituminous coal is less energy intensive than bituminous, you cannot ship as many BTU's on the same ship, so a subbituminous discount is applied. There is also a discount for the increased shipping distance called the Indonesian Shipping Delta. Coal companies are also subject to "take or pay" contracts. This means that if a company is unable to use all of its contracted capacity with the terminals or the railroads, they are subject to pay for the costs anyway. Either the company "takes" the capacity or "pays" the costs. As the BLM looks at the export prices, they need to consider all costs. The difference in export versus domestic prices is created by transporting coal, not any changes to or difference in the quality of the coal itself.

3. Coal importing countries such as Japan commonly pay premiums above the market price to ensure a long-term supply of energy. Hume, E.T., Japan's annual coal benchmark influence on the wane, Financial Times (April 8, 2016); [18] (WY0-02158 to 02162). The final price paid is not always based upon market factors, but could include political considerations, such as the need for a stable supply to ensure electricity supply reliability. The BLM needs to consider how political and energy security factors impact the final price paid for coal. These externalities should not impact the valuation of the commodity itself.

4. The BLM needs to consider how much federally owned coal is exported as a percentage of total coal production. Using 2015 figures, this is less than 1% and may be statistically insignificant to warrant a separate valuation process.

Comment Excerpt Text:

The Wyoming Infrastructure Authority supported by the DOE National Energy Technology Laboratory (NETL), conducted a GHG LCA for coal exports from the PRB to Japan, South Korea and Taiwan. The NETL study was performed using an attributional approach to compare the next marginal megawatt-hour (MWh) of electricity produced from PRB subbituminous coals exported to Japan, South Korea and Taiwan versus coals supplied from Australia and Indonesia. Preliminary results of the NETL study are presented in Figures 3.2.1 and 3.2.2 that includes a carbon capture pre-commercial option for Japan that uses conventional CO₂ capture, CO₂ pipeline and underground storage technologies. For the carbon capture option shown in Figure 3.2.2, the kilograms of CO₂ equivalent emissions per megawatt-hour (kgCO₂e/MWh) for use of PRB subbituminous coal in Japan for power generation drop from 864 kgCO₂e/MWh to 111 kgCO₂e/MWh.

During review of the draft NETL report a number of significant limitations with the available GHG LCA models and data were identified and should be taken into account by BLM in its PEIS review of the federal coal program. Many of these limitations were not resolvable before completion of the NETL study and are highlighted within the NETL draft report [9] results presentation. (WY0-01558 to 01582). Resolving these limitations is considered essential in order for BLM to study both negative and beneficial impacts and to comprehensively and accurately determine NCCIBs for the federal coal program.

iv. Coal Exports

As the notice of intent to prepare the PEIS emphasizes, the impacts of coal exports are of great concern. To this end, the PEIS must fully analyze and assess the reasonably foreseeable impacts of coal exports that may occur as a result of future coal management. These impacts include, but are not limited to, the following:

- Rail-related impacts: The impacts of hauling coal from mines to ports must be analyzed and assessed. The impacts that must be addressed include, but are not limited to, the air quality impacts of rail traffic, noise impacts of rail traffic, fish and wildlife impacts of rail traffic, and water quality impacts. Such an analysis must take into account the potential for spills and/or derailments and the impacts such events may have on land, water, fish,

wildlife, and air.

- Port-related impacts: The impacts of unloading coal from trains, loading coal onto barges and/or ships, constructing and/or maintaining port facilities, and the impacts of port operations, including ship, locomotive, and/or truck operations must be analyzed and assessed. The impacts that must be addressed include, but are not limited to, the air quality impacts of all port operations, including ship, locomotive, and truck emissions, water quality impacts (including wetland impacts), and fish and wildlife impacts.
- Shipping impacts: The impacts of shipping coal, both within waters of the United States and through international waters must be addressed. The impacts that must be analyzed and assessed include air quality impacts, impacts to water quality (particularly through discharge from ships), and impacts to river and ocean species, especially species listed as threatened or endangered under the Endangered Species Act.
- Coal unloading impacts at international ports: Just as coal unloading and loading at American ports must be addressed, the impacts of unloading coal from ships and loading coal onto trains and/or trucks at international ports must be analyzed and assessed.
- Inland coal transport abroad: The impacts of transporting coal from international ports to facilities must be analyzed and assessed. Such an analysis must analyze and assess whether the coal is hauled by rail or by truck, and analyze and assess the attendant impacts.
- Coal combustion abroad: Finally, the impacts of combusting coal abroad must be analyzed and assessed. Such an analysis must include, but not be limited to, an analysis of the air quality impacts of coal combustion (including greenhouse gas emission impacts), water quality impacts, coal ash disposal impacts, fish and wildlife impacts, and impacts to lands.

BLM Should Analyze the Direct And Indirect Impacts of Exporting Federal Coal. The activities associated with coal leasing dramatically increase air emissions, hazard risk and negative impacts to health. Exporting coal exacerbates these affects because export demands more transport, involves greater distances, requires expanded infrastructure (e.g., ports), and increases emissions due to often softened regulations overseas related to transport and combustion, compared to domestic emissions. The PEIS must analyze the direct, indirect and cumulative impacts from these activities. At minimum, the PEIS should analyze the following: Rail-related impacts: The cumulative and indirect impacts to wildlife and human health of coal traffic due to exports along the entire route from federal lands to existing and contemplated coal ports. Coal can be transported more than a thousand miles by rail just to reach this first stop before being shipped overseas. Impacts to analyze include, but are not limited to: the air quality impacts of rail traffic, noise impacts of rail traffic, fish and wildlife impacts of rail traffic, and water quality impacts. Such an analysis must take into account the potential for spills and/or derailments and the impacts such events may have on land, water, fish, wildlife, and air. Port-related impacts: The PEIS should analyze the impacts from unloading coal from trains, loading coal onto barges and/or ships, constructing and/or maintaining port facilities, and the impacts of port operations, including ship, locomotive, and/or truck operations. Specifically, the PEIS must address the air quality impacts of all port operations at each of the US coal ports, including ship, locomotive, and truck emissions, water quality impacts (including wetland impacts), and fish and wildlife impacts, and impacts to human health and safety. Exporting coal also increases vessel traffic. The PEIS should include an analysis of this impact. The PEIS should consider the impacts of foreseeable (proposed) export terminals as 64 well as analyze the potential for continued or expanded federal coal leasing to induce construction of new coal export terminals, particularly on the West Coast. Shipping impacts: The PEIS should analyze the impacts of shipping coal both within US waters and through international waters. Specifically, the analysis must include air quality impacts, impacts to water quality (particularly through discharge from ships), and impacts to river and ocean species, especially species listed as threatened or endangered under the Endangered Species Act. Coal unloading impacts at overseas ports: The EIS should analyze the impacts of unloading coal from ships and loading coal onto trains and/or trucks at Asian, South American and European ports, and wherever else

coal is exported. Coal transport overseas: The PEIS should analyze the impacts of transporting coal from ports in Asia, Europe and Latin America to facilities on those continents. This analysis must include impacts of transport by rail or truck. Coal combustion overseas: The PEIS must analyze the impacts of processing and combusting coal from federal lands. This includes but is not limited to analyzing the air quality impacts of coal combustion (including greenhouse gas emission impacts), water quality impacts, coal ash disposal impacts, fish and wildlife impacts, impacts to human health and safety, and impacts to lands. The PEIS should analyze the impacts described above but should by no means be limited to these impacts. NEPA requires agencies to gather necessary information relevant to reasonably foreseeable impacts unless the cost of obtaining the data is exorbitant. To this end, the agency must make every effort to analyze and assess these impacts.

BLM should consider exports in valuing/pricing leases and in deciding whether to issue leases intended for export. Coal exports undermine our efforts both to reign in greenhouse gas emissions and to reduce pollution and hazards simply by extending and intensifying the coal lifecycle. Scenarios involving higher export volumes have correspondingly higher projected greenhouse gas emissions. 233 Offering cheap federal coal leases further frustrates efforts to realize national and international climate goals, degrades our shared environment and erodes our health; low coal prices can increase demand and with it, consumption. 234 The PEIS should analyze how exporting coal will influence demand, and hence coal consumption both in the U.S. and overseas. 232 See 40 C.F.R. § 1502.22(a). See Synapse Energy Economics, *Analysis of the Tongue River Railroad Draft Environmental Impact Statement* (Sept. 23, 2015), at 15-17, attached as Ex. 43. 234 See *id.* at 3 (“a new source of coal that has a less expensive delivered price than some other coals currently being purchased should ‘shift the supply curve’ for coal”). 65 The coal leasing program also breathes life into a declining and damaging industry. 235 As one report summarizes, “Coal export is part of the last chance bailout strategy for an industry that is in a state of permanent, structural decline.” 236 Coal export prices to Asia, and the associated profits, have declined each year for the past five years. 237 Over the past four years, since 2012, the amount of coal producers have exported has dropped by half, from 125 million tons of coal to an estimated 72.3 million tons. 238 The market is suffering from oversupply. 239 In addition to oversupply, cheap leases can induce overbuild. Industry has proposed numerous West Coast export infrastructure projects over the past few years that would allow for a doubling or tripling of some states’ GHG emissions. 240 At the same time, many of the nations that producers seek as export partners are transitioning away from coal. For instance, the Indian government, which currently imports coal, has announced a policy to reduce its imports to zero. 241 China has been reducing coal production over the past few years and has recently announced further steps to shrink its coal industry. These plans include closing 1,000 coal mines in 2016 alone, while transitioning as many as 1.8 million workers out of the coal and steel industries and into other fields. 242 It plans to convert to a greater share of natural gas. And other nations in Asia have the capacity to shift from coal to natural gas. 244 These shifts are needed for the world to meet the GHG mandate to keep 80 percent of all fossil fuels unburned. A decision by BLM to buoy approaches that spur coal burning, by offering an abundance of cheap coal for export, steers us away from our joint 235 Testimony of Tom Sanzillo, City of Oakland, City Council Hearing, Institute for Energy Economics and Financial Analysis (Sept. 2015), at 3, attached as Ex. 44. 236 *Id.* at 5. 237 Williams-Derry, Clark, *Unfair Market Value II: Coal Exports and the Value of Federal Coal*, SIGHTLINE, June 2016, at 5, attached as Ex. 45. 238 Testimony of Tom Sanzillo (Ex. 44) at 11. 239 *Id.* at 7, 13. 240 See, e.g., Columbia Riverkeeper, et al., *Comments on Draft Environmental Impact Statement for Millennium Bulk Terminals Longview*, at 69. 241 Testimony of Tom Sanzillo (Ex. 44) at 11. 242 Sophia Yan, *China plans to cut 1.8 million coal and steel jobs*, CNN Money, February, 29, 2016, available at <http://money.cnn.com/2016/02/29/news/economy/china-steel-coal-jobs/> (last visited July 28, 2016) 243 Thomas Power, et al., *Comments on the Greenhouse Gas Impacts of Modeling of Coal Flows in the Millennium Bulk Terminals Longview SEPA Draft Environmental Impact Statement* (June 2016), attached as Ex. 46. 244 *Id.* 66

commitments. 245 The PEIS must evaluate these environmental and economic impacts of coal exports, as well as options for limiting export of federal coal.

Comment Excerpt Text:

It is in the country's best interest to incent the export of coal from BLM coal lands. When coal is economically viable as an export commodity these exports provide a positive contribution to the nation's taxpayers in a number of ways:

- 1) The taxpayer is paid a royalty on the coal mined and sold as well as a Bonus Bid when new coal lands are leased. This income reduces the tax burden on individuals for the same level of services from government which enhances our standard of living or lowers the public debt. As mentioned before the basis for royalty needs to continue to be the net back price at the mine loading point to account for the costs to transport the coal to the port and port charges along with other costs to move the coal to the market. This method recognizes the geographic impacts due to the reserve location.
- 2) The sale of coal to other countries increases the demand for coal mined in the United States, which creates high quality jobs in the United States along with the income taxes from those jobs and jobs in the support industries associated with this production. This reduces the amount of taxpayer money paid out in unemployment or indigent support payments reducing the tax burden on individuals and enhancing our standard of living.
- 3) Export sales improve the balance of payments for the United States and put the nation in a stronger position financially.
- 4) Generally speaking the types of coal that are exported by the United States tend to be higher quality than those in the countries where it is imported. This has the potential to reduce emissions in those countries.
- 5) Energy produced by the United States and shipped to our allies provides a stable and reliable source of energy to those countries and can reduce their dependence on politically less stable sources. (Specifically Europe and the potential to reduce their exposure to gas produced in Russia).
- 6) Coal mines in the United States have safety records that are the envy of the world. With few exceptions coal mined in the United States results in fewer injuries and fatalities than coal mined in countries that import coal. Incenting the export of coal from the United States might displace coal mined with greater numbers of injuries or

death. (Specifically China although the comment applies to other countries as well.)

7) The United States requires all coal mining operations to meet very high standards with respect to reclamation, much more rigorous than many of the nations that import coal. Coal exports from the United States might displace coal production from other countries that have less stringent reclamation standards thus netting cleaner air and water than the alternative.

8) Export of coal from the United States to other countries enables them to increase the number of households that have electrical power available to them. IEA reported recently that 1.2 billion people do not have access to electricity, and that 2.7 billion people do not have access to clean cooking facilities. Coal exports from the United States enables countries to expand their electric generation capacity to more households. The World Bank indicates that households with access to electricity and clean cooking facilities have longer life spans, so incentivizing coal exports from the United States can result in improving standards of living in countries where imports occur and increase life spans.

Organization I: Bowie Resource Partners, LLC

Commenter I: Gene DiClaudio

Comment Excerpt Text:

NMA correctly observes that the export of coal is a tiny fraction of total U.S. production, and is a vanishingly small fraction of worldwide coal consumption. Even if U.S. exports were aggressively expanded, they would have no material effect on overall federal coal production or no detectible effect whatsoever on worldwide consumption. Exports do not provide a rationale to undertake significant revisions to the federal coal program.

Comment Number: 0020056-3

Organization I: Bowie Resource Partners, LLC

Commenter I: Gene DiClaudio

Comment Excerpt Text:

Finally, although the impact of major federal actions on conditions outside the United States is generally excluded from NEPA, it is worth noting that the export of federal coal saves lives and promotes human welfare. Federal coal, especially coal that is attractive for export, is often of substantially higher quality and lower ash and sulfur than alternative coals that overseas facilities might consume. Developing nations typically cannot afford the sophisticated and expensive pollution controls required of U.S. facilities, and thus burning cleaner coal can produce immediate and dramatic improvements in emissions. In addition, U.S. coal mines are far safer than many overseas mines. For its part, Bowie has an outstanding safety record. To the extent Bowie (and other operators) export federal coal, lives are saved.

Organization I: Wyoming Mining Association

Commenter I: Jonathan Downing

Comment Excerpt Text:

In the event that conditions improve and increased export capacity becomes available, WMA believes that federal

coal mined and sold to international buyers should be treated similarly to domestic buyers. In Wyoming, coal producers pay an average of 40% of the sales price of coal in taxes, fees and royalties. Revenue generated from these amount to over \$1 billion annually to state and local governments. Expanded markets for federal coal mined in Wyoming are in the financial interest of the state, as well as the federal government pursuant to the Mineral Leasing Act. Exported coal historically demands a higher sales price because it includes the transportation costs which are paid by the producer. This is different than the situation for coal sold domestically where transportation costs are paid by the customer. For the coal producer, these higher sales prices do not necessarily translate to higher profits on exported coal. WMA encourages the agency to avoid measures that would act as a disincentive to exporting federal coal to include raising costs, regulatory barriers or implementing arbitrary "social costs of carbon" standards. These actions would be contrary to the agency's charge of responsible management of the resource.

Comment Excerpt Text:

Even though the coal industry has seen a significant decline over the last decade, we can't ignore the reality of the United States is the fourth largest source of coal exports in the world. Of those exports, the majority of our coal is headed to Asia. Joby Warrick in a Washington Post article put it most aptly: "Each shipment highlights what critics describe as a hypocrisy, underlining U.S. climate policy: While boasting of pollution cuts at home, the United States is facilitating the sale of large quantities of government-owned coal abroad." To make it abundantly clear, continuing the mining and export of government owned coal is making a statement to the world where our priorities lie and most importantly it goes against President Obama's Climate Action Plan. By the Bureau of Land Management not taking into account the effects of coal exports on global warming, you are undermining global efforts to address climate change. In yesterday's USA Today article on the West Virginia floods, it stated that climate change may have added to this disaster. According to the National Climate Assessment, the part of the U.S. that includes West Virginia has seen a 71 percent increase in extreme precipitation since 1958. We are exporting our pollution and that pollution is not only still contributing to global climate change, but its local effects are impacting poor and vulnerable populations. Now is the time to take a serious stance on climate change and protect the most vulnerable.

The statement that the mines are not completing the required reclamation is completely false. Black Thunder has approximately half of all their disturbed land in permanent reclamation. The reclaimed land is being grazed by local ranchers and are more productive than native lands. Wildlife is abundant including a herd of elk frequently seen grazing on the reclamation. Black Thunder and many other mines have been recognized for outstanding reclamation achievements by a number of agencies including the Office of Surface Mining and the State of Wyoming.

The costs to taxpayers for the broken leasing program are \$1 billion a year in lost revenues. What could that one billion do? Many of us feel that it should fund a strong program for coal communities to identify what will help them thrive as the coal markets continue to decline. We also feel that one billion needs to fully fund reclamation which is currently way behind and the good dependable jobs that go with reclamation. That one billion can help mitigate the growing effects of climate change that we're all suffering.

Commenter I: Beth Kaeding

Comment Excerpt Text:

Despite federal and state laws that mandate reclamation following coal strip mining, it is not happening. There is a woeful lack of evidence of contemporaneous reclamation and/or reclamation success as measured by bond release throughout the West. Coal strip mines have been operating in Montana for more than 40 years. But as of September 2015, of the 41,005 acres that have been disturbed by coal strip mining operations, only 20,290 acres have achieved Phase I reclamation and bond release (backfilling, re-grading, topsoil replacement, re-contouring, and drainage control) and, even worse, only 491 acres in all of Montana have achieved final Phase IV bond release. By the way, bond amounts are woefully inadequate, and in this time of coal company bankruptcy, the lack of proper bonding - or even worse, the practice in some states of self-bonding - means that the taxpayer could once again be stuck with cleaning up the messes left by corporations who take their profits and run.

Comment Excerpt Text:

It is worthy of note that the diversity of plant species, an important indicator of wildlife habitat, on reclaimed land is significantly less than on untouched lands. Additionally, plant areas that are reestablished have more invasive and non-native species than undisturbed lands. For example, a study of undisturbed sagebrush steppe lands found 100 to 130 unique species in 24 sample plots of 50x10 meters. In contrast, the mining and reclamation plan for Cloud Peak's Antelope Mine in Wyoming covered only 30 species in its regeneration seed mixes. BLM must consider that native sagebrush-grassland steppe plant communities can require up to 60 years for natural development

Our proposal for how this program would work is outlined in detail below and contains the following major elements:

- Planning for new coal offerings set by DOI based on accurate analysis of coal reserves and demand.
- Financing for the coal industry provided by a combination of private sector borrowing, and public sector asset transfers of coal, revenue and market guarantees, and regulatory streamlining.
- Coal prices set by a committee made by a federal-state coal price Commission, with a pricing structure that takes into account the need to maintain affordable and reliable electricity and to adjust to changing market conditions.
- Eliminating the self-bonding system for coal mine reclamation, replacing it with a program in which coal producers and the federal government share responsibility for clean-up and in which royalty payments are set aside to cover liabilities (and to provide for pensions for coal miners).
- Regular bi-annual external audits of the program by the inspector generals of the Department of Energy and the Department of the Interior.

As a citizen who wants coal users to pay for the public resources they extract, I believe that this program has been a give-away to coal companies, especially because they have often not reclaimed the land.

Comment Number: 0002152_Bruse_20160518-3

Commenter I:Debbie Bruse

Comment Excerpt Text:

The idea that the mining companies are not completing their reclamation is simply not true. It is in the best interest of the mining companies to complete reclamation as closely behind mining as possible. Direct hauling topsoil from the pit advance directly to the backfill avoids re-handling costs. It is the Wyoming Land Quality Division's responsibility for verifying that all mines are meeting their reclamation commitments in their permit document. Not meeting the requirements would result in a notice of violation.

Comment Number: 0002152_Bruse_20160518-4

Commenter I:Debbie Bruse

Comment Excerpt Text:

While bond release acres may be low, it takes many years after final reseeding of topsoil to meet bond release requirements. I would not be far off to estimate a 10 year period. During that time the grasses need to reestablish themselves enough to support livestock grazing, and the reclamation must meet diversity and shrub requirements. Vegetation monitoring will have occurred several times and supplemental seeding may have to occur to meet requirements. Supplemental seeding essentially restarts the clock. Getting final bond release is not an easy process to succeed at. But that does not mean that reclamation is not occurring. Changes to the self-bonding program will surely encourage coal companies to pursue more bond release.

Comment Excerpt Text:

Cloud Peak Energy is actively reclaiming mined lands on a continual basis. Preserving, protecting, and reclaiming the environment is as much of our day to day business as sending a coal train down the track. In fact, part of our permit that allows the mine to operate is an approved reclamation plan complete with plans to retopsoil, revegetate, and return the land to what it was before. Our permit also requires a reclamation bond to guarantee the financial liability of the reclamation process. The reclamation process goes through four stages of bond release. Phase 4 bond release for final reclamation can not be granted until all mining activities are complete within the entire designated drainage basin.

Today at Spring Creek, approximately 25% of the land at the mine is used for facilities and will not be reclaimed until the end of mine life. About 50% of the land is within the active mining area, and approximately 25% of the land at Spring Creek is under reclamation. That accounts for over 1200 acres of reclaimed mine land, one third of which has been issued Phase III bond release, the first in the state of MT.

Comment Excerpt Text:

In point of fact, if strip mining is the proposed method of removal, the surface owner in that case really should not expect to either get his land back within his lifetime or even see it with bond released for successful reclamation. Successful reclamation, of course, includes success with water, something that has been very elusive, and something BLM has not wanted to consider when it proposed land for leasing and mining. Montana will have something resembling its previous surface, but Wyoming may have immense holes in the ground, either dry pits or slowly filling versions of Butte's Berkley Pit.

I believe BLM could have had quite a bit of control on how mine plans were laid out even before leasing the coal reserve, so that reclamation could have proceeded in a much more contemporaneous manner with mining. When many of these mine plans were presented to Montana and Wyoming, there was a sense of hysteria in the air to catch the money on the fly.

Thoughts of planning for reclamation were as elusive as butterflies.

Some of the mine plans when regarded from a more sober time show disregard of when reclamation would take place---in some cases many years. I do not know how those plans met the standard of contemporaneous reclamation. The states were overwhelmed and over impressed by guys in suits with slide rules and calculators.

With the bankruptcies currently floating through the coal industry, BLM may be getting some of the biggest holes in the world back into its possession. It will be a cold day determining multiple use for some of the pits.

Comment Excerpt Text:

Indeed, due to challenges of restoring native habitat in the arid west, no mined areas have been able to reclaim pre-mining conditions – topography is gentler, shrub density lighter, and water balance is changed. (163) Soil

storage is often a problem, with nutrients leaking from soils and/or becoming deposited within nutrient hot spots on soil storage sites. The result is that when soil is reapplied to mining sites, areas are either too nutrient rich or too nutrient poor to support native vegetation, and the vegetation fails. (164) Non-natives and invasions are often primed to outcompete native plants, and weeds will quickly establish themselves on mined areas. Even in areas where natives are planted and take hold, the overall diversity of plants do not match pre mining conditions, lessening habitat quality. (165)

(163) Id. at 25

(164) Id. at 26-28.

(165) Id. at 28-29.

Water balance on sites is also extremely difficult to reclaim. Groundwater tables are often disturbed and lowered, impacting stream flow and timing, drying up wetland areas, and reducing water availability for plants. Coal mining also can cause long term water pollution and sediment issues. (166) With climate change altering hydrological cycles and resulting in conditions favorable for invasives, the challenge of establishing pre-mining conditions gets steeper.

Comment Excerpt Text:

Coal leasing on federal land has high external costs that are not being borne by the industry. Major areas of failure include basic compliance with environmental safeguards, particularly reclaiming mined land that serves as important habitat for wildlife; protecting the public through adequate bonds that are third party backed and keep clean-up costs from being passed on to the public; and failure to account for the high and increasing costs of carbon pollution associated with every life-cycle phase of federal coal mining.

As a particularly apt example, a recent report has found that reclamation – a basic requirement of mining – suffers from chronic failure, particularly in the west where the vast majority of federally leased coal is mined. (76) The report finds that coal companies in the west are not fully reclaiming mines to final standards, and the public faces increasing long-term liability for massive reclamation costs of up to \$2 billion and damage to landscapes, wildlife and crucial water supplies. More specifically, after decades of mining, of the 450 square miles of disturbed mined land in Montana, North Dakota, and Wyoming, only 46 square miles has met the final reclamation requirements for final phase III and IV bond release. (77) This calls into question the industry's prospects and capabilities of successfully reclaiming the harsh, brittle and arid ecosystems of western states.

Comment Excerpt Text:

Surface coal mining is an extraordinarily destructive process. Although SMCRA requires that land be reclaimed contemporaneously with mining, the alarmingly weak financial state of coal companies mining federal coal raises serious questions about the companies' capacity to fulfill reclamation requirements. Currently, in nine states, reclamation self-bonds can be secured by assurances or assets that may not be available in the event of a reclamation claim.

Even for reclaimed sites, the true value of these lands compared to pre-mining conditions is questionable. While some sites may achieve vegetation coverage – the type of vegetation needed that is essential to support pre-mining – native habitats may take decades to become re established. For example, reclaiming mined lands to

sagebrush habitat for sage grouse may take between 15-60 years to develop native shrub communities comparable to pre-mining conditions. (162)

Comment Excerpt Text:

Every year, OSMRE prepares oversight reports on state programs implementing SMCRA which analyze state-

wide trends regarding contemporaneous reclamation. OSMRE evaluates the effectiveness of a state program achieving reclamation success based on the number of acres that meet the standards for phases of bond release and acres that have been released from bond. BLM should fully consider these reports in the scope of its PEIS and solicit additional information from OSMRE as necessary to disclose the current reclamation status of mines with federal coal leases.

Specifically, the reports on the Wyoming program, where the largest amount of federal coal is being mined, show that contemporaneous reclamation requirements are not being met because of a growing gap between disturbed and reclaimed acreages, delays in reclamation activities, failure to achieve bond release, and operational emphasis on production over reclamation. These reports affirmatively demonstrate that, on average, the rate of land disturbance is much greater than the rate of reclamation for PRB coal mines. OSMRE has stated that “the data shows that the State program may not be fully effective in its goal of having all disturbed lands reclaimed to the approved post-mining land use as contemporaneously as possible.” Annual Evaluation Summary Report For The Wyoming Regulatory Program (OSMRE 2009) at 9. OSMRE concludes that “...there could be delays in backfilling and grading or permanent seeding operations due to the mines’ operational emphasis on coal production over reclamation.” Id.

The risks and impacts associated with the failure to complete these reclamation obligations must be thoroughly examined in the PEIS. The PEIS should also disclose the reclamation and bond release status of all mining operations. BLM must also assess how long land uses will be impacted (e.g. what is the expected time frame for reclamation and the area to re-gain access for grazing, hunting, and recreational purposes?). These impact analyses should be site-specific and cumulative on a regional basis. (23)

(23) As identified by BLM’s sister agency, OSMRE, bond release status is the most objective measure of reclamation success. For example, in Wyoming bond release is tied to restoration progress, and the operator is not eligible for final bond release until re-vegetation standards have been met, pre-mining productivity has been re-established, and pre-mining surface and groundwater quality and quantity (including groundwater recharge capacity) have been restored. See Wyo. Land Quality Regulations Ch. 15 § 5.

Assessing the status of reclamation is fundamental to BLM’s responsibilities to limit coal leasing to those circumstances that are in the public interest. 30 U.S.C. § 201. Federal law makes contemporaneous reclamation a pre-requisite to coal leasing. Leasing and the right to mine coal that it conveys is allowed only where reclamation can and does occur. 30 U.S.C. § 1202(c) (purpose of SMCRA is to “assure that surface mining operations are not conducted where reclamation as required by this Act is not feasible.”). The success and failure of coal companies to reclaim land previously mined is a critical factor in BLM’s determination whether to lease more coal.

Comment Excerpt Text:

It is critical that before new leasing, BLM ensure that previously leased lands fully comply with SMCRA, the Clean Water Act, the Clean Air Act, and other environmental requirements governing coal mining and development. However, beyond these legal requirements more often met by EPA, OSMRE, and state agencies, BLM has an independent duty to assess impacts and corresponding mitigation measures pursuant to its mandates under the MLA, FLPMA, and other statutes. This is especially true for areas mining federal coal, where SMCRA and FCLAA has given the Department of Interior special management obligations under federal mining plans and resource recovery and protection plans (R2P2s). In sum, the new federal coal leasing regulatory framework must minimize and mitigate adverse environmental impacts of mining federal coal reserves.

Comment Excerpt Text:

Timely and effective reclamation practices are essential to protecting land and water resources, minimizing the length of time lands are disturbed, maintaining stable non-eroding mine sites, reducing fugitive dust from unvegetated areas, and achieving productive end land uses. Inadequate reclamation has substantial adverse impacts, including the spread of noxious weeds, decreased air quality as a result of a larger area of disturbance, less water restoration, and a longer loss of livestock and wildlife pastureland. Absent ensured contemporaneous reclamation, land may not be able to be restored “to a condition equal to or greater than the ‘highest previous use’” as required by Federal and state laws.

Facilitating reclamation

As noted, NEPA requires agencies to consider appropriate mitigation measures, which include “[r]ectifying the impact by repairing, rehabilitating, or restoring the affected environment,” “[r]educing or eliminating the impact over time by preservation and maintenance operations during the life of the action; and/or “[c]ompensating for the impact by replacing or providing substitute resources or environments. 40 C.F.R. § 1508.20.

Certain mining sites are more difficult to successfully remediate, and a tract’s design is critical to facilitating successful remediation. To fulfill mitigation requirements under NEPA and other statutes, under this alternative BLM would consider establishing additional unsuitability criteria focused on insuring that remediation can be adequately completed, and additional design criteria to ensure that tract design best aligns with remediation objectives.

BLM would also consider subjecting lease tract design to public comment, including from neighboring landowners, allowing the public the opportunity to weigh in on whether lease design could be improved to ensure reclamation timeliness and success.

Comment Excerpt Text:

The BLM must review its bonding regulations and practices to determine whether current arrangements will adequately cover reclamation costs in the event of default. Reclamation costs must be reviewed to keep pace with current development costs. And BLM must change self-bonding practices to ensure that companies have assets adequate to cover all unreclaimed leases.

The Surface Mining Control and Reclamation Act of 1977 (SMCRA) requires coal mining operators to restore all land affected by their operations and to post a bond to cover reclamation costs if they fail to restore the land.¹⁷ With many coal companies financially stressed, the ability of BLM to implement the law’s bonding requirements, particularly in allowing “self-bonding,” is questionable.

Develop a program to hire mine workers for restoration and rehabilitation beyond the mine site. BLM should also propose a program to employ the skills of mine workers in restoration and rehabilitation of public lands, aimed at both improving resilience of public lands in the face of climate change and their ability to mitigate climate change through biological sequestration.

Over the last several decades, the federal government has invested in programs to address job losses and improve environmental conditions in local areas. BLM should look to, learn from, and improve upon past examples like the watershed restoration and the “Jobs-in-the-Woods Program” from the 1990s and its contemporary incarnations. (69)

Achieving successful, contemporaneous reclamation of lands disturbed by coal mining is a central feature of SMCRA and it should therefore be central to the analysis in the PEIS. The MLA and the BLM’s coal mining regulations also call for ensuring successful reclamation. The PEIS should therefore ensure that strong

reclamation requirements are in place for the federal coal mining program, by rulemaking if necessary. The BLM should seek to meet a goal of restoring the land to the condition it was in prior to mining. As mentioned in the recommendation above, the BLM should prohibit self-bonding as a means to meet coal mining reclamation obligations on the federal mineral estate.

Comment Excerpt Text:

Coal mining in Wyoming has a temporary impact on livestock and wildlife grazing and management. Wyoming surface coal operators reclaim lands in a timely manner and in compliance with the permitted mine and reclamation plans. Wyoming has primacy from the OSMRE for regulating compliance of these mining operations. Mine and reclamation acres for coal operations in Wyoming as of January 1, 2016 are: 169,639 disturbed acres, 90,214 acres (53%) in active mining/facilities or partially reclaimed; 79,425 acres (47%) reclaimed through final seeding; and 38,000 acres (22%) in agricultural or hay production. Wyoming operators have received national recognition for their excellence in reclamation in 7 out of the past 10 years and range from shrub establishment to stream channel design and function. Wyoming has been and continues to be a national leader in reclamation of disturbed lands and places high importance on returning reclamation to livestock grazing, agricultural production and wildlife habitat in a timely manner.

Successful reclamation in Wyoming is at least two times more productive than pre-mine native rangeland and provides a valuable mechanism for carbon capture and sequestration which must be evaluated by BLM in the PEIS. See Wick, et al., Aggregate and organic matter dynamics in reclaimed soils as indicated by stable carbon isotopes, *Soil Biology and Chemistry*, pp. 1-9 (2008); (WY0-02814 to 02822); and Stahl, et al., Accumulation of organic carbon in reclaimed coal mine soils of Wyoming (2003); (WY0-02824 to 02836). Reclamation of surface mines can provide an avenue for atmospheric CO₂ to be captured as organic carbon in the soil and vegetative community. See Ganjgunte, et al., Accumulation and composition of total organic carbon in reclaimed coal mine lands, *Land Degradation and Development*, 20: 156-175 (2008); (WY0-02838 to 02857); and Miyamoto, et al., Long-term effects of mechanical renovation of a mixed-grass prairie: II. Carbon and Nitrogen Balance, *Arid Land Research and Management*, 18:141-151 (2004); (WY0-02869 to 02880). Reclaimed surface mine soils not only capture significant levels of carbon but also provide higher levels of organic nutrient storage, and thus vegetative biomass, allowing for additional carbon capture. These factors show the importance and benefits reclamation, and subsequent management of soil and vegetation has on the carbon cycle. Id.; (WY0-02869 to 02880); McDermott c, Elavarthi S., Rangelands as carbon sinks to mitigate climate change: A review, *Earth science & climate change*, 5:8 1-12 (2014); (WY0-02882 to 02893); and Rhoades et al., Carbon Sequestration of Surface Mine Lands, Department of Forestry, University of Kentucky, Department of Soil Science, North Carolina State University; (WY0-02895 to 02916).

2. Just Transition Alternative

The “Just Transition Alternative” is meant to both wind down the federal coal program in order to keep fossil fuels in the ground and to ensure an orderly, effective, and fair transition of workers and communities away from coal to more prosperous and sustainable economies. The “Just Transition Alternative” is defined by the following key components:

1. An end to federal coal leasing: Consistent with authorities and discretion under the Mineral Leasing Act, the

Just Transition Alternative imposes a permanent pause on the leasing of federal coal. The primary basis for adopting this permanent pause would be to ensure the protection of the public interest and the interests of the United States. Such justification for an end to leasing is clearly supported by the Mineral Leasing Act.

This pause would apply to all competitive leases (including all leases by application, including emergency leases, as defined by 43 C.F.R. § 3425.1-4) and lease modifications. We further believe there is ample justification for applying a permanent pause to other forms of non-competitive leasing, such as preference right lease applications and lease exchanges. With regards to lease exchanges, the BLM has clear authority to reject exchanges that are not in the “public interest.” 43 C.F.R. § 3435.4(a); see also 43 C.F.R. § 3436.0-2(b) (related to alluvial valley floor exchanges) and 43 C.F.R. § 2200.0-6 (generally related to exchanges). With regards to preference right lease applications, the BLM has the authority to reject such applications where there does not exist “commercial quantities” of coal. 43 C.F.R. § 3430.5-1(a)(1). Given the dismal state of the coal industry and the overwhelming climate costs that coal imposes on society, it would be dubious at best to claim that any commercial quantities of coal exist where there are preference right lease applications. Accordingly, the BLM has the authority to reject such applications. (20)

Furthermore, to ensure an orderly end to federal coal leasing, the BLM and the Department of the Interior should issue a rule or guidance requiring that as land management planning is undertaken pursuant to 43 C.F.R. § 1610, et seq., that all lands within a resource management area that are not currently leased for coal, be made unavailable for leasing. The authority to impose such direction is set forth at 43 C.F.R. § 3420.1-4(e), which gives the BLM broad discretion to “eliminate additional coal deposits from consideration to protect other resource values.” 43 C.F.R. § 3420.1-4(e)(3).

(20) The only preference right lease applications that exist are in northwestern New Mexico, where Arch Coal, which is currently bankrupt, has the rights to acquire 21,000 acres of leases. Legislation was introduced in the U.S. House of Representatives that would allow the Secretary to retire these preference right lease applications. See HR-1820, available online at <https://www.congress.gov/bill/114th-congress/house-bill/1820/text>. If this legislation is passed, there would be no additional preference right lease applications requiring action. We support this legislation and urge the Secretary of the Interior to encourage its passage in the U.S. Senate and adoption into law.

Putting a permanent pause on leasing will not destroy the U.S. economy or otherwise endanger our energy security. As a recent report looking at leasing in the Powder River Basin found, existing leased reserves in the Powder River Basin are sufficient to meet demand and effectively contribute to limiting temperature increases.

(21) This report is instructive as the Powder River Basin is the largest coal producing region in the United States and imposes the greatest influence on energy supply and demand in the nation. If an end to federal leasing can be justified in the Powder River Basin, it can be justified for federal leasing elsewhere in the U.S.

21 See Exhibit 11, Fulton, M., D. Koplow, R. Capalino, and A. Grant, “Enough Already: Meeting 20C PRB Coal Demand Without Lifting the Federal Moratorium,” Report Prepared for Energy Transition Advisors, Earth Track, and Carbon Tracker Initiative (July 2016), available online at <http://www.carbontracker.org/report/enough-already-2c-powder-river-basin-coal-demand-federal-moratorium/>.

2. Increased royalty rates and rentals: Coal is exacting a tremendous toll on our nation, costing our society billions in climate damages, adverse health impacts from air pollution, and water contamination. Royalty rates from production on existing coal leases and rentals on existing leases must be increased to begin to recoup the costs of these externalities, which are currently shouldered by the public.

Although royalty rates are normally imposed through new leasing, we recommend that the Interior Department and BLM incorporate higher royalty rates into existing leases as existing leases are readjusted pursuant to 43 C.F.R. § 3451.1. To accomplish this, we urge the amendment of 43 C.F.R. § 3473.3-2(a)(1) and (2) to incorporate increased royalty rates for both surface and underground mining. As leases are readjusted, these royalty rates must be applied to existing leases pursuant to 43 C.F.R. § 3451.1(a)(2).

Increasing royalty rates has been recommended by the White House as both a means to generate revenue and address the costs of environmental externalities, including carbon costs. (22)

(22) See Exhibit 12, Executive Office of the President of the United States, “The Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to Taxpayers” (June 2016), available online at

https://www.whitehouse.gov/sites/default/files/page/files/20160622_cea_coal_leasing.pdf.

Furthermore, royalty rate reductions should not be approved. Currently, royalty rate reductions are routinely granted as companies claim poverty or difficulty in mining with little apparent scrutiny as to whether the reductions are justified. In Colorado, for example, BLM officials have approved royalty rate reductions to facilitate methane venting and most recently proposed to approve a retroactive royalty rate reduction for a mine that was not even producing coal. (23) See Exhibits 13 and 14.

Similarly, we urge Interior and BLM to amend 43 C.F.R. § 3473.3-1(a) to raise rental rates for federal coal leases. Currently, rental rates are set at \$3.00 per acre, a figure that has not been adjusted since 1979, if not earlier. This rental rate not only has failed to be adjusted to account for inflation, but fails to account for the fact that some leases may be of small acreage, yet yield significant amounts of coal. Rentals should reflect the value of the lease, which depends on the amount of coal a lease contains. In accordance with 43 C.F.R. § 3473.3-1(a), any increased rental rate must be applied to any readjusted coal lease.

3. Existing leases that are not producing must be canceled: Where a lease is not meeting continued operation requirements under 43 C.F.R. § 3483.1(a)(2), it is subject to cancellation pursuant to 43 C.F.R. § 3452.2. Where a lease is not meeting continued operation requirements, BLM and the Interior Department should make clear that cancellation of the lease must be pursued. To this end, discretionary avenues for avoiding cancellation should be prohibited. Thus, lease suspensions under 43 C.F.R. § 3483.3 and payment of advanced royalties in lieu of continued operation under 43 C.F.R. § 3483.4 should be barred.

The justification for imposing such direction is very clear. Currently, BLM regularly grants lease suspensions and allows payment of royalties in lieu of continued operation with no assessment of whether such actions are appropriate or in the public interest. BLM appears to be under the impression that lease suspensions or advanced royalties are somehow mandated, and that the agency has no choice but to approve company requests. An egregious example of this is with regards to Arch Coal's Carbon Basin Lease in southern Wyoming (No. WYW-139975). Arch acquired this lease with the aim of developing a mine to fuel a proposed coal to liquids facility. However, this coal to liquids facility has never materialized or even shown any promise of materializing. Most recently, the Wyoming Department of Environmental Quality terminated the permit for the proposed facility. (24) Nevertheless, since 2010, Arch has failed to meet continued operation requirements. The BLM has allowed Arch to maintain its lease, however, by routinely allowing the company to pay advanced royalties in lieu of continued operation. (25) These decisions appear to be pro forma in nature, and do not reflect any consideration as to whether it is appropriate or remotely in the public interest to accept advance royalties in lieu of continued operation.

(24) See Exhibit 15, Wyoming Department of Environmental Quality, "Permit Termination, Medicine Bow Fuel and Power Coal to Liquid Project" (June 27, 2016).

(25) See Exhibit 16.

Furthermore, where an existing lease is not producing, yet is part of a producing logical mining unit, BLM and the Interior Department should use their discretion to modify the boundaries of logical mining units to eliminate the non-producing lease and facilitate its cancellation. BLM has such discretion under 43 C.F.R. § 3478.1.

Cancelling leases that are not producing will serve the goal of preventing any potential future development of existing leases and contribute to an orderly end to the federal coal program.

4. Accounting for carbon costs in coal management: It should be made clear, whether through new rules or guidance, that carbon costs must be analyzed, assessed and disclosed as federal coal management decisions are made. Such decisions are most likely to include mining plan modifications issued pursuant to the Mineral Leasing Act, 30 U.S.C. § 207(c), and the Surface Mining Control and Reclamation Act ("SMCRA"), 30 C.F.R. § 746, and lease readjustments. It is imperative that the BLM and Interior maintain close accounting of the carbon emissions and costs resulting from its coal management actions, to ensure full transparency around these emissions and costs, and to meaningfully act to address these emissions and costs. Particularly given that, pursuant to authorities under the Mineral Leasing Act and SMCRA, the Secretary of the Interior has full discretion to disapprove mining plans authorizing the development of leased federal coal, it is imperative that carbon emissions and costs factor into and influence such decisionmaking.

5. Reclamation must be guaranteed: To ensure an orderly end to the federal coal program, full and final reclamation must be guaranteed within a reasonable timeframe. We urge two regulatory changes to ensure this occurs.

First, Interior should amend regulations at 30 C.F.R. §§ 816.100 and 817.100 to provide clarification and specificity around contemporaneous reclamation. Current rules are vague and fail to ensure that reclamation proceeds in a manner that is as “contemporaneously as possible” with mining in accordance with 30 U.S.C. § 1202(e). These regulations should be amended to make clear that the success of contemporaneous reclamation must be measured based on a comparison of Phase III bond release acres, as defined under 30 C.F.R.

§ 800.40(c)(3), with disturbed acres and ensure that reclamation proceeds at a 1:1 rate, in other words for every acre disturbed, one acre should be fully reclaimed to meet Phase III bond release standards.

Second, just as current BLM rules require diligent development of federal coal, these rules should also require diligent reclamation. To this end, Interior and BLM should consider rule changes to ensure that nonproducing coal leases are fully reclaimed within two years of failing to meet continued operation requirements and set deadlines for the full reclamation of federal coal leases that are no later than 2035. This reclamation deadline should be established by rule and incorporated into lease terms as leases are readjusted.

Finally, Interior should amend self-bonding regulations at 30 C.F.R. § 800.23, and any other regulations, as appropriate, to prohibit self-bonding whenever publicly owned coal is permitted to be mined. This will ensure that, as coal companies continue their decline, that American public resources are fully protected and fully guaranteed to be cleaned up.

6. Prioritizing transition: Above all, the BLM and Interior must make transition away from coal a foremost goal as the federal coal program comes to an end. To do this, the agencies should not only explicitly commit, to the extent possible, their leadership, resources, and expertise to ensure that workers and communities receive the support and assistance they need to transition to more sustainable and prosperous economies. Among the actions that Interior and BLM can and should undertake to ensure transition:

- Work to secure Congressional authorization to direct increased royalty and rental payments toward worker and community support. Under NEPA, agencies are required to rigorously explore and objectively evaluate reasonable alternatives “not within the jurisdiction of the lead agency.” 40 C.F.R. § 1502.14(c). Here, although BLM and Interior may not be able to direct royalties toward transition support, they can recommend that Congress pass legislation that provides such authorization.

- Establishing an Economic Transition Fund, which would be sustained by an increase in reimbursement fees charged by the Interior Department when processing coal-related applications. Under the Federal Land Policy and Management Act (“FLPMA”), Interior has authority to recover reasonable costs associated with its coal management program and to appropriate and spend such monies. Specifically, FLPMA provides the Secretary of the Interior with authority to “require a deposit of any payments intended to reimburse the United States for reasonable costs with respect to applications,” including coal lease application. See 43 U.S.C. § 1734(b). Such payments are “authorized to be appropriated and made available until expended” by FLPMA. Id. Funds from the Economic Transition Fund should be directed toward transition-oriented initiatives.

- Prioritizing support and assistance to help communities transition. In addition to securing funds and making them available, the Department of the Interior can play a key role in helping direct communities to support, steering resources to support conservation and research projects in or near communities, encouraging renewable energy development on public lands. Such leadership could be conveyed through a Secretarial Order that simply makes it an overarching priority of the Interior Department to advance transition

Overall, the Interior Department and BLM must move to keep our publicly owned coal in the ground. However, keeping coal in the ground should not mean that we turn our backs on the workers and communities that have been dependent on coal for so long. Embracing an alternative that ensures “Just Transition,” in other a fair, compassionate, and orderly transition away from coal, is the most effective way to both protect our climate and help our nation effectively move to more sustainable economies and reliable and affordable means of energy production.

A comprehensive review of the federal coal program must ensure that coal companies clean up their pollution caused by mining and coal ash disposal. Despite the low lease fees, coal companies are in debt and relying on self-insurance. They are then walking away from the remaining pollution when they go bankrupt. Even worse, as some of the world's largest coal companies file for bankruptcy protection, coal executives are reaping millions of dollars' worth of compensation packages while laying off coal workers and dumping the costs of clean-up and reclamation on taxpayers.

Comment Excerpt Text:

The PEIS Should Evaluate Unmet Reclamation Obligations The PEIS also must examine the impacts of federal coal leasing in light of the coal industry's general failure to meet obligations to reclaim mined land. The Surface Mining Control and Reclamation Act ("SMCRA"), 30 U.S.C. §§1201-1328, establishes minimum federal standards for the regulation of coal mining. Pursuant to SMCRA, most states have primary coal-mine permitting authority under state regulatory programs that satisfy those minimum standards. One key component of an application for a permit to mine is the "reclamation plan." Id. § 1258. SMCRA requires the operator to restore the affected land to a condition capable of supporting the uses it could support before mining, or to "higher or better uses." Id. § 1265(b)(2). The operator must also: restore the approximate original contour of the land by backfilling, grading, and compacting; minimize disturbances to the hydrologic system by avoiding acid mine drainage and preventing additional contributions of suspended solids to nearby streams and other water bodies; "insure that all reclamation efforts proceed in an 217 Id. at 8-13. 218 See id. at 13-18. 219 Id. at 18. 60 environmentally sound manner and as contemporaneously as practicable with the surface coal mining operations;" and establish a permanent vegetative cover in the affected area. Id. § 1265(b). In addition, "after a surface coal mining and reclamation permit application has been approved but before such a permit is issued," the operator must furnish a bond for the area of land on which mining will occur during the five-year permit term. Id. § 1259(a). "The amount of the bond required for each bonded area shall depend upon the reclamation requirements of the approved permit; shall reflect the probable difficulty of reclamation giving consideration to such factors as topography, geology of the site, hydrology, and revegetation potential, and shall be determined by the regulatory authority." Id. The Secretary of the Interior may approve state programs that authorize "self-bonding" where "the applicant demonstrates to the satisfaction of the regulatory authority ... a history of financial solvency and continuous operation sufficient for authorization to self-insure or bond such amount or in lieu of the establishment of a bonding program." Id. § 1259(c). Eighteen states currently allow self-bonding. 220 Coal-mine operators almost universally fail to meet SMCRA's reclamation standards, and increasingly fall short of their bonding obligations. The National Wildlife Federation, Western Organization of Resource Councils, and Natural

Resources Defense Council published a report in 2015, “Undermined Promise II,” documenting reclamation and enforcement failures under SMCRA. 221 Of 287,442 acres of disturbed land in Montana, North Dakota and Wyoming, only 29,673 acres have achieved Phase III bond release, demonstrating successful establishment of vegetation and soils to satisfy permit requirements for post mining land uses. 222 257,769 acres—or more than 400 square miles—remain unreclaimed by federal standards. In addition, reclamation that is accomplished often is inadequate to restore pre-mining conditions, particularly hydrologic and habitat conditions. “Mining always alters the ecosystem – topography is gentler, shrub density is lighter, water balance is altered. The long term and cumulative impacts of coal mining and reclamation are significant and often permanent.”²²³ While reclamation of mined land historically has been inadequate, the problem is exacerbated by the dismal state of current coal markets and financial insolvency of coal producers. According to the most recent data reported by the States, outstanding self-bond obligations total approximately \$3.86 billion. Of that total, \$2.4 billion is held by coal companies currently or recently in bankruptcy. 224 As OSMRE observed, this raises “a concern about whether disturbed coal mines will be reclaimed by the bankrupt companies; whether the 220 Office of Surface Mining Reclamation and Enforcement, Notice of availability of petition to initiate rulemaking and request for comments on the petition, 81 Fed. Reg. 31,880 (May 20, 2016). 221 National Wildlife Federation et al., UNDERMINED PROMISE II (June 2015), attached as Ex.40. 222 UNDERMINED PROMISE, at 7 223 Id. at 25. 224 Office of Surface Mining Reclamation and Enforcement, Notice of availability, 81 Fed. Reg. at 31,880. 61 bankrupt companies will abandon their legal obligations to restore impacted lands and waters; whether the costs to restore the land and water will be shifted to taxpayers; and, whether the existing regulations are adequate to protect people, communities, and the environment as envisioned by Congress when it enacted SMCRA.”²²⁵ Further, because coal companies have been allowed to self-bond so many acres of disturbed land, they have acquired significant leverage over state regulators desperate to avoid permit forfeitures and the associated transfer of reclamation liability to the state. BLM echoed these concerns in the NOI, observing that given the state of the coal market, many stakeholders have expressed concern over the practice of “self-bonding” and noted that the combination of depressed market conditions and reluctant enforcement of existing regulations threaten to put states and taxpayers on the hook for coal companies’ unfunded reclamation obligations. 226 In response, BLM specifically sought input as part of the PEIS process on whether it should “[p]rohibit or otherwise limit leasing to entities that are not meeting their environmental responsibilities, such as ... Entities that have not met their reclamation or bonding (including bond release) requirements.”²²⁷ Consistent with BLM’s NEPA obligation to take a hard look at the economic and environmental consequences of its proposals, BLM must acknowledge the current state of the market—and the hundreds of millions of dollars of under-funded “self-bonds” held by companies currently in bankruptcy—and explain how BLM’s proposals could impact the economic effects of its considered alternatives, particularly the risks to taxpayers and states of continued reliance on self-bonding practices for coal mines situated on federal lands. Further, the PEIS must examine the environmental impacts of mining federal coal in light of the coal industry’s overall failure to meet SMCRA’s reclamation standards—a situation that is worsened by the proliferation of self-bonding and financial instability of the coal industry. The Secretary of Interior should take action to prohibit financially vulnerable companies from utilizing “self-bonds,” including those that emerge from the recent spate of coal company bankruptcies. In the short term, however, OSMRE need not tie its action to the federal coal leasing PEIS process. On July 20, 2016, Sierra Club, Earthjustice, and nine other organizations submitted extensive comments to OSMRE in response to a call for public comments on a petition to initiate changes to existing self-bonding regulations. 228 Additionally, Sierra Club and more than thirty other organizations submitted similar comments on the same rulemaking on July 14, 2016.²²⁹ As explained in those comments, extensive reliance on self-bonding puts taxpayers in an unnecessary and dangerous position. OSMRE should step in to correct this situation by 225 Id. at 31,881. 226 Notice of Intent, 81 Fed. Reg. 17,724. 227 Id. at 17,727. 228 Letter from Sierra Club et. al to Office of Surface Mining Reclamation and Enforcement (July 20, 2016), attached as Ex. 41. 229 Letter from Powder River Basin Resource Council et. al to Office of Surface Mining Reclamation and Enforcement (July 14, 2016), attached as Ex. 42. 62 taking immediate action under the existing regulations to transition self-bonded mine operators towards surety bonds or other financial instruments held by third parties. The federal SMCRA statute authorizes self-bonds, but only where the regulator determines that there is “a history of financial solvency and continuous operation

sufficient for authorization to self-insure or bond such amount.” 30 U.S.C. § 1259(c). The statute’s emphasis on the regulator’s discretion means that self-bonding may be authorized, but it is not mandatory. Furthermore, self-bonding should be available only in limited circumstances. The federal bonding regulations underscore this point by emphasizing that a “regulatory authority may accept a self-bond from an applicant for a permit if all of the [specified] conditions are met by the applicant or its parent corporation guarantor.” 30 C.F.R. § 800.23 (emphasis added). Like the enabling statute, the regulations are clear that even where a mine operator or its guarantor satisfies all of the enumerated financial conditions, the regulator nonetheless retains the discretion to deny an application for a new or renewed self-bond and require the use of a different form of bond. SMCRA and its implementing regulations provide the regulatory authority with “case-by-case discretion to consider factors particular to a case which may indicate, for instance, that even though the applicant meets the general qualifications of the self-bonding rules, past behavior tending to undercut the soundness of the applicant, or other factors, may dictate refusal.” 48 Fed. Reg. at 36,420. OSMRE should immediately release additional guidance to state regulators clarifying that due to the extremely high risk of insolvency within the coal mining industry at this time, self-bonding is not appropriate, even for companies that satisfy the 30 C.F.R. § 800.23(b)(3) criteria. In particular, OSMRE should emphasize that operators who have emerged from bankruptcy within the last five years are not eligible for self-bonding, even if they—or a separate guarantor—otherwise satisfy the specified criteria. Insolvency and bankruptcy represent precisely the sort of “past behavior” that OSMRE has determined should render an operator ineligible for self-bonding. In the longer term, among other changes, OSMRE should revise its existing regulations to ensure that the financial fitness tests are strong enough to ensure that only truly sound companies qualify for the practice. 230 As explained in that letter, “recent history clearly demonstrates the financial fitness metrics in the current regulations do not properly ensure that only healthy, stable companies with low risk of bankruptcy can self-bond. The regulatory financial fitness tests should be thoroughly rewritten to ensure that self-bonded companies are financially sound enough to live up to their cleanup commitments.”²³¹ While OSMRE is responsible for ensuring that coal companies meet their reclamation obligations under SMCRA, BLM must consider the implications of the coal industry’s enduring 230 Sierra Club et. al letter to Office of Surface Mining Reclamation and Enforcement at 5 (July 20, 2016) (Ex. 41). 231 Id. 63 failure to satisfy those obligations—a failure likely exacerbated by the industry’s financial instability—in its analysis of the environmental consequences of the federal coal program. F. The EIS Must Analyze the Impacts of Federal Coal Exports and the Implications of Under-Valued Coal Federal coal leasing affects the environment at each stage of the coal lifecycle, from exploration, extraction, and transport, to processing and use. Coal export expands and intensifies this lifecycle. Exports can also effect coal price and increase coal consumption. NEPA requires that federal agencies consider the reasonably foreseeable direct and indirect impacts of their actions, even if the extent of these impacts is not known. See 42 U.S.C. § 4332(2)(C), 40 C.F.R. § 1508.8; see also *Mid States Coal. for Progress*, 345 F.3d at 549-550 (finding that the agency should examine the rail project’s reasonably foreseeable effect of increasing coal consumption). Consequently, the PEIS should analyze the impacts of allowing federal coal export, consider exports in its coal-price valuation, and, given the adverse impacts of coal exports, consider whether to lease federal land where the coal is likely bound for international markets.

Comment Excerpt Text:

The coal mining process in of itself is destructive to the surrounding areas not just limited only to the mine site. The burdensome costs related to the mass cleanup of coal and other mines historically has all too often ended up on the shoulders of the tax paying public while the profits have been gained by just a few. Then to add insult to injury, when the 'public' land's lease is up, the land is usually not useable by the owners (the public) and is dangerous, and polluted. Oftentimes mines have had hazardous pollutants leach into or drain into public and municipal waterways and not only is the mine site on said 'public' land rendered hazardous it can and probably will negatively affect surrounding areas by emitting toxic runoff (and may be gasses into air also) into waterways. further Furthermore, the public's liability and future usability of the land after the lease is up should be far more considered when deciding any land lease, particularly for any extractive uses.

The BLM should not have any responsibility with regards to determining the operator's position with respect to reclamation. This is covered by the mining permit. Mining permit oversight is conducted by individual State

agencies with OSM oversight. Within existing regulations mining companies are required to maintain contemporaneous reclamation and can be forced to curtail operations should they fail to achieve acceptable reclamation within specific timelines.

Additional stipulations or regulations by the BLM in this area would only add confusion to the process that already exists to address reclamation and in my mind would result in lawsuit after lawsuit to clarify the differences that would undoubtedly result from a duplicate set of regulations in this area.

Commenter I:Jim Lyon

Comment Excerpt Text:

Our report recently found that of the 450 square miles of mined land in the Powder River Basin, only 46 square miles have been fully reclaimed to final bond to these standards. It's doubtful these lands are going to be fully reclaimed because of damaged water. How far reclamation has lagged behind performance and company's financial health is in trouble. This is not ultimate use, this is permanent damage. As you know, the majority of these, federal coal lies under prairies, fragile habitat that's home to imperiled sage grouse, mule deer, elk, pronghorn and 300 other species. Can take decades to reclaim these mines to pre-mining conditions. Another recent study we did of wildlife herds in and outside of fossil fuel extraction zones of the Powder River showed that only one out of 8 mule deer herds and only 3 out of 11 pronghorn herds are healthy. So the coal leasing must not result in permanent damage to public lands and water. It must include repercussions for wildlife.

Comment Excerpt Text:

The federal government has a duty to mitigate climate impacts from downstream GHG emissions associated with the coal leasing program. There are at least four potential non-statutory sources of the federal government's affirmative duty to mitigate greenhouse gas emissions and associated climate impacts from federal coal: the principles of international law and the requirements set forth under the United Nations Framework Convention on Climate Change; the public trust doctrine; the federal common law of public nuisance; and private nuisance under state common law. Although it is plausible that none of these sources would result in an affirmative court decision holding the government liable for a breach of its duty, that shortfall does not negate the existence of the duty itself. The statutes and regulations that govern Interior's management of public lands provide other, and potentially even more forceful, sources for a duty to mitigate upstream and downstream greenhouse gas emissions and associated climate change impacts arising from the federal coal leasing program. Pursuant to the Federal Land Policy and Management Act (FLPMA), the Mineral Leasing Act (MLA) and NEPA, BLM has a duty to

analyze and implement mitigation measures for the adverse environmental, social and public health impacts attributable to its management of fossil fuels on public lands.

Comment Excerpt Text:

Federal statutes, regulations and policy provide Interior and BLM with ample authority to adopt a fee as a form of compensatory mitigation

BLM has recognized that compensatory mitigation for unavoidable or residual climate change impacts arising from agency decisions is fully consistent with its mission and its multiple use mandate and that it possesses the discretion to require it, and has clarified that doing so is in fact the agency's policy. A climate change impacts fee for downstream GHG emissions fits within the agency's NEPA obligations and its compensatory mitigation policy. The climate change impacts at issue in this paper are those that occur as a result of GHG emissions both at the coal mine and downstream, when the extracted coal is transported and eventually combusted for its end use. These downstream GHG emissions are considered "indirect effects" under NEPA, and the climate change impacts associated with those emissions are unavoidable or "residual" impacts. In undertaking the Programmatic EIS, Interior has recognized that NEPA requires it to analyze downstream emissions – a conclusion that comports with the current trajectory of courts' interpretations of NEPA. Under NEPA, then, the agency must also identify and assess appropriate mitigation measures for these emissions, including compensatory mitigation measures. The mitigation measures discussed in the Programmatic EIS should follow the "mitigation hierarchy," and should include both a "net zero" emissions offset program as well as a climate change impacts fee. A climate change impacts fee would be consistent with recent directives, including the Presidential Memorandum Mitigating Impacts on Natural Resources from Development and Encouraging Related Private Investment; Secretarial Order 3330, Improving Mitigation Policies and Practices of the Department of the Interior; and "Landscape-Scale Mitigation Policy," a new chapter in its Departmental Manual, which effectively operationalizes Order 3330. The sum total of the White House and Interior guidance is that BLM can and should assess and potentially implement mitigation measures, which might operate through any number of mechanisms, including lease stipulations and chargeable fees, among other things. The mitigation measure should first seek to avoid GHG emissions and their climate impacts; second, seek to minimize emissions and impacts; and third, compensate for unavoidable impacts, as through a climate change impacts fee.

Comment Excerpt Text:

There are a number of key questions to address in developing a mitigation framework in any context: 1) whether to mitigate; 2) when to mitigate; 3) what mitigation should be required; 4) technical issues surrounding how to mitigate. The question of whether to mitigate was addressed above. The question of when to mitigate is one of practical consequence: advance mitigation in this context, based on acreage or projected production, might result in overcharging lessees and so basing mitigation on actual production would seem to be a more reasonable approach. The questions of what mitigation should be required and what technical issues the agency will necessarily confront are more complex they are. They are treated in summary form below.

a. What mitigation should be required The Presidential Memorandum Mitigating Impacts from Natural Resource Development identifies three types or categories of resources: irreplaceable resources; resources that are important, scarce or sensitive; and other resources managed consistent with an agency's mission and objectives. There is an argument to be made that the climate in which human civilization took shape and in which we continue to exist constitutes an irreplaceable resource, and that the appropriate mitigation measure for continued GHG emissions and climate change impacts is avoidance. If BLM concludes that the climate is not an irreplaceable resource warranting avoidance to the maximum extent practicable the agency must conclude that it is nonetheless an important and sensitive resource, and that the appropriate mitigation standard is a minimum of no net loss, and preferably a net benefit. Such mitigation could be pursued on a number of different scales: planetary, national or regional.

b. How to calculate a climate change impacts fee

The question of what the proper amount to charge for federal coal has been the subject of several economic analyses, and this paper does not seek to answer it. Rather, the paper identifies a number of fee-related issues Interior and BLM should consider in the environmental review. These include: whether to use the Social Cost of Carbon and the Social Cost of Methane or other metrics; how to account for intervening actors; how to account for regulations on power plants and other coal users; how to account for the different carbon intensity of coal; whether and how to account for historic emissions; whether and how to account for historic costs; and how to account for the impacts different prices will have on different companies, industry sectors, states, tribes, and local communities. The paper also looks at different mechanisms for compensatory mitigation—such as in lieu fees, mitigation banks and permittee-responsible measures.

Comment Excerpt Text:

The federal government has the discretion to mitigate climate impacts from downstream GHG emissions associated with the coal leasing program

Even if the duty to mitigate is of uncertain scope or enforceability, FLPMA, the MLA and NEPA all confer a definite discretion to mitigate climate change impacts. The multiple use mandate and unnecessary and undue degradation prohibition of FLPMA, the public interest requirements of the MLA and the ambitious goals and specific analytical requirements of NEPA individually and taken together grant the agencies broad discretion to mitigate foreseeable impacts, and to require compensation for impacts that cannot be avoided or minimized.

EPA recommends that the Draft PEIS estimate the direct and indirect GHG emissions caused by the various future coal use scenarios, including emissions associated with end use combustion of coal. It may be appropriate to employ the social cost of carbon and social cost of methane to estimate the economic value of impacts associated with the proposal's net change in CO₂ and CH₄ to contextualize the potential emissions and compare alternatives. EPA recommends that the Draft PEIS describe measures to reduce GHG emissions, including reasonable alternatives and practicable mitigation opportunities, and disclose the estimated GHG reductions. Such measures should include technologies used to mitigate coal mine methane that is currently vented to the atmosphere. Given the likelihood of advancements in GHG mitigation technologies during the timeframe considered, we recommend the Draft PEIS discuss how the BLM can encourage adoption of those technologies in future lease sales.

Comment Excerpt Text:

To date, restoration and mitigation efforts have largely failed when it comes to protecting water quality and species. For this reason, we ask BLM to focus on protection of essential habitat areas and waterways first, and to rely on mitigation only in certain limited situations – i.e., when ESA-listed or proposed species or designated critical habitats are not present downstream or in the mine site area, and it can be shown with sufficient evidence that the functions and values of the impacted streams and native ecosystems can be fully restored.

Numerous studies document the failure of restoration to protect water quality, species, and local communities from the impacts of coal mining. These studies are too numerous for us to list in total so we provide relevant excerpts of scientific conclusions:

-“Overall, the data show that mitigation efforts being implemented in southern Appalachia for coal mining are not meeting the objectives of the Clean Water Act to replace lost or degraded streams ecosystems and their functions”²⁶⁹

-“Mitigation actions being undertaken are primarily geomorphic projects to enhance perennial streams yet the majority of streams impacted are intermittent and fewer linear feet of stream have been restored than impacted. Compliance is primarily based on visual habitat assessments performed by the mining company or their consultants which typically report marginal or suboptimal habitat status post restoration. Projects were not required to meet specified biological or water quality standards yet for the projects that reported such data, most were impaired.”²⁷⁰

-“The disturbance caused by MTR/VF is drastically changing the central Appalachian landscape, compromising the natural ecological and functional state of both terrestrial and aquatic environments. The reclamation process, emphasizing soil compaction and the establishment of non-native herbaceous species, has hindered the establishment of native tree species on MTR sites (Zipper et al., 2011). These terrestrial impacts in combination with changes in water chemistry and stream geomorphology lead to long-lasting changes to terrestrial and aquatic ecosystem function (Simmons et al., 2008). Full recovery of species diversity in streams impacted by MTR/VF has not been documented”²⁷¹

-“Indeed, the MTR/VF streams had, on average, 75% less forest cover than control streams”²⁷²

-“Reclaimed mine sites have soils containing unweathered rock that is heavily compacted to reduce erosion, resulting in altered water tables and disturbed flow paths (Bonta et al., 1992; Bernhardt and Palmer, 2011). In particular, compacted soils lead to high rates of storm water runoff. Negley and Eshleman (2006) and Ferrari et al. (2009) found that MTR/VF streams had tripled storm runoff and doubled flow rates compared to reference catchments.”

-“The extent to which these constructed channels provide important ecosystem services lost by burial of natural headwater streams as a result of mining is not well known. Fritz et al. (2010) reported significantly lower rates of litter breakdown and higher levels of iron, manganese, sulfate, and conductivity in constructed channels draining VF watersheds than in natural channels draining forested watersheds. Petty et al. (2013) observed lower organic matter (OM) decomposition rates and higher levels of conductivity, dissolved solids, and dissolved organic carbon (DOC) in West Virginia MTR/ VF constructed channels than in nearby reference channels. Based on their database containing descriptions of 38,000 stream and river restoration projects, Bernhardt and Palmer (2011) stated that they did not know of a single case where a constructed channel recreated the hydrology or ecological functions of natural streams.”²⁷³

As these examples illustrate, mitigation of coal mining activities has failed to reclaim the functions and values of impacted waterways. In particular, it has failed in Appalachia to restore water quality and fish, wildlife, and other species. Moreover, as discussed above coal mining has been one of several threats that has led to the need to protect species under the ESA, indicating that mitigation efforts have not been successful in protecting species, and should not be relied on by BLM to protect the environment.

Therefore, in light of the record before it, it is critical that BLM ensure that waterways affected by proposed mines with ramifications for species listed or proposed for listing under the ESA and their critical habitat are protected, rather than rely on mitigation plans to justify destruction of these important habitat areas, since restoration plans may not adequately address impacts to imperiled species and their habitat.²⁷⁴

Comment Excerpt Text:

If BLM will continue to rely on mitigation for the coal program, a new mitigation protocol must be developed. The Department of the Interior has been revising its mitigation policies in recent years, and has in fact declared that it is “necessary to successfully shift from project-by project management to consistent, landscape-scale, science-based management of the lands and resources for which the Department is responsible.”²⁷⁵ DOI has further stated that “in the mitigation context, the landscape approach dictates that it is not sufficient to look narrowly at impacts at the scale of the project; it is necessary to account for impacts to resource values throughout the relevant range of the resource that is being impacted.”²⁷⁶

It does not appear that the current mitigation regime for BLMs coal program is meeting the goals set forth by DOI. Mitigation is done piecemeal, without the comprehensive, industry-wide analysis that is necessary for landscape-scale mitigation, resulting in the environmental harm discussed herein. As DOI even admits, “mitigation experts have noted, “[T]he way mitigation is currently applied does not capture cumulative impacts associated with development; it does not provide a structured decision-making framework to determine when projects can proceed or should be avoided; and it does not harness the full potential of offsets (conservation actions applied away from the development site).”²⁷⁷

To rectify this, DOI has provided guiding principles for landscape-scale mitigation. These include that an agency, “[a]t the outset of the project planning process, [should] incorporate mitigation and landscape objectives into the design and development of projects that are likely to impact natural or cultural resources.” DOI further urges bureaus to “[i]dentify and promote mitigation efforts that improve the resilience of our nation’s resources in a rapidly changing climate,” and to “[p]romote transparency and consistency in the development of mitigation measures.” Therefore, we urge BLM to undertake, concurrent with this programmatic EIS, an analysis of the various alternatives to mitigation for coal mining, and to thereby develop protocols to establish a mitigation program on a landscape-scale.²⁷⁸ This should be done in consultation with FWS and NMFS for mitigation that has the potential to affect listed species.²⁷⁹

Comment Excerpt Text:

It is readily apparent that mitigation for the impacts of coal mining has been woefully inadequate. As discussed herein, the existing regulatory program has proven to be insufficient, resulting in the wanton destruction of habitat areas across the country. For example, the Powder River Basin in Montana and Wyoming is well known as a sacrifice zone that pumps out coal for domestic and foreign use. Once home to wide ranging elk herds, pronghorn, mule deer, prairie falcons, bobcats, mountains lions, and greater sage-grouse – as well as providing habitat for hundreds of migratory birds – today the region is largely dotted with coal mines, roads, and other coal-related facilities. While wildlife still hang on the brink of extirpation in a few areas in this region, the basin evidences how environmental laws have failed to strike a balance of protecting environmental values while authorizing coal production, and that harm is not being mitigated.

Although the majority of federal coal leasing occurs in the interior west (and primarily the Powder River Basin of Wyoming and Montana), federal coal leasing also occurs in Appalachia, where biodiversity and human health are being devastated for coal production.²⁵⁸

Comment Excerpt Text:

The BLM must ensure that the mitigation components of the PEIS are consistent with all relevant laws and policies, including current mitigation guidance. This includes the use of a landscape-scale approach, an emphasis on a net benefit outcome, the importance of preservation as a mitigation action, and the use of Regional Mitigation Strategies and Plans to support the PEIS. A Regional Mitigation Strategy for the Coal PEIS would set an important framework to guide additional Regional Mitigation Strategies and Regional Mitigation Plans. Mitigation should be analyzed at both the land use planning stage and at the regional coal leasing stage via NEPA-based EISs that adopt the required mitigation policies. The mitigation policy should be made applicable to existing mines and areas in the vicinity of existing mines that are proposed for mining, as well as to new areas that might be open for mining consideration.

Comment Excerpt Text:

For unavoidable climate change impacts associated with leasing and development of coal resources, BLM should develop a framework in the PEIS that can be used for the entire program. We will be releasing a longer whitepaper going into greater detail on key design considerations and operational elements in August 2016 and will provide as supplemental comment. In the meantime, this letter spells out the basic framework.

To establish this framework, BLM must quantify through the PEIS the GHG emissions using the tools described in Section VI.C, and analyze the climate impacts associated with these GHG emissions using the tools described in Section VI.D.

The BLM should establish in the Record of Decision as a matter of policy that the agency will require compensatory mitigation to offset the climate impacts of federal coal leasing and production. The same tools should be required to be used for future lease-level analysis with guidance for field staff on how to apply them. The estimated impacts resulting from the analysis represent unavoidable climate impacts that should be addressed through compensatory mitigation.

As part of the compensatory mitigation policy, the BLM should initiate a regional mitigation strategy/plan for key coal leasing areas that addresses all impacts include climate. BLM should consider several key design features that should be spelled out in the ROD:

- BLM should consider compensatory mitigation actions that offset the climate impacts associated with the emissions attributable to the leased coal in question, and that offset the carbon emissions themselves.

Quantifying impacts is becoming increasingly more practical, and the science connecting impacts to temperature changes increasingly more precise. The practice of arriving at a mitigation fee at a lease level can be challenging, but real harm will be felt by human and natural communities. Compensatory mitigation funds can be directed at enhancing the adaptive capacity of human and natural communities in the affected landscape to improve their health and resilience in the face of expected change. Offsetting actions can include investments in land protection, restoration or rehabilitation. They can also include payments to communities to assist with a transition away from coal-dependent regional economy.

Significant opportunity also exists to offset the GHG emissions themselves. EPA has repeatedly urged land management agencies to assess carbon offsets in EAs and EISs as a way to reduce climate change impacts of agency actions. EPA has specifically noted that offsets are a reasonable alternative to lessen the impacts of coal mine methane emissions. In a 2007 letter concerning a proposal to permit MDWs at the West Elk Mine, EPA specifically rejected the Forest Service's assertion that a carbon offset alternative was not reasonable: "[I]t is reasonable to consider offset mitigation for the release of methane, as appropriate. Acquiring offsets to counter the greenhouse gas impacts of a particular project is something that thousands of organizations, including private corporations, are doing today." (45) EPA specifically recommended that the Forest Service's Lease Modifications EIS "acknowledge that revenues for carbon credits are available via several existing markets." (46) Similarly, EPA has recommended that a Forest Service NEPA analysis of a forest health project "discuss reasonable alternatives and/or potential means to mitigate or offset the GHG emissions from the action." (47) Numerous state agencies already use offsets to control GHG emissions. (48) Offsets can include participation in third-party offset markets or renewable energy credits.

(45) Letter of L. Svoboda, EPA to C. Richmond, Forest Service (Aug. 7, 2007) at 7 (emphasis added).

(46) EPA July 2012 Comment Letter (Ex. 29) at 5 (identifying four U.S. carbon exchanges creating a market for

carbon credits).

(47) Letter of L. Svoboda, EPA, to T. Malecek, USFS, at 8 (Oct. 27, 2010).

(48) See, e.g., Settlement Agreement, ConocoPhillips and California (Sept. 10, 2007) (California agency requiring offsets as a condition of approving a project), attached as Ex. 46; Minn. Stat. § 216H.03 subd. 4(b) (Minnesota law requiring offsets for certain new coal-fired power plants); Me. Rev. Stat. Ann. tit. 38, § 580-B(4)(c) (Maine law establishing greenhouse gas initiative that includes the use of carbon offsets).

The potential for federal participation in an offsets program is well demonstrated by actions that have been taken relative to emissions from the Navajo Generating Station in Arizona to comply with Clean Air Act requirements pursuant to EPA's regional haze rules. There, in agreement with state, federal, tribal and NGO participants, the DOI has committed to reduce or offset federal carbon dioxide emissions by three percent annually for a total of 11.3 million metric tons of emissions reductions by the end of 2031. (49) This is intended to reduce carbon dioxide emissions and demonstrate the workability of a credit-based system to achieve carbon dioxide emission reductions. In addition, the DOI has committed to facilitating development of Clean Energy Projects intended to achieve eighty percent generation of clean energy for the federal share at the Navajo Generating Station by 2035 by securing over twenty-six million megawatt hours in Clean Energy Development Credits. Comment Excerpt Text:

In lieu fees collected for compensatory mitigation are often paid in lump sum at the beginning of a project's operational life. In the case of climate impacts, it may make more sense to consider an annual payment on the basis of production, or an annualized payment schedule based on expected production with corrections on a semi-annual basis. By spreading payments over the life of the project (and tying them to when the impacts actually occur), the system should be both fairer to producers and truer to the spirit of mitigation.

- BLM must ensure mitigation actions are additional—that is, result in actions that add real, verifiable carbon savings or other benefit—and durable—that is, the conservation benefit lasts for at least a period of time commensurate with the duration of the impact itself.

More recent guidance in the form of the Presidential Memorandum: Mitigating Impacts on Natural Resources from Development and Encouraging Related Private Investment (2015) and the Department of the Interior's Landscape-Scape Mitigation Manual (2015) also emphasize the importance of mitigation in BLM planning and decision-making. Key elements of these policies are summarized below and should be incorporated into BLM's approach to mitigation in the PEIS:

- Landscape-scale approach: land use planning for conservation and energy development as well as analysis of proposed development and consideration of mitigation must use a landscape-scale approach to focus development in low-conflict areas and prioritize conservation in areas with important and sensitive resources and values.
- "Irreplaceable resources": avoidance is the most appropriate tool for addressing "irreplaceable resources," "resources recognized through existing legal authorities as requiring particular protection from impacts and that because of their high value or function and unique character, cannot be restored or replaced."
- No net loss of important resources and values: mitigation must achieve a goal of no net loss of important resources and values, with a net benefit goal as required or appropriate.
- Climate change impacts and resilience: agencies must identify and promote mitigation measures that help address climate change impacts and resilience.
- Compensatory mitigation standards: compensatory mitigation (generally comprised of acquisition, restoration or preservation of resources and values) must be:
 - o Durable: protected against non-conforming uses like development and lasting as long as the impacts;
 - o Additional: demonstrably new conservation benefits that would not occur without mitigation;
 - o Be developed based on the best available science: including for determining equivalency of impacts and mitigation benefits;
 - o Provide for public transparency: including tracking locations of impacts and mitigation actions; and
 - o Include monitoring and adaptive management.

In addition to the legal and policy direction that requires mitigation for climate impacts from the federal coal program and provide the agency with ample discretion to require mitigation, it is important to underscore that as a land manager, the federal government is facing huge and rapidly escalating costs to address the impacts caused

by fossil-fuel driven climate change. Forest fires, widespread drought, rising sea levels, spread of invasive species and spread of disease already result in significant costs to the federal government, and each new coal lease the BLM authorizes increases these problems and the associated costs. Research from the University of Vermont's Gund Institute for Ecological Economics and The Wilderness Society suggests that total costs in degraded ecosystem services could exceed \$14.5 billion annually under a 2-degreeC warming scenario. (42) These costs are ultimately borne by all American taxpayers, and BLM has a responsibility to recoup these costs when it makes decisions authorizing activities that directly cause these impacts and associated costs.

Comment Excerpt Text:

Should mitigation be attempted at the programmatic level, estimates of potential impacts may be used that are highly speculative and may never come to fruition at the project level. Additionally, without project specific details it would be difficult, if not impossible, for the BLM to prescribe mitigation within the jurisdiction of the BLM at the programmatic level.

Specifically, any air quality impact assessment is speculative at the programmatic level, would not result in informed decisions and lacks technical justification. A more appropriate action would be for the BLM to work with state agencies that have regulatory authority for air quality to develop an agreement that defines how and when an air quality impact assessment should be performed and appropriate air quality mitigation within the

jurisdiction of the BLM.

BLM must acknowledge and analyze the role and responsibilities of states and the regulatory control of Wyoming and state environmental agencies generally and specifically in any consideration of air quality and air resources. BLM must also acknowledge its jurisdictional limits in the PEIS.

Requiring Lessees to Obtain Offsets for GHG Emissions from Coal Produced from their Lease Could Achieve the Largest GHG Emissions Reductions at Lowest Cost

Offsets are a well-established mechanism in environmental regulation to reduce the impacts of an activity. Offsets are intended to achieve particular environmental objectives at a lower cost and/or to achieve additional environmental objectives without raising compliance costs. Offsets are accepted United States, including under the Clean Air Act.[8] State and regional GHG programs (such as California's GHG regulations and the Regional Greenhouse Gas Initiative among Northeastern states) include offsets to encourage greater emissions reductions at lower costs. The American Clean Energy and Security Act, which passed in the House of Representatives in 2009, included offsets as a component of achieving greater emissions reductions. BLM's Notice of Intent for the PEIS explicitly noted that it would assess "whether and how to mitigate, account for, or otherwise address [climate impacts] through the structure and management of the coal program, including, as appropriate, land use planning, adjustments to the scale and pace of leasing, adjustments to royalties or other means of internalizing externalities, mitigation through greenhouse gas reductions elsewhere, information disclosure, and other approaches." [9]

Offsets from the land sector offer low-priced GHG abatement opportunities. There is significant potential for reducing emissions in the U.S. land sector.[10] Obtaining some portion of offsets internationally from actions taken in developing countries offers additional affordable abatement. Emissions reductions from projects and policies to manage land use in developing countries are among the lowest cost GHG abatement opportunities in the world.[11] In 2014, reducing one ton of CO₂ emission from international land use projects cost approximately \$7.50 on average.[12] Estimates for reducing emissions in the U.S. power sector (by switching from coal generation to non-emitting generating sources) are many times that amount.[13]

By including scenario(s) that require offsets in its integrated modeling, BLM can most comprehensively explore options for achieving maximum emissions reductions at lowest cost. Some commenters advocate for complete cessation of federal coal leasing. Others advocate for including a price on carbon as part of the leases (either as part of a royalty payment, rent, or otherwise). These options should be assessed in the modeling to determine the relative emissions reductions that can be obtained (and the cost of those emissions reductions). Excluding

scenarios with offsets arbitrarily would limit the insights that can be gained from the assessment, and may overlook options that can achieve the greatest GHG reductions at lowest cost.

Including the option for lessees to obtain international offsets would support U.S. climate leadership. As noted above, ensuring that all major federal policies are consistent with the U.S. emissions reductions goals will enable the United States to continue to exercise international leadership. The United States, collectively with other developed countries, has committed to mobilizing \$100 billion per year by 2020 in public and private finance to support adaptation and mitigation in developing countries.[14] Allowing lessees to obtain offsets internationally would not only potentially allow lessees to reduce emissions most cost-effectively, but would also support the United States' climate finance commitment. The projects that generate offsets in developing countries also have many co-benefits, including improved biodiversity and economic development for local populations.[15]

Comment Excerpt Text:

Interior Has the Authority to Require Lessees to Acquire GHG Offsets as a Condition of Their Lease

The Mineral Leasing Act (MLA) grants Interior broad authority to place terms and conditions in a coal lease, providing: "The lease shall include such other terms and conditions as the Secretary shall determine." [16] The MLA further provides that effects on the environment are among the factors Interior shall consider before granting a lease.[17] Finally, the MLA provides that even after a lease is granted, the lessee cannot take any action that might cause significant disturbance of the environment until the lessee submits an operation and reclamation plan for Interior's approval.[18]

This broad discretion to the Secretary, and the directive to consider environmental impacts in considering a lease, has resulted in Interior including conditions in BLM's model lease that direct the lessee to carry out operations in a way that avoids damage or degradation to "any land, air, water, cultural, biological, visual, and other resources, ... Lessee must take measures deemed necessary by lessor to accomplish the intent of this lease term." [19] It has long been recognized that additional specific or general mitigation provisions to protect the environment can be included in lease conditions or stipulations. This includes mitigation provisions beyond those specifically mandated by statute and mitigation provisions that protect resources beyond the mine site.[20] A 1984 report to Congress noted:

Mitigation techniques can be specific or generic, and can address either sites specific or cumulative impacts. They can be designed to accommodate uncertainties about potential impacts or tailored to cover well-understood mining and reclamation situations. Requirements for impact mitigation included in a lease or mining permit might reiterate requirements of current laws and regulations, or they may impose higher standards. They usually apply to lease tracts, but may cover offsite locations affected in some manner by the mining and reclamation operations.

Thus, not only is there statutory authority for broad discretion in determining lease terms and conditions, but the agency already exercises that authority to enact environmental protections. Using this authority to address the climate impacts of allowing a coal lease, including by requiring offsets for the full life-cycle emissions of the coal, is consistent with the MLA.

In addition to the MLA, coal-leasing decisions are affected by Interior's broader mandates to be the caretaker of federal lands under the Federal Land Policy and Management Act (FLPMA). FLPMA directs Interior to manage federal lands so that they are "utilized in the combination that will best meet the present and future needs of the American people;...a combination of balanced and diverse resource uses that takes into account the long-term

needs of future generations for renewable and non- renewable resources” (emphasis added).[21] FLPMA further provides that the public lands will be managed “in a manner that will protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resource, and archeological values...”[22]

These provisions require Interior to take full account of the life-cycle emissions from coal produced on federal lands. Climate change driven by GHG emissions will have profound impacts on the United States, including on the federal lands managed by Interior. Changing precipitation patterns and growing seasons, increasing heat waves, droughts, and greater risks of wildfires will fundamentally alter federal lands in the coming decades. Including terms and conditions in federal coal leases, requiring lessees to obtain offsets for emissions from the combustion of coal from those lands, is a direct way for Interior to balance the present and future needs of the American people in avoiding the worst impacts of climate change, including their future use and enjoyment of federal lands.

Exercising its authority to impose terms and conditions in leases to address environmental concerns is fully consistent with Interior’s mandate to manage public lands “in a manner which recognizes the Nation’s need for domestic sources of minerals”[23] and the Federal Government policy of fostering “economically sound” domestic mining and “orderly and economic development of domestic mineral resources . . . to help assure satisfaction of industrial, security, and environmental needs.”[24]

Climate Advisers believes Interior has the discretion under FLPMA and the MLA to impose changes on coal leasing practices up to an indefinite moratorium. If further federal coal leasing is to be allowed, however, requiring lessees to obtain offsets may represent a cost-effective way to maximize total GHG emissions reductions.

Comment Excerpt Text:

We are looking at an increasing numbers of trains throughout the system, and that delay in getting onto a ferry system is important to local jobs and important to our local economy, and I think that's something that this impact statement really needs to look at. Edmonds is not alone in that. There are communities throughout Washington and I think throughout the region, from the Powder Basin on that would have these effects with increasing numbers of coal trains. I think we also have to look at the, you know, economic effects when it comes to local health. I think this is something that the EIS has been looking at, but as we look where these trains load and unload, where these trains travel through, I think it especially affects communities of color that are already showing severe health, negative health effects from the coal dust as well as just from the pollution of these incredibly long trains. These are trains that are a mile long that go through -- incredibly slowly through our towns. And finally, I think that the EIS also has to look at some of the public safety aspects, not only the force of derailment of one of these trains, as we just saw in Oregon, whether it's an oil train or a coal train, these have incredible public safety aspects.

Comment Number: 0002223_HigbeeSudyka_20160531-2

Commenter I: Debra HigbeeSudyka

Comment Excerpt Text:

Coal trains (today) are 120–125 cars long, and each car holds 115 tons of coal. [NOTE: Coal trains are transitioning to 150 cars in length.] At the lower level of coal exports studied in the report, Oregon would likely see at least 30 more coal trains each day (15 loaded going west and 15 empty returning to the coal fields) – in addition to all the train traffic we currently experience. And, if all the West Coast ports were built or expanded and the high-end coal company projections are met, Oregon could potentially experience as many as 64 more coal trains (total east and west) each day.

There will be health, safety, quality of life, as well as actual financial costs to Oregon citizens and communities

from this increase in coal train traffic. Oregon cities along the train routes will be most affected by this increase in the number of coal trains.

The increased number of trains in Oregon will mean more noise, a greater potential that emergency responders will be delayed in reaching residents when there is a medical emergency (or a fire or the need for police), and a greater potential for vehicle collisions with trains and for pedestrian accidents. These issues must be addressed, analyzed, and their consequences fully considered in the EIS being prepared.

More trains in Oregon will mean an increase in the amount of airborne pollutants (particulate matter) from diesel engines as well as from coal dust. Medical studies have shown a clear link between both diesel air pollutants and coal dust and disease. Additionally, more trains will mean more vehicles idling at train crossings when trains are passing – and adding their exhaust (containing particulate matter and other pollutants) into the air. While those with chronic disease, the elderly, young children, and pregnant women are most at risk, the health effects from particulate matter exposure may occur years later, so even healthy individuals need to be concerned. These issues must be addressed, analyzed, and their consequences fully considered in the EIS being prepared.

Coal Transportation Impacts

Downstream impacts on air quality must also be considered. For example, trains used to transport federal coal run on fossil fuels – in particular diesel – which produce a variety of air pollutants, including nitrogen oxide, soot, sulfur dioxide²², and carcinogens. In 2006, U.S. diesel trains released approximately a million tons of ozone forming oxides of nitrogen and 32,000 tons of PM_{2.5}, causing 3,400 deaths and 290,000 lost work days. Hein and Howard at A4. Assuming that 40% of U.S. trains are freight and 40% of freight is coal, one study estimated the approximate cost of air pollution from U.S. coal transport to be \$4 per ton of coal in 2015 USD. Id. at A13.

Coal trains also emit dust from the exposed coal in the train cars. Even with surfactant sprayed over coal train cars, over 100 pounds of coal dust per train car, or about 12,500 pounds per train, blows off the trains as they move from the mines to their final destination. See, e.g., Ashley Ahearn, What Coal Train Dust Means for Human Health, Earthfix, June 21, 2016, available at <http://www.opb.org/news/article/coal-dust-a-closer-look/>. Over 160

doctors in Washington expressed public health concerns about increased coal train traffic, and resulting air pollution from diesel emissions and coal dust. See Whatcom Docs, Position Statement on the Proposed Cherry Point Coal Terminal, available at <http://www.coaltrainfacts.org/whatcom-docs-position-statement-and-appendices>.

Rail transportation also poses risks to public health due to accidents, noise and congestion. Transportation of federal coal can also burden traffic patterns in towns with rail lines, causing impacts to emergency services and daily commuting. If communities wish to avoid these impacts, they must invest in expensive infrastructure projects, such as bypasses and overpasses.

Increased coal train traffic can also displace other rail users, such as agricultural freight trains, leading to impacts for those economic sectors. Limited rail capacity means that freight, agricultural shippers, and passenger trains, risk delays and higher rates as they are bumped by coal, which often takes priority on the tracks. See, e.g., Terry Whiteside, et al., Heavy Traffic Ahead and Heavy Traffic Still Ahead, available at www.heavytrafficahead.org. Timely deliveries are particularly important with agricultural products. At least one significant agricultural business has been closed in recent years due to being pushed off the rails by coal train traffic. See Steve Wilhelm, Coal Trains Kill Cold Trains: Fruit delivery service shuts down as rail congestion heats up, Puget Sound Business Journal, Aug. 8, 2014, available at <http://www.bizjournals.com/seattle/news/2014/08/07/coal-trains-kill-cold-trains-fruit-delivery.html>.

All of these impacts should be considered cumulatively across all federal coal leasing, and the PEIS should guide how they will be considered in site-specific EISs.

. Coal Transportation Impacts

The PEIS must fully analyze and assess impacts related to coal transport, including, but not limited to, the impacts of rail transport of coal, local and regional trucking of coal, and any conveying of coal from mines to power plants. Transport-related impacts are likely to include air impacts, impacts related ongoing rail maintenance and possible expansions, water quality impacts related to roads and railways, and fish and wildlife impacts. The PEIS must provide a detailed analysis and assessment of how federal coal is transported from mines to the source of consumption, and provide the public with information and analysis on what the impacts of this transport are likely

to be. See Attached for Graphic - Coal from the Powder River Basin being hauled by rail through downtown Denver.

iv. Coal Exports

As the notice of intent to prepare the PEIS emphasizes, the impacts of coal exports are of great concern. To this end, the PEIS must fully analyze and assess the reasonably foreseeable impacts of coal exports that may occur as a result of future coal management. These impacts include, but are not limited to, the following:

- Rail-related impacts: The impacts of hauling coal from mines to ports must be analyzed and assessed. The impacts that must be addressed include, but are not limited to, the air quality impacts of rail traffic, noise impacts of rail traffic, fish and wildlife impacts of rail traffic, and water quality impacts. Such an analysis must take into account the potential for spills and/or derailments and the impacts such events may have on land, water, fish, wildlife, and air.
- Port-related impacts: The impacts of unloading coal from trains, loading coal onto barges and/or ships, constructing and/or maintaining port facilities, and the impacts of port operations, including ship, locomotive, and/or truck operations must be analyzed and assessed. The impacts that must be addressed include, but are not limited to, the air quality impacts of all port operations, including ship, locomotive, and truck emissions, water quality impacts (including wetland impacts), and fish and wildlife impacts.
- Shipping impacts: The impacts of shipping coal, both within waters of the United States and through international waters must be addressed. The impacts that must be analyzed and assessed include air quality impacts, impacts to water quality (particularly through discharge from ships), and impacts to river and ocean species, especially species listed as threatened or endangered under the Endangered Species Act.
- Coal unloading impacts at international ports: Just as coal unloading and loading at American ports must be addressed, the impacts of unloading coal from ships and loading coal onto trains and/or trucks at international ports must be analyzed and assessed.
- Inland coal transport abroad: The impacts of transporting coal from international ports to facilities must be analyzed and assessed. Such an analysis must analyze and assess whether the coal is hauled by rail or by truck, and analyze and assess the attendant impacts.
- Coal combustion abroad: Finally, the impacts of combusting coal abroad must be analyzed and assessed. Such an analysis must include, but not be limited to, an analysis of the air quality impacts of coal combustion (including greenhouse gas emission impacts), water quality impacts, coal ash disposal impacts, fish and wildlife impacts, and impacts to lands.

The PEIS should analyze the impact of accidents caused by federal coal transport and storage. The PEIS should include a meaningful analysis of the potential safety, human and environmental risks of rail accidents, both those involving, and those proximately caused by, coal trains. Rail accidents can release coal into the surface waters and water supply causing significant impacts. Moreover, coal is very difficult to clean up. This affects downstream communities as coal released into water supply can degrade agricultural communities and municipal water supplies in addition to harming fish and other aquatic life. The blast zone for coal trains is within one mile of the train tracks. These explosions disproportionately impact low income communities and communities of color—

because these often are the communities that live near railroad tracks. 202 This impact should be analyzed as an indirect and cumulative impact, especially in light of other hazards these communities are exposed to. 203 Coal trains, which weigh far more than other types of trains, also deposit coal dust on the tracks and in the track ballast. The additional stress on the tracks increases the probability of accidents. 204 Coal dust is highly combustible and causes risks from explosions and fire. The federal Surface Transportation Board has concluded that coal dust can impair track stability lead to train derailment. 205 Consequently, coal trains are a proximate cause of rail accidents. 206 200 Id. at 20. 201 Id. at 9. 202 “Crude Injustice on the Rails,” Communities for a Better Environment and Forest Ethics, (June 2015) at 3 (80 percent of the 5.5 million Californians with homes in the blast zone live in low income communities and communities of color). 203 Id. at 11. 204 Id. at 10. 205 Surface Transportation Board Decision, Arkansas Electric Cooperative Corporation – Decision on Petition for Declaratory Order, Docket No. FD 35305 (Mar. 3, 2011); available at [http://stb.dot.gov/Decisions/readingroom.nsf/UNID/79B5382AE20F7930852578480053111F/\\$file/40436.pdf](http://stb.dot.gov/Decisions/readingroom.nsf/UNID/79B5382AE20F7930852578480053111F/$file/40436.pdf) (last visited July 28, 2016). 56 Spills are not uncommon during bunkering (or fueling), and spills into environmentally sensitive waters. The PEIS should evaluate this spill risk for both offshore bunkering— throughout the route— and onshore at port.

EPA recommends that the Draft PEIS estimate the direct and indirect GHG emissions caused by the various future coal use scenarios, including emissions associated with end use combustion of coal. It may be appropriate to employ the social cost of carbon and social cost of methane to estimate the economic value of impacts associated with the proposal's net change in CO₂ and CH₄ to contextualize the potential emissions and compare alternatives. EPA recommends that the Draft PEIS describe measures to reduce GHG emissions, including reasonable alternatives and practicable mitigation opportunities, and disclose the estimated GHG reductions. Such measures should include technologies used to mitigate coal mine methane that is currently vented to the atmosphere. Given the likelihood of advancements in GHG mitigation technologies during the timeframe considered, we recommend the Draft PEIS discuss how the BLM can encourage adoption of those technologies in future lease sales.

5. The PEIS Should Evaluate the Impacts of Coal Mine Methane and Mitigation Measures to Limit Coal Mine

Methane Emissions. There is increasing scientific evidence that for humanity to have a chance to keep climate change within tolerable levels (below 2 °C), governments around the world must act quickly to reduce methane emissions in particular. 88 Part of that consensus is that methane pollution is more damaging than previously thought. The Fifth Assessment Report of the Intergovernmental Panel on Climate Change (“IPCC”) in 2013 concluded that methane is a much more potent driver of climate change than scientists understood it to be just a few years previous—with a global warming potential as much as 36 times greater than CO₂ over a 100-year time frame, and 87 times greater than CO₂ over a 20-year time frame. Approximately one-third of the anthropogenic climate change we are experiencing today is attributable to methane and other short-lived climate pollutants, and about thirty percent of the warming we will experience over the next two decades as a result of this year’s greenhouse gas emissions will come from methane. 89 Climate scientists now recognize that avoiding catastrophic climate change will require both a long-term strategy to reduce carbon dioxide emissions and near-term action to mitigate methane and similar “accelerants” of climate change. As a 2013 article in the journal *Science* stated: “The only way to permanently slow warming is through lowering emissions of CO₂. The only way to minimize the peak warming this century is to reduce emissions of CO₂ and [short-lived climate pollutants],” including methane. 90 Because of methane’s outside role in near-term climate-forcing, this administration has specifically targeted methane pollution to address climate change. In 2013, the White House published a climate strategy that concluded: “Curbing emissions of methane is critical to our overall effort to address global climate change.”91 The need to address methane’s damaging climate impacts spurred both BLM and EPA to propose regulations to limit the fugitive methane emissions from oil and gas operations. EPA’s 88 B. McKibben, *Global Warming’s Terrifying New Chemistry*, *THE NATION* (Mar. 23, 2016), attached as Ex. 14, and available at <http://www.thenation.com/article/global-warming-terrifying-new-chemistry/> (last visited July 28, 2016). 89 *Climate Change 2013: The Physical Science Basis, Contribution of Working Group I to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change* (Thomas Stocker et al., eds. 2013), available at http://www.climatechange2013.org/images/report/WG1AR5_ALL_FINAL.pdf (last visited July 28, 2016). 90 J.K. Shoemaker, et al., *What Role for Short-Lived Climate Pollutants in Mitigation Policy?* 342 *SCIENCE* 1323-24 (2013), attached as Ex. 15, and available at <http://www-ramanathan.ucsd.edu/files/pr200.pdf> (last visited July 28, 2016). 91 Executive Office of the President, *The President’s Climate Action Plan* (June 2013), attached as Ex. 16, and available at <https://www.whitehouse.gov/sites/default/files/image/president27climateactionplan.pdf> (last visited July 27, 2016). 35 2015 proposed regulations specifically address methane’s damaging climate impacts. 92 BLM has issued draft rules that also address climate impacts. 93 Both agencies concluded that reducing methane pollution would have significant social benefits, based in large part on the significant social cost of methane and/or carbon in continuing to permit unnecessary methane releases. 94 Earlier this year, the U.S. and Canada also signed a climate agreement which calls for significant methane reductions from the oil and gas sector. 95 Coal mines—including operations that mine federal coal in the U.S. —are a significant source of methane pollution. Eight percent of global methane emissions come from coal mines. 96 One coal mine operating on federal leases in Colorado is reportedly that state’s largest single source of methane pollution; this in a state with a vast amount of oil and gas infrastructure. 97 As a result, coal mine methane (“CMM”) has also long been targeted for reduction by the federal government. In 1994, EPA established the Coalbed Methane Outreach Project (“CMOP”) to “work[] cooperatively with the coal mining industry in the United States – and other major coal-producing countries – to reduce CMM emissions. By helping to identify and implement methods to recover and use CMM instead of emitting it to the atmosphere, CMOP has played a key role in the United States’ efforts to reduce GHG emissions and address 92 U.S. Environmental Protection Agency, *Proposed Rule, Oil and Natural Gas Sector*, 80 Fed. The BLM also has authority under the same section of the MLA to include such terms and conditions in new coal leases. 101 The ANPR also notes that agency climate policy supports the control or elimination of methane pollution from coal mines: [R]educing [waste mine methane] venting would reduce emissions of a potent greenhouse gas, consistent with the President’s Climate Action Plan— Strategy to Reduce Methane Emissions (March 2014) and Secretarial Order 3289, Amendment No. 1 (“Addressing the Impacts of Climate Change on America’s Water, Land, and other Natural and Cultural Resources,” dated February 22, 2010). 102 98 U.S. Environmental Protection Agency, *Coal Mine Methane – What EPA is Doing*, attached as Ex. 21, and available at <https://www.epa.gov/epa-coalbed-methane-outreach-program/what-epa-is-doing> (last visited 28, 2016). 99 The White House, *Climate Action Plan, Strategy to Reduce Methane Emissions* (Mar. 2014), attached as Ex. 22, and available at https://www.whitehouse.gov/sites/default/files/strategy_to_reduce_methane_emissions_2014-03-28_final.pdf (last visited July 28, 2016). 100 79 Fed. Reg. 23,923 (Apr. 29, 2014). 101 *Id.* at 23,924; see also *id.* at 23,923 (citing 30 U.S.C. § 189, which states that the Secretary “is authorized to prescribe necessary and proper rules and regulations and to do any and all things necessary to carry out and accomplish the purposes of” the Mineral Leasing Act governing coal leasing, and 30 U.S.C. § 207, which states that coal leases “shall include such other terms and conditions as the Secretary shall determine.”). 102 *Id.* at 23,924. 37 BLM should immediately finalize its coal mine methane rulemaking to address harmful methane emissions now, even as it considers broader reforms. In addition, BLM must evaluate the climate consequences of coal mine methane and potential mitigation to reduce those emissions in its programmatic review of the federal coal leasing program. In the context of this review, if the BLM considers any alternative that provides for new coal leasing, the agency must also consider requiring methane mitigation measures on those leases. *Wilderness Soc’y v. Wisely*, 524 F. Supp. 2d 1285, 1309 (D. Colo. 2007) (holding that EIS must consider “all possible approaches to, and potential environmental impacts of, a particular project”). In comments on the ANPR for the coal mine methane rulemaking, attached, Sierra Club, Earthjustice and others provided detailed recommendations for feasible and available mine methane mitigation measures. 103 As those comments explain, coal mine methane generally is removed from underground mines one of two ways. Methane can be removed by moving vast quantities of air, including dilute quantities of methane, through a mine’s ventilation system. This methane pollution, known as ventilation air methane (VAM), is distinct from methane removed from the coal seam by methane drainage wells (MDWs) drilled into the coal seam from above. Mitigation measures are available for both removal methods. VAM makes up over half of all coal emissions in the United States and worldwide. VAM mitigation measures are technically and economically feasible and have already been employed at mines worldwide, including in the United States, to reduce 95% or more of VAM emissions. BLM and the Forest Service (which must consent to coal leasing on national forest lands) have generally declined to address such an alternative at the leasing stage, for example, when addressing lease modifications for the West Elk Mine in the last few years, despite the multiple

examples of successful VAM mitigation measures. But the agencies' previous justifications for declining to study in detail and alternative requiring the use of VAM reduction technology all lack support, and should not be used by BLM to reject such alternative in the PEIS. In addition to measures available to reduce VAM emissions, BLM should consider carbon offsets, which are a tested, feasible, and practical alternative to allowing federal coal leaseholders to vent millions of cubic feet of methane into the atmosphere every without (or with minimal) mitigation or control. EPA has repeatedly urged land management agencies to assess carbon offsets in EAs and EISs as a way to reduce climate change impacts of agency actions. EPA has specifically noted that offsets are a reasonable alternative to lessen the impacts of coal mine methane emissions. In a 2007 letter concerning a proposal to permit methane drainage wells at the West Elk Mine, EPA specifically rejected the Forest Service's assertion that a carbon offset alternative was not reasonable: "[I]t is reasonable to consider offset mitigation for the release of methane, as appropriate. Acquiring offsets to counter the greenhouse gas impacts of a particular project is something that thousands of organizations, including private corporations, are doing today." 104 EPA specifically recommended that another EIS on a coal leasing proposal 103 See Comments by Sierra Club, et al., 1004-AE23, Waste Mine Methane Capture, Use, Sale, or Destruction, Advance Notice of Proposed Rulemaking (June 30, 2014), attached as Ex. 23. 104 Letter from L. Svoboda, U.S. Environmental Protection Agency to C. Richmond, U. S. Forest Service (Aug. 7, 2007) at 7 (emphasis added), attached as Ex. 24. 38 "acknowledge that revenues for carbon credits are available via several existing markets." 105 Similarly, EPA has recommended that a Forest Service NEPA analysis of a forest health project "discuss reasonable alternatives and/or potential means to mitigate or offset the GHG emissions from the action." 106 Numerous state agencies already use offsets to control GHG emissions. 107 BLM has authority to require such offsets, and numerous federal agencies require similar mitigation, and so addressing such an alternative in the PEIS is reasonable. For example, the Interior Department is a participant in an offset program related to GHG pollution from the Navajo Generating Station in Arizona. In a settlement with state, federal, tribal and conservation groups related to Clean Air Act compliance, DOI committed to reduce or offset federal CO2 emissions by 3% annually for a total of 11.3 million metric tons of emissions reductions by the end of 2031. 108 This is intended to reduce CO2 emissions and demonstrate the workability of a credit-based system to achieve pollution reductions. DOI also committed to facilitating development of Clean Energy Projects intended to achieve 80% generation of clean energy for the federal share at the Navajo Generating Station by 2035 by securing nearly 27 million megawatt hours in Clean Energy Development Credits. 109 A number of underground coal mines operating on federal leases not only remove methane in dilute quantities through ventilation systems (as VAM), but also emit millions of cubic feet a day of higher concentration methane via methane drainage wells (MDWs). Because emissions from MDWs generally contain methane in higher concentrations, such emissions can be combusted, or flared, before they enter the atmosphere. Flaring results in an 87% reduction in GHG emissions compared with venting methane directly into the atmosphere. 110 As a State of Colorado 2016 report states: From a climate change standpoint, emitting carbon dioxide is much less harmful on the environment than a mine's direct emission of methane into the atmosphere. Accordingly, flaring methane, 105 U.S. Environmental Protection Agency July 2012 Comment Letter at 5 (identifying four U.S. carbon exchanges creating a market for carbon credits), attached as Ex. 25. 106 Letter from L. Svoboda, U.S. Environmental Protection Agency, to T. Malecek, U. S. Forest Service, at 8 (Oct. 27, 2010), attached as Ex. 26. 107 See, e.g., Settlement Agreement, ConocoPhillips and California (Sept. 10, 2007) (California agency requiring offsets as a condition of approving a project), attached as Ex. 27; Minn. Stat. § 216H.03 subd. 4(b) (Minnesota law requiring offsets for certain new coal-fired power plants); Me. Rev. Stat. Ann. tit. 38, § 580-B(4)(c) (Maine law establishing greenhouse gas initiative that includes the use of carbon offsets). 108 See Technical Work Group Agreement Related to Navajo Generating Station (July 25, 2013) at 5-6, 9, available at https://www.doi.gov/sites/doi.gov/files/migrated/upload/7-25-2013-NGS-TWG-Agreement-FINAL_Executed.pdf (last viewed July 28, 2016). 109 Id. 110 Daniel J. Brunner & Karl Schultz, *Effective Gob Well Flaring* 724 (1999), attached as Ex. 28. 39 which converts the residual gas emission to carbon dioxide, has nearly the same environmental impacts as using methane to generate electricity or heat. 111 Where MDWs are or can be utilized, methane flaring is a reasonable, practical, effective, and feasible alternative to reduce GHG emissions from new or existing coal lease. 112 Although mitigation for coal mine methane emissions is not alone sufficient to avoid or mitigate the climate change impacts of the federal coal leasing program, it is a near-term necessity to

ensure that existing coal mining does not exact irreversible consequences. The PEIS should analyze these mitigation options.

You've heard about our very clean burning coal. North Fork communities have benefited from this wealth over many decades without sacrificing the other riches that our local land, water, and air provide. That, coupled with methane off-gassing from our closed and currently operating mines in our recapture project, puts us into an excellent position for the Federal Government to leverage our values of methane recapture methods [indiscernible] research and training site. It could create training and jobs for some displaced miners while diversifying our local economy and energy generation through methane recapture and other renewable sources at our disposal.

Much of BLM's 570 million acre mineral estate in the West is under private surface such as mine. And as the surface owner, I am very concerned about this. This thing has hung over my head for 25 years. Only one thing will be mined from the coal deposit, but the lease is for all the coal. And so we actually stand a potential for being under-mined two or three more times, and we don't know when the lease expires. Does it expire when the main seam is taken? Does it expire a hundred years from now when maybe they get around to the last one? There's no certainty when you coal -- when you own surface over federal coal, and there's a lot of private surface owners in the West in that situation.

BLM has areas in its lease forms for additional provisions. There is lots of talk today about "private property rights". In some cases property owners have everything except the coal, but as holders of those rights from the federal government, we are treated as nothing more substantial than overburden. I believe the Federal Government has an equitable responsibility to see that our lands are reclaimed and not rendered unusable while and after federal mineral is developed. BLM has been unwilling to add equitable remedies to coal leases in the additional provisions sections

It is also important to note that many of the properties being considered are so close to, or adjacent to, our beautiful National Parks, which are the source of millions of dollars to the tourism industry of our state. Decimating the quality of air in our Parks and further damaging the quality of our public roads including historic scenic byways is not worth the bargain basement prices the BLM offers these lands for leasing. Then there is the question of rehabilitation of the lands after they have been robbed of their resources, and left as slag heaps when the Coal companies have gone bankrupt, as reported by the banking industry, which is reluctant to offer loans for further coal development.

Organization I:North American Coal Corporation
Commenter I:Christopher Friez
Comment Excerpt Text:

As indicated above, in North Dakota, in some cases where the federal government owns coal, it does not own 100% of the coal underlying an entire tract. In those cases, the federal government shares its coal ownership with private owners. By sterilizing these tracts of coal, the federal government is stranding the assets of private citizens and may bring liability issues upon itself by not allowing private citizens to develop their valuable resources. In addition, in nearly all cases where the federal government owns coal at NACoal's operations, the surface on those tracts is privately owned.

Comment Excerpt Text:

The PEIS Should Evaluate the Impacts of Mining and Burning Federal Coal on Downstream Communities, Including the Environmental Justice Impacts Associated with Each Considered Alternative BLM's Notice of Intent states that "[w]ith respect to the climate impacts of the Federal coal program, the Programmatic EIS will examine how best to measure and assess the climate impacts of continued Federal coal production, transportation, and combustion."¹⁶⁸ We applaud this commitment. But the PEIS must go further: it must also analyze and disclose the non-carbon environmental, health, and economic impacts of coal production, transport, and combustion. NEPA requires federal agencies to consider "any adverse environmental effects of their major actions." 42 U.S.C. § 4332(2)(C). This consideration extends to both direct and indirect impacts. 40 C.F.R. § 1508.8. Indirect impacts are reasonably foreseeable impacts that are caused by the project but that occur later in time or at a greater distance. *Id.* A "reasonably foreseeable impact" is one that is "sufficiently likely to occur that a person of ordinary prudence would take into account in reaching a decision." *Mid States Coal. for Progress*, 345 F.3d at 549 (citing *Sierra Club v. Marsh*, 976 F.2d 763, 767 (1st Cir. 1992)). Even if complete information is lacking on the extent of the foreseeable impact, "the agency may not simply ignore the effect." ¹⁶⁶ Leonard G. Pearlstine, *Elise V. Pearlstine, & Nicholas G. Aumen, A Review of the Ecological Consequences and Management Implications of Climate Change for the Everglade*, 29-4 *JOURNAL OF THE NORTH AMERICAN BENTHOLOGICAL SOCIETY*, 1510, 1513 (2010); E. Stabenau, J. Sadle, & L. Pearlstine, *Sea-level Rise: Observations, impacts, and proactive measures in Everglades National Park*, 28 *PARK SCIENCE*, 26-30 (2011). ¹⁶⁷ Government Accountability Office, *Climate Change*, at 27. ¹⁶⁸ 81 Fed. Reg. at 17,725. ⁴⁹ *Id.* If the nature of the effect is reasonably foreseeable, this effect must be addressed in the PEIS. *Id.* Given the scope and scale of the federal leasing program, it is undeniable that it has significant, adverse effects on water quality and access, air quality, health and climate. The activities directly and indirectly associated with coal leasing include, among other things, coal transport by rail, truck and sea, construction and operation of infrastructure and equipment related to storing, shipping and processing coal, coal combustion domestically and overseas, and disposal of coal ash. Each of these "downstream" activities negatively downstream communities, harming their health, threatening their safety and causing significant nuisance. More specifically, the federal coal program's downstream activities generate coal dust and other air , reduce water access and worsen water quality, increase accident and hazard risk, induce growth that magnifies these affects, and hasten impacts from climate disruption, such as sea level rise. These impacts are particularly pernicious because many downstream communities, and low income communities and communities of color in particular, are already disproportionately impacted by pollution and hazards. Communities situated within two miles of rail lines, ¹⁶⁹ in cities next to ports, those near coal terminals and plants, and communities that depend upon clean and accessible water for their livelihoods are most vulnerable. Since NEPA requires analysis of all foreseeable direct, indirect and cumulative impacts, the PEIS must analyze impacts to downstream communities.

Comment Excerpt Text:

The PEIS must analyze downstream impacts of coal dust. Coal dust emissions can significantly impact the health of downstream communities and workers, and damage our environment. The PEIS should analyze both coal dust emissions impacts from railcars and fugitive emissions. Coal dust is generated by coal-carrying rail cars during transit and as a fugitive emission from coal storage piles, and loading and unloading activities. ¹⁷⁷ Rail lines parallel waterways where rail cars emit coal dust, transporting it to nearby communities and farms. Coal trains emit coal dust from the top and bottom of the rail cars throughout the trip. An average rail car loses 645 lbs during a 400

mile trip. 178 BNSF estimates that 500 to 2000 lbs of coal dust can be emitted from each train car per trip. 179 Surfactants are sometimes sprayed over the coal to control dust. However, surfactants wear off during the trip and require tremendous quantities of water to apply. Coal dust can impact port communities and workers because of higher emissions associated with containment within a smaller area and the types of locomotives used within port facilities. 180 Currently, no federal regulations protect communities from coal dust exposure. Coal dust consists mainly of granules and fine black particles that increase both PM10 and PM 2.5 in the ambient air. Most acutely, coal dust causes wheezing, excess cough and other 176 Power Consulting, Inc., *The Economic Consequences of the Federal Coal Leasing Program: Improving the Quality of the Economic Analysis* (July 27, 2016) at 49, attached as Ex. 1, citing, inter alia, National Research Council, *Hidden Costs of Energy: Unpriced Consequences of Energy Production and Use*, Committee on Health, Environmental, and Other External Costs and Benefits of Energy Production and Consumption (2010), available at <http://nap.edu/12794> (last visited July 27, 2016), attached as Ex. 32; Paul R. Coal dust also increases accident risk because coal dust from trains destabilizes the track ballast—the surface that bears the load of the railroad ties. Coal dust contaminates soil, coats crops, yards, homes and vehicles raising health concerns and causing nuisance. 182 Fugitive coal dust can impair lung function, and cause or contribute to cardiovascular disease and developmental disorders. Covered rail cars would appear to reduce coal dust emissions, so the PEIS should also explore the impacts of covered rail cars. To our knowledge, at this time, no covered coal trains are in use in the U.S. and we know of no published study of the efficacy for coal trains. Covered cars would still emit coal dust from the bottom of the train, which constitutes 7 percent of the total coal dust. 183 And if the cars included venting units, the coal dust would additionally vent from the top of the car. Covered rail cars also pose an additional rail accident risk; coal is highly combustible, and coal trapping heat limited space could facilitate spontaneous combustion. 184 In addition to analyzing the impacts of coal dust emissions from uncovered cars, the PEIS should analyze and disclose emissions from empty coal trains. One recent Australian study found that empty coal trains emit more particulate pollution than loaded ones. 185 Controlling coal dust requires millions of gallons of water per year. Water is needed during rail car loading, at storage piles within enclosures, at drop points, and during ship loading. 186 About 8 gallons of water are required for each ton of coal throughput to control dust. 187 Given that coal travels through states that are experiencing drought, the PEIS should analyze the impacts of coal leasing in this context. The PEIS should also consider the cumulative impacts of coal dust given the impacts faced by communities located near rail lines and ports where the trains are carried. Cumulative impacts are the related past, present, and reasonably foreseeable future projects. 181 Comments of Phyllis Fox, *Environmental Health and Safety Impacts of the Proposed Oakland Bulk and Oversized Terminal*, September 21, 2015, at 16 (Ex. 35). 182 Paul R. Organization I:Earthjustice

Commenter I:Jenny Harbine

Comment Excerpt Text:

8. The PEIS must analyze environmental justice impacts. The PEIS must address the environmental justice implications the federal coal program, particularly with regard to climate impacts. Minority and low-income communities bear a disproportionate risk of suffering adverse effects of climate disruption. According to EPA, “[C]limate change is an environmental justice issue. Low-income communities and communities of color already overburdened with pollution are likely to be disproportionately affected by, and less resilient to, the impacts of climate change.”²⁰⁷ In addition, low-income communities and communities of color face multiple vulnerabilities due to threats to health, housing, healthy food, transportation, jobs, safety, and clean energy, among other things, 208 all of which the mining and burning of federal coal exacerbates. EPA cites the Intergovernmental Panel on Climate Change’s (“IPCC’s”) Fifth Assessment Report, which concludes that climate disruption will hit low-income neighborhoods and people of color the hardest. According to the IPCC, “[m]any key risks constitute particular challenges for the least developed countries and vulnerable communities, given their limited ability to cope.”²⁰⁹ These disproportionate risks relate to economic impacts and effects on 206 A recent draft EIS evaluating the impact of Millennium Bulk Terminals Longview in Washington State acknowledged that the coal project would increase the number of rail accidents by 22% statewide. 207 Clean Power Plan, 80 Fed. Reg. 64,662, 64,914 (Oct. 23, 2015). 208 National Association for the Advancement of Colored People, EQUITY IN BUILDING RESILIENCE IN ADAPTATION PLANNING at 2 available at http://action.naacp.org/page/-/Climate/Equity_in_Resilience_Building_Climate_Adaptation_Indicators_FINAL.pdf (last visited July 28, 2016), attached as Ex. 39. 209 Intergovernmental Panel on Climate Change, CLIMATE CHANGE 2014: IMPACTS, ADAPTATION, AND VULNERABILITY: SUMMARY FOR POLICYMAKERS (2014), at 13. 57 human health. In the United States, researchers have found that African-Americans and Latinos are also more likely to reside in areas vulnerable to climate change impacts such as sea-level rise, flood risk, and wildfire risk, and that median household incomes are inversely related to these vulnerability risks. 210 This is not a recently reached conclusion. EPA’s supporting documents in its 2009 Endangerment Finding summarized major assessment reports by the U.S. Global Change Research Program (USGCRP), the IPCC, and the National Research Council (NRC) of the National Academies, which found that that poor communities can be especially vulnerable to climate change impacts. 211 According to EPA, recent studies reaffirm these conclusions. These studies, cited extensively in supporting documentation for EPA’s Clean Power Plan, “find that certain climate change related impacts—including heat waves, degraded air quality, and extreme weather events—have disproportionate effects on low-income populations and some communities of color, raising environmental justice concerns.”²¹² Additionally, EPA concluded that climate disruption poses particular threats to health, well-being, and ways of life of indigenous peoples in the U.S. As part of the PEIS process, DOI must, at a minimum, acknowledge the body of well-established research, endorsed by EPA, which concludes that “low income populations and some communities of color are especially vulnerable to the health and other adverse impacts of climate change.” In addition to fully disclosing the climate impacts of its federal coal leasing program, DOI must disclose the likelihood that the impacts of any decision to continue leasing and burning taxpayer-owned coal will fall disproportionately on low-income communities and communities of color.

Commenter I:John Crystal

Comment Excerpt Text:

Proposed changes to the federal coal program could threaten the reliability and affordability of electricity by

increasing federal coal royalty rates and thus forcing consumers like me to pay more for the power we need at home and work. While I personally might be able to afford that, all I read about are the increasing numbers of more economically disadvantaged that are having problems in affording their monthly utility bills. Why should our government penalize those that are most economically disadvantaged?

In 2008, one billion gallons of coal ash contaminated with heavy metals spilled on the communities of Roane County. The cleanup was long and costly, finishing only last year and doing damage that cannot be truly quantified. The ash from the spill was shipped by train to the cash poor predominantly African-American community of Uniontown, Alabama, where it sits in a land fill directly across from houses. Residents report health problems and crop failures, and they have filed a civil rights complaint and testified in Washington, D.C. We must understand that the Federal Coal Leasing Program is directly connected to the injustices in Kingston and Uniontown.

Comment Excerpt Text:

I live in a city that has the twelfth worst air pollution in the country. And most of that air pollution comes from coal-fired power plants. Those coal-fired power plants are owned by Alabama Power. Fifty percent of Alabama Power's energy comes from coal. Fifty percent of that coal comes from the Powder River Basin, and so a lot of their coal is mined from lands that you all work on. Ever since I moved to Birmingham, I have had about four times worse health than before, and, according to my doctors, is about twenty percent of my health condition. And I think all of these health issues are something that needs to be considered when you all work to decide your policies on what the price of leasing is.

Comment Excerpt Text:

These are some of the healthcare costs of burning coal. The emission from coal plants are the major source of sulfur dioxide, second only to automobiles as sources of nitrogen oxide and particulate matter. NOx also is also a precursor of ozone. The emissions of all the coal-powered plants in this country have been calculated by the American Lung Association to cause about 25,000 premature deaths every year or an average of 30 to 50 deaths per plant per year. Coal-powered plant pollution is responsible for half a million asthma attacks, 16,000 episodes of conic bronchitis and 38,000 nonfatal heartaches every year. This pollution increases the annual healthcare bill by about \$170 billion according to the California EPA. The American Heart Association and the American Lung Association state that air pollution on average shortens the life span of everyone one to three years. No one escapes the consequences of air pollution. 47,000 Utah children live within 30 miles of a coal power plant. Please look at the 2015 USGS report of toxic mercury concentration in the Colorado River. It doesn't take a rocket scientist to recognize that this mercury comes from coal-fired power plants near Price, Utah, and Page, Arizona.

The health and environmental impacts of coal combustion are many and varied. Pollutants discharged into the atmosphere through the combustion of coal by electrical utilities are well-known to cause harm to the respiratory system; this is especially problematic for children, whose lungs and respiratory systems are still in the process of developing. These effects, as noted in literature from Physicians for Social Responsibility, fall into several classes: "de novo production of a condition, such as asthma, that did not exist prior to an exposure; an exacerbation of a previously-existing illness, again, such as asthma; and the development or progression of a chronic illness such as asthma, lung cancer, chronic obstructive pulmonary disease (COPD), and emphysema."²

Comment Excerpt Text:

According to the Utah Department of Health's Utah Asthma Program, "poor air quality [is] a health concern for many Utahns, especially children and those with asthma."³ Although air quality and childhood asthma are significant concerns in Utah, however, the majority of the state's energy is still produced by the burning of coal. Despite the well-settled correlation between air quality and respiratory conditions, moreover, policy efforts aimed at controlling

asthma tend merely to emphasize limiting exposure to pollution rather than highlighting the importance of pollution reduction. The reality, though, is that reducing the triggers of asthma attacks - including carbon pollution - represents an equally critical element of any viable approach.

Comment Excerpt Text:

According to the international disaster database (Emergency Events Database EM-DATL climate-related deaths are down 98 percent over the past 80 years. In 2013, there were 21,122 such deaths worldwide compared to a high of 3.7 million in 1931, when world population was less than a third of its current size. Why is the climate killing less people? Because while fossil fuel use has only a mild warming impact, it has an enormous protecting impact. Nature doesn't give us a stable, safe climate that we make dangerous. It gives us an ever-changing, dangerous climate that we need to make safe. And the driver behind sturdy buildings, affordable heating and air-conditioning, drought relief and everything else that keeps us safe from climate is cheap, plentiful, reliable energy, overwhelmingly from coal and other fossil fuels. (Source: "The Moral Case for Fossil Fuels", Alex Epstein)

Comment Excerpt Text:

David Hillman spoke about labor-related liabilities, such as legacy healthcare costs for retirees. He described several types of such liabilities and whether they can be terminated in bankruptcy.

First, there are benefits from collective bargaining agreements (CBAs), and these can be terminated in bankruptcy if deemed necessary for the reorganization or liquidation. Second, the Coal Act imposes two types of obligations on companies: to provide healthcare benefits to their own retirees and

dependents, and to pay monthly premiums to health care funds that cover not only the operator's former employees but also employees of operations that have gone out of business. Bankruptcy courts have held that the debtors may terminate or modify the healthcare benefits, but they cannot terminate the premiums (because these are treated in bankruptcy as taxes with administrative expense priority status). Third, the Black Lung Act requires operators to pay certain health and disability benefits to current and former employees with black lung disease and to pay an exercise tax on coal sales. The Black Lung obligations cannot be terminated in bankruptcy: the person with black lung has an unsecured claim against the operator, and if the operator cannot pay, the employee can receive funds from the federal Black Lung Disability Trust Fund. Andy Stevenson concluded the panel with a presentation about taxpayer liability to these costs when coal companies go bankrupt. He noted that the short-term taxpayer costs from coal bankruptcies are up to \$3.7 billion from the big 3 coal companies alone (Alpha Natural, Peabody, and Arch Coal). This includes \$1.7 in exposure from coal mine reclamation settlements. In terms of long-term taxpayer costs, he estimated that there could be up to \$30 billion in total mine and worker retirement obligations.

Comment Excerpt Text:

Methylmercury is a potent neurotoxin . It is well known that most mercury in our lakes and rivers and children comes from coal powered power plants. In early 2004, EPA scientists estimated that one in six women of childbearing age in the U.S. has levels of methylmercury in her blood that are sufficiently high to put 630,000 of the four million babies born each year at risk of learning disabilities, developmental delays, and problems with fine motor coordination, among other problems. This figure is a doubling of previous estimates based on increasing evidence that methylmercury concentrates in the umbilical cord, exposing the developing fetus to higher levels of mercury than previously understood. The neurological deficits can be subtle and not recognizable until the child is 4-5 years old. The mother may not have any symptoms and yet her child may be born with severe deficits. I urge you to look at the 2015 USGS report of toxic mercury concentrations in Lake Powell and the Colorado River. It doesn't take a rocket scientist to conclude that this mercury originates from coal powered power plants near Price, Utah and Page, Arizona.

Comment Excerpt Text:
The coal lease program needs serious review and significant reform. Coal from leased public lands constitutes a significant percentage of the greenhouse gas emissions and other pollutants that contribute to the deterioration of the air quality in our region, a decrease in the ability to see clearly into the distance and an increase in the respiratory diseases that effect both the adults and children living here. We have also seen here in Eastern TN the devastating results of coal ash spill and the impact on the surrounding area. Part of any lease, should include strict regulations regarding worker, environmental and community health and safety.

When coal is burned, toxins in the coal are released into the smokestack. If modern air pollution controls are in

place, airborne toxins are captured through filtration systems before they can become airborne. The captured toxins end up in coal ash. As a result, heavy metals such as mercury are concentrated in what the EPA considers "recycled air pollution control residue." This only delays the exposure of the public to these toxins. The EPA concedes that all coal ash landfills eventually leak, and Federal regulation of coal ash landfills is minimal. Rain falling on ash piles leaches out these heavy metal compounds. The heavy metals eventually end up in ground water, or in lakes and streams, contaminating drinking water sources.

There are over 3,500 peer-reviewed scientific studies that document the harm to public health from air pollution, especially in urban in developed economies. (D'amato, g., et al., 2010.) Fossil fuel combustion is responsible for the vast majority of air pollution in developed countries.(21) Air pollution has been found to damage every major organ system in the human body. These studies have caused the World Health Organization to conclude that air pollution is the most important environmental cause of cancer, more important than second-hand cigarette smoke. <http://www.usatoday.com/story/news/world/2013/10/17/cancer-air-pollution-carcinogens/3002239/>.

Comment Excerpt Text:

Cigarette smoke contains 69 known carcinogens. Coal-fired power plant emissions contain 67 known carcinogens or neurotoxins (U.S.EPA, 1998)—many of the same ones found in cigarette smoke. Cigarette smoke and power-plant emissions both contain

- Fine particulate matter (PM2.5)
- Carbon monoxide
- Ozone precursors
- Volatile Organic Compounds (VOCs), such as benzene, toluene, and formaldehyde;
- Acid gases, such as hydrogen chloride and hydrogen fluoride;
- Dioxins and furans;
- Lead, arsenic, and other toxic heavy metals;
- Mercury;
- Polycyclic Aromatic Hydrocarbons (PAH); and
- Thorium, Uranium, Polonium and other radioactive metals

The harm to public health that second-hand cigarette smoke and fossil fuel emissions pose is remarkably similar. The difference is primarily quantitative, not qualitative. A typical life-long smoker will shorten his life by ten years. The American Lung Association reports that the typical urban dweller in the United States is exposed to enough airborne fine particulate matter to shorten his life by one-to-three years. (Pope, C.A. III, 2000.) Nearly all of that exposure is due to pollution from the burning of fossil fuels. This shortened life span of a typical urban dweller is not just the effect of his exposure to fine particulate pollution. Exposure to other components of air pollution caused by burning fossil fuels--such as ozone and Hazardous Air Pollutants (HAPs)--further shortens his life.

Comment Excerpt Text:

An example of the current research on the toxicity of lead is provided by a major study of the relationship between lead exposure levels and reduced intellectual capacity that was completed in Italy in 2012. (Lucchini, R.G., et al., 2012.) The study found that the I.Q. of Italian teenagers is reduced in proportion to their lead exposure, no matter how small their lead exposure is. Specifically, the study demonstrated that every 0.19 micrograms of lead per deciliter in an adolescent's blood is accompanied by a one-point reduction in that teenager's I.Q.

According to this study, the I.Q. of Italian adolescents has been reduced by 9 points on average, given their average blood serum lead level of 1.71 micrograms. The most recent lead exposure data available for the United States focuses on the 1-5 year-old age group. For the years 2007-2010, their average blood serum level was 1.3 µg/dL. The Italian study implies that the I.Q. of preschoolers in the United States has been reduced by 7 points, on average, due to their exposure to lead pollution, since the exposure of American preschoolers is a little more than three-fourths that of Italian teenagers. (24)

(24) The implication that the degree of mental impairment in American pre-school children due to their average blood-serum levels of lead is approximately three-fourths of the impairment experienced by Italian teenagers is based on the assumption that impairment is proportional to exposure levels. This is a conservative assumption since other research consistently shows that the younger children are, the more vulnerable they are to exposure to neurotoxins. In addition, although blood lead concentrations in American preschool children of 1.3 µg/dL are less than the 1.71 µg/dL in Italian teenagers, these concentrations would likely be comparable if American teenagers were measured, because blood levels of heavy metals generally increase quadratically until age 50. See Caldwell KLI, Mortensen ME, Jones RL, Caudill SP, Osterloh JD., Total blood mercury concentrations in the U.S. population: 1999-2006, *Int J Hyg Environ Health*. 2009 Nov;212(6):588-98. doi: 10.1016/j.ijheh.2009.04.004. Epub 2009 May 29.

It is estimated that average blood lead levels are 50 times higher than natural lead levels were before the industrial revolution. (Flegal, A.R., et al., 1992.) In the United States, as in Italy, lead exposure has historically had three main sources: lead paint, leaded gasoline, and coal-fired power plants. Lead exposure from paint and gasoline has largely been brought under control. Coal-burning power plants are now the primary source of lead exposure for young children in most of the United States.

The harm to public health from lead pollution from coal-fired power plants, however, is modest compared to the harm that they cause through mercury pollution. Estimates of the amount of mercury in the environment that is generated by human activity range from 70 to 96%. The World Health Organization estimates that total worldwide mercury emissions have tripled as a result of the industrial revolution. The single largest source of environmental exposure to mercury in the United States (65%) is from coal-fired power plants. (AMAP/UNEP, 2013 at 3-4.) (26) The main sources of man-caused mercury pollution are the proliferation of coal-fired power plants, the use of mercury in small-scale, low-technology (and typically illegal) gold and silver mining in less developed countries, and the use of lead in dental amalgam. See www.psr.org/assets/pdfs/coal-fired-power-plants.pdf.

Comment Excerpt Text:

From the perspective of epidemiologists, coal-fired power plants are huge neurotoxin factories. A typical coal-fired power plant without modern pollution controls emits 170 pounds of mercury each year. In 2009, coal-fired power plants in the United States injected 134,365 pounds (more than 67 tons) of mercury into our environment. Ninety percent of this mercury could be removed by using activated carbon injection (ACI) technology combined with baghouses. As of 2011, however, only 8% percent of coal-fired power plants were equipped with this technology. (EPA Trends Report, 2010.)

When coal is burned by a power plant without controls, mercury is released into the air and settles onto bodies of water where it is converted to its organic form (methylmercury). Methylmercury accumulates in the tissue of fish and shell fish. Eating fish is the main source of methylmercury exposure for most of the population.

Climate disrupting CO₂ emissions come primarily from coal-fired power plants. Reducing those emissions also reduces other pollution (notably SO₂, NO_x, and PM_{2.5}), which brings major health benefits to the American public. The EPA's Integrated Planning Model yields an updated estimate that implementing the Clean Power Plan would reduce CO₂ and related emissions in the year 2030 by 30% relative to 2012 levels. This would yield health and benefits of from \$64 to \$99 billion by reducing SO₂, NO_x, PM_{2.5} emissions (without taking the effects of reduced exposure to neurotoxins into account). <http://www.nrdc.org/air/pollution-standards/>. However, if political or legal considerations keep the Clean Power Plan from being implemented, or an unreformed Federal coal leasing program continues to offset its effects, coal-fired power plants will continue to inject neurotoxins into the environment at the pace. The result could be that the productivity of the nation's children will be far below what it could otherwise be at the time that those children enter the workforce.

In 2010, utilities in the United States burned 1.05 billion tons of coal. (Energy Information Agency, 2014.) This coal contains 109 tons of mercury, 7884 tons of arsenic, 1167 tons of beryllium, 750 tons of cadmium, 8810 tons of chromium, 9339 of nickel, and 2587 tons of selenium. [http://www.precaution.org/lib/laid to waste.000601.pdf](http://www.precaution.org/lib/laid%20to%20waste.000601.pdf), p. 2. On top of emitting 1.9 billion tons of carbon dioxide each year, coal-fired power plants in the United States also create 120 million tons of toxic waste. That means each of the nation's 600 coal-power plants produce an average 240,000 tons of toxic waste each year. A plant that operates for 40 years will leave behind 9.6 million tons of toxic waste. This coal combustion waste (CCW) constitutes the nation's second largest waste stream, after municipal solid waste. See [http://www.precaution.org/lib/08/prn is coal green.081106.htm](http://www.precaution.org/lib/08/prn%20is%20coal%20green.081106.htm)

Comment Excerpt Text:

Methylmercury is the most powerful non-radioactive neurotoxin in nature. It is many-fold more toxic than lead.

This is confirmed by a recent study conducted at the University of Calgary medical school. In the study, brain neurons were exposed in vitro to a series of metals that were known or suspected neurotoxins. At concentrations so small that neither lead, cadmium, aluminum, nor manganese affected neuron integrity, methylmercury caused 77% of exposed neuron endings to disintegrate. (Leong, C.C., et al., 2001.)

According to the World Health Organization, exposure to methylmercury damages not just the nervous system, but the digestive, respiratory, and immune systems as well. It causes intellectual impairment during fetal development and childhood, attention deficit disorder, impaired vision and hearing, tremors, paralysis, insomnia, and emotional instability. (WHO Report, 2005.) In adults, mercury poisoning closely mimics the symptoms of Alzheimer's disease. (Mutter, J., et al., 2010.) The World Health Organization observes that "mercury may have no threshold below which some adverse effects do not occur." Id.

As an indication of its potency, just 1/70th of a teaspoon of mercury deposited in a 25-acre lake can make all of the fish in that lake unsafe to eat for a year. (Weiner, J.G., et al., 1990.) It is estimated that over 6 million acres of lakes, reservoirs, and ponds in the United States have unsafe concentrations of mercury. (EPA Watershed Assessment, 2010.) In 47 of the 50 states, wild fish cannot be eaten because their methyl mercury exceeds safe levels, due, primarily, to emissions from coal-fired power plants. www.ucsusa.org/clean-energy/coalswind/c02c.html#.VHQPMfRDuSq.

Human fetuses are five to ten times more vulnerable than adults to the brain-addling powers of methylmercury. There are two reasons, 1) they typically receive a 70% greater exposure to mercury than the mother (because of the placenta's concentrating action), and 2) their brain cells need to move from the center of the brain to the surface before they multiply. Methylmercury paralyzes brain cells, blocking the movement and multiplication that is necessary for normal fetal development. (Mahaffey, K., et al., 2004 at 562-570; Mahaffey, K., EPA Methylmercury Update, 2004, Slide 9.)

In the United States, one in six mothers of childbearing age has enough mercury in her blood to put her fetus at risk of intellectual impairment. (Center for Disease Control, 2001; Mahaffey, K., EPA Methylmercury Update, 2004.) This implies that 689,000 of the 4.1 million babies born every year are at risk of reduced mental capacity as a result of mercury exposure. (National Center for Health Statistics, 2010 at 1.) The estimate that one in six mothers of childbearing age have blood lead levels that are unsafe for a fetus, however, is almost certainly understated because it is based on the EPA's definition of a safe blood level of 0.58 µg/dL. This is higher than the World Health Organization's definition of a safe blood level of lead [0.5 µg/dL]. The recent research described above, however, implies that methylmercury is much more toxic than lead and other toxic metals, and, therefore, the definition of a safe blood level of methylmercury (if there were one) should be well below that of other such metals.

There is evidence that the neurotoxic effects of methylmercury in the presence of other heavy metals in blood and tissues is not merely additive, but is synergistic, and amplifies the neurotoxic effects of both metals. (Schubert, J., et al., 1978.) Child development experts have recently been warning chemical and metal brain toxicity is increasingly prevalent in the human population, causing a silent, global pandemic of neurobehavioral disorders and intellectual compromise in children. (Grandjean, P., et al., 2014.) The rapid proliferation of neurotoxins that children are exposed to, and the likelihood that they act synergistically, provide a powerful argument for the Federal government to become more aggressive in reducing their exposure. At the top of the list of known neurotoxins that are contributing to this tragic trend are mercury, lead, and arsenic—all prominent components coal-fired power plant emissions.

While overall exposure to some neurotoxins like lead has decreased in recent years for a variety of reasons having nothing to do with reduced coal power plant emissions, mercury exposure has increased. A study showed that in 2006, 30% of women had detectable levels of mercury, up from 2% in 2000. (Laks, D., 2009.) Mercury is also implicated as a cause of Alzheimer's disease. A recent meta-analysis reviewing 1,041 studies clearly showed a strong relationship between this increasingly common illness and exposure to mercury. (Mutter,

J., et al., 2010.) Research shows that Alzheimer's was the underlying cause in 500,000 deaths in the United States in 2010. This represents a 68% increase from 2000. [http://www.alz.org/alzheimers disease facts and figures.asp#cost](http://www.alz.org/alzheimers_disease_facts_and_figures.asp#cost).

More money is spent on treating Alzheimer's patients than on any other disease. Care for Alzheimer patients is costing the nation about \$200 billion annually, a figure which does not reflect the costs of lost productivity, nor the emotional and financial burden of the "free care" that family members provide. If the rapid growth of Alzheimer's continues, it has the potential to bankrupt the nation's health care system. Mercury emitted by coal-fired power plants appears to bear a significant share of the blame.

2. Accounting for the Combined Effect of Exposure to Methylmercury and Lead on Intellectual Capacity and Workforce Productivity

A crucial question is what the combined effect of exposure to methylmercury and lead is on the public's intellectual capacity. We know that methylmercury is far more toxic than lead to the nervous system, and we know that the separate effects of methylmercury and lead are amplified when they occur in combination. Although we do not know precisely how much more toxic to the nervous system methylmercury is than lead, or how synergistic it is with lead, it is safe to assume that its toxicity is at least equal to that of lead. Therefore, it is also safe to assume that the effect of blood serum levels of mercury and lead are at least additive when exposure to mercury and lead occurs together at levels near their current average concentrations.

Under this conservative hypothesis, to account for the combined impact of currently prevailing blood levels of both methylmercury and lead on the intellectual capacity of the preschool population, one would have to assign a neurological effect to methylmercury in blood serum that is at least equal to the neurological effect of an equivalent concentration of lead in the blood. Average blood levels of methylmercury among American preschool female children are 0.356 $\mu\text{g}/\text{m}^3$. (27) This implies that, on average, blood serum levels of methylmercury in preschool children in the United States have reduced their intellectual capacity by roughly 2 points (at a minimum) in addition to the 7 I.Q. points from their exposure to lead, or a total of 9 I.Q. points.

(27) Caldwell KLI, et al. 2009, cited above. Total mercury in blood serum occurs overwhelmingly in the form of methylmercury.

If the current generation of American workers had escaped exposure to both methylmercury and lead, their average I.Q. could be expected to be at least 9 points higher. Reducing the intellectual capacity of an entire workforce by 9 points transforms the intellectual capacity that workforce. National average I.Q. has a strong correlation with GDP per worker. Research suggests that while an increase of 15 points (one standard deviation) results in a 15% increase in average wages of individuals, it results in proportionately greater increases in national productivity (approximately 150%), due largely to a multitude of external effects that increased intellectual capacity has on the economic processes of a society as a whole.(28) Again, taking a conservative approach, if the average I.Q. of American school-age children has been reduced at least 9 points due to exposure to lead and methylmercury, this amounts to a reduction of one-half of a standard deviation. Therefore, such exposure has likely reduced the productivity of the national workforce at least 75% (half of 150%).

(28) See, e.g., research summarized in Jones, G., 2011.)

The loss of intellectual capacity from the avoidable exposure of America's children to methylmercury and lead pollution is a personal and social tragedy. The recent epidemiological and macroeconomic studies cited above imply that this loss of intellectual capacity is drastically reducing the productivity of our nation's workforce, as illustrated by our back-of-the-envelope estimate of those effects presented below. This strongly implies that the most important co-benefit of reducing reliance on coal to generate electric power—as the Administration's Clean Power Plan hopes to do—is that it reduces the level of exposure of the American workforce to methylmercury and lead pollution.

According to research by the Center for Health and the Global Environment at the Harvard School of Public Health (2) (CHGE), “The economic, health and environmental impacts associated with extraction, transportation, processing, and combustion cost the U.S. public between a third to over half a trillion dollars annually.” Coal mining regions have 11,000 excess deaths annually from lung cancer, heart, respiratory and kidney disease. Lives lost in coal mining regions are evaluated at \$74.6 billion per year.

(1) <http://www.emnrd.state.nm.us/MMD/Coal-FAQs.html#CoalinNM>

(2) [p://www.chgeharvard.org/resource/explore-true-costs-coal](http://www.chgeharvard.org/resource/explore-true-costs-coal)

These adverse health impacts are felt in New Mexico. In San Juan County, where coal activity is more prevalent, the American Lung Association (ALA) reports that residents are at an elevated risk for lung diseases. The ALA indicates there are 2,885 cases of pediatric asthma, 8,442 cases of adult asthma and 5,219 people diagnosed with COPD in this rural northwestern New Mexico county alone.

Measurable health effects of coal-related air pollution include increased rates of lung and heart disease. According to CHGE, 2005 data showed that “[p]articulates and oxides of nitrogen and sulfur kill over 24,000 people annually, including 2,800 from lung cancer.” Further, pollution from coal operations produces 38,200 non-fatal heart attacks annually.

Health reasons: Coal mining itself causes health problems for the workers, the people in the surrounding communities, and also, importantly, the people affected by the dumping of the coal ash. In Uniontown, AL, those people didn't even know they were getting a coal ash pond in their community. Why didn't the coal ash pond remain in TN where it started? TN needs to keep it in TN and completely secure the coal ash so it doesn't affect any of TN's citizens. Meanwhile, Uniontown's residents are still reeling from and dealing with the unclean ash pond. And they are not the only ones in the USA with this problem.

Comment Excerpt Text:

The occupational health impacts of mining coal are well known and must be considered when reviewing the effects of electricity generation with coal. Most of the research on the health effects of coal mining have been performed among miners in large scale mines in Europe and North America.¹⁵⁰

Traumatic injury remains a significant problem and ranges from trivial to the fatal. Coal mining leads U.S. industries in fatal injuries.¹⁵¹ Common causes of fatal injury include rock fall, fires, explosions, mobile equipment accidents, falls from height, entrapment and electrocution.¹⁵² Less common but recognized causes of fatal injury include flooding of underground workings, wet-fill release from collapsed bulkheads and air blast from block caving failure.¹⁵³ Noise is almost ubiquitous in mining; it is generated by drilling, blasting, cutting, materials

handling, ventilation, crushing, conveying and ore processing. Controlling noise has proven difficult in mining and noise-induced hearing loss remains common.¹⁵⁴

Coal mining is also associated with chronic health problems among miners, such as Coal Workers' Pneumoconiosis, also known as CWP or "black lung disease," which causes permanent scarring of the lung tissue.¹⁵⁵ A 2002 review of 250 studies on coal mining calculated that up to 12% of coal miners develop the potentially fatal lung condition due to the inhalation of dust during mining operations. Data indicates a direct relationship between the mass of respirable coal mine dust inhaled and the incidence and severity of CWP.¹⁵⁶ The following chain of events has been proposed for the initiation and progression of CWP: (1) inhaled coal dust concentrates at the bifurcations of the respiratory bronchioles; (2) local inflammation results in the accumulation of phagocytic cells that scavenge coal dust particles, forming lung lesions known as coal macules; (3) with further exposure, coal macules enlarge to form coal nodules; (4) as the lesions condense, surrounding tissue is torn forming scar emphysema; and lastly (5) connective tissue becomes associated with these lesions leading to progressive massive fibrosis (PMF).¹⁵⁷

Not only are miners at a higher risk for CWP, but they are also at higher risk for chronic bronchitis and accelerated loss of lung function. As a result, the Federal Coal Mine Health and Safety Act of 1969 legislatively has defined "black lung disease" to include not only CWP but also obstructive lung diseases, such as chronic bronchitis and emphysema, as well as silicosis associated with an employment history in coal mines.¹⁵⁸ Inhalation of coal mine dust is associated with the development of pulmonary disease in miners, and coal miners have also been reported to have a higher than normal incidence of stomach cancer.¹⁵⁹

Threats to the public health persist even after removal of coal from a mine. Surface mining destroys forests and groundcover, leading to flood-related injury and mortality, as well as soil erosion and the contamination of water supplies. When mines are abandoned, rainwater reacts with exposed rock to cause the oxidation of metal sulfide minerals. This reaction releases iron, aluminum, cadmium, and copper into the surrounding water system and can also contaminate drinking water.

Comment Excerpt Text:

The "external costs" of electricity generation from coal are the burdens to society that are not included in the electricity's monetary price. Estimates of the external costs of electricity generation from coal suggest that 95% of the external cost consists of the adverse health effects on the population.¹⁶³ When coal is burned, it produces air-borne pollutants of sulfur dioxide, particulate matter (PM), nitrogen oxides, mercury, arsenic, chromium, nickel, and other heavy metals, acid gases, hydrocarbons, and dozens of other substances known to be hazardous to human health.¹⁶⁴ It also contributes to smog through the release of oxides of nitrogen, which react with volatile organic compounds (VOCs) in the presence of sunlight to produce ground level ozone, the primary ingredient in smog. In 2011, the World Health Organization compiled air quality data from 1,100 cities in 91 countries and found that residents living in many urban areas are exposed to persistently elevated levels of fine particle pollution, partly due to coal-fired power plants, as well as the burning of coal for cooking and heating.¹⁶⁵

A 2007 article published in the medical journal, *The Lancet*, summarizes the burden of the health effects of generating electricity from coal and lignite (a type of coal). It estimated that for every TWh (Terrawatt-hour) of electricity produced from coal in Europe, there are 24.5 deaths, 225 serious illnesses including hospital admissions, congestive heart failure and chronic bronchitis, and 13,288 minor illnesses.¹⁶⁶ When lignite, the most polluting form of coal, is used, each TWh of electricity produced results in 32.6 deaths, 298 serious illnesses, and 17,676 minor illnesses.¹⁶⁷ To give these data perspective, consider the fact that nearly half of the 4,160 TWh of electricity generated in the United States in 2007 came from coal-fired power plants.¹⁶⁸ If these estimates are applied to the U.S., as many as 50,000 deaths per year may be attributable to burning coal.¹⁶⁹

The major health effects linked to coal combustion emissions damage the respiratory, cardiovascular, and nervous systems and contribute to four of the top five leading causes of death in the United States: heart disease, cancer, stroke, and chronic lower respiratory diseases.¹⁷⁰ Although it is difficult to ascertain the proportion of this disease burden that is attributable to coal pollutants, even very modest contributions to these major causes of death are likely to have large effects at the population level, given high incidence rates.

Comment Excerpt Text:

Particulate Matter -- Particulate matter is generated from the combustion of coal and is characterized by size -- small particles less than 2.5 micrometers (PM_{2.5}) and larger particles up to 10 micrometers (PM₁₀). PM_{2.5} travels deeper into the airways than PM₁₀ and is therefore generally believed to cause a greater threat to human health.¹⁷¹ In a report evaluating over 40 studies on the health effects of exposure to small particulate matter (PM_{2.5}), the U.S. Environmental Protection Agency concluded that PM_{2.5} likely causes respiratory symptoms, the development of asthma, and decrements in lung function in children.¹⁷² Findings from the review conclude that a 10 µg/m³ increase in PM_{2.5} is associated with a 1% to 3.4% decrease in FEV₁, a measure of lung function, in asthmatic children.¹⁷³ It also concluded that exposure to PM_{2.5} increases emergency department visits and hospital admissions for respiratory related symptoms such as infections and chronic obstructive pulmonary

disease.¹⁷⁴ Epidemiological evidence from Australia and New Zealand, Mexico, Canada, and Europe confirm that these health effects on the respiratory system are seen around the globe among communities exposed to PM_{2.5}.¹⁷⁵ In addition to respiratory illnesses, long-term exposure to PM_{2.5} is causally linked to the development of lung-cancer. [Implementing the final emission guidelines of the Clean Power Plan may lead to reductions in ambient PM_{2.5} concentrations below the NAAQS for PM and ozone in some areas and assist other areas with attaining these NAAQS.]¹⁷⁶

Sulfur Dioxide -- Exposure to sulfur dioxide (SO₂) emitted by coal burning power plants increases the severity and incidence of respiratory symptoms of those living nearby, particularly children with asthma.¹⁷⁷ For adults and children who are susceptible, inhalation of SO₂ causes inflammation and hyper-responsiveness of the airways, aggravates bronchitis, and decreases lung function. There is a significant association between community-level SO₂ concentration and hospitalizations for asthma and other respiratory conditions, and asthma emergency department visits particularly among children and adults over 65.¹⁷⁸ The EPA identified three short-term morbidity endpoints that the SO₂ ISA identified as "causal relationship": asthma exacerbation, respiratory related emergency department visits, and respiratory-related hospitalizations.¹⁷⁹

Oxides of Nitrogen -- Oxides of nitrogen (NO_x) are by-products of fossil fuel combustion from automobiles and coal-fired power plants, among many other sources. Oxides of nitrogen react with chemicals in the atmosphere to create pollution products such as ozone (smog), nitrous oxide (N₂O), and nitrogen dioxide (NO₂). NO₂ and ozone are pollutants of particular concern. When asthmatic children are exposed to NO₂ they can experience increases in wheezing and cough.¹⁸⁰ Exposure to NO₂ also increases susceptibility to viral and bacterial infections, and at high concentrations (1-2 ppm), it can cause airway inflammation.¹⁸¹ At low concentrations (0.2 - 0.5 ppm) NO₂ causes decrements in lung function in asthmatics.¹⁸² Increases in ambient NO₂ levels (3-50 ppb) cause increases in hospital admissions and emergency department visits for respiratory causes, particularly asthma. Depending on localized concentrations of volatile organic compounds, reducing NO_x emissions would also reduce human exposure to ozone and the incidence of ozone-related health effects.¹⁸³

Reducing emissions of SO₂ and NO_x would also reduce human exposure to ambient PM_{2.5} and the incidence of PM_{2.5}-related health effects.¹⁸⁴ In 2008, the National Academies of Sciences issued a series of recommendations to the EPA regarding the quantification and valuation of ozone-related short-term mortality. Chief among these was that "...short-term exposure to ambient ozone is likely to contribute to premature deaths" and the committee recommended that "ozone-related mortality be included in future estimates of the health benefits of reducing ozone exposures..."¹⁸⁵

Coal-fired power plants contribute to the global burden of cardiovascular disease primarily through the emission of particulate matter. PM_{2.5} has been causally linked to cardiovascular disease and death.¹⁸⁶ The World Health Organization (WHO) estimates that worldwide, 5% of cardiopulmonary deaths are due to particulate matter pollution.¹⁸⁷ Long term exposure to PM_{2.5} has been shown to accelerate the development of atherosclerosis and increase emergency department visits and hospital admissions for ischemic heart disease and congestive heart failure.¹⁸⁸ The U.S. EPA reports that a majority of the studies it reviewed found a 0.5-2.4% increase in emergency department visits and hospital admissions for cardiovascular diseases per each 10 µg/m³ increase in PM_{2.5} concentrations,¹⁸⁹ and a 2007 scientific review of the health effects of combustion emissions reported an 8-18% increase in cardiovascular deaths per 10 µg/m³ increase in PM_{2.5} concentration in the United States.¹⁹⁰

Coal contains many naturally-occurring heavy metals, including mercury. When coal is burned, mercury is emitted into the atmosphere in gaseous form. The United Nations estimates that 26% of global mercury emissions (339-657 metric tons/ year) come from the combustion of coal in power plants.¹⁹¹ The mercury emitted into the atmosphere is deposited into waterways, converted to methylmercury, and passed up the aquatic food chain. Consumption of methylmercury-contaminated fish, from mercury emissions locally, regionally, and internationally, by pregnant women can cause developmental effects in their offspring such as lower intelligence levels, delayed neurodevelopment, and subtle changes in vision, memory, and language.¹⁹²

The storage of post-combustion wastes from coal plants also threatens human health. After combustion, some coal ash is recycled into cement and other engineering products, but most of it is disposed of in dry or wet landfills.²¹⁷ There are 584 coal ash dump sites in the U.S., and toxic residues have migrated into water supplies and threatened human health at dozens of these sites.²¹⁸ Landfills that leak fly-ash waste can contaminate ground and surface water with arsenic, cadmium, barium, thallium, selenium, and lead.²¹⁹

In evaluating the federal coal leasing program as a whole, however, BLM must consider not only energy supply and economic return and the physical and policy limits on greenhouse gas emissions, but also several other significant indirect consequences of the coal leasing program. Federal coal leasing has significant adverse effects on both human health and welfare and on species at risk of extinction (both from the direct impacts of coal mining, transport, combustion, and disposal, and from the federal coal programs' significant contribution to global greenhouse gas emissions).

As discussed herein, coal's life-cycle impacts are significant based on the intensity of effects on public health and safety, and the cumulative nature of the effects, particularly on coal mining, transport and export communities. Other agencies have recognized that the impacts of coal mining and coal transport are sufficiently significant to require preparation of an EIS. See e.g., *WildEarth Guardians*, 738 F.3d at 311 (Department of Interior prepared EIS for coal mining leases, where impacts included local air pollution, including ozone and nitrous oxides); *Natural Res. Def. Council, Inc. v. Jamison*, 815 F. Supp. 454, 457 (D.D.C. 1992) (Department of Interior prepares EIS to assess impact of leasing proposed sites for coal mining); *US Army Corps of Engineers, Notice of Amendment to the Intent To Prepare an Environmental Impact Statement (EIS) for the Millennium Bulk Terminals—Longview Shipping Facility Project*, 78 Fed. Reg. 54873 (Sept. 6, 2013) (EIS to be prepared due to potentially significant impacts related to proposed construction and operation of a facility to ship coal, which included air and water quality, noise, traffic, and recreation).

Comment Excerpt Text:

In addition to the significance of impact based on health and safety effects, the cumulative impact of coal's life-cycle processes is significant. See 40 C.F.R. §1508.27(b)(7). CEQ regulations define cumulative impact as "the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions. Id. at 1508.7. When an agency's action involves an increase in existing impacts, the relevant environmental impact is the cumulative impact, not merely the incremental difference between the new and existing level of activity. See *Grand Canyon Trust v. FAA*, 290 F.3d 339, 342 (D.C. Cir. 2002) (EA should have considered cumulative impact of new airport, and not merely incremental difference between noise associated with new airport and noise associated with existing airport.). The cumulative impacts of coal's life-cycle effects on human health and the environment are significant and therefore, BLM is obligated to consider the effects of those impacts, "incorporating the effects of other projects into the background data base of the project at issue." *Grand Canyon Trust*, 290 F.3d at 342 (citation omitted). Finally, recognizing the potentially significant public health impacts of the life-cycle of coal would set a precedent that would require BLM to apply NEPA to all future impacts and activities associated with federal coal, both upstream and downstream. Clearly, the health impacts of coal from cradle to grave are significant, as discussed at length in

the following sections. Therefore, BLM has a responsibility within the scope of their NEPA authority to examine these impacts thoroughly and provide for ample public review.

From cradle to grave, coal’s impact on human health is undeniable. At every stage of coal’s lifecycle, health impacts are clearly documented including during mining, transport, preparation at the power plant, combustion, disposal of post-combustion wastes, and export abroad. Coal combustion in particular has been well-studied, with compelling evidence of widespread health effects on neighboring communities. Burning coal to generate electricity harms human health and compounds many of the major public health problems facing the world today. The pollution from coal affects all major organ systems in the human body, and contributes to diseases affecting large portions of the U.S. population, including asthma, lung cancer, heart disease and stroke.¹⁴⁸ It interferes with lung development, increases the risk of heart attacks, and compromises brain capacity and mental health. In addition, the discharge of carbon dioxide into the atmosphere associated with burning coal is responsible for more than 30% of total U.S. carbon dioxide pollution, contributing significantly to global warming and its associated health impacts.¹⁴⁹

Climate change health effects

Pollution from the life-cycle of coal is one of the leading causes of climate change.¹⁹⁶ Climate change itself is a

significant threat to human health and well-being.¹⁹⁷ The health impacts of climate change include harms from increasing heat stress and other extreme weather events, increases in air pollution, the spread of vector-borne diseases, food insecurity and under-nutrition, changing exposure to toxic chemicals, displacement, and stress to mental health and well-being.¹⁹⁸ Although everyone is vulnerable to health impacts from climate change, certain groups are particularly vulnerable to climate change-related health harms such as children, the elderly, low-income communities, some communities of color, immigrant groups, and persons with disabilities and preexisting medical conditions.¹⁹⁹ The 2015 Lancet Commission on Health and Climate Change highlighted that climate change is causing a global medical emergency, concluding that “the implications of climate change for a global population of 9 billion people threatens to undermine the last half century of gains in development and global health.”²⁰⁰

Climate change-driven health impacts are already occurring in the United States, particularly due to morbidity and mortality from extreme weather events which are increasing in frequency and intensity.²⁰¹ Heat is already the leading cause of weather-related deaths in the United States, and extreme heat is projected to lead to increases in future mortality on the order of thousands to tens of thousands of additional premature deaths per year across the United States by the end of this century.²⁰² Extreme precipitation events have become more common in the United States, contributing to increases in severe flooding events in some regions.²⁰³ Floods are the second deadliest of all weather-related hazards in the United States and can lead to drowning, contaminated drinking water leading to disease outbreaks, and mold-related illnesses.²⁰⁴

Air pollution components, specifically ozone, air particulates, and allergens, are expected to increase with climate change. 74 Fed. Reg. 66496 §IV.B.1(b). Climate-driven increases in ozone will cause more premature deaths, hospital visits, lost school days, and acute respiratory symptoms.²⁰⁵ Projected climate-related increases in ground-level ozone concentrations in 2020 could lead to an average of 2.8 million more occurrences of acute respiratory symptoms, 944,000 more missed school days, and over 5,000 more hospitalizations for respiratory-related problems.²⁰⁶ In 2020, the continental U.S. could pay an average of \$5.4 billion (2008\$) in health impact costs associated with the climate penalty on ozone, with California experiencing the greatest estimated impacts averaged at \$729 million.²⁰⁷

Risks from infectious diseases are also increasing as climate change alters the geographic and seasonal distribution of vector-borne diseases.²⁰⁸ Climate change favors the spread of some pathogen-carrying vectors. Lyme disease is the most common vector-borne disease in the United States, with 25,000–30,000 cases reported to the CDC per year, with the highest incidence among children between ages 5 and 9.²⁰⁹ The risk of human exposure to Lyme disease is expected to increase as ticks carrying Lyme disease and other pathogens become active earlier in the season and expand northward in response to warming temperatures.²¹⁰ Rising temperatures and changes in rainfall have already contributed to the maintenance of West Nile virus in parts of the United States, and climate change is expected to increase suitable conditions for the mosquitoes that transmit West Nile virus, increasing human exposure risk to the disease.²¹¹

As highlighted by the Third National Climate Assessment, fighting climate change by reducing greenhouse gas pollution provides critical “opportunities to improve human health and well-being across many sectors,” including a wide array of important health co-benefits.²¹²

The impacts of coal combustion can also be described in economic terms, and several papers have attempted to estimate the cost of using coal by assigning value to the environmental and public health damage caused during each stage of coal’s extraction, transportation, combustion, and disposal. One such study estimated that the external costs of coal-fired electricity in the U.S. add an extra 17.8 cents to each kWh of electricity produced; an amount that would triple its cost to consumers.²¹³ Another U.S. report by Machol et al. estimates 45 cents per kWh as the cost of the health burden and environmental damages from coal combustion.²¹⁴ In 2011, the US EPA estimated the benefits and costs of the Clean Air Act, a law which regulates emissions of sulfur dioxide, oxides of

- nitrogen, carbon monoxide, and particulate matter in the United States. The EPA calculated that the ratio of health care cost savings to compliance costs was 25:1 in 2010.²¹⁵ This means that for every dollar spent complying with the Clean Air Act, twenty-five dollars were saved in health care costs due to lower disease burden, including a reduction in premature deaths, and cases of bronchitis, asthma, and myocardial infarction.²¹⁶

The United States produced just under a billion short tons of coal in 2015, but as domestic coal use declines, producers are increasingly looking to export U.S. coal—and the pollution associated with burning this coal—overseas.²²¹ Even though the coal will ultimately be burned elsewhere, the mining and transportation of coal for export nonetheless have significant adverse effects on human health and the environment in the United States. Transporting the coal to ports releases coal dust from open rail cars, as well as diesel exhaust from train engines, along the rail lines.²²² Coal dust particles themselves contribute to lung disease, asthma, and cardiopulmonary diseases, and can contain toxic heavy metals like arsenic and lead, which pose additional health risks, such as skin, bladder, liver, and lung cancers and damage to the nervous system.²²³ At the ports, unloading the coal, storage in piles, and reloading it onto ships all emit large quantities of coal dust.²²⁴ Trains and ships used to transport coal also emit diesel exhaust and other harmful air pollutants, which worsen respiratory and pulmonary conditions and can cause premature death.

Comment Excerpt Text:

Ports are also a significant source of coal dust. When a train arrives at a coal export terminal, it may dump its coal into an open air storage pile or holding silo. Alternatively, a train arriving at a port terminal may wait for days in a train yard at the port before its coal is unloaded. These waiting train cars and open-air coal piles are significant sources of coal dust particulate matter at export terminals because typical wind speeds and wind gusts prevalent in near-coastal areas cause coal particles from the storage piles and from the uncovered tops of waiting coal cars to be released into the air.²²⁸ Unloading the coal from rail cars into storage piles at the port facility and storing the coal in these piles emits coal dust into the air, soil, and water nearby. In addition, coal dust is carried off the storage piles as runoff when the piles are exposed to rain.²²⁹ This runoff can impact both surface water and underlying groundwater. When a ship is ready for loading, conveyor belts transport the coal from the train car, silo, or coal pile, and dump the coal onto the ship, releasing additional coal dust into the air and water.

Coal dust, once emitted, can have multiple impacts on humans and the environment. Fugitive coal dust that is 10 micrometers or less in diameter is classified as PM₁₀, and fugitive coal dust that is 2.5 micrometers or less in diameter is classified as PM_{2.5}. PM₁₀ can travel up to 30 miles, and PM_{2.5} can travel 500 miles.²³⁰ Both PM₁₀ and PM_{2.5} are extremely harmful to human health. The particles can travel deep into the lungs and into the bloodstream, causing premature death in people with heart or lung disease, heart attacks, decreased lung function, and increased respiratory effects, including irritation of the airways, aggravated asthma, coughing, and breathing difficulties.²³¹ Groups that are most at risk due to PM₁₀ and PM_{2.5} exposure include children, older adults, low-income communities, and individuals with asthma or preexisting heart and lung disease. Inorganic arsenic found in coal dust deposited in soil near coal export terminals is a human carcinogen.²³² Human

exposure to inorganic arsenic by inhalation has been strongly associated with lung cancer, and ingestion has been linked to skin, bladder, liver, and lung cancers.²³³ Chronic inhalation has been associated with irritation of the skin and mucous membranes, as well as effects in the brain and nervous system. Gastrointestinal effects, anemia, peripheral neuropathy, skin lesions, hyperpigmentation, and liver or kidney damage have resulted from chronic oral exposure to elevated levels of inorganic arsenic.²³⁴

In addition to coal dust, the trains and ships used to transport coal emit diesel exhaust. Diesel exhaust contains significant sources of harmful air pollutants including particulate matter (PM/PM_{2.5}), volatile organic compounds (VOCs), toxic compounds known as air toxics, carbon monoxide (CO), nitrogen oxides (NO_x) and, in the case of ships, sulfur oxides (SO_x), and contributes to elevated ozone levels.²³⁵ This pollution causes poor air quality, reduced visibility, water and soil contamination, and ecosystem damage. Health effects associated with exposure to this pollution include premature mortality, increased hospital admissions, heart and lung diseases, asthma, reduced lung function, and increased cancer risk.²³⁶

Comment Excerpt Text:

The indirect effects of coal leasing and mining include atmospheric emissions of mercury from coal combustion. Mercury is a potent and widely distributed neurotoxin with serious adverse health effects on human health and development as well as the behavior, reproduction, and survival of threatened and endangered species. The United Nations estimates that 26% of global mercury emissions (339-657 metric tons/ year) come from the combustion of coal in power plants.²⁹⁴ A recent decision held that agencies must consider the indirect effects of even microscopic levels of mercury from coal leasing, mining and combustion decisions: (294) J. Pacyna, et al., Study on Mercury Sources and Emissions and Analysis of Cost and Effectiveness of Control Measures: "UNEP Paragraph 29 Study", UNEP (Nov. 2010).

"the record reveals that even microscopic changes in the amount of mercury deposition can have significant impacts on threatened and endangered species in the area impacted by the Four Corners Power Plant. See AR 1-2-14-1990 (concluding that a .1% increase in mercury deposition in the basin is likely to jeopardize the continued existence of the Colorado pikeminnow). Given the potentially significant impacts of mercury pollution, OSM's failure to discuss or analyze the deleterious impacts of combustion-related mercury deposition in the area of the Four Corners Power Plant is troubling.²⁹⁵"

(295) *Dine Citizens Against Ruining Our Environment v. U.S. Office of Surface Mining Reclamation and Enforcement*, 82 F.Supp. 3d 1201, 1215 (D. Colo. 2015).

The deposition of mercury and selenium within the Colorado River Basin continues to threaten both human health and endangered species, including the four Colorado River endangered fish. Current scientific information indicates continuing mercury and selenium contamination in the Colorado River Basin, which has the potential to detrimentally affect these species.

Consumption through the food chain is the primary mechanism of bioaccumulation of mercury in the endangered fish, and particularly affects the Colorado pikeminnow's diet as the largest of the endangered Colorado River fish (Herrmann et al. 2016 at 204). Sources of mercury include high levels of atmospheric mercury deposition called "cold condensation" from coal-fired power plant emissions (Id. at 205). This atmospheric deposition and watershed runoff is the most prevalent source of mercury in the Colorado River, but mercury pollution from old gold smelters in the Basin have also infiltrated this river system through decades of runoff from smaller tributaries (Id. At 215). In Grand Canyon, there is a high concentration of mercury in the atmosphere due to emissions from the coal burning Navajo Generating Station in Page, Arizona, resulting in direct negative effects on the endangered fishes' habitat in the lower Colorado River Basin (Walters 2015 at 2385).

Mercury contamination is especially concerning because all four species depend on aquatic invertebrates as a food source. Other piscivorous animals and non-native fish that prey on these juvenile fish, in turn, accumulate mercury, which continues up the food chain, bioaccumulating in adult fish. Concentrations of mercury exceeding 8 micrograms ($\mu\text{g/g}$) in fish organs or eggs may result in reproductive dysfunction and abnormalities (Herrmann et al. 2016 at 204). Walters et al. (2015) found that mean mercury concentrations for three native species and three non-native species from a Colorado River sample site exceeded the risk threshold for piscivorous mammal consumption (Id. at 2390).

Because of the scale of the federal coal leasing program (over 40% of U.S. coal production), BLM must quantify, consider, and consult on, the indirect mercury emissions from combustion of coal, its contribution to global mercury atmospheric concentrations and deposition rates, and its ensuing effects on sensitive, threatened, and endangered species, including the four Colorado River listed fish.

Emissions associated with the coal leasing program impair the public interest through the health and welfare costs of air pollution and climate change. Of total nationwide emissions in 2013, 36% came from electric power generation, of which 76% was from coal combustion, of which 41% was from coal produced from federal lands.²² A recent study by PSE Healthy Energy concludes that communities living near coal power plants are at higher risk of developing adverse health impacts. Emissions from coal combustion in Pennsylvania and Ohio caused more than 4,333 premature deaths nationwide in 2015 alone.²³ These premature deaths and illnesses also generated nearly \$38 billion in health impacts.²⁴ The per-capita impacts were most concentrated in areas near to and downwind of coal power plants – areas with higher than average concentrations of minority and/or low-income residents. By failing to consider these health effects, BLM misses the opportunity to interpret the public interest in a way that serves Americans.

[²² U.S. Environmental Protection Agency, Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2013 (April 15, 2015).]

[²³ This figure compiles the health burdens from Ohio and Pennsylvania power plants' fine particle pollution, with 2,133 adult deaths in Ohio and 2,300 adult deaths in Pennsylvania (4,333 total) from coal and gas plants combined. Of these totals, 2,088 and 2,263, respectively, were attributable to coal power plants in each state.

Ash management impacts: Burning of coal produces massive amounts of coal ash, which is often disposed of in inconsistent and potentially unhealthy ways. The PEIS must address the impacts of coal ash production and disposal and provide information and analysis disclosing to what extent the federal coal program is linked to adverse health and environmental impacts related to coal ash production.

Comment Number: 0002513_Lish_20160707-12

Commenter I: Christopher Lish

Comment Excerpt Text:

Respiratory effects: Air pollutants from coal play a role in the development of chronic obstructive pulmonary disease (COPD), a lung disease characterized by permanent narrowing of airways. Coal pollutants may also cause COPD exacerbations. Coal pollutants —among them nitrous oxide and very small particles, known as PM2.5— adversely affect lung development and trigger asthma attacks, thus posing particular risks to children. Nitrous oxide in combination with volatile organic compounds in the presence of sunlight and heat forms ground-level ozone, a widespread pollutant which can cause permanent lung scarring as well as exacerbations of asthma. Exposures to ozone and PM are also correlated with the development of and mortality from lung cancer, the leading cancer killer in both men and women.

Cardiovascular effects: The concentration of PM2.5 in ambient air increases the risk of heart attacks and hospital admissions for ischemic heart diseases, disturbances of heart rhythm, and congestive heart failure. Nitrogen oxides and PM2.5, along with other pollutants, are associated with hospital admissions for potentially fatal cardiac arrhythmia. Nervous system effects: Studies have shown a correlation between coal-related air pollutants and stroke. Mercury exposure contributes to neurological and developmental impairments like autism and causes lifelong loss of intelligence. Coal Life-Cycle: Burning coal is not the only health harming action, but all steps of the coal lifecycle—mining, transportation, washing, and disposing of post-combustion wastes—impacts human health. Each of these steps must be evaluated for the cumulative impacts on Americans of further coal leasing on federal lands.

Health effects associated with climate change: Because coal-fired power plants account for so much of U.S. carbon dioxide emissions, coal is a major contributor to the health impacts of climate change. Determination of the climate threats needs to be quantified by the PEIS to evaluate the ultimate cumulative impact of additional leasing on federal land. For example, more frequent heat waves will lead to a rise in heat exhaustion and heat stroke, potentially resulting in death, especially among elderly and poor urban dwellers. Rising temperatures are expanding the ranges for disease-carriers like mosquitoes and ticks in some cases causing epidemics of Lyme disease. Drought causes detrimental effects on food supply resulting in crop failure, higher prices and worsening nutrition. The increased frequency of intense precipitation events contributes to flooding, water contamination and the spread of infectious and mosquito-borne diseases. Drought, declining food supplies and rising sea levels increase the migration of affected populations and increase armed conflict and global instability.

These threats to health are of great concern to me. It is essential to analyze the large costs to our health from the mining, combustion and management of coal ash to our health when we evaluate the leasing program on publicly-owned land.

The PEIS Should Examine Significant Non-climate Impacts Associated With Coal Mining, Transport, and Combustion. BLM's scoping notice acknowledges that "[t]he Federal coal program has other potential impacts on public health and the environment, beyond climate impacts, that will also be assessed in the Programmatic EIS." 170 However, the notice states that the EIS's analysis will "include the effects of coal production" without explicitly addressing the impacts of coal transport and combustion. 171 The scoping notice also commits to a broad analysis of the federal coal program's socioeconomic impacts. 172 Because NEPA requires agencies to evaluate the direct, indirect and cumulative impacts of a proposed action, and coal combustion is a foreseeable result 169 Comments of Phyllis Fox, Environmental Health and Safety Impacts of the Proposed Oakland Bulk and Oversized Terminal, September 21, 2015, at 19. 170 81 Fed. Reg. at 17,725-26. 171 Id. at 17,726 (emphasis added) 172 Id. 50 of coal mining on federal lands, the PEIS must disclose the non-carbon environmental and socio-economic impacts of coal combustion. 173 It is particularly crucial that the PEIS address these impacts because they are likely significant. The that mining, transportation, and especially combustion of federally owned coal causes to life expectancy and health may be much larger than the current estimates and are tied to greenhouse gas emissions. In June 2016, a White House Council of Economic Advisors report on the economic impacts of the federal coal leasing program explicitly recognized that significant health-based costs are associated with the continued mining and burning of federal coal. 174 Specifically: On the production side, coal mining involves emissions of methane, which is a potent greenhouse gas. Coal extraction and processing also may lead to external costs from water pollution and land degradation. Transportation of coal is often energy and emissions intensive. Coal combustion releases carbon dioxide, mercury, and other harmful air pollutants. Impoundments and coal combustion waste can also lead to severe water . 175 All of these social and environmental costs must be disclosed in the PEIS. Numerous environmental reviews from the past several years support the White House Report findings concerning harms from the non-carbon emissions of coal-fired electric generators: sulfur and nitrogen oxides, particulate matter, volatile organic compounds, ammonia, and mercury. These environmental reviews reveal damage from coal burning to health, 173 In addition, this letter speaks at length about the need to analyze the impacts of the federal coal program's climate-related impacts. The program drives the continued production of coal and reliance on coal for energy generation, frustrating state, national, and international climate goals. In addition the federal coal program perpetuates and increases exposure by downstream communities to climate disruption. While this section focuses on non-climate impacts, the downstream climate impacts due to the federal coal program also should be analyzed in the PEIS. 174 White House Fair Return Report, at 28 175 Id. 51 longevity, quality of life, and property. 176 As discussed below, these are all environmental and health impacts that NEPA mandates that the PEIS address

Comment Excerpt Text:

The PEIS must analyze downstream impacts of coal dust. Coal dust emissions can significantly impact the health of downstream communities and workers, and damage our environment. The PEIS should analyze both coal dust emissions impacts from railcars and fugitive emissions. Coal dust is generated by coal-carrying rail cars during transit and as a fugitive emission from coal storage piles, and loading and unloading activities. 177 Rail lines parallel waterways where rail cars emit coal dust, transporting it to nearby communities and farms. Coal trains emit coal dust from the top and bottom of the rail cars throughout the trip. An average rail car loses 645 lbs during a 400

mile trip. 178 BNSF estimates that 500 to 2000 lbs of coal dust can be emitted from each train car per trip. 179 Surfactants are sometimes sprayed over the coal to control dust. However, surfactants wear off during the trip and require tremendous quantities of water to apply. Coal dust can impact port communities and workers because of higher emissions associated with containment within a smaller area and the types of locomotives used within port facilities. 180 Currently, no federal regulations protect communities from coal dust exposure. Coal dust consists mainly of granules and fine black particles that increase both PM10 and PM 2.5 in the ambient air. Most acutely, coal dust causes wheezing, excess cough and other 176 Power Consulting, Inc., *The Economic Consequences of the Federal Coal Leasing Program: Improving the Quality of the Economic Analysis* (July 27, 2016) at 49, attached as Ex. 1, citing, inter alia, National Research Council, *Hidden Costs of Energy: Unpriced Consequences of Energy Production and Use*, Committee on Health, Environmental, and Other External Costs and Benefits of Energy Production and Consumption (2010), available at <http://nap.edu/12794> (last visited July 27, 2016), attached as Ex. 32; Paul R. Epstein, et al., *Full cost accounting for the life cycle of coal*, in “*Ecological Economics Review*, *ANNALS OF THE NEW YORK ACADEMY OF SCIENCES*, 1219 (2011): 73-98, available at http://www.chgeharvard.org/sites/default/files/epstein_full%20cost%20of%20coal.pdf (last visited July 27, 2016), attached as Ex. 33; Nicholas A. Muller et al., *Environmental Accounting for Pollution in the United States Economy*. *AMERICAN ECONOMIC REVIEW* 101 (August 2011): 1649-1675, available at <http://pubs.aeaweb.org/doi/pdfplus/10.1257/aer.101.5.1649> (last visited July 27, 2016), attached as Ex. 34. 177 Comments of Phyllis Fox, *Environmental Health and Safety Impacts of the Proposed Oakland Bulk and Oversized Terminal*, September 21, 2015, at 13, attached as Ex. 35. 178 Comments of Phyllis Fox, *Environmental Health and Safety Impacts of the Proposed Oakland Bulk and Oversized Terminal*, September 21, 2015, at 2 (Ex. 35). 179 Sustainable Systems Research, LLC, “*Technical Memorandum Air Quality, Climate Change, and Environmental Justice Issues from Oakland Trade and Global Logistics Center*, September 18, 2015, at 6, attached as Ex. 36. 180 Id. 52 respiratory symptoms. 181 Longer term exposure can lead to skin damage, circulatory problems, and increased risk of developing cancer. Coal dust also increases accident risk because coal dust from trains destabilizes the track ballast—the surface that bears the load of the railroad ties. Coal dust contaminates soil, coats crops, yards, homes and vehicles raising health concerns and causing nuisance. 182 Fugitive coal dust can impair lung function, and cause or contribute to cardiovascular disease and developmental disorders. Covered rail cars would appear to reduce coal dust emissions, so the PEIS should also explore the impacts of covered rail cars. To our knowledge, at this time, no covered coal trains are in use in the U.S. and we know of no published study of the efficacy for coal trains. Covered cars would still emit coal dust from the bottom of the train, which constitutes 7 percent of the total coal dust. 183 And if the cars included venting units, the coal dust would additionally vent from the top of the car. Covered rail cars also pose an additional rail accident risk; coal is highly combustible, and coal trapping heat limited space could facilitate spontaneous combustion. 184 In addition to analyzing the impacts of coal dust emissions from uncovered cars, the PEIS should analyze and disclose emissions from empty coal trains. One recent Australian study found that empty coal trains emit more particulate pollution than loaded ones. 185 Controlling coal dust requires millions of gallons of water per year. Water is needed during rail car loading, at storage piles within enclosures, at drop points, and during ship loading. 186 About 8 gallons of water are required for each ton of coal throughput to control dust. 187 Given that coal travels through states that are experiencing drought, the PEIS should analyze the impacts of coal leasing in this context. The PEIS should also consider the cumulative impacts of coal dust given the impacts faced by communities located near rail lines and ports where the trains are carried. Cumulative impacts are the related past, present, and reasonably foreseeable future projects. 181 Comments of Phyllis Fox, *Environmental Health and Safety Impacts of the Proposed Oakland Bulk and Oversized Terminal*, September 21, 2015, at 16 (Ex. 35). 182 Paul R. Epstein et al, *Full Cost of Accounting for the Life Cycle of Coal*, *ANNALS OF THE NEW YORK ACADEMY OF SCIENCES*, v. 1219, 2011, at 84 (Ex. 33). 183 Comments of Phyllis Fox, *Health and Safety Impacts of the Proposed Oakland Bulk and Oversized Terminal*, September 21, 2015, at 17 (Ex. 35). 184 Id. at 18. 185 Nick Higgenbotham et al, *Coal Train Pollution Signature Study: A briefing paper prepared for the For the Coal Terminal Action Group Dust and Health Committee*, August 2013, attached as Ex. 37. 186 Comments of Phyllis Fox, *Environmental Health and Safety Impacts of the Proposed Oakland Bulk and Oversized Terminal*, September 21, 2015, at 2 (Ex.

35). 187 Id. at 7. 53 Given that ports and other areas impacted by coal dust are located in low-income communities and communities of color, the PEIS must analyze these impacts. 188

Comment Excerpt Text:

The PEIS must consider all air pollutant impacts from coal transport on downstream communities. Coal transport by rail also causes significant air quality and health impacts through coal train exhaust, which includes diesel particulate matter (DPM), and criteria pollutants including NO_x, SO₂, PM₁₀, PM_{2.5} and CO. Trains emit these pollutants while in motion and idling. 189 Communities and workers in close proximity to rail tracks, coal terminals, and shipping lanes are at highest risk for DPM exposure. DPM is associated with “acute short term symptoms such as headache, dizziness, light headedness, nausea, coughing, difficulty breathing, tightness of chest, and irritation of eyes, nose and throat. Long-term exposure can result in increased probability of heart attacks, lung cancer, worsening of asthma, and infant mortality. 190 Health risk assessments of rail terminals and ports have found significant cancer risks associated with DPM up to two miles from coal terminals. 191 The PEIS should quantify health impacts along the entire coal transportation corridor. In addition, the PEIS should analyze air emissions from coal export and shipping activities. For instance, air modeling for a proposed state of the art covered coal export at the Port of Morrow in Oregon showed major exceedances of particulate matter and NAAQs for NO_x. 192 Storing coal in communities also generates large amounts of PM. 193 It is also well known that coal export can increase acid rain and mercury deposition in the Pacific Ocean and Western US from Asia. 194 These impacts should also be analyzed. In evaluating the significance of air quality impacts due to coal storage and transportation, the analysis should not base its conclusions solely on National Ambient Air Quality Standards (“NAAQS”) because harms may occur at pollutant concentrations below the NAAQS standards. For example, epidemiological studies have shown associations between SO₂ 188 Pastor, Manuel Jr., et al., *Waiting to Inhale? The Demographics of Toxic Air Release Facilities in 21st Century California*, 85 *SOCIAL SCIENCE QUARTERLY*, no. 2, June, 2004. 189 Comments of Phyllis Fox, *Environmental Health and Safety Impacts of the Proposed Oakland Bulk and Oversized Terminal*, September 21, 2015, at 19 (Ex. 35). 190 Id. 191 Id. 192 See, e.g., AMI International, *AIR QUALITY MODELING FOR THE PROPOSED ENCLOSED COAL EXPORT FACILITY AT THE PORT OF MORROW* (2012), http://media.oregonlive.com/environment_impact/other/AERMOD_Modeling_Morrow_vfin.pdf (last visited July 28, 2016), attached as Ex. 38. 193 See id. 194 Comments of Phyllis Fox, *Environmental Health and Safety Impacts of the Proposed Oakland Bulk and Oversized Terminal*, September 21, 2015, at 7 (Ex. 35). 54 concentrations and emergency room visits and hospital admissions down to the 50 ppb level even though the NAAQS for SO₂ is 85 ppb. 195 Moreover, NAAQS does not account for the fact that some pollutants have higher localized impacts—pollutants like SO₂ concentrate locally. The PEIS should analyze the significance of the health impacts of the program associated with air emissions on downstream communities.

Comment Excerpt Text:

The PEIS should analyze the impact of accidents caused by federal coal transport and storage. The PEIS should include a meaningful analysis of the potential safety, human and environmental risks of rail accidents, both those involving, and those proximately caused by, coal trains. Rail accidents can release coal into the surface waters and water supply causing significant impacts. Moreover, coal is very difficult to clean up. 201 This affects downstream communities as coal released into water supply can degrade agricultural communities and municipal water

supplies in addition to harming fish and other aquatic life. The blast zone for coal trains is within one mile of the train tracks. These explosions disproportionately impact low income communities and communities of color—because these often are the communities that live near railroad tracks. 202 This impact should be analyzed as an indirect and cumulative impact, especially in light of other hazards these communities are exposed to. 203 Coal trains, which weigh far more than other types of trains, also deposit coal dust on the tracks and in the track ballast. The additional stress on the tracks increases the probability of accidents. 204 Coal dust is highly combustible and causes risks from explosions and fire. The federal Surface Transportation Board has concluded that coal dust can impair track stability lead to train derailment. 205 Consequently, coal trains are a proximate cause of rail accidents. 206 200 Id. at 20. 201 Id. at 9. 202 “Crude Injustice on the Rails,” Communities for a Better Environment and Forest Ethics, (June 2015) at 3 (80 percent of the 5.5 million Californians with homes in the blast zone live in low income communities and communities of color). 203 Id. at 11. 204 Id. at 10. 205 Surface Transportation Board Decision, Arkansas Electric Cooperative Corporation – Decision on Petition for Declaratory Order, Docket No. FD 35305 (Mar. 3, 2011); available at [http://stb.dot.gov/Decisions/readingroom.nsf/UNID/79B5382AE20F793085257848005311F/\\$file/40436.pdf](http://stb.dot.gov/Decisions/readingroom.nsf/UNID/79B5382AE20F793085257848005311F/$file/40436.pdf) (last visited July 28, 2016). 56 Spills are not uncommon during bunkering (or fueling), and spills into environmentally sensitive waters. The PEIS should evaluate this spill risk for both offshore bunkering— throughout the route— and onshore at port.

Comment Excerpt Text:

Respiratory effects: Air pollutants from coal play a role in the development of chronic obstructive pulmonary disease (COPD), a lung disease characterized by permanent narrowing of airways. Coal pollutants may also cause COPD exacerbations. Coal pollutants—among them nitrous oxide and very small particles, known as PM2.5—adversely affect lung development and trigger asthma attacks, thus posing particular risks to children. Nitrous oxide in combination with volatile organic compounds in the presence of sunlight and heat forms ground-level ozone, a widespread pollutant which can cause permanent lung scarring as well as exacerbations of asthma. Exposures to ozone and PM are also correlated with the development of and mortality from lung cancer, the leading cancer killer in both men and women.

Other Sections: 6

Comment Excerpt Text:

Health effects associated with climate change: Because coal-fired power plants account for so much of U.S. carbon dioxide emissions, coal is a major contributor to the health impacts of climate change. Determination of the climate threats needs to be quantified by the PEIS to evaluate the ultimate cumulative impact of additional leasing on federal land. For example, more frequent heat waves will lead to a rise in heat exhaustion and heat stroke, potentially resulting in death, especially among elderly and poor urban dwellers. Rising temperatures are expanding the ranges for disease-carriers like mosquitoes and ticks in some cases causing epidemics of Lyme disease. Drought causes detrimental effects on food supply resulting in crop failure, higher prices and worsening nutrition. The increased frequency of intense precipitation events contributes to flooding, water contamination and the spread of infectious and mosquito-borne diseases. Drought, declining food supplies and rising sea levels increase the migration of affected populations and increase armed conflict and global instability.

Organization I: Climate911

Commenter I: Wendy Ring

Comment Excerpt Text:

Costly damage to public health

Coal is harmful to human health in every phase of its life cycle and a contributor to 4 of our 5 leading causes of death. Harvard's Center for Global Health and the Environment estimates that coal mining costs the American

public \$175 billion to 523 billion dollars per year in damage to health, the climate and the environment (CGHE, 2011). Since 41% of coal is mined from federal lands, the attributable cost is \$70 to \$209 billion dollars annually. When the full social cost of coal; including health, climate and environmental impacts extending far beyond the lifetime of the leases; is taken into account along with fees and royalties commensurate with market value, coal is less affordable than clean alternatives.

Comment Excerpt Text:

The United States produced 110 million tons of coal ash in 2012. It contains manganese, selenium, and arsenic, which can cause nerve problems, reproductive system problems and cancer. People living within a mile of unlined coal ash storage ponds have a 1-in-50 risk of cancer, according to the EPA. It's a cancer risk more than 2,000 times higher than the EPA considers acceptable

Comment Number: 003069_Rabener_1072016-1

Commenter I: Nancy Rabener

Comment Excerpt Text:

U.S. coal-fired power plants pump more than 48 tons of mercury into the air each year. Approximately a third of U.S. emissions settles within U.S. borders, poisoning lakes and waterways. The rest cycles through the atmosphere, with much of it eventually winding up in the world's oceans. Inorganic mercury is not easily assimilated into the human body, and if the mercury emitted by power plants stayed in that form, it probably would not have made so many people sick. But when inorganic mercury creeps into the aquatic sediments and marches, as well as mid-depths of oceans, bacteria convert it into methylmercury, an organic form that not only is easily assimilated, but also accumulates in living tissue as it moves up the food chain: the bigger and older the fish, the more mercury in its meat. It takes only a tiny amount to do serious damage: One-seventieth of a teaspoon can pollute a 20-acre lake to the point where its fish are unsafe to eat. Thousands of tons a year settle in the world's oceans, where they bioaccumulate in carnivorous fish. Forty percent of human mercury exposure comes from a single source --- Pacific tuna.

Organization I: Climate Reality Project

Commenter I: Yana Slabakov

Comment Excerpt Text:

Coal mining areas are also the hardest hit by another reality -- health impacts. These external costs are great. And coal miners and their communities often pay for them with their wellbeing. Coal is harmful to the human body at every stage of its production cycle. The American Lung Association estimates that 13,000 premature deaths occur each year from coal pollution. And this pollution is a major contributor to chronic respiratory diseases, heart disease, stroke, and cancer. Those who mine coal themselves take on the biggest dangers associated. But, it certainly doesn't end there. Mining operations spew water contaminated with mercury, sulfur oxides, and heavy metal, which finds its way into local water supplies and into the aquatic food chain. This acid mine drainage, coupled with mine chemicals that are often improperly injected underground, spread an unforeseen and uncontained wave. At its core, this is a public health problem. Not only miners are affected. The consequences of coal combustion impacts us all. Associated air pollutants, such as mercury, sulfur dioxide, and particulate matter contribute to growing rates of asthma, lung disease, and nervous system impairment. High mercury concentrations in water have a left more and more children being born with low birth weights and blood mercury levels high enough to impact IQ.

Comment Excerpt Text:

Coal is particularly significant due to the high concentration and wide range of harmful particles and chemicals it produces and the large amount of coal that America uses to generate heat and power. The ideas I'm presenting today are not just my own personal opinions. They are evidence-based. The world's scientists have been studying the health effects of coal for decades and have accumulated a vast database indicating that the health effects are indeed extremely harmful. These findings are not controversial. They are universally acknowledged as scientifically valid. For those who are interested in understanding this scientific evidence, I would recommend a publication titled Scientific Evidence of Health Effects from Coal Use in Energy Generation. Again, for those interested, the publication is Scientific Evidence of Health Effects from Coal Use in Energy Generation. And it is easily available on the internet. It's produced by the Healthcare Research Collaborative, based at the University of Illinois. It's a summary of documents that the use of coal as an energy source has multiple, large-scale, serious worldwide health effects, including illness and considerable death rates related to respiratory, cardiac, and neurologic diseases, as well as cancers and adverse effects on pregnancies and developing fetuses.

Comment Number: 00001271_Sussors_20160623-3

Commenter I: Kenneth Sussors

Comment Excerpt Text:

In conclusion, the scientific evidence for adverse health effects stemming from using coal as an energy source is overwhelming. In fairness to the human race and all other living species and the planet itself, it is an urgent medical and ecological imperative to take a more comprehensive approach to our fuel choices and move vigorously towards clean energy sources.

Certainly our own government, tasked with protecting its citizenship and protecting its environment, should take a lead role in safe energy development for our country.

Comment Number: 0001280_Weidner_20160623-1

Commenter I: Sharon Weidner

Comment Excerpt Text:

Burning coal releases numerous toxic chemicals and particulates, which can have hidden costs to a country's population in terms of life expectancy and increased health cost. While pollutants, such as acid gases, stay in a local area, metals, such as lead and arsenic, travel beyond the State line. And fine particulate matter has a global impact. Physicians for Social Responsibility released a report in 2009 called Coal's Assault on Human Health. Some of what they're saying is that coal combustion releases mercury particulate matter, nitrogen oxide, sulfur oxide, dioxide, and dozens of other hazardous substances. Air pollutants produced by coal combustion act on our respiratory system, causing asthma, lung disease, lung cancer. Pollutants from coal combustion have cardiovascular effects as arterial blockage causing heart attacks, tissue death due to oxygen deprivation, leading to permanent heart damage, as well as cardiac arrhythmia, and congestive heart failure. Coal pollutants, mainly

mercury, act on the nervous system to cause decreased influxual [phonetic] capacity. It's estimated that between 300 and 600,000 children born each year with blood mercury levels high enough to decrease the IQ scores and cause lifelong loss of intelligence. Researchers from Harvard University School of Public Health found that pregnant women exposed to high levels of mercury were twice as likely to have an autistic child than their peers in low-pollution areas. Even people who do not develop illness from coal pollutants will find their health and wellbeing impacted due to coal's contribution to climate change. We're seeing increased and stronger storm systems causing flooding. Increased temperatures causing fires, heat stroke, malaria. Declining food production, scarce water supplies, social conflict, and starvation. There are negative impacts in each step of the coal life cycle. Coal mining leads U.S. industries in fatal injuries and is associated with chronic health problems among miners. The communities near the mines may be as [indiscernible] affected by blasting, washing, leakage from [indiscernible] ponds, damage to streams and waterways. And I'd just like to say that the cost of coal, it has to include our health and our planet's health.

Comment Number: 0000741_Perry_NWF-3

Comment Excerpt Text:

The adverse impacts on human health are also substantial. As just one example, every body of water in our country is contaminated with mercury caused primarily by burning coal. Some streams and lakes in Pennsylvania are so contaminated the state lists an additional 86 streams and lakes where they recommend women of childbearing age only consume one meal of fish per month.

Comment Number: 0000848_Tomick_20160628-2

Commenter I: Patrice Tomcik

Comment Excerpt Text:

I live downwind from one of the largest coal plants. I'm particularly concerned about what my children are breathing in. The pollutants that are emitted are particulate matter, nitrogen oxide, sulfur dioxide and dangerous heavy metals such as mercury, lead and there are many more. This pollution can effect our children's health by causing ground level ozone response, which affects lung tissue, cause respiratory diseases, adversely affect the normal lung development of children and exacerbate asthma attacks. Asthma is a leading cause of missed school days among children ages 5 to 17. Exposure to mercury is a particular concern for pregnant women and nursing mothers and young children because mercury is a toxic heavy metal that can cause brain damage, impairs learning and growth. Even people who do not develop illness directly from whole foods find their health impacted due to coal's contribution to carbon dioxide and causing climate change. The health risk from climate change are especially serious for children, elderly those who are immune compromised. The direct effects of climate change include increased illness and deaths from extreme weather and heat stress. Children are especially vulnerable to heat exposure because they don't have fully developed temperature regulation mechanisms within their bodies. The indirect effects of climate change are malnutrition, food insecurity, anxiety, depression and increase of insect-borne diseases like the zika virus. The BLM must consider the climate consequences and health impacts on our children and future generations of leasing public lands for fossil fuel extraction. We need to start developing the capacity today to generate energy from clean, safe and renewable sources for the health of our children today and future generations.

Campbell County's employment is primarily dominated by goods-producing sectors, jobs that add value to the economy. That 40 percent figure is about twice that of the State's overall average and more than twice of the national average. So that 40 percent accounts for all the rest, quite frankly. That also is not mentioned in your research and it has to be. You have to distinguish between goods-producing and service-providing. And the folks you have heard today, these miners, they are the goods-producing people that make our lives that much better. The number of jobs, 2000 jobs direct and indirect that have basically been lost in the coal industry in recent months, I imagine if that percentage were to apply to a larger metropolitan area, take Campbell County's population and multiply that out. Let's take Chicago. Instead of being 2,000 jobs, it would be more like 100,000 jobs. The 2,000 jobs in Wyoming are hardly a blip on the national media, but a hundred-thousand-plus jobs in Chicago would be national news.

Comment Excerpt Text:

But have you thought about the moral issues of burdening the coal companies to the extent of bankrupting them? I do not advocate for those companies, but for the thousands of people who work in our mines and associated jobs in our communities, the effort to shut down coal is not bankrupting just the companies. They are bankrupting our communities and my people.

Comment Number: 00000127_Kot_Sweetwater_Board_of_Count-1

Organization I: Sweetwater County Board of Commissioners

Commenter I: Mark Kot

Comment Excerpt Text:

Coal production provides approximately \$245 million to the annual assessed valuation of the county. This valuation helps support high quality public services including schools, roads, recreation, social services, and healthcare. "The Sweetwater County coal mines of Jim Bridger and Black Butte together employ approximately 710 workers. With the 310 employees who work at the coal-fired Jim Bridger power plant, the coal industry employs approximately 1,000 workers within Sweetwater County. "The National Mining Association estimates that for every coal mining job, an additional 3.5 jobs are created. This means the Sweetwater County coal creates approximately 350 additional jobs -- excuse me 3,500 additional jobs. "Employees directly or indirectly related to coal production, their families, communities depend upon the stable coal and energy markets backed by sound federal policies. Without these stable markets and sound policies, jobs could be lost, home values could fall, and the economy of our communities, county and state, will suffer."

Organization I: Western Fields Association and Western Fields Wyoming, Inc.

Commenter I: Beth Goodnough

Comment Excerpt Text:

The Clean Power Plan is projected to -- depending on what study you read -- either raise electricity prices by more than 10 percent or double or triple the price. This will be coupled with losses of 260,000 jobs annually between 2020 and 2040. Therefore, while the Clean Power Plan calls for reducing coal use by 32 percent nationwide, the market replacement technology is simply not available or would wreck the economy to try to implement by 2030. Given the projected negative impacts to the economy due to the Clean Power Plan, it is imperative that the BLM retain a reasonable and practical federal coal leasing program in order to keep the lights on in this country and especially in rural America.

Comment Number: 00000138_Simonson_20160517-1

Organization I: Wyoming Machinery Company

Commenter I: David Simonson

Comment Excerpt Text:

Every coal mining job that is regulated out of existence eliminates at least three additional service support jobs, reduces federal and state revenues, and reduces the incomes of every citizen of Wyoming with really no quantifiable benefit to our nation. Current royalty rates and compounded taxes and fees of the coal industry are above all other industries and above the market of those charged for private lands in other states, and if increased, it will only result in decreased production and decreased return on investment for federal and local taxpayers. That hurts schools, roads, infrastructures. It hurts everyone in Casper, the State of Wyoming and also the federal -- the rest of the United States.

Comment Number: 00000141_Kline_20160517-1

Commenter I: David Kline

Comment Excerpt Text:

The coal royalties currently provide sufficient value and should continue to provide values for the American public as long as the coal is allowed to be mined. Further restrictions on coal production will severely impact the local and state economies. Coal jobs are some of the highest-paying jobs, as everybody's been saying earlier. For every coal job lost, there's three to seven additional jobs, service jobs that are also lost throughout the community and the country.

Comment Excerpt Text:

But I want to talk about little bit the economic impact that our money brings to the state and to our surrounding

communities. We employ 107 employees. Out of that there are an additional 73 trucking jobs that are supplied through another vendor to haul the coal from our mine. This is just last year, 2015. So total jobs indirect and direct -- there's another ratio of vendors and other support -- comes to 501 people. 501 families supported from this small mine but in MSHA's eyes a large mine. Our payroll is 13 million and some change. Supplies and services 24 million, that we're paying out to vendors. Our utilities, Rocky Mountain Power, \$1,425,000. Here's getting to these ends. Property taxes, 385,000. Production taxes 902,000, and royalties 2,229,00. Again, this is 2015. So total direct benefits to the state that they see out of Dugout Canyon Mine is \$42,422,000. Indirect benefits, average employee wage for the mine, so 107 employees, \$122,000 annual. That's wages and benefits. We're part of Bowie Resource Partners teams. You're going to hear substantially higher numbers that we're part of. So we provide a service that's actually paying to help our schools, help our state, help our communities, and help our children. So please take that into consideration when you look at this re-leasing.

Comment Excerpt Text:

Due to the war on coal and the companies having to change their health insurance to higher deductible, lower reimbursing plans, healthcare in Wyoming is at an incredible risk. At a hospital in Wyoming, the bad debt has increased by 43% in less than two years. This is directly due to the war on coal. There are over 670 rural hospitals in America that are at risk for closure, none in Wyoming, yet! If this war on coal continues there will continue to be an effect and the chance for a Wyoming hospital to close greatly increases.

If it were not for the very low Montana severance tax on underground coal, Musselshell County, where most of the coal for Signal Peak is located, would receive nothing back from the Federal coal leasing, since Great Northern Properties, LLC and the Northern Cheyenne Tribe have latched onto the money produced from the federal coal in this area. Under ordinary circumstances, half the lease money would have been paid to the State of Montana, and half of that would have gone to Musselshell County. Today all of it goes to Houston and Lame Deer.

As an economist, I submit that raising taxes and leases will not increase revenue to the Federal government - it will decrease, it will not increase the viability of low cost energy - it will reduce it, it will not increase the stability and dependability of the nations power grid - it will reduce both. It will not increase economic growth, but rather drastically reduce it. Nobody benefits. Most important, it will not contribute any measurable impact on the climate, whatsoever.

Comment Excerpt Text:

In Wyoming, production of federal coal has enabled thousands of people to achieve the American dream. Production of federal coal provides good jobs for Americans regardless of their educational background.

In 2014, the average annual wages for coal workers in Wyoming was \$83,594. That is almost twice the average annual wages for all workers in Wyoming. And over 60 percent above the average annual wages for all workers in the United States.

In Wyoming, a coal worker's salary provides financial security. It allows parents to buy a home, save for their children's education, prepare for their own retirement, and assist their elderly parents. Simply put- coal production provides a level of financial security and social mobility that is unavailable in most of America

Commenter I:Chris Nutgrass

Other Sections: 2

Comment Excerpt Text:

There are a few techniques already being used around the American West and world to help mitigate the impacts of market fluctuations on community livelihoods.

The first are local stabilization funds. These are funds created by collecting revenue when resource prices are high and distributed when resource prices are low. This type of fund helps to smooth out the volatility of government receipts and spending. Stabilizations funds require communities to set trigger prices for the commodity above which revenue is collected and below which signal disbursements. These funds are also sometimes referred to as "rainy day" funds and can provide critical assistance during an unexpected event that affects the market.

Another type of fund is a permanent trust. Whereas stabilization funds are designed to counter the cycle of revenue flows, permanent trusts are established to create a sustainable benefit from an unsustainable source. These funds are created by placing a portion of the revenues from resource extraction into a trusts for future generations. The fund can then be invested and income from that fund used to support education, health, economic development, infrastructure maintenance, and other local priorities. Although there are many examples of this type of fund around the west, including Wyoming, Montana, and New Mexico, Colorado has no such fund. On an international level, over \$4 trillion has been invested in this type of fund.

And yet another fund, known as a growth fund, is also being implemented. It is similar to a permanent trust but used to expand business and investment holdings. The Southern Ute tribe is using this type of fund to capitalize on revenues from their land. Realizing that energy resources are finite, the fund is used to diversify the economic activity of the tribe.

Comment Excerpt Text:

It is also possible that other ailing mining companies could follow their competitors into Chapter 11. Such a development may make it possible to close unprofitable mines, restructure their debt (especially nonsecured debt), sell or shut noncompetitive assets, and start to restore their businesses to a firmer financial footing. In addition, some companies may wind up liquidated and their creditors wiped out, creating the opportunity for players that provide new capital to earn profits by buying up the mine properties that are cash positive and would then be unencumbered by previous obligations. But these initiatives might have only limited impact on the overall financial health of the industry, given that there could continue to be many miners sticking to the business as usual path.

Powerful economic forces continue to influence a shift in the U.S. energy sector. A combination of factors is forging a new reality where lower natural gas prices, rising coal costs, and the competitive cost of renewable energy sources are driving a shift to clean energy. The new energy technologies coming on-line will create hundreds of thousands of new jobs and will continue to do so in communities across the country. But, as our nation makes this transition, some workers and communities may be impacted.

The contemplated review of the federal coal leasing systems must evaluate BLM authority and opportunities—as well as actions other agencies and Congress could take—to help ensure a just transition for workers and communities to a clean energy economy. Such actions should include robust investment in community economic development, protection of worker livelihoods, and development of new tax revenue sources for local economies.

Comment Number: 0002147_Anderson_20160621_BlueGreenAlliance-8
Organization I: BlueGreen Alliance
Commenter I: Kim Glas
Comment Excerpt Text:

Coal mines, coal-fired power plants, coal transportation infrastructure, coal handling facilities, and their associated supply and maintenance industries are often the lifeblood of small towns, providing significant employment and contributing to their communities' tax base. Moving toward clean energy could result in fewer jobs at a local level and a reduction in the tax stream going to local governments, cutting into funding for public schools, hospitals, and infrastructure projects.

Therefore, as the BLM works to capture a fair return for American taxpayers generally, it must also consider that the economic impacts of a reduction in coal usage over the coming years will not be shared equally across the American public. We must consider what authority and opportunities it possesses—having succeeded in capturing a fair return for extracted coal—to ensure that some portion of this increased return is put to use ensuring a just transition for workers, communities, and regional economies. It will be necessary for some workers to obtain new skills and employment and for some communities to redevelop and diversify their economies.

Comment Excerpt Text:

Prior to the recent downturn in the coal industry, Wyoming's coal producers created more than 11% of Wyoming's gross state product. In 2012, the industry produced more than \$5 billion of coal. It employed almost 7,000 hard-working Wyomingites in good-paying jobs. According to the Bureau of Labor Statistics, in 2013 the average Wyoming coal mine worker's annual salary exceeded \$80,000. Each Wyoming coal mine worker depended on that job to help accomplish life's goals: to buy a house, to send a child to college, to save for retirement. Additionally, tax revenue from the coal industry provides vital support to our state and local governments. In 2012, direct taxation on coal production provided almost \$1.3 billion in total revenues to the state.

Comment Excerpt Text:

The Bureau of Land Management (BLM), with control of more than 40 million acres of federal mineral estate in Wyoming, plays a pivotal role in determining how Wyoming's coal industry performs. Reductions in coal production caused by an overhaul of the federal coal program would reduce our ability to provide for our state's schools, roads, and hospitals. Wyoming is already dealing with the negative effects of reduced demand for coal: higher unemployment, reduced incomes, corporate bankruptcies, and lower revenues for state and local governments. Our federal government should not make this problem worse; rather it should work to help increase coal production. We should maximize our coal's value and put it to work to improve our country.

Comment Number: 0002149_Hewitt_20160519_WyLSO-9

Organization I: Wyoming Legislature's Select Federal Natural Resource Management Committee

Coal PEIS Economic Impact: Sweetwater County strongly objects to the PEIS proposed modifications to the Coal Leasing Program, and believes that, if the BLM suggestions are implemented, they will negatively impact the economy of Sweetwater County and the State of Wyoming. Some of the PEIS proposed modifications we object to include:

- Adding external costs such as climate change and social and environmental impacts to the determination of fair market value for coal leases.
- Increasing coal royalty and bonus payments
- Creating new regulations addressing water resources, air quality, human health, visibility, wildlife and others.

All of these proposed modifications will increase the cost of mining coal especially when added to the myriad of federal rules that have been adopted to regulate coal mining and its related industries. A partial list of these rules include the Clean Power Plan, Regional Haze Rules, Clean Water Act Definition of Water of the United States, pending regulation regarding Sage Grouse, Mercury and other Toxic Air Pollution Standards which are in addition to more than three dozen additional federal rules that govern the mining industry. The layering effect of these regulations drives up the cost of coal mining making it more costly for coal mining companies to stay in business.

Comment Excerpt Text:

How the pricing of Federal Coal will affect regional and national economies- By increasing royalty rates at a time when the market is so low would ensure the demise of the coal industry. Which in my opinion is what this department & president are out to do. Having said that, I believe that increasing royalty rates will ensure that coal is no longer mined and that the government as well as the public will lose all income produced by mining. By switching to alternative energies the cost of electricity will no doubt increase substantially (a point that even the president has admitted to), to a point where electricity will be too expensive for most people to afford. This nation will begin to suffer the economic and social issues this will cause when it cannot afford the required energy to function. At a local level, I invite you to come to Gillette Wyoming or how about West Virginia where the mines are closing....Funding for schools for the state is dwindling resulting in teachers being laid off, construction projects for public transportation have been paused, halted or cancelled altogether forcing workers to abandon their homes because they can't sell them and certainly can't pay for them since there are no longer any jobs, the businesses that supported the mines have already started closing or going bankrupt. These are not just a few businesses or just a few people but thousands that have already lost everything they own due to this administrations agenda. The people have not just been affected in this town but in towns all across this state. In short, the socio economic impact that's already been made by this administration is deplorable and you have only affected us this far, if you do this to the rest of the country it will be devastating to the economy.

Comment Excerpt Text:

Several thousand prime jobs have vanished in Campbell county over the past year – coal company jobs direct, contract labor direct, plus community indirect impact jobs of several thousand more. With the loss of 10,000 jobs over the past year, Wyoming's unemployment rate today is at 5%, below the national rate. The mines have made their cuts, now comes the trickle down effects – home sales and distressed prices, declining retail sales, and most importantly in the Gillette area uncertainty about the future.

The job losses in Campbell County (Gillette) – over 4,000 – are impactful, but on the national scale miniscule. Extrapolated, these 4,000 jobs for an area of 40,000 people would, in Chicago alone, be 280,000! Clearly that would catch the attention of the American public, and all federal agencies.

The recent report on the economics of federal coal leasing issued by the Obama administration's Council of Economic Advisors ("CEA") mirrors that lack of understanding. This government modeling exercise addresses the question of whether an increase in royalty rates by the Department of the Interior will increase or decrease government revenues. The CEA's answer to the question is that it will increase them. However, the conclusions reached by CEA in arriving at its answer show a complete disconnect between its theoretical modeling results and the way the real-world coal marketplace functions. The CEA therefore misconstrues the outcome

of such a policy change and its report must not be relied on. As an example of the problematic nature of the report, one of the CEA's conclusions is that increasing the cost to produce coal under federal leases (which mainly occurs in the Powder River Basin) through higher royalty payments will raise the market price of coal nationally. This conclusion is incorrect, and it demonstrates a failure to appropriately analyze the competitive market forces at play in the various coal producing regions of the United States, as well as the broader energy marketplace in America.

Premature shutdown of coal-consuming plants is a trend already occurring due to the influence of an increasing number of environmental regulations promulgated for such plants. The robust marketplace competition that exists coal and natural gas 2 Energy Information Administration, "Today in Energy", March 16, 2016.

3 IHS Energy News Release, “IHS Study: Diversity of United States Power Supply Could be Significantly Reduced in Coming Decades”, July 24, 2014. Available at <http://press.ihs.com/press-release/energy-powermedia/ihs-study-diversity-united-states-power-supply-could-be-significant> will be significantly changed as more coal plants are shut down and new ones are not added to the system. The graph below from the Department of Energy’s Energy Information Administration is a snapshot of scheduled electric generation capacity additions and shutdowns for 2015, and clearly shows the net reduction in coal capacity. If this trend continues, as expected, coal demand and production will drop. Natural gas demand will increase, bolstered by the build out of new natural gas capacity underway. These conditions will lead to higher natural gas prices and coal will be less available to buffer higher gas prices and gas price spikes.

Climate disrupting CO₂ emissions come primarily from coal-fired power plants. Reducing those emissions also reduces other pollution (notably SO₂, NO_x, and PM_{2.5}), which brings major health benefits to the American public. The EPA's Integrated Planning Model yields an updated estimate that implementing the Clean Power Plan would reduce CO₂ and related emissions in the year 2030 by 30% relative to 2012 levels. This would yield health and benefits of from \$64 to \$99 billion by reducing SO₂, NO_x, PM_{2.5} emissions (without taking the effects of reduced exposure to neurotoxins into account). <http://www.nrdc.org/air/pollution-standards/>. However, if political or legal considerations keep the Clean Power Plan from being implemented, or an unreformed Federal coal leasing program continues to offset its effects, coal-fired power plants will continue to inject neurotoxins into the environment at the pace. The result could be that the productivity of the nation's children will be far below what it could otherwise be at the time that those children enter the workforce.

BLM leases are the source of 40% of the thermal coal burned for power in the United States. Current Federally-leased reserves are projected to run out in 20 years. If the current moratorium were made permanent, it might eventually reduce the amount of thermal coal burned in the United States by as much as 40%. Such a moratorium would then bring with it a roughly 40% reduction in exposure of the American public to SO_x, NO_x, PM_{2.5}, and to mercury, lead, and other toxic heavy metals. A back-of-the-envelope estimate of the long-term value to the American economy of phasing out Federally leased thermal under these assumptions is an increase in the productivity of the American workforce worth about \$5.83 trillion per year ($\$14.586 \times 0.40 = \5.83). Chronically selling Federal coal far below its market value continues to have a number of socially damaging effects. It has resulted in depriving both Federal and state governments of some \$40 billion in revenue⁽²⁾ since the market made its major turn from privately-sourced coal to underpriced Federally-leased coal. Chronically selling Federal coal far below its market value has also had a damaging effect on employment. Most Federally-leased coal is surface mined. Selling it below its market price displaces coal from the privately-held underground mines of Appalachia and Illinois. In the process, it substantially reduces overall employment in the coal mining industry. Mining coal underground in Appalachia is labor intensive, while surface mining is capital intensive. Coal strip mined in the Powder River Basin supports one-tenth as many jobs as the same quantity of coal mined underground in Appalachia, and one-fifth as many jobs as the same quantity of coal mined in the Illinois Basin

A study by the New Climate Economy Project⁽¹⁹⁾ and a working paper from the International Monetary Fund⁽²⁰⁾ recently corroborated the results of the NRDC's update of the EPA's Integrated Planning Model. They conclude that because of recent advances in renewable technology and the secondary health benefits of cutting fossil fuel emissions, the choice between a strong economy and a strong response to climate change is a false one. They found that ambitious policies to cut carbon emissions would either have a very small drag on economic growth or lead to faster growth. Jeff Spross, *Would Limiting Carbon Emission's Destroy the Economy?*, October 16, 2013, at <http://thinkprogress.org/climate/2013/10/16/2730271/carbon-regulations-economy/>. Recent modeling of an extremely aggressive national carbon tax for the United States found a similar result, even before the health benefits are factored in. (Nystrom, S., 2014.) A recent of upcoming British policy to cut emissions from its economy reached a similar conclusion. (Cambridge Economics, 2014.)

The Board would first like to lend its support to the concerns raised by members of the United States Senate in a letter dated July 14, 2016, and signed by both Senator Barrasso and Senator Enzi representing the great State of Wyoming. The letter expressed concern regarding the timing of a report entitled The Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to the Taxpayers which was published by the President's Council of Economic Advisors. This report covers and makes assertions regarding the federal coal leasing program that we understood was to be the subject of the programmatic assessment being conducted by your office. The issuance and timing of this report severely compromises the integrity of any assessment of the federal coal leasing program completed by the Department.

There is a reference in the above mentioned report that increasing royalty payments will increase revenues to state governments. As you know, Campbell County relies on ad valorem tax as its revenue source. Ad valorem tax is paid on the fair market value of the coal produced less federal royalty payments. Any increase in federal royalty payments has a direct negative impact on ad valorem taxes paid to Campbell County. This was a point we made at the scoping session held in Gillette, Wyoming, last summer. It should be further noted that the majority of ad valorem tax collected in Campbell County goes to support the K through 12 school system throughout the State of Wyoming. In Wyoming, ad valorem tax revenue is recaptured and redistributed from wealthier school districts to poorer districts within the state. To date, Campbell County School District has paid over \$1 billion to the State of Wyoming that was redistributed to other school districts within the state. Under the best scenario, only 48% of the additional money that may be gained by an increase to the federal mineral royalty would be returned to the State of Wyoming. (Federal mineral royalties are distributed 50% to the federal government, 48% to the State of Wyoming with a 2% administrative charge withheld by the federal government.)

Comment Excerpt Text:

According to research by the Center for Health and the Global Environment at the Harvard School of Public Health (2) (CHGE), “The economic, health and environmental impacts associated with extraction, transportation, processing, and combustion cost the U.S. public between a third to over half a trillion dollars annually.” Coal mining regions have 11,000 excess deaths annually from lung cancer, heart, respiratory and kidney disease. Lives lost in coal mining regions are evaluated at \$74.6 billion per year.

(1) <http://www.emnrd.state.nm.us/MMD/Coal-FAQs.html#CoalinNM>

(2) [p://www.chgeharvard.org/resource/explore-true-costs-coal](http://www.chgeharvard.org/resource/explore-true-costs-coal)

These adverse health impacts are felt in New Mexico. In San Juan County, where coal activity is more prevalent, the American Lung Association (ALA) reports that residents are at an elevated risk for lung diseases. The ALA indicates there are 2,885 cases of pediatric asthma, 8,442 cases of adult asthma and 5,219 people diagnosed with COPD in this rural northwestern New Mexico county alone.

Measurable health effects of coal-related air pollution include increased rates of lung and heart disease. According to CHGE, 2005 data showed that “[p]articulates and oxides of nitrogen and sulfur kill over 24,000 people annually, including 2,800 from lung cancer.” Further, pollution from coal operations produces 38,200 non-fatal heart attacks annually.

-People spoke of poor communities where coal mines are – I believe that is a false statement. These communities may be poor compared to larger developed communities but the incomes that are made in these areas are spent in these areas. What causes these communities to become run down and desolate and poor is when it becomes too expensive for operators to operate the mine and it shuts down due to federal regulations – that income (normally higher paying wages) has disappeared and now who is left to buy the new vehicles, shop at the local furniture store, etc. The trickledown effect causes the communities to dry up. No greater example than what happened in Detroit under this administration.

I have a four year degree in Wildlife Conservation. I have worked for both the North Carolina Wildlife and the Wyoming Game and Fish. I have also worked for the Wyoming Department of Corrections. Until I worked for Antelope Mine, Cloud Peak Energy, a coal mine, I could not afford more than a house trailer. I now own a new 2,200 square ft. house, if I lose my job my family and I will not be able to afford the payments on the house, a situation many of my friends and miners from other companies are currently facing. The sudden loss of jobs in

the area has caused a huge increase in available houses for sale, all our houses are under water. There aren't any comparable jobs in the area so the vast majority of us will end up defaulting on our loans and we will lose our homes and our credit rating. This will affect not only us but also the economy of the region.

Commenter I: John Prinkki

Comment Excerpt Text:

Coal is important to the state of Montana. It's important to Carbon County. We are going to spend another \$2 Million in the next biennium on TSEP project funded bridges – that trust fund is going to be inviolate and never removed, but we rely on the interest rates. Without building that fund, the interest that we draw on that money – inflation is going to eat that benefit up. So infrastructure projects that are good for the State of Montana and Carbon County will not be funded in the same way they have in Helena. We introduced resolutions to the National Associations of Counties and the interim resolution we have now is in opposition basically to the Clean Power Plan urging congress not to allow the implementation of the Clean Power Plan until the federal government finds a way to either provide tax incentives or funding to develop clean coal technology. Like the Crow Tribe – they have developed technology where they can use Carbon through algae to produce fertilizer or high grade jet fuel. That would be a win-win process for the State of Montana, the Crow Tribe and the federal government. Its alarming to me that the federal government is in a deficit situation, yet we will not use our natural resources to reduce that deficit.

The United

States has 25% of the recoverable coal in the world. Out of that 25%, 8% of it is in Montana so it's kind of like we are sitting on a coal mine or a gold mine, however you want to look at it. So, if we are going to develop this coal, this is what's going to run up our economy for our state. It will affect our state government, but it will especially affect us at the county government. Signal Peak, the only underground coal mine in Montana is mostly in our county. But last year, 36.3% of our revenue come directly from Signal Peak mine and that's of course is what is running our economy and our budget. This coming year we are going to take a 50% drop in that so we are going to have to cut our budget by 18% because of the loss of coal revenue. When I was a commissioner the first time in 2000, we were the second lowest county per capita income of non-reservation counties so we were pretty close to the bottom. Now we are 17th from the bottom per capita income. We have a lot of high paying coal miner jobs and because of that my three children were able to stay in Musselshell County and not have to move away to make a living. We are looking forward to Signal Peak continuing production.

In conducting the Programmatic Environmental Impact Statement (PEIS) of the federal coal leasing program, the

Pew Charitable Trusts recommends that BLM consider the potential impacts new policy direction will have on the agency's mission to manage the lands with wilderness characteristics as part of BLM's multiple use mission. Pristine BLM lands provide a range of uses and benefits in addition to their value as settings for solitude or primitive and unconfined recreation. These lands are some of our nation's most sought after hunting and fishing grounds, most popular mountain biking trails, home to an extensive network of ungulate migration corridors, essential habitat for imperiled species like the greater sage grouse and habitat for 450 listed species. The protection of these values deserves consideration when reforming the federal coal leasing program on BLM lands. Recreation on natural BLM-managed lands has a significant positive impact on rural economies across the West. A study conducted by the independent firm ECONorthwest and commissioned by The Pew Charitable Trusts recently highlighted this value, finding non-motorized recreation on the 246 million acres of our nation's land overseen by the Bureau of Land Management supports 25,000 jobs and generates \$2.8 billion for the U.S. economy. (See: <http://www.pewtrusts.org/en/research-and-analysis/analysis/2016/03/31/the-economic-value-ofquiet-recreation-on-blm-lands>)

Comment Excerpt Text:

The result of keeping coal in the ground will also have a devastating impact on employment rates. Those who earn their living mining support local businesses, charities, community programs, and quality education. As this domino effect, created by keeping coal in the ground, spreads we will see high unemployment; increased tax burden with fewer taxpayers; increased cost of electricity; businesses shutting down; and degradation of local infrastructure.

Comment Number: 0002451_Hibbs_20160727-4

Organization I: Utah American Energy

Commenter I: David Hibbs

Comment Excerpt Text:

BLM contends that even if coal production decreases as a result of higher royalty rates, the net effect of increased royalty rates may be revenue neutral. But, the public return on coal development cannot be measured only through federal coal lease revenue. Federal coal development provides many measurable benefits to rural, western communities. Coal production provides high paying jobs. These jobs, mine support services and businesses generate state and local tax base and additional opportunities for economic development in rural

areas. Although, BLM argues that decreased production would be offset by higher royalty rates. BLM does not address the fact that other impacts of decreased production cannot be offset.

Employment in rural, Utah counties would be significantly impacted by decreased coal production on federal lands. Lower production translates into fewer jobs. Approximately 80% of coal produced in Utah is mined on federal land. Overall, coal mining generated 14,570 jobs in the State of Utah in 2012. In 2014, the EIA identified Utah as having 1,393 direct coal mining jobs. Most of these jobs are located in rural Utah counties. Approximately 300 of these jobs are directly attributed to UEI. Many coal producers throughout the region have already been forced to cut their workforce in the face of decreased demand and increasing production costs. An increase in the federal royalty would put further pressure on the Utah coal market, and in some cases, render operations uneconomic.

Comment Number: 0002452_Donovan_20160727-1

Organization I: Colorado State Senate

Commenter I: Kerry Donovan

Comment Excerpt Text:

In Delta and Gunnison Counties, there is the same shared passion about the pathway forward and the uses of public lands. These discussions are more acute now that additional coal mines have been shuttered and additional layoffs have been announced. Change resulting in job loss is a tough subject to discuss and an even tougher one to solve. As you thoughtfully proceed through your review of coal guidelines, the associated processes, the royalties, and the future uses of our public lands, I ask that you consider including a plan that would help Western communities diversify their economies. When I have listened to national dialogue or participated in conversations regarding the decline in coal, the West is often forgotten. The wonderful small communities in my district have the will and the want to create a new diversified future, but often lack the resources. We can help them move forward.

As a Nation, and as a world, our energy supply is changing and there is momentum causing coal demand to decline. We cannot leave our coal communities behind as collateral damage. I suggest there is an opportunity to enhance the overall discussion by being proactive and helping our coal communities find their next great identity.

Comment Number: 0002453_Cook_20160727-1

Organization I: Rio Blanco County

Commenter I: Katelin Cook

Comment Excerpt Text:

Rio Blanco County is highly dependent upon the natural resource extraction industries, including coal production. Sixty percent of Rio Blanco County's total assessed value is attributed to these industries, with the top fifteen taxpayers being industry related companies. Federal Mineral Lease and Severance Tax payments are critical to maintaining local infrastructure, and without additional production, these payments will not be realized by Rio Blanco County, educational institutions, special taxing districts and other service providers that are an absolute necessity. Having the ability to continue coal production and supply these resources to the world is paramount to the existence of rural communities in Northwest Colorado. If coal production is minimalized, the economic impact on Colorado, especially the Western slope of Colorado, will be devastating.

The coal industry pays a tremendous amount of taxes including, but not limited to: Federal and State Excise Tax; Federal and State Severance Tax; Black Lung Tax; Sales Tax including Excise Tax; Natural Resources Consumption Tax; Local Property Tax; Impact Fees; Payroll Taxes. The true economic impact, direct and indirect, that this specific industry has on the United States and local communities is unparalleled, and we should be working to eliminate barriers and decrease production and permitting expenses to encourage continued development, while providing a balanced, realistic approach to offering affordable energy to United States citizens.

Support Needed for Community Transition

Crested Butte, the town where HCCA is based, was founded on coal mining. Scattered ghost towns across the

area attest to the rise - and fall - of coal in Gunnison County: Baldwin, Kubler, Floresta, Anthracite, and more. It is important that the PEIS consider the need for community transition and worker support as local economies move beyond coal mining and embrace other, less polluting energy economies. The agency should evaluate means of creating opportunities to help ensure a viable transition away from coal and to a clean energy economy, including robust investment in community economic development, job training and protecting worker livelihoods. Phasing out coal mining from public lands will entail job loss. But it will also lead directly to job growth and new job opportunities. We ask that the BLM consider options for ensuring that rural western counties, like Gunnison, are able to adjust to the changes.

Comment Number: 0002473_Hornback_20160728_WCC-I

Organization I: Western Colorado Congress

Commenter I: Emily Hornback

Comment Excerpt Text:

Headwaters Economics has compiled economic and fiscal data that provide context for the socioeconomic assessment in the PEIS, including coal production, employment, and revenues. This report provides background information and methods, and documents the data sources used, and is accompanied by a web post with data visualizations and maps:

<http://headwaterseconomics.org/energy/coal/federal-coal-program-context/>

Summary Findings

- Federal coal, which is mined predominantly in the West, made up more than 43 percent of total U.S. coal production in 2015.

- The value of federal coal made up 20 percent of the total value of coal mined nationally in 2014. The low value relative to production is explained by a wide range of factors including low heat content, remoteness, and lower mining costs that allow producers to gain market share by selling coal at lower prices.

- Federal coal is produced largely from efficient surface mines and employs relatively few people compared to the volume of production. Coal mines with federal leases employed 19 percent of total coal mine workers in the U.S. in 2015.

-Federal coal production is concentrated in a few places. Changes to the federal coal program will be felt acutely in rural communities dependent on coal mining for employment and tax revenue. However, these impacts will be limited in scale from a state and national perspective.

-Royalty and tax revenues from coal are relatively more important to states and local governments when compared to the employment benefits. Recent modeling of leasing and royalty reform options suggests new revenues will outweigh the costs associated with reform.

The Secretarial Order stated that the PEIS should at a minimum address six topics, including socioeconomic considerations. Specifically, the Order states: "Beyond the issue of fair market value, the PEIS should assess whether the current Federal coal leasing program adequately accounts for externalities related to Federal coal production, including environmental and social impacts. It should more broadly examine how the administration, availability, and pricing of Federal coal affect regional and national economies (including job impacts)."⁶

Headwaters Economics developed the Economic Profile System (EPS) in partnership with Bureau of Land Management (BLM) and U.S. Forest Service in order to make public data available to these federal agencies and to the public, and to help provide context to socioeconomic impact assessments.¹¹ For example, EPS can be used to assess the size of the projected changes relative to the rest of the economy (Is the expected change big or small?) and to understand the role of federal lands and natural resources in the broader economy.

Headwaters Economics also worked with academic experts to provide suggestions for how make socioeconomic monitoring effective and efficient. We produced two case studies (one on Sublette County, WY, and one on Garfield County, CO)¹² in addition to a review of social impact assessment and recommended best practices for monitoring the social and economic impacts related to energy development.

Increased efficiency in federal coal production resulted in significant job losses nationally. Coal employment was down by about 200,000 jobs from the early 1980s to 2015 despite large increases in total production volume.³² Most of these jobs have been lost in Appalachia as coal mining shifted to more efficient Western surface mines where fewer people are required to extract an equivalent amount of coal. These mines are located primarily in the Powder River Basin in Wyoming and Montana.

Coal Mining Employment will be more uncertain in the future. Future employment in coal mining will depend on the relative price of natural gas, renewable energy, and coal. Because natural gas prices have historically been more volatile compared to coal prices, coal producers can be less certain going forward about how much coal

will be demanded from year to year, or even month to month. This uncertainty in electricity markets creates uncertainty for coal workers.

Coal fired electricity generation provides additional employment opportunities.³⁴ Thirteen counties have coal-fired power generators that receive coal deliveries directly from mines with federal leases. These coal-fired plants listed in Table 3 contribute to an additional 3,782 direct jobs in electricity generation, transmission, and distribution,³⁵ adding to 13,098 federal coal mining jobs.

Comment Excerpt Text:

The current downturn in production is resulting in job losses in coal mining in the West. Increased competition with natural gas and renewable energy sources is resulting in additional job losses in the coal sector. In the last year, employees at coal mines have worked 10 million fewer hours, and a total of 16,746 coal mining jobs have been lost.³³ These declines come on the heels of 22,549 coal mining jobs already lost between the first quarter of 2012 and the first quarter of 2015. The West has seen fewer coal mining job losses over time, but the recent

downturn is starting to affect the region. Wyoming has lost 858 coal mining jobs since the second quarter of 2012, with 343 of these job losses coming in the last year.

[See Figure 4: Hours Worked by U.S. Coal Miners per Quarter, 2000-2016]

Comment Excerpt Text:

Coal mining communities have different challenges associated with declining coal production. For all coal mining communities, continued dependence on natural resources may become increasingly problematic as coal production and prices decline and are likely to become more volatile in the future. Declining coal production will disproportionately impact rural counties that do not have easy access to major population centers via road travel or that lack an educated labor force necessary to compete in the non-resource extraction portions of the U.S. economy. Rural counties will have more difficulty diversifying economically and replacing lost coal mining jobs with jobs in other sectors.³⁸

Organization I:Headwaters Economics

Commenter I:Mark Haggerty

Comment Excerpt Text:

Coal extracted from federal land is an important source of revenue for some states and local governments. Coal production in states with federal leases generated \$1.2 billion in 2014. The largest source of revenue is federal royalties, followed by a host of state production taxes levied directly on coal extraction, and royalties from coal extracted from state-owned lands.⁴⁰

(40) Mark Haggerty, *The Impact of Federal Coal Royalty Reform on Prices, Production, and State Revenue* (Bozeman, MT: Headwaters Economics, 2015)

<http://headwaterseconomics.org/wphw/wp-content/uploads/Report-Coal-Royalty-Reform-Impacts.pdf>.

Federal coal revenue is a relatively larger contribution to state economies compared to employment. Coal revenue made up 12.5 percent of total state and local government budgets in Wyoming in 2012 (the latest year for which accurate, national data on total state and local government budgets is available). By comparison, coal mining jobs made up only 1.8 percent of total employment in 2012. This same relationship holds in the other states, although the relative importance of federal coal revenues is significantly lower. In Montana, the state where federal coal mining is second most important in terms of its fiscal contributions, federal royalty and state taxes on federal coal production add to 1.1 percent of total state and local government revenue.

Support communities' creation of impact mitigation plans. Given the relatively small number of counties and communities engaged in mining of federal coal, BLM should work with communities to conduct analyses of the socio-economic characteristics of each county in which federal coal is mined. BLM should, among other things, use the Economical Profile System (EPS) and produce detailed socioeconomic profiles. (67) BLM should incorporate best practices for social impact assessment, including involving potentially affected publics and developing mitigation plans. (68) BLM could incorporate transition approaches for affected communities both in the PEIS and through targeted RMP amendments or revisions for areas with current mining operations.

Comment Excerpt Text:

Communities that are largely dependent on mining publicly-owned coal are already feeling the impacts of structural changes in the coal industry. Compared to 2008, coal production in the Powder River Basin was down by 19 percent in 2015, a decrease of nearly one-fifth in just eight years. Across ETA's Western Region, where most federally-owned coal is located, over the same period coal mining jobs went from 15,177 down to 14,100, a seven percent decrease. Colorado has lost roughly 320 coal mining jobs since January 2015, or 20 percent of jobs at mines. (62) Workers and their families have borne the brunt of these changes, losing jobs, facing unmet healthcare needs and dealing with the emotional impacts of suffering dramatic changes to their lives and those of their neighbors.

(62) Colorado Division of Reclamation, Mining and Safety

Monthly Coal Summary Reports, <http://mining.state.co.us/Reports/Reports/Pages/Coal.aspx>. Last accessed July 26, 2016. See also, <http://www.denverpost.com/2016/05/14/collapse-of-colorado-coal-industry-leaves-mining-towns-unsure-whats-next/>.

Going forward, coal-dependent communities in the West will continue to experience declines in employment and revenue. ETA's Annual Energy Outlook 2016 (AEO2016) reference case projects that coal production in the Western Region will fall by 155 million tons between 2015 and 2040. (63) These changes have occurred without any significant new policies or regulations specific to the federal coal program, driven by gains in productivity and loss of market share to natural gas and renewable energy.

(63) <http://www.eia.gov/todayinenergy/detail.cfm?id=26992>

The federal coal program should help communities become more resilient to the accelerating changes in the coal sector. A significant part of federal coal program reform and the PEIS should include taking action to address current job losses and mine closures and create more resilient economies in future.

As BLM reviews socio-economic impacts of federal coal leasing and development, it should consider the positive and negative impacts of continued economic reliance of local communities on coal extraction. Some research has shown that dependence on coal adversely affects non-coal employment in places like Appalachia. (66) They found that high levels of coal employment are associated with lower levels of entrepreneurship and higher levels of migration out of Appalachian regions as coal crowds out other types of businesses. Prolonging coal employment may actually slow the transition to other economic activities and reduce long-term economic growth.

Explore changes to revenue sharing statutes to improve community access to funding for local schools and other community priorities. Headwaters Economics and others have proposed changing the formula through which the federal Payments in Lieu of Taxes (PILT) program functions so that the size and relative distribution of federal payments to counties is less directly tied to the specific source of revenue. This would create a framework that can accommodate new dedicated funding streams from public lands from various sources, such as increased fossil fuel royalties, new leasing fees or a carbon tax. (70) It could also provide more stable funding for local schools in vulnerable communities. Though such an approach would require federal legislation, the PEIS could propose and analyze such an option.

Comment Excerpt Text:

In an era of rapidly changing energy systems, electricity produced by coal has provided the foundation for building a robust and diversified energy economy in Utah and the country. Needlessly restricting coal production has direct impacts to Utah's coal fleet. The result is conditions that can both increase prices and reduce resiliency of the industry. The benefits of a diversified energy fleet are well understood, and actions to restrict diversity can lead to increased costs without realizing any associated benefits.

Additionally, the coal industry in Utah is largely supported through the BLM's coal-leasing program. Continuing this program without unwarranted restriction is crucial to the vitality of Utah's coal industry. Eighty-three percent of Utah coal is produced from federal land. In 2014, Utah coal produced on federal lands had a total sales value of over \$570 million and generated royalty revenues in excess of \$41 million.⁷ BLM must lift the coal lease moratorium during the programmatic review to prevent further harm and destabilization to the coal industry Utah's economy.

Coal is generally a more price stable fuel source than natural gas.⁸ A study on the nation's fuel diversity for generating power found that reductions in coal utilization would cost the U.S. economy more than \$93 billion dollars a year.⁹ Unfortunately, despite these significant costs, the BLM's coal moratorium and review are unlikely to result in any additional revenues or benefits to the American people.

In addition, the Regulatory Flexibility Act (hereinafter RFA), as amended by the Small Business Regulatory Enforcement Fairness Act (SBREFA) requires BLM to analyze adequately the impacts of its proposals on small entities. BLM must ensure that while conducting review of the Federal Coal Program (hereinafter Coal Program) that adverse impacts to small businesses as a result of Coal Program reform are considered. As BLM discovered in Northwest Mining Association v. Babbitt, 5 F.Supp.2d 9 (D.D.C. 1998), failure to comply with the RFA and SBREFA will invalidate a rulemaking.

As currently managed, the federal coal program provides significant benefits to the American people. Not only does federal coal production provide substantial revenue to federal, state, and local governments, but it also provides high-paying jobs to hardworking coal miners and other employees in industries tied to coal extraction, transportation, and combustion. The continued leasing and development of federal coal also plays an important role in America's energy portfolio by ensuring a safe, reliable, and cost-effective domestic energy source that provides America with greater energy independence from foreign sources. Any proposed change to the federal coal program that discourages coal production will harm these important domestic interests.

Comment Excerpt Text:

In recent years, several economic factors have adversely impacted the U.S. coal industry. With the increase of low-priced natural gas, the demand for coal in the United States has declined over the past several years. The U.S. Energy Information Administration ("EIA") estimates that the use of coal to generate electricity in the United States has decreased 29% between 2007 and 2015. Attachment 2, U.S. EIA, "Power Sector Coal Demand Has Fallen in Nearly Every State Since 2007" (Apr. 28, 2016). In turn, coal production has also declined. According to the EIA, coal production in the first three months of 2016 constituted the lowest levels since the second quarter of 1981. Attachment 3, U.S. EIA, "Quarterly Coal Production Lowest Since the Early 1980s" (June 10, 2016). In the first quarter of 2016, the Powder River Basin saw the largest decline in coal production—in both tonnage and percentage—from the previous quarter. Id. Moreover, the U.S. EIA projects that coal production will continue to decrease by more than 100 million short tons in 2016, which would constitute the largest decrease in coal production since the beginning of data collection in 1949. Attachment 4, U.S. EIA, "Short-Term Energy Outlook" (July 12, 2016).

The table below illustrates the current economic burdens on Cloud Peak Energy (see next page):

Table I – Cloud Peak Energy Economic Burdens

(All \$ in thousands)	2013	2014	2015	Total	3 Year Average
Total Gross Revenue	1,396,097	1,324,004	1,124,111	3,844,212	1,281,404
Total Payments to Federal, State, and Local Governments(1)	439,000	423,000	372,000	1,234,000	411,333
Government Payments as a Percentage of Total Gross Revenue	31.4%	31.9%	33.1%	–	32.1%
Net Income (Loss)	51,971	78,960	(204,900)	(73,969)	–

To further illustrate, the following is an illustrative breakdown of the royalties, taxes, and production costs assessed on a single ton of July 2016 Powder River Basin coal:

Table 2 –	Taxes, Royalties, and Production	Costs Per Ton of PRB Coal
Spot Price—	July 2016 PRB Coal	(8800 Btu) \$8.78
Federal Royalty	(12.5%)	(\$1.10)
Abandoned Mine Lands Tax	(3.19%)	(\$0.28)
Black Lung Tax	(4.21%)	(\$0.37)
Bonus Bid Payment(2)	(11.39%)	(\$1.00)
State Severance Tax	(5.24%)	(\$0.46)
County Ad Valorem Tax	(4.33%)	(\$0.38)
Total Taxes and Royalties =		(\$3.59)
Illustrative Cash Cost of Production		(\$6.75)
Loss:		(\$1.56)

(1) These amounts represent the accrued federal bonus payments and royalties and production-related taxes, as well as property, sales, and payroll taxes payable on 2013, 2014, and 2015 operations, respectively. This differs from the amounts actually paid in 2013, 2014, and 2015, which would have included payments for operations in other years.

(2) The bonus bid payment reflects the average bonus bid received on the last ten federal coal lease sales in the southern Powder River Basin from 2008 to 2012.

Finally, the United States government receives a far higher rate of return than any other country involved in the production of coal:

Table 3 – Comparative Global Coal Royalty Rates(3)

Country	Surface Royalties	Total Royalties, Taxes, and Other Governmental Fees
Australia	8.2%	8% - 12.5%
India	6.0%	6% - 14%
China	0.5% - 4%	4% - 14%
Republic of South Africa	0.5% - 7%	0.5% - 7%
Colombia	5% - 10%	Less than 10%
Canada	4% - 15%	4% - 15%
United States	12.5%	Federal 32% - 42% Federal 5% - 8% Private

Emissions associated with the coal leasing program impair the public interest through the health and welfare costs of air pollution and climate change. Of total nationwide emissions in 2013, 36% came from electric power generation, of which 76% was from coal combustion, of which 41% was from coal produced from federal lands.²² A recent study by PSE Healthy Energy concludes that communities living near coal power plants are at higher risk of developing adverse health impacts. Emissions from coal combustion in Pennsylvania and Ohio caused more than 4,333 premature deaths nationwide in 2015 alone.²³ These premature deaths and illnesses also generated nearly \$38 billion in health impacts.²⁴ The per-capita impacts were most concentrated in areas near to and downwind of coal power plants – areas with higher than average concentrations of minority and/or low-income residents. By failing to consider these health effects, BLM misses the opportunity to interpret the public interest in a way that serves Americans.

[²² U.S. Environmental Protection Agency, *Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2013* (April 15, 2015).]

[²³ This figure compiles the health burdens from Ohio and Pennsylvania power plants’ fine particle pollution, with 2,133 adult deaths in Ohio and 2,300 adult deaths in Pennsylvania (4,333 total) from coal and gas plants combined. Of these totals, 2,088 and 2,263, respectively, were attributable to coal power plants in each state. Comment Excerpt Text:

Wyoming relies heavily on its mineral wealth to support public education. Beginning in 1995 the State evaluated the needs of school facilities in all school districts across the state to determine how to provide adequate school facilities to all school districts whether they are large or small, urban or rural. A change in law resulting from the school finance litigation cases, known collectively as the Campbell cases, resulted in financial responsibility for capital construction being vested with the State, not local school districts. In 2001 the State created the School Facilities Commission to determine school facilities conditions and needs and to implement facilities remedies; counting on the State’s mineral wealth and more specifically coal lease bonuses to fund the maintenance, renovation and construction of schools. In 2011 the State created the School Facilities Department to work with local school districts to administer the program for improving school facilities; again counting on coal lease bonuses to fund the maintenance, renovation and construction of schools.

Since 2001 Wyoming has renovated/modernized 35 schools, constructed 75 new schools and established funding of a uniform major maintenance program for all school districts. In addition, there are 31 new schools and 6 additions/renovations currently being designed or under construction. On average, approximately \$217 million Dollars per year has been appropriated by the State legislature for the period 2003-2017. Projections of future funding for school facility improvements because of a drop in coal lease bonus payments, decrease to approximately \$17 million Dollars for 2018. Further projections indicate that there will be no available funds beyond 2018. While the need for additional school facilities improvements has been identified as well as the need for an ongoing major maintenance program for the foreseeable future, currently there is no funding mechanism in place to continue the Wyoming school facilities program.

Wyoming's school facility improvement program has played a major role in the State's planning, design, and construction industry. It has been a catalyst to create job opportunities and support a diversification of employment within the industry and across the State. The diversification of employment has been a welcome opportunity for a State whose economy is overwhelmingly dependent on agriculture, minerals, and tourism. The BLM must analyze the impacts to Wyoming's education system and its ability to meet the needs of students and communities along with the associated impact to the construction industry that will result from any reduction, significant modification or elimination of the coal leasing program.

The Unemployment Insurance (UI) wage and salary covered payroll is the single largest component of gross state product and represents a key component of Wyoming's contribution to the U.S. Gross Domestic Product. In the fourth quarter of 2015, the total UI covered payroll for the state was \$3.4 billion. One of Wyoming's few base export industries, private sector coal production, accounted for 4.2% of total payroll and 2.3% (6,515 jobs) of all wage and salary covered jobs. Clearly, this industry is an important component of Wyoming's labor market.

According to the Wyoming Legislative Service Office, each one million ton decrease in coal sold equates to a \$1,800,000 reduction in state collected revenue. See Wyoming Legislative Service Office 2015 Budget Fiscal Data Book. [14] (WY0-04040 to 04173). This immediate reduction in revenue resulted in cuts across state and local government. Wyoming has lost over 1,300 jobs in the coal industry over the past year and the secondary impacts of this decrease in personal income are just beginning. Creating further uncertainty in the future of coal in the energy portfolio will accelerate the downward momentum of Wyoming's economy.

Comment Excerpt Text:

The BLM must consider the potential impacts to all sources of revenue from coal mining activities including those on federal payroll and income taxes. The replacement of high paying jobs in the mining sector with lower paying careers impacts federal tax receipts through lower Federal Insurance Contributions Act (FICA), federal and state income taxes. For example, in one published case, a laid off coal miner found new employment as a prison guard. Davenport, C, *As Wind Power Lifts Wyoming Fortunes, Coal Miners Are Left in the Dust*, *The New York Times* (June 19, 2016).[2] In 2015, according to the Wyoming Mining Association the average salary for a coal miner was \$83,594 and Bureau of Labor Statistics data states the median salary for a correctional officer was \$40,580. See Wyoming Coal Information Committee, *The 2015-16 Concise Guide to Wyoming Coal* (August, 2015); [3] (WY0.:03521 to 03528); and Bureau of Labor Statistics, *Correctional Officers and Bailiffs* (Dec. 17, 2015); [4] (WY0-03530 to 03531). In this - instance, the lost taxable wages would be \$43,014, a loss of over 51%. This reduction in salary could also lead to the individual dropping into a lower IRS tax bracket, costing the federal government additional revenue.

Comment Excerpt Text:

The Wyoming School Foundation Program (Foundation Program) guarantees local school districts the necessary instructional and operational resources to provide each Wyoming student with an equal opportunity to receive a proper education. The Foundation Program is overwhelmingly dependent on the mineral industry for revenue. FMR from the production of minerals on federal land, most notably coal, make up a significant portion of the revenue to the School Foundation Program Account (SFPA). The amount the SFPA receives is dependent upon the actual mineral production and the state distribution policy. In total, FMRs account for approximately 23% of revenue to the SFPA. The impact of the moratorium and the BLM PEIS will result in fewer FMRs to the SFPA and shrinking enrollment in impacted districts.

The School Foundation Funding guarantee is based on a number of factors, the most important of which is the number of students enrolled in the district. Any future changes in the federal coal leasing program that would lead to the loss of job opportunities and the decline in families with school-aged children in areas with high activity in coal extraction will result in a reduction in K-12 funding for the impacted school districts. The loss of even a small number of students could have a significant impact on local school district resources and the ability

to deliver educational services. The BLM must consider how its actions will impact Wyoming's Foundation Program under any scenario considered in the PEIS.

Comment Excerpt Text:

The federal coal program, however, is doing more than just damaging our climate. Facing declining demand, the consequences of chronically poor business decisions, and increased competition from cleaner sources of energy, the coal industry is now in the midst of one of the most significant job killing and downsizing sprees in history, firing thousands of workers and leaving communities hanging.

In the past year, the first, second, and fourth largest coal companies, Peabody Energy, Arch Coal, and Alpha Natural Resources, filed for Chapter 11 bankruptcy in federal court. (12) All three of these companies have major mining operations in the western United States and rely heavily on federal coal to sustain their businesses. Further, in the western United States, more than 2,600 jobs have been lost in the coal industry since 2012. (13) In the wake of the industry's collapse, coal-dependent communities are struggling to stay afloat, with revenues declining and putting even local schools at risk. (14) Not surprisingly, coal production rates are hitting historic lows, particularly in the western United States.

(12) For information on Alpha Natural Resources bankruptcy, see <http://www.kccllc.net/alpharestructuring>. For information on Arch Coal's bankruptcy, see <http://www.archcoal.com/restructuring/>. For information on Peabody Energy's bankruptcy, see <http://www.kccllc.net/peabody>.

2. Just Transition Alternative

The "Just Transition Alternative" is meant to both wind down the federal coal program in order to keep fossil fuels in the ground and to ensure an orderly, effective, and fair transition of workers and communities away from coal to more prosperous and sustainable economies. The "Just Transition Alternative" is defined by the following key components:

1. An end to federal coal leasing: Consistent with authorities and discretion under the Mineral Leasing Act, the Just Transition Alternative imposes a permanent pause on the leasing of federal coal. The primary basis for adopting this permanent pause would be to ensure the protection of the public interest and the interests of the United States. Such justification for an end to leasing is clearly supported by the Mineral Leasing Act. This pause would apply to all competitive leases (including all leases by application, including emergency leases, as defined by 43 C.F.R. § 3425.1-4) and lease modifications. We further believe there is ample justification for applying a permanent pause to other forms of non-competitive leasing, such as preference right lease applications and lease exchanges. With regards to lease exchanges, the BLM has clear authority to reject exchanges that are not in the "public interest." 43 C.F.R. § 3435.4(a); see also 43 C.F.R. § 3436.0-2(b) (related to alluvial valley floor exchanges) and 43 C.F.R. § 2200.0-6 (generally related to exchanges). With regards to preference right lease applications, the BLM has the authority to reject such applications where there does not exist "commercial quantities" of coal. 43 C.F.R. § 3430.5-1(a)(1). Given the dismal state of the coal industry and the overwhelming climate costs that coal imposes on society, it would be dubious at best to claim that any commercial quantities of coal exist where there are preference right lease applications. Accordingly, the BLM has the authority to reject such applications. (20)

Furthermore, to ensure an orderly end to federal coal leasing, the BLM and the Department of the Interior should issue a rule or guidance requiring that as land management planning is undertaken pursuant to 43 C.F.R. § 1610, et seq., that all lands within a resource management area that are not currently leased for coal, be made

unavailable for leasing. The authority to impose such direction is set forth at 43 C.F.R. § 3420.1-4(e), which gives the BLM broad discretion to “eliminate additional coal deposits from consideration to protect other resource values.” 43 C.F.R. § 3420.1-4(e)(3).

(20) The only preference right lease applications that exist are in northwestern New Mexico, where Arch Coal, which is currently bankrupt, has the rights to acquire 21,000 acres of leases. Legislation was introduced in the U.S. House of Representatives that would allow the Secretary to retire these preference right lease applications. See HR-1820, available online at <https://www.congress.gov/bill/114th-congress/house-bill/1820/text>. If this legislation is passed, there would be no additional preference right lease applications requiring action. We support this legislation and urge the Secretary of the Interior to encourage its passage in the U.S. Senate and adoption into law.

Putting a permanent pause on leasing will not destroy the U.S. economy or otherwise endanger our energy security. As a recent report looking at leasing in the Powder River Basin found, existing leased reserves in the Powder River Basin are sufficient to meet demand and effectively contribute to limiting temperature increases.

(21) This report is instructive as the Powder River Basin is the largest coal producing region in the United States and imposes the greatest influence on energy supply and demand in the nation. If an end to federal leasing can be justified in the Powder River Basin, it can be justified for federal leasing elsewhere in the U.S.

21 See Exhibit 11, Fulton, M., D. Koplow, R. Capalino, and A. Grant, “Enough Already: Meeting 20C PRB Coal Demand Without Lifting the Federal Moratorium,” Report Prepared for Energy Transition Advisors, Earth Track, and Carbon Tracker Initiative (July 2016), available online at <http://www.carbontracker.org/report/enough-already-2c-powder-river-basin-coal-demand-federal-moratorium/>.

2. Increased royalty rates and rentals: Coal is exacting a tremendous toll on our nation, costing our society billions in climate damages, adverse health impacts from air pollution, and water contamination. Royalty rates from production on existing coal leases and rentals on existing leases must be increased to begin to recoup the costs of these externalities, which are currently shouldered by the public.

Although royalty rates are normally imposed through new leasing, we recommend that the Interior Department and BLM incorporate higher royalty rates into existing leases as existing leases are readjusted pursuant to 43 C.F.R. § 3451.1. To accomplish this, we urge the amendment of 43 C.F.R. § 3473.3-2(a)(1) and (2) to incorporate increased royalty rates for both surface and underground mining. As leases are readjusted, these royalty rates must be applied to existing leases pursuant to 43 C.F.R. § 3451.1(a)(2).

Increasing royalty rates has been recommended by the White House as both a means to generate revenue and address the costs of environmental externalities, including carbon costs. (22)

(22) See Exhibit 12, Executive Office of the President of the United States, “The Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to Taxpayers” (June 2016), available online at https://www.whitehouse.gov/sites/default/files/page/files/20160622_cea_coal_leasing.pdf.

Furthermore, royalty rate reductions should not be approved. Currently, royalty rate reductions are routinely granted as companies claim poverty or difficulty in mining with little apparent scrutiny as to whether the reductions are justified. In Colorado, for example, BLM officials have approved royalty rate reductions to facilitate methane venting and most recently proposed to approve a retroactive royalty rate reduction for a mine that was not even producing coal. (23) See Exhibits 13 and 14.

Similarly, we urge Interior and BLM to amend 43 C.F.R. § 3473.3-1(a) to raise rental rates for federal coal leases. Currently, rental rates are set at \$3.00 per acre, a figure that has not been adjusted since 1979, if not earlier. This rental rate not only has failed to be adjusted to account for inflation, but fails to account for the fact that some leases may be of small acreage, yet yield significant amounts of coal. Rentals should reflect the value of the lease, which depends on the amount of coal a lease contains. In accordance with 43 C.F.R. § 3473.3-1(a), any increased rental rate must be applied to any readjusted coal lease.

3. Existing leases that are not producing must be canceled: Where a lease is not meeting continued operation requirements under 43 C.F.R. § 3483.1(a)(2), it is subject to cancellation pursuant to 43 C.F.R. § 3452.2. Where a lease is not meeting continued operation requirements, BLM and the Interior Department should make clear that cancellation of the lease must be pursued. To this end, discretionary avenues for avoiding cancellation should be prohibited. Thus, lease suspensions under 43 C.F.R. § 3483.3 and payment of advanced royalties in lieu of

continued operation under 43 C.F.R. § 3483.4 should be barred.

The justification for imposing such direction is very clear. Currently, BLM regularly grants lease suspensions and allows payment of royalties in lieu of continued operation with no assessment of whether such actions are appropriate or in the public interest. BLM appears to be under the impression that lease suspensions or advanced royalties are somehow mandated, and that the agency has no choice but to approve company requests. An egregious example of this is with regards to Arch Coal's Carbon Basin Lease in southern Wyoming (No. WYW-139975). Arch acquired this lease with the aim of developing a mine to fuel a proposed coal to liquids facility. However, this coal to liquids facility has never materialized or even shown any promise of materializing. Most recently, the Wyoming Department of Environmental Quality terminated the permit for the proposed facility. (24) Nevertheless, since 2010, Arch has failed to meet continued operation requirements. The BLM has allowed Arch to maintain its lease, however, by routinely allowing the company to pay advanced royalties in lieu of continued operation. (25) These decisions appear to be pro forma in nature, and do not reflect any consideration as to whether it is appropriate or remotely in the public interest to accept advance royalties in lieu of continued operation.

(24) See Exhibit 15, Wyoming Department of Environmental Quality, "Permit Termination, Medicine Bow Fuel and Power Coal to Liquid Project" (June 27, 2016).

(25) See Exhibit 16.

Furthermore, where an existing lease is not producing, yet is part of a producing logical mining unit, BLM and the Interior Department should use their discretion to modify the boundaries of logical mining units to eliminate the non-producing lease and facilitate its cancellation. BLM has such discretion under 43 C.F.R. § 3478.1.

Cancelling leases that are not producing will serve the goal of preventing any potential future development of existing leases and contribute to an orderly end to the federal coal program.

4. Accounting for carbon costs in coal management: It should be made clear, whether through new rules or guidance, that carbon costs must be analyzed, assessed and disclosed as federal coal management decisions are made. Such decisions are most likely to include mining plan modifications issued pursuant to the Mineral Leasing Act, 30 U.S.C. § 207(c), and the Surface Mining Control and Reclamation Act ("SMCRA"), 30 C.F.R. § 746, and lease readjustments. It is imperative that the BLM and Interior maintain close accounting of the carbon emissions and costs resulting from its coal management actions, to ensure full transparency around these emissions and costs, and to meaningfully act to address these emissions and costs. Particularly given that, pursuant to authorities under the Mineral Leasing Act and SMCRA, the Secretary of the Interior has full discretion to disapprove mining plans authorizing the development of leased federal coal, it is imperative that carbon emissions and costs factor into and influence such decisionmaking.

5. Reclamation must be guaranteed: To ensure an orderly end to the federal coal program, full and final reclamation must be guaranteed within a reasonable timeframe. We urge two regulatory changes to ensure this occurs.

First, Interior should amend regulations at 30 C.F.R. §§ 816.100 and 817.100 to provide clarification and specificity around contemporaneous reclamation. Current rules are vague and fail to ensure that reclamation proceeds in a manner that is as "contemporaneously as possible" with mining in accordance with 30 U.S.C. § 1202(e). These regulations should be amended to make clear that the success of contemporaneous reclamation must be measured based on a comparison of Phase III bond release acres, as defined under 30 C.F.R. § 800.40(c)(3), with disturbed acres and ensure that reclamation proceeds at a 1:1 rate, in other words for every acre disturbed, one acre should be fully reclaimed to meet Phase III bond release standards.

Second, just as current BLM rules require diligent development of federal coal, these rules should also require diligent reclamation. To this end, Interior and BLM should consider rule changes to ensure that nonproducing coal leases are fully reclaimed within two years of failing to meet continued operation requirements and set deadlines for the full reclamation of federal coal leases that are no later than 2035. This reclamation deadline should be established by rule and incorporated into lease terms as leases are readjusted.

Finally, Interior should amend self-bonding regulations at 30 C.F.R. § 800.23, and any other regulations, as

appropriate, to prohibit self-bonding whenever publicly owned coal is permitted to be mined. This will ensure that, as coal companies continue their decline, that American public resources are fully protected and fully guaranteed to be cleaned up.

6. Prioritizing transition: Above all, the BLM and Interior must make transition away from coal a foremost goal as the federal coal program comes to an end. To do this, the agencies should not only explicitly commit, to the extent possible, their leadership, resources, and expertise to ensure that workers and communities receive the support and assistance they need to transition to more sustainable and prosperous economies. Among the actions that Interior and BLM can and should undertake to ensure transition:

- Work to secure Congressional authorization to direct increased royalty and rental payments toward worker and community support. Under NEPA, agencies are required to rigorously explore and objectively evaluate reasonable alternatives “not within the jurisdiction of the lead agency.” 40 C.F.R. § 1502.14(c). Here, although BLM and Interior may not be able to direct royalties toward transition support, they can recommend that Congress pass legislation that provides such authorization.

- Establishing an Economic Transition Fund, which would be sustained by an increase in reimbursement fees charged by the Interior Department when processing coal-related applications. Under the Federal Land Policy and Management Act (“FLPMA”), Interior has authority to recover reasonable costs associated with its coal management program and to appropriate and spend such monies. Specifically, FLPMA provides the Secretary of the Interior with authority to “require a deposit of any payments intended to reimburse the United States for reasonable costs with respect to applications,” including coal lease application. See 43 U.S.C. § 1734(b). Such payments are “authorized to be appropriated and made available until expended” by FLPMA. Id. Funds from the Economic Transition Fund should be directed toward transition-oriented initiatives.

- Prioritizing support and assistance to help communities transition. In addition to securing funds and making them available, the Department of the Interior can play a key role in helping direct communities to support, steering resources to support conservation and research projects in or near communities, encouraging renewable energy development on public lands. Such leadership could be conveyed through a Secretarial Order that simply makes it an overarching priority of the Interior Department to advance transition

Overall, the Interior Department and BLM must move to keep our publicly owned coal in the ground. However, keeping coal in the ground should not mean that we turn our backs on the workers and communities that have been dependent on coal for so long. Embracing an alternative that ensures “Just Transition,” in other a fair, compassionate, and orderly transition away from coal, is the most effective way to both protect our climate and help our nation effectively move to more sustainable economies and reliable and affordable means of energy production.

Comment Excerpt Text:

Transition must be a priority: Above all, you must make transition away from coal a foremost goal of reform. The coal industry is collapsing, already leaving communities and workers struggling. As the federal coal program comes to an end, it behooves your Interior Department to ensure resources, expertise, and leadership are provided to help communities move to more prosperous and sustainable economies. A “Just Transition,” one that is fair and helps workers move on from coal, must be embraced.

Comment Excerpt Text:

The PEIS must evaluate how changes to the Federal Coal Program impact the revenues of those communities that are dependent on federal coal resource extraction.

Collectively, Wyoming's counties rely heavily on the revenue generated from the production of federal coal resources in Wyoming. Accordingly, they are particularly situated to shoulder the worst of any detrimental economic impacts associated with changes in coal production or utilization based on changes in regulation. Counties' economic viability, as well as the economic viability of our entire state's economy, is dependent upon coal revenues to fund essential governmental services - most notably K-12 education.

For example, Campbell County's 2015 total assessed valuation was \$6.2 billion. Eighty-three percent of that assessment was from mineral production, with a majority (sixty-five percent) of that eighty-three percent represented by federal coal.¹ In 2016, Campbell County's assessed value is \$5.2 billion, a nearly fifteen percent reduction from last year.² A reduction of this kind can only result in reduced services to Campbell County residents. Additionally, a county like Niobrara, with an assessed value of only \$141 million³, is heavily dependent upon state-shared revenue sourced from the production and delivery of coal.

Comment Excerpt Text:

The PEIS must evaluate impacts felt at the local level from the loss of jobs and revenue associated with severe declines in rail transport employment, as well as small mining service contractors.

The downturn in the oil and gas sector and previous downturns in auto manufacturing have shown to most significantly affect small suppliers and service contractors. However, too often federal regulatory analysis fails to account for jobs outside the direct employment of the large manufacturer or operator.

While some may argue that alternative fuel market forces have driven the value of Wyoming's coal downward, we believe that federal regulation affecting the production and use of coal have also had a measurable detrimental impact. We believe that revenue impacts and its effect on quality of life in Wyoming's counties must be fairly reviewed and evaluated for both its direct and indirect impacts.

Comment Excerpt Text:

American taxpayers are propping up the dirty coal that is polluting our planet and negatively affecting our health. According to independent nonprofit research group Headwaters Economics, reforming the coal-leasing program would have generated \$900 million to \$5.6 billion more revenue between 2008 and 2012. That math doesn't even speak to the social costs of the climate change and health impacts of burning coal. Including those costs, the 522,443,982 metric tons of carbon dioxide emitted by the top three U.S. coal mining companies in 2014 alone amount to \$18 billion in damages to society, using the federal government's midrange social cost of carbon figures.

IV. THE PEIS SHOULD EVALUATE OPPORTUNITIES TO ENSURE AN ECONOMICALLY JUST TRANSITION OF COAL-DEPENDENT COMMUNITIES TO A RENEWABLE ENERGY FUTURE Through the PEIS process, BLM must evaluate opportunities and actions to help ensure an economically just transition to a clean energy economy for communities most affected by the downturn in the coal market. BLM must evaluate ways to promote economic diversification within those communities most directly affected by the essential and irreversible shift away from burning fossil fuels. The PEIS should explore, among other things, opportunities for robust investment in community economic development, protecting worker livelihoods, and replacing lost tax revenues to aid miners and coal communities. The measures should not be limited to what BLM alone can accomplish, but include actions that other agencies and Congress can take. 309 The opportunities that BLM identifies must help ensure a fair and just transition to a clean energy economy for all people. While the transition from dirty fuels to clean energy will create many more jobs than those lost, we must not ask workers and communities that have helped power our country to bear the burden of this energy transformation that will benefit everyone. Identified measures should drive sustainable investment and job creation in regions where the coal industry has abused and abandoned the land, air, water and people. On the most fundamental level, "just transition" refers to a path or plan for workers displaced by transformations in the economy. 310 The PEIS should identify measures for a fair and just transition in which affected workers, their unions, and communities are equal partners in a well-planned, carefully negotiated and managed transition from fossil fuels to clean energy. Such measures should bring good job opportunities to those traditionally left behind and job security and livelihood guarantees to affected workers. Workers' pensions and health care benefits should be preserved, and workers and members of affected 307 Id. 308 White House Fair Return Report, at 28. 309 Forty Questions, 46 Fed. As explained in detail in the attached Power Consulting report on available energy-economy models, the model selected by BLM to evaluate impacts of competing alternatives in the PEIS should, at a minimum, have the following characteristics: 1. The ability to estimate GHG emissions with a high enough degree of precision to differentiate between emissions output from a reference scenario and adjusted scenarios where various levels of federal coal are allowed as inputs; 2. The ability to differentiate between coal with different properties both in supply and end user; 3. The ability to accurately account for changes in delivered coal prices, including changes in mine-mouth prices and transportation costs; 4 ICF International, Integrated Planning Model, available at <http://www.icfi.com/insights/products-and-tools/ipm> (last visited July 21, 2016). 42 Peter H. Howard, The Bureau of Land Management's Modeling Choice for the Federal Coal Programmatic Review, Institute for Policy Integrity (2016). 22 4. The ability to accurately account for price elasticity between supply and demand; 5. The ability to account for emissions reduction through fuel switching inherent in our current electric economy; 6. The ability to account for coal mine methane emissions; 7. The ability to account for changes in electricity demand as electricity prices change; and 8. Be transparent and independently verifiable. Of particular importance—and an aspect that the Forest Service did not account for when employing ICF's IPM in its 2015 Draft EIS to reinstate the coal mining loophole in the Colorado Roadless Rule—is the likelihood that policies that increase the supply of comparatively low-cost Powder River Basin coal may reduce the cost of electricity to Americans, and that this reduced cost may lead to an increase in the overall use of electricity. This is a significant oversight. Just as the lower coal prices are expected to lead to the increased use of coal, the lower electric prices should also increase the use of electricity. That would require the burning of additional fuel, the emission of more GHGs, and greater economic costs from damages caused by climate change. Any use of the IPM or another model by BLM here must not simply assume a fixed level of demand for electricity for each year no matter what happens to fuel and other electric generating costs. Accurate modeling must be able to reflect market adjustment to lower energy prices.

The PEIS Should Evaluate the Impacts of Mining and Burning Federal Coal on Downstream Communities, Including the Environmental Justice Impacts Associated with Each Considered Alternative BLM's Notice of Intent states that “[w]ith respect to the climate impacts of the Federal coal program, the Programmatic EIS will examine how best to measure and assess the climate impacts of continued Federal coal production, transportation, and combustion.”¹⁶⁸ We applaud this commitment. But the PEIS must go further: it must also analyze and disclose

the non-carbon environmental, health, and economic impacts of coal production, transport, and combustion. NEPA requires federal agencies to consider “any adverse environmental effects of their major actions.” 42 U.S.C. § 4332(2)(C). This consideration extends to both direct and indirect impacts. 40 C.F.R. § 1508.8. Indirect impacts are reasonably foreseeable impacts that are caused by the project but that occur later in time or at a greater distance. Id. A “reasonably foreseeable impact” is one that is “sufficiently likely to occur that a person of ordinary prudence would take into account in reaching a decision.” *Mid States Coal. for Progress*, 345 F.3d at 549 (citing *Sierra Club v. Marsh*, 976 F.2d 763, 767 (1st Cir. 1992)). Even if complete information is lacking on the extent of the foreseeable impact, “the agency may not simply ignore the effect.” 166 Leonard G. Pearlstine, Elise V. Pearlstine, & Nicholas G. Aumen, *A Review of the Ecological Consequences and Management Implications of Climate Change for the Everglade*, 29-4 *JOURNAL OF THE NORTH AMERICAN BENTHOLOGICAL SOCIETY*, 1510, 1513 (2010); E. Stabenau, J. Sadle, & L. Pearlstine, *Sea-level Rise: Observations, impacts, and proactive measures in Everglades National Park*, 28 *PARK SCIENCE*, 26-30 (2011). 167 Government Accountability Office, *Climate Change*, at 27. 168 81 Fed. Reg. at 17,725. 49 Id. If the nature of the effect is reasonably foreseeable, this effect must be addressed in the PEIS. Id. Given the scope and scale of the federal leasing program, it is undeniable that it has significant, adverse effects on water quality and access, air quality, health and climate. The activities directly and indirectly associated with coal leasing include, among other things, coal transport by rail, truck and sea, construction and operation of infrastructure and equipment related to storing, shipping and processing coal, coal combustion domestically and overseas, and disposal of coal ash. Each of these “downstream” activities negatively downstream communities, harming their health, threatening their safety and causing significant nuisance. More specifically, the federal coal program’s downstream activities generate coal dust and other air , reduce water access and worsen water quality, increase accident and hazard risk, induce growth that magnifies these affects, and hasten impacts from climate disruption, such as sea level rise. These impacts are particularly pernicious because many downstream communities, and low income communities and communities of color in particular, are already disproportionately impacted by pollution and hazards. Communities situated within two miles of rail lines, 169 in cities next to ports, those near coal terminals and plants, and communities that depend upon clean and accessible water for their livelihoods are most vulnerable. Since NEPA requires analysis of all foreseeable direct, indirect and cumulative impacts, the PEIS must analyze impacts to downstream communities.

The PEIS should analyze the safety and economic impacts of traffic for downstream communities. The PEIS should analyze the impact that coal trains cause at rail grade crossings. Coal trains are frequently 120 cars long. 196 Consequently, these coal trains adversely impact traffic at grade crossings. 197 They can create traffic jams during rush hour and hours of after spills or rail accidents. Coal trains also cause traffic jams with other freight trains. A 2014 study showed that congestion from coal and oil trains is already displacing and harming other economic sectors. 198 These economic impacts should be analyzed. Most significantly, coal trains can delay emergency vehicles, such as ambulances and fire trucks. 199 The PEIS must consider the frequency and magnitude of these impacts on communities.

a. The PEIS Cannot Assume That Coal Mining Has Only Beneficial Economic Impacts Because History Shows Otherwise. Coal mining can in some instances pay relatively high wages, and those mines that are located on public lands can make substantial payments to local, state, and federal governments, helping them to fund important public services. But the financial contributions of coal mining are often the only economic characteristics mentioned in federal agency NEPA reviews. Concluding that expanded or continued coal mining will have a positive impact on coal-dependent communities or that declines in coal mining will have catastrophic impacts on such communities is incomplete and misleading, and cannot be used to guide public decision making. Recent empirical economic studies on the relationship between coal mining and local economic vitality and well-being paint contradict the rosy picture of coal mining's socio-economic impacts. For example, historical evidence shows that: coal and other metal mining 215 White House Fair Return Report, at 28 216 Power Consulting, Inc., The Economic Consequences of the Federal Coal Leasing Program: Improving the Quality of the Economic Analysis (July 27, 2016) at 49 (Ex. I). have often failed to bring sustained prosperity to adjacent communities; that counties that rely more heavily on natural resource extraction experience less economic growth than counties with more diverse economic portfolios; that while coal and mining booms result in few additional jobs outside the mining sector, busts cause a greater loss in local employment; that a high share in coal employment in a county was correlated with a lower rate of self-employment, indicating that reliance on mining may restrain entrepreneurial activity. The attached report by Power Consulting, Inc. et al. describes in detail studies supporting these conclusions. The PEIS must take this evidence into account in preparing its socio-economic analysis

The PEIS Must Carefully Identify the Scale at Which it Analyzes Socio-economic Impacts. To take the “hard look” at the federal coal program’s socio-economic benefits, which NEPA requires, the PEIS must analyze the area where those impacts are likely to be most significant and measurable: the county in which the mine is located or the majority of impacts are likely to occur. Focusing solely on a larger area is likely to mask how coal mining can effect local communities, as the impacts from coal mining will be overwhelmed by other sectors of the economy. For this reason, the Powers Consulting report recommends focusing the analysis on the 51 rural counties where coal mining provided more than 5% of the employment in 1990.²¹⁸ The data Powers analyzed shows such coal dependent communities experienced slower job growth, lower real earnings, lost more population, and recovered from economic downturns more slowly, “reflect[ing] the instability of coal mining employment.” This is the type of information that should inform the PEIS’s analysis as the Interior Department attempts to understand how the federal coal program impacts local mining economies

Further, the value of coal to the American people isn't just royalty revenue — the value of high paying jobs and reliable, affordable energy has to be taken into account as well. Increases in coal prices induced by higher royalty rates will flow through to the electricity market due to reduced production on federal lands. The states that rely on coal for the bulk of electric generation consistently enjoy lower electricity rates. Whatever incremental revenue the Department believes it will obtain from increasing the coal royalty rate will be at the expense of American businesses and families paying higher utility bills. The federal coal program has generated tens of billions of dollars of value for the American people in recent decades and additional billions of dollars for Colorado state and local governments and school districts, to the benefit of all the state's citizens. It's simple: I oppose new taxes that will only serve to drive coal further to the edge, will deprive public schools of an important source of revenue from federal leases, and ultimately increase electricity rates for hard working families.

An increase in federal coal royalty rates would force consumers like me to pay more for the power we need at home and work. Raising royalty rates also would reduce coal production which means less revenue for pressing public needs.

Comment Number: 0003012_MasterFormK-2

Comment Excerpt Text:

Roughly 41 percent of US coal production comes from federal lands. Of that, 85 percent came from the Powder River Basin. Over the last ten years, coal leases on federal lands have generated \$10.3 billion in federal revenues from bonus bids, rental fees, and production royalties. Using these resources creates opportunities for businesses and individuals, and supports so much more than the miners and their families. In 2012, overall coal mining activities contributed nearly 2 million jobs across various sectors of the economy.

Comment Excerpt Text:

The push by NGOs to "Keep It in the Ground" and seek "Coal Reform" have again caused a huge waste of taxpayer dollars by forcing the Bureau of Land Management to conduct a multi-year Programmatic EIS process and support the effort by the Department of the Interior to increase the cost of coal leasing and royalties. As a result, it will be even more expensive to operate a coal mine and subsequently raise the price of electricity for all consumers. It's a disastrous combination for everyone, from the miners whose jobs have been lost and are in jeopardy, to the ratepayers that will pay more each month for electricity and the communities that will have to go without the vital taxes and royalty dollars generated by coal mining.

The federal coal program has been a tremendous success story that has generated tens of billions of dollars of value for the American people in recent decades. If DOI must take action, we strongly encourage the department to take steps to improve the return to the American public by making coal on public lands more competitive, not less.

I oppose increased coal royalties and new taxes on our electricity.

Other Sections: 8.7

Comment Excerpt Text:

I write today to voice my grave concerns with increasing coal royalty rates. Raising taxes on coal will add stress to coal markets and ultimately decrease the revenues accruing to the public. Simply put, a ton of coal never sold due to uncompetitive prices produces no revenue.

Too, American taxpayers are receiving more than owners of private coal. The federal royalty rate is above the prevailing royalty rates for private coal. As compared to private coal leases, federal coal rates are, in many cases, forty percent higher than the prevailing rate for private coal.

Federal lessees pay non-recoupable bonus bids, an additional upfront payment made prior to mining. Bonus bids are rarely if ever included in leases of private coal. Bonus bids are a significant expense. Over the last decade, lessees have paid over \$4.2 billion in bonus bids before any coal is even mined.

States and local communities also benefit from coal leasing and royalties. In 2014 Colorado coal producers paid nearly \$40 million in federal royalties, rents, and bonus payments. Almost half of this comes back to the State and is distributed to local communities, the State Public School Fund, the Higher Education fund, and the Water Conservation Board Construction fund.

The BLM can best carry out its responsibility to ensure that American taxpayers receive a fair return on the coal resources managed by the federal government by encouraging the growth of the coal industry and removing impediments to leasing coal.

Other Sections: 8.7

Comment Excerpt Text:

It concerns me that the DOI is modifying the current coal leasing program, including increasing the royalty rate on federal coal. While, on the surface, this may seem like a plan to increase revenue, it is obvious that it will in

fact have the opposite effect and be harmful to our economy.

As royalties increase, so will the price of coal. An industry such as this is very dependent on the price of the product, so as the prices increase, the amount of coal being sold will decrease due to market factors. Eventually this will trickle down to less coal being mined and less revenue going to the taxpayers and back into our communities. Not only will this damage local economies, but the increased energy prices will stress the lower and middle class nationwide.

It is obvious to me that the ultimate goal of raising royalty rates on federal coal is not to increase revenue, but to instead put more stress on the already burdened coal industry.

Other Sections: 8.8

Comment Excerpt Text:

It is in the country's best interest to incent the export of coal from BLM coal lands. When coal is economically viable as an export commodity these exports provide a positive contribution to the nation's taxpayers in a number of ways:

1) The taxpayer is paid a royalty on the coal mined and sold as well as a Bonus Bid when new coal lands are leased. This income reduces the tax burden on individuals for the same level of services from government which enhances our standard of living or lowers the public debt. As mentioned before the basis for royalty needs to continue to be the net back price at the mine loading point to account for the costs to transport the coal to the port and port charges along with other costs to move the coal to the market. This method recognizes the geographic impacts due to the reserve location.

2) The sale of coal to other countries increases the demand for coal mined in the United States, which creates high quality jobs in the United States along with the income taxes from those jobs and jobs in the support industries associated with this production. This reduces the amount of taxpayer money paid out in unemployment or indigent support payments reducing the tax burden on individuals and enhancing our standard of living.

3) Export sales improve the balance of payments for the United States and put the nation in a stronger position financially.

4) Generally speaking the types of coal that are exported by the United States tend to be higher quality than those in the countries where it is imported. This has the potential to reduce emissions in those countries.

5) Energy produced by the United States and shipped to our allies provides a stable and reliable source of energy to those countries and can reduce their dependence on politically less stable sources. (Specifically Europe and the potential to reduce their exposure to gas produced in Russia).

6) Coal mines in the United States have safety records that are the envy of the world. With few exceptions coal mined in the United States results in fewer injuries and fatalities than coal mined in countries that import coal. Incenting the export of coal from the United States might displace coal mined with greater numbers of injuries or death. (Specifically China although the comment applies to other countries as well.)

7) The United States requires all coal mining operations to meet very high standards with respect to reclamation, much more rigorous than many of the nations that import coal. Coal exports from the United States might displace coal production from other countries that have less stringent reclamations standards thus netting cleaner air and water than the alternative.

8) Export of coal from the United States to other countries enables them to increase the number of households that have electrical power available to them. IEA reported recently that 1.2 billion people do not have access to electricity, and that 2.7 billion people do not have access to clean cooking facilities. Coal exports from the United States enables countries to expand their electric generation capacity to more households. The World Bank indicates that households with access to electricity and clean cooking facilities have longer life spans, so incenting coal exports from the United States can result in improving standards of living in countries where imports occur and increase life spans.

Comment Excerpt Text:

Because Tri-State is a not-for-profit association of rural electric cooperatives, any increase in the cost to generate and deliver that electricity, such as increasing the cost of the fuel, is directly borne by the our member systems, many of whom serve consumers that can least afford increased electricity rates. Tri-State's member systems serve some the most rural and economically disadvantaged families in the western U.S. Member system residents typically pay a higher percentage of their income for electricity in the rural West because there are so few consumers per mile to share the cost of its development and delivery. An increase in the cost of coal production does not provide a more "fair return from the development of these publicly owned resources" for these taxpayers, but does add extra costs and the possible loss of jobs and community services.

The impacts of the cost to mine federal coal on the cost of the electricity it generates and the impact that the increased cost of electricity has on the American taxpayer in the rural West.

o The dependence of state and local governments on the royalty payments and taxes and the benefits that they provide for local communities in the rural west.

Comment Number: 0020052-7

Organization I: Tri-State Generation and Transmission Association, Inc.

Commenter I: Barbara A. Walz

Comment Excerpt Text:

Production plays a vital role supporting rural communities and their ability to maintain key government services. Many of these rural communities have grown up around the implementation of the federal coal program. For example, Tri-State (Tri-State, through its ownership of Elk Ridge Mining and Reclamation) owns and operates the Colowyo Mine (Colowyo), located in northwest Colorado, about 26 miles southwest of the town of Craig. Colowyo has been conducting surface mining operations since 1977 and holds several federal coal leases from which it produces coal for sale. Since 2012, when Tri-State purchased the mine, Colowyo has generated over \$32 million in royalty payments. Much of this has gone to the state of Colorado and been distributed through various mechanisms to local communities. Coal mining and the electric power generation industry are major economic drivers for communities in northwest Colorado and benefit greatly from the revenues resulting from energy production. Another example was highlighted in a recent article in the Denver Post (June 23, 2016), which discussed how the loss of federal coal production revenue to the community of Oak Creek, Colorado has impacted to school, fire protection, library services and the local cemetery.

Commenter I: Alex Johnson

Comment Excerpt Text:

The coalmines have invested in our communities. They have supported generations of families who built the homes and streets and irrigation canals that have made our Valley so productive. For more than a century, coal and agricultural -- agriculture have gone hand-in-hand. Farmers mined coal. And coal miners farmed. Together, the Western Slope Conservation Center, local coal mines, and community residents formed good neighbor partnerships that not only mitigated impacts, but directly supported conservation of the North Fork Valley. Offering just one example, over the last 15 years, the West Elk Mine and the Western Slope Conservation Center have worked together to put over 11,000 acres of private land into conservation easements, conserving our agricultural heritage forever. But, this is a difficult and historic moment for our Valley. In the last two years, the local coal mines have laid off nearly 900 well-paid employees. Two of the coal mines have shut down indefinitely, with Oxbow having just demolished its rail silo this past month. The reality of our community is that we are now looking into an unknown and scary future.

Comment Excerpt Text:

But, as the Outdoor Rec Coalition, we don't have really a horse in this race. What I'm doing here is we're actually wanting to offer our hand and our help as a coalition of manufacturers of outdoor goods to the people, the community, and the land managers of the North Fork Valley. We're looking at a diversification of the economy up there. We've done this in the past. We've done it with Fruita. We've done it with Cortez. We're doing it right now with Ridgeway, Colorado. In fact, a guy came down from Ridgeway, and after having ridden their mountain bike trails that were just put in, and he said it's going to be like printing money up there. But, I think what we're trying to do is we would like to help drive tourism up into the North Fork Valley. We would also like to drive entrepreneurs and manufacturers and people with higher educations. We would like to take and drive people into the area so that the people in the North Fork Valley can take advantage of those extra tourism dollars and those opportunities to start businesses of their own. You know we've seen this happen in Grand Junction. We've got businesses like Bonsai Designs, who design zip-lines that go -- send them all over the world. We've got Lightner Plummer [phonetic] who designs chair lifts and sends them all over the world. Mountain racing products. Cortez has osprey packs. So, certainly there's, there's life after minerals have been played out or did they lose their pricing. And I'm one of those people. I, I have a welding and fabrication shop here in Grand

Junction. You know one of the things that we started back when Oxbow had the accident which locked in their, their [indiscernible] equipment, was working with tourism officials, both at the State and the local level, to develop a plan. And we've had [indiscernible] work on this. Develop a plan to drive tourism into the area. And we hope that that plan and working with you in this room, we can additionally give some economic boost to the area.

Comment Excerpt Text:

Opponents of the coal moratorium correctly argue that the coal industry provides jobs and economic benefits to working class towns that need it. According to the U.S. Energy Information Administration, about 56,700 Americans are employed in coal mining; down from 80,000 in 2014. These workers are drawn to coal because jobs are a plenty. The U.S. still gets one-third of its energy from coal. Coal companies claim that we cannot replace the jobs that they provide with jobs in the green industry. The data says something different. Worldwide, there are more jobs in renewables than coal mining, oil, and gas combined. As fossil fuels dry up, workers are turning to the solar sector. There are already twice as many solar workers in the U.S. as there are coal miners. 31,000 new solar jobs were created in 2014 alone. With wise policies centered around green energy subsidies, we could create thousands of jobs, effectively nullifying the job loss experienced during the inevitable and necessary divestment from fossil fuel based energy.

The Coal Leasing Program is more than fair. And coal mines benefit the communities they affect in an overwhelmingly positive way

Comment Number: 00001276_Bear_20160623-2

Commenter I: Bill Bear

Comment Excerpt Text:

Many local communities have built school systems and other needed infrastructure on the continued mining of coal. What, if any, alternative will be offered to replace this lost revenue from the leasing and the mining of coal? Limiting or denying the leasing of coal destroys coal companies, as well as other related industries, such as transportation systems, including railroads. What impact will the reduction of [indiscernible] put on the rail have

on the overall [indiscernible] and the cost of goods delivered to distant destinations? How will the Federal Government manage or pay to hold the cost related to transportation to what they are -- to what they were before the eliminating the lease of -- leasing of coal? Electric utilities have been able to supply low-cost power to their consumers, based on the fact that their two large users helped defray the utilities fixed cost. With the loss or the curtailing of these large users, the fixed costs are going to be dumped onto the little guy, driving up their cost. How many will be able to absorb the extra burden? The Programmatic EIS needs to address this and how the Federal Government and those driving this process are going to help pay for that.

Comment Number: 00001276_Bear_20160623-3

Commenter I: Bill Bear

Comment Excerpt Text:

In Delta County, we are seeing vital support industries, such as medical, leaving. Doctors and their employees are leaving the area because they can no longer generate revenues to sustain their practices. A healthy mining community provides medical insurance to their employees as a benefit of their employee. With the diminishing job market for miners and subsequent cash flow streams to doctors and hospitals, these community resources are beginning to disappear. How will the Federal Government address this?

Comment Excerpt Text:

Washington and Greene Counties are communities where almost no one owns the rights to their coal. Greene

County just in the past couple years was the third largest coal-producing county in the country, home to the largest underground coal mine in the country. These are frontline communities directly impacted by coal every single day for people who live there. So not having the rights to their coal means so many people are forced to live with the harms of the coal industry, destroyed streams, displaced communities, reduced tax base, destroyed property values.

Comment Number: 0000871_Kasserman-I

Commenter I: Krissy Kasserman

Comment Excerpt Text:

continued federal coal leasing diverts our attention from the real work, transitioning coal communities like mine to a clean energy future. The transition to a clean energy economy will create new jobs and new opportunities for those of us living in coal country. Some of these new jobs will be in reclamation, reclaiming and restoring old dangerous and polluted mine sites which foul our streams and create a danger to community. We want time and opportunity to assist communities in moving forward. And we can be using funds released by the U.S. government to manage the Federal Coal Leasing Program to enhance this transition or to restore these legacy sites. The Federal Coal Leasing program should be ended in order to save taxpayers money, protect public land and to begin the meaningful transition for coal communities here in Appalachian and beyond.

Commenter I: Anna Marie Frazier

Excerpt Text:

am a resident of Navajo (Native American) reservation where there are 2 large coal mines active - one is closed. There are also 2 large coal burning power plants all located on Navajo land. Existing along border of Navajo land are two more large power plants. The coal mines were developed in 1930's and continuing today.

The health impacts from the coal has been devastating to our people - health has declined from the mines and

power plants operating year round 24/7 days a week for 364 days a year releasing 14,491,316 tons of carbon dioxide, 39,189 tons of Nitrogen Oxides, 11,144 tons of Sulfur Dioxide and 445.75 pounds of mercury.

The contaminants from coal mining have impacted our drinking water as well. Today we are fighting for our share of use of Colorado River and LC's although we have first residents rights to the water - the corporations don't acknowledge the initial agreements and laws that relate to Indian Country.

In the case of coal mining on Indian lands - federal review process leaves the Tribal Coal off the table, while it should be treated similar to any other states.

I encourage the Federal Government that has oversight over Tribal Lands to begin closure of coal mining so the land can heal as well as healing for all living species.

Commenter I:Raymond Estrada

Comment Excerpt Text:

And I come here as an eyewitness to the effects of coal and the effects of the climate change on a traditional level. This year alone we've had -- we've seen a -- the earliest harvest of our traditional foods. It's been about a month, month and a half early, and we've also seen the shortest harvest our foods, our traditional foods that we hold dear to us. It's only been about two weeks that we've been able to gather our foods that we rely on for many events throughout the year, many traditional funerals, traditional gatherings that we cannot support most of these gatherings anymore because the food is not there because of the climate change. And I am also a traditional fisherman and have witnessed many things happen on the Columbia River. I've seen a lot of fish and a lot of the effects that we, as people, have had on the salmon itself and on the sturgeon and all the other river ecosystem, and one being taking our Celilo Falls away to build a railroad bridge and the dams on the Columbia River for electricity. I encourage the Bureau of Land Management to have a hearing just for tribal leadership because we are nations within a nation. We are with the United States but we are separate. We reserved that right in our traditional treaties. And I would hope that you would hear my words and address our leaders through not only in the Yakama Nation but all the nations throughout the United States that are affected by this and our traditional foods that are affected by this.

Organization I:Northern Cheyenne Tribe

Commenter I:Kaden Walksnice

Comment Excerpt Text:

Our reservation is almost surrounded by coal mines, and we're fighting to protect our land. And in fact, the Powder River coal basin is all ancestral Cheyenne territory from Montana all the way down into Colorado. So anything that happens affects our people.

Comment Number: 0001195-1

Commenter I:Ramona Owen

Comment Excerpt Text:

It's important to remember that industrialized nations have made decisions regarding the use of natural resources that not only impacts citizens of that nation but eventually small, nonindustrialized nations all around the world. Right now the Pacific Ocean is rising and encroaching on the homes of Belauan people. Recently a large and important taro plant garden that provides a traditionally sacred and critical food supply to an entire village has begun dying. This is due to the elevation of sea levels and acidification impacting coasts and islands.

Comment Number: 0002009_CenterBioDiversity_20160329-13

Organization I:WildEarth Guardians

Commenter I:Jeremy Nichols

Comment Excerpt Text:

We also strongly urge that as you undertake reforms to modernize the way federal coal is managed, that you also give considerations to the way tribal coal is managed. We understand there are significant differences between the management regimes and fully support the sovereign authority of tribal nations. At the same time and recognizing the broader impacts of coal, we urge Interior and tribal nations to work together to ensure the management of tribal coal is also modernized with full consideration of climate impacts. At a minimum, we urge

you to ensure that tribal interests are consulted as federal coal reforms, are undertaken. The concerns raised during last summer's listening sessions highlight the impacts of the federal coal program to tribal interests, and the corresponding need for consultation.

Indian treaties should be taken into consideration and the Indians' present desires should both be included in the PEIS scoping.

Comment Number: 0002383_Wilson_20160721-1

Organization I: Crow Nation Executive Branch

Commenter I: Dana Wilson

Comment Excerpt Text:

What does it mean to me as a tribal official? 2/3 of my budget comes from coal mining. That's depending on coal sales but that averages out to about \$17 million a year. That supports a lot of jobs and a lot of people are dependent on that. Also, every single tribal member gets a capital payment that is similar to a dividend, they reap the benefits, every tribal member does – that's our rule they get a check every quarter from coal. So I am a little worried about this moratorium. It doesn't affect the leasing of Crow coal, however, it could have some spillover effects that can affect me.

Comment Number: 0002383_Wilson_20160721-2

Organization I: Crow Nation Executive Branch

Commenter I: Dana Wilson

Comment Excerpt Text:

There is a set of regulatory hurdles. Especially the unreasonable restrictions the development on our coal it's not only making it hard on us but what the coal companies do to export coal. Suspending or further impeding Indian coal leasing would be an infringement on tribal sovereignty.

Organization I: National Wildlife Federation Action Fund

Commenter I: Jim Lyon

Comment Excerpt Text:

In addition, NWF has significant concerns about the environmental and cultural impacts of mining to our tribal partners. We have worked with the Northern Cheyenne Tribe, and many other tribes, for over a decade to prevent the development of the largest proposed coal mine in the U.S., the Otter Creek Mine. The threat of this mine to tribal communities is immense and is dramatically amplified by the fact that mining companies are subject to a low royalty rate and that federal lands are opened up to new coal development prior to the companies meeting their obligations for reclamation of existing mines. Taxpayers should not be left on the hook for the

costs of mine cleanup, nor should tribes and other Americans suffer the brunt of new mines before existing mines are reclaimed

Organization I: Navajo Nation

Commenter I: Anna Fraser

Comment Excerpt Text:

And the problem with that is that the Federal regulations that are supposed to have been protecting the citizens of the communities throughout our nation, does not really have that strength or whatever. I mean it's not being utilized enough to protect the people that are impacted. Because we have on our Reservation, there's two [indiscernible]. One on Black Mesa, that produces coal. And it transports it over to a Navajo generating station right along the [indiscernible] right along the Colorado River. And that, that power plant pumps water from Parker, Arizona. And then, it, it sends the water to Phoenix, Arizona, where they water their plants and build swimming pools and, and golf courses and whatnot. But, here on our Reservation, we are -- you know we, we're fighting for the water, as well, because we're in a drought area. So, those at the things that are, are very concerning for us. And there's also another power plant over at the Navajo, Navajo Mine. There's a Navajo Mine, a coal mine. And then, right next to it, is the San Juan generator station that's near Farmington, New Mexico. And, and from that, power is also going down to [indiscernible] City, Arizona, and then on to Phoenix, too. So, we don't see any of the power that, that is going off of our Reservation at all. So, in the -- and, and what happens there with that is that the power is -- it goes down to Phoenix. And our Navajo Tribe has to buy the power back to Navajo Tribal Utility Authority, which is the only utility company for our Reservation. So, we have to almost like double -- it's a double pay -- oh, goodness, it's [indiscernible]. Anyway, I just wanted to say that it's really devastating for our, our Navajo people to be in that situation.

Issue 10 - State's interests and concerns

Total Number of Submissions: 13

Total Number of Comments: 15

Comment Number: 00000111_Deutsch_20160517-1

Organization I: North Dakota Public Service Commission

Commenter I: Jim Deusch

Comment Excerpt Text:

I think the BLM needs to understand the federal coal situation is different in North Dakota. It's only about 15 percent of the lands that are on federal land and BLM does not own any of the surface. The rest of it is all either private or state-owned coal. Mining companies when they -- before they sign their contracts, they typically lease all that federal coal or not just the federal coal, but the private coal that is necessary for the life of those contracts. The federal coal leasing comes later, and if they're unable to get the federal coal, they need to bypass those federal coal tracts. But they still have a surface lease to disturb the surface of that, and typically it is for roads, soil stockpiles, and sedimentation piles. If the federal coal ends up getting bypassed in these situations, the federal coal will never be mined in the future, and as a result of this, the federal government and the State of North Dakota loses this royalty and other revenues from that, and the rate of return to the taxpayers becomes

zero. Also mining around federal coal, it basically means more private coal has to be mined. So instead of eliminating or reducing the amount, the total amount of coal mined, it's just increasing the cost because typically what happens is they have to close the pit, open a new pit, go around the federal coal tracts, and that increases the cost significantly, and those costs then get passed on to rate-payers.

Comment Number: 0002329_Segger_20160724_CambellCntyWY-1

Organization I: County and Prosecuting Attorney's Office, Campbell County, Wyoming

Commenter I: Carol Seeger

Other Sections: 11

Comment Excerpt Text:

The potential impacts to state and local government resulting from a proposed change to the federal coal leasing program are not identified as being an issue that will be addressed in the environmental assessment. We specifically request that the economic impacts to state and local governments be included. Currently, there is an estimated 25 billion tons of economically recoverable coal located in the Powder River Basin with 343 million tons of coal being produced in Campbell County in 2013 accounting for 88% of the state's total production. Eighty percent of all coal in Wyoming is produced from federal and Indian lands.

Comment Number: 0002329_Segger_20160724_CambellCntyWY-2

Organization I: County and Prosecuting Attorney's Office, Campbell County, Wyoming

Commenter I: Carol Seeger

Other Sections: 11

Comment Excerpt Text:

Campbell County generated 120 million in revenue in FY2014 stemming from coal resources valued at 3.5 billion. In 2013, Campbell County collected 64.7 million in ad valorem tax with 85% coming from natural resource production. This percentage does not include the revenue generated by the service industries that support coal production nor the fact that 5,195 people representing approximately 11% of the county residents and 24% of total employment are directly employed by the coal mining industry. In addition to the revenue generated to support Campbell County government, a mill levy is also applied to the taxable value of the coal to support the Campbell County Hospital District, the Campbell County Cemetery District, the Campbell County School District, the Campbell County Weed & Pest District, the Campbell County Conservation District, the City of Gillette and the Town of Wright. Any EIS intended to evaluate the federal coal leasing program must address the economic impacts to state and local governments. Such impacts are without question relevant in evaluating the federal coal program.

Surface coal mining severely alters the landscape, disrupting virtually all ecological and aesthetic elements of the landscape and reducing the value of the natural environment in the mined area and surrounding land. Strip mining destroys the genetic soil profile, eliminates existing vegetation, displaces or destroys wildlife and habitat, and to some extent permanently changes the general topography of the area mined. This often results in a scarred landscape with no scenic value. Soil disturbance results in conditions conducive to erosion. Soil removal from the area to be mined alters or destroys many natural soil characteristics and reduces its biodiversity and productivity for revegetation and agriculture. Paleontological, archeological, cultural, and other historic features and values may be endangered due to the disruptive activities of mining coal.

Comment Excerpt Text:

When coal is burned, toxins in the coal are released into the smokestack. If modern air pollution controls are in place, airborne toxins are captured through filtration systems before they can become airborne. The captured toxins end up in coal ash. As a result, heavy metals such as mercury are concentrated in what the EPA considers "recycled air pollution control residue." This only delays the exposure of the public to these toxins. The EPA concedes that all coal ash landfills eventually leak, and Federal regulation of coal ash landfills is minimal. Rain falling on ash piles leaches out these heavy metal compounds. The heavy metals eventually end up in ground water, or in lakes and streams, contaminating drinking water sources.

Comment Excerpt Text:

Another aspect of reclamation is restoration of water resources, including surface and groundwater hydrology. SMCRA requires coal operators to: assure the protection of the quality and quantity of surface water systems from the adverse effects of mining; restore the recharge capacity of the mined area to approximate pre-mining conditions; and, in Western states, preserve the essential hydrologic functions of most alluvial valley floors. (156) Where they cannot assure that the quantity of water will be protected, surface mine operators must provide an

alternative water source. (157) Since coal seams serve as aquifers in much of the western United States, such as in the Powder River Basin, demonstrating the ability of water (both pre-mining quality and quantity) to return to mined lands can be the most difficult reclamation requirement.

(156) Mark Squillace, THE STRIP MINING HANDBOOK at Ch. 7 (Participating in Bond Release Proceedings), available at <https://sites.google.com/site/stripmininghandbook/>

(157) Id. at Ch. 5 (Reviewing a Permit Application).

Organization I: National Wildlife Federation Action Fund

Commenter I: Jim Lyon

Comment Excerpt Text:

Surface coal mining adversely affects surface water and groundwater. Coal beds often contain underground aquifers, which are dewatered or destroyed during mining, which in turn leads to lowering of water levels in adjacent areas and changes in flow direction within aquifers. Other adverse impacts include contamination of usable aquifers below mining operations due to infiltration (percolation) of poor-quality mine water as well as increased infiltration of precipitation on spoil piles, which can result in increased runoff of poor-quality water and erosion from spoil piles, recharge of poor-quality water to shallow groundwater aquifers, and poor-quality water flow to nearby streams. Infiltration may contaminate both groundwater and nearby streams for long periods. Deterioration of stream quality results from acid mine drainage, toxic trace elements, high content of dissolved solids in mine drainage water, and increased sediment loads discharged to streams. When coal surfaces are exposed, pyrite comes in contact with water and air and forms sulfuric acid, which moves into waterways during precipitation events. Also, waste piles and coal storage piles can yield sediment, acid, and toxic trace elements to streams that can harm wildlife. Surface waters may be rendered unfit for agriculture, human consumption, bathing, or other household uses.

Open-pit mining requires large amounts of water for coal preparation plants and dust suppression. To meet this need, mines acquire (and remove) surface or groundwater supplies from nearby agricultural or domestic users, which reduces the productivity of these operations or halts them. These water resources, once separated from their original environment, are rarely returned after mining, presenting flow harms for wildlife and harming other water uses. This can be a significant problem in places like the arid west, which comprise the vast majority of federal coal leasing.

Comment Number: 0002459_Ball_20160728-2

Comment Excerpt Text:

Groundwater Depletion

Western coal mining often takes place in very arid environments, with limited rainfall and surface water resources. Thus, successful reclamation of rangeland requires not only establishing surface vegetation, but also replacement and restoration of pre-mining water resources, the impacts on which must also be fully considered.

As such, BLM should analyze and disclose the bond release status of previously leased acreage, and assess associated impacts related to water resources. OSMRE dictates that, “[a]chievement of surface water quality and quantity restoration can be measured by acres of Phase III bond release.” OSMRE Wyoming 2009 Report at 9. There is no other objective measure of water quality and quantity restoration (sufficient to allow post-mining land uses) that BLM could substitute for its evaluation.

Additionally, BLM should review previous NEPA analyses for federal coal leases, analyses which have disclosed significant – and irreversible – impacts to groundwater resources. For instance, the Wright Area Leases Final Environmental Impact Statement for the Powder River Basin in Wyoming disclosed: “[t]he overburden and coal aquifers within the leased tracts would be completely dewatered and removed, and the area of drawdown caused by overburden and coal removal would be extended...” Bureau of Land Mgmt., Final EIS For the Wright Area Coal Lease Applications, 3-111 (July 2010). According to the EIS, “the effect of coal mine dewatering on the Upper Fort Union from 1990 to 2010...is a cumulative drawdown ranging from...50 to 150 feet in the vicinity of the Black Thunder” mine. Id. at 4-62. BLM states that “[t]he rate and extent of the actual drawdown in the coal is currently much greater than the life-of-mine drawdown predictions,” and that “[r]oughly 30 years of surface mining and the more recent CBNG development have resulted in complete dewatering of the coal aquifer in localized areas...” Id. at ES-40, 3-118. Additionally, the agency discloses that “resaturation of coal mine pit backfill to form backfill aquifers may take approximately 100 years after cessation of mining.” Id. at ES-67 (emphasis added).(24)

(24) These statements essentially acknowledge that coal mining is resulting in material damage to the hydrologic balance of ground and surface water and that compliance with SMCRA’s statutory requirement to restore the regional Fort Union coal aquifer to “pre-mining conditions” may in fact be impossible.

Coal mining also uses substantial amounts of water for dust control, extraction (i.e., to cool equipment and prevent fire), and processing (e.g., coal washing). The Department of Energy estimates that U.S. coal mining uses approximately 70 to 260 million gallons of water per day, with average uses of 10 gallons per ton of coal mined on the surface in the West. See Hein and Howard at 10. Most, if not all, of this water comes from underground sources. The PEIS should provide a cumulative analysis of these impacts and direction for considering these impacts in future site-specific EISs.

Comment Excerpt Text:

Groundwater Depletion: Coal mining has caused complete dewatering of aquifers formerly used for drinking water and livestock watering. The Surface Mining Control and Reclamation Act (SMCRA), 30 U.S.C. §1201 et seq., creates responsibilities to restore both the quality and quantity of aquifers; however, companies are far behind on meeting these obligations, especially at a landscape scale.

Delayed Reclamation and Corresponding Impacts to Other Land Uses: The gap between disturbed and reclaimed lands continues to grow. After decades of mining, across 562 square miles of land in Colorado, Montana, New Mexico, North Dakota, Utah, and Wyoming, only 77 square miles have been fully reclaimed and released from bond, meaning that the vast majority of lands have not met regulatory requirements for re-vegetation and water restoration necessary to sustain pre-mining land uses. Western Organization of Resource Councils, et al., *Undermined Promise II*, available at www.underminedpromise.org. This lack of reclamation prevents land from being returned to its prior use of habitat for wildlife and livestock. Unreclaimed lands can also lead to the spread of noxious weeds and can contribute to air quality impacts. Due to down market conditions for coal, the threat of failed and untimely reclamation is becoming even more prevalent for companies that are “self-bonded.”

The PEIS must also address the substantial hydrological impacts of coal leasing. In the water-scarce western U.S., groundwater, intermittent surface water and sub-irrigation are vital to the environment and the economic base. Mined coal seams often contain groundwater aquifers that nourish springs, wells, streams, and natural systems. Coal mining pollutes both surface and groundwater resources, often increasing levels of suspended solids and sediment load in streams and wetlands nearby. This in turn can increase ventilation rates, reducing oxygen levels for aquatic life. Suspended solids can also diminish light penetration through water, limiting aquatic plant productivity. See *Undermined Promise II* at 30.

Surface waters can become contaminated from the leaching of toxic substances from exposed ore, waste rock, and overburden. In Wyoming and Idaho, for example, dust from the surface mining of coal in areas with selenium containing overburden was found to cause selenium levels to increase in the environment. Selenium leaches from coal ash and coal mine waste into nearby water and soil and heavily impacts aquatic ecosystems, where it can easily reach toxic concentrations and bio-accumulate through the food chain. In several lakes and reservoirs, selenium has been linked to reproductive impairment in fish and waterfowl. Contamination of groundwater usually occurs as the result of the leaching of ions from soils or the leakage of chemicals from waste-management facilities. See Helmut Meuser, *Contaminated Urban Soils* (Springer Sciences 2010) at 39; see also Richard S. Ogle et al., *Bioaccumulation of Selenium in Aquatic Ecosystems*, 4 *Lake and Reservoir Management* 2 (1988).

Before coal can be transported to power plants, it must be washed to remove soil and rock impurities. Coal washing uses polymer chemicals and large quantities of water and creates a liquid waste called slurry. Slurry ponds can leak or fail, leading to injury and death, and slurry injected underground into old mine shafts can release arsenic, barium, lead, and manganese into nearby wells, contaminating local water supplies. 160 (160) See A. Lockwood, et al., *Coal's Assault on Human Health* at 4; E. Burt, et al., *Health Effects from Coal Use* at 3.

Comment Excerpt Text:

Impacts to water resources: “Water resources across large areas of the country are at serious risk from climate change, with effects on water supplies, water quality, and adverse effects from extreme events such as floods and droughts. Even areas of the country where an increase in water flow is projected could face water resource problems from the supply and water quality problems associated with temperature increases and precipitation variability, as well as the increased risk of serious adverse effects from extreme events, such as floods and drought. The severity of risks and impacts is likely to increase over time with accumulating greenhouse gas concentrations and associated temperature increases.”²²

Impacts from sea level rise: “The most serious potential adverse effects are the increased risk of storm surge and flooding in coastal areas from sea level rise and more intense storms. Observed sea level rise is already increasing the risk of storm surge and flooding in some coastal areas. The conclusion in the assessment literature that there is the potential for hurricanes to become more intense (and even some evidence that Atlantic hurricanes have already become more intense) reinforces the judgment that coastal communities are now endangered by human-induced climate change, and may face substantially greater risk in the future. Even if there is a low probability of raising the destructive power of hurricanes, this threat is enough to support a finding that coastal communities are endangered by greenhouse gas air pollution. In addition, coastal areas face other adverse impacts from sea level rise such as land loss due to inundation, erosion, wetland submergence, and habitat loss. The increased risk associated with these adverse impacts also endangers public welfare, with an increasing risk of greater adverse impacts in the future.”²³

Unlike most states, Wyoming has laws and regulations that address all aspects of surface and groundwater within coal mining permit areas as well as offsite. In this capacity, the State Engineer's Office regularly coordinates with the DEQ, LQD to prepare cumulative hydrologic impact assessments for the coal production permitting process under provisions of the Wyoming Environmental Quality Act. This Act requires that no coal mining activity is to

be approved in Wyoming unless the operation is designed to prevent material damage to the hydrologic balance outside the permit area.

It is important that the BLM analyze the regulatory control exerted by Wyoming in any consideration of the quantity and quality of water resources, including aquifer drawdown and impacts on streams and alluvial valley floors.

Comment Excerpt Text:

A recent BLM lease (ALES-055199) of 160 acres was awarded to Narley Mine No. 3 utilizing the “emergency lease” qualification, under the premise that the 868,423 tons of recoverable federal coal were needed within a three-year timeframe to maintain an existing mining operation – the adjacent Narley Mine. Operated by Best Coal, Inc., Narley Mine No. 3 (surface mine) is permitted by the U.S. Army Corps of Engineers (NWP 21: SAM-2012-00615-CMS), the Alabama Surface Mining Commission (P-3954) and the Alabama Department of Environmental Management (NPDES: AL0075752). NPDES AL0075752 allows discharges through six sediment basins to an unnamed tributary to Trouble Creek, which flows into Trouble Creek, and then into the Locust Fork of the Black Warrior River in Jefferson County, AL. Sediment basins are allowed to be placed within streams in Alabama by utilizing a grandfather provision to exercise use of the old Nationwide Permit 21. This Corps permitting system is outdated and destructive – its use was discontinued in all other Appalachian coal mining states years ago. Sadly, its use has been allowed to continue in Alabama. It is stated that fill impacts would not be had by this operation on Trouble Creek, but there will be fill impacts to Trouble Creek’s tributaries. For this mine, SAM-2012-00615-CMS allows for the destruction and fill of 4,080 linear feet of intermittent streams and 7,106 linear feet of ephemeral streams. Headwater tributaries and their critical ecosystem functions should not and cannot be overlooked when considering the cumulative impacts of an operation within a watershed. Placement of fill and sediment ponds in drainages and tributaries is a key concern of Black Warrior Riverkeeper, and we believe this is a practice allowed by NWP 21 that should be expressly banned. These streams are headwater tributaries, and any impacts to them eventually have a downstream cumulative impact on the Locust Fork. A 100 foot Stream Buffer Zone cannot and should not be touted as a sufficient measure to protect water quality and aquatic species, as it is in the EA on page 46.

Impacts to Water Coal mining depletes aquifers and pollutes groundwater and surface water. The PEIS should

examine these direct effects of coal mining, as well as the indirect impact on water resources due to climate change spurred by the mining and burning of federal coal. As with land, water resources are permanently altered by coal mining. BLM has acknowledged that mining coal means removing aquifers that are never reclaimed, but instead are replaced with homogeneous backfill material. 137 As mines are dewatered, groundwater levels decline under surrounding lands. 138 The cumulative effect of mining-related drawdown and groundwater depletion from coalbed natural gas development in the same areas can be substantial. In addition to groundwater depletion, coal mining impairs water quality. BLM has observed that, as a general matter, concentrations of total dissolved solids, calcium, magnesium, and sodium sulfates all are elevated in mined areas compared to undisturbed areas. 139 These same pollutants may discharge to surface waters. In addition, coal mining can pollute surface waters with selenium, which is naturally present in coal and mobilized into the environment when coal-bearing strata are exposed to air and water. 140 Because selenium is toxic to aquatic 134 U.S. Government Accountability Office, *Climate Change*, at 3. 135 National Climate Assessment and Development Advisory Committee, *CLIMATE CHANGE IMPACTS IN THE UNITED STATES* at 4 (2014). 136 See U.S. Government Accountability Office, *Climate Change*, at 23. 137 Bureau of Land Management, *Wright Area FEIS*, at ES-40; see also *Alton Coal Tract Lease by Application Draft Environmental Impact Statement*, at ES-14 (Nov. 2011), available at http://www.blm.gov/ut/st/en/prog/energy/coal/alton_coal_project/alton_coal_eis.html (last visited July 27, 2016). 138 Bureau of Land Management, *Wright Area FEIS*, at ES-40. 139 Bureau of Land Management, *Wright Area FEIS*, at 3-115. 140 D. Lemly, *AQUATIC HAZARD OF SELENIUM POLLUTION FROM COAL MINING*, Fosdyke, Gerald B. ed. *Coal Mining: Research, Technology and Safety* (2009), available at <http://www.srs.fs.usda.gov/pubs/33826> (last visited July 26, 2016). 44 life and bioaccumulates in food chains, even “a small amount of selenium in water can translate to a significant environmental hazard.” 141 The PEIS must examine these and other direct impacts to ground and surface waters due to mining federal coal. Further, the nation’s bodies of water are vulnerable to the impacts of climate change catalyzed and accelerated by fossil fuel development. 142 These existing and future impacts are broad and can range from drought, to altered runoff patterns, to a lack of drinking water and adverse effects on that dwindling water supply, to ocean acidification, and even to damage to national marine sanctuaries. While rising sea levels due to climate change will affect enormous portions of coastal lands, 143 the impact on water will persist far inland as well. A common problem will be drought, which is expected to become worse in broad regions ranging from California, to South Dakota, to Georgia. 144 As these droughts worsen surface and groundwater supplies will begin to steadily decrease, resulting in widespread water shortages. 145 These shortages affect not only the human population, but can be harmful to aquatic and terrestrial ecosystems and may even cause land subsidence. 146 As these natural processes are adversely impacted by climate change the quality of the available water will also begin to decrease. 147 Poor water quality can be hugely detrimental to the health of human populations, wildlife populations, and vegetation. 148 To make matters worse, these impacts on water quality will not be restricted to those areas facing drought. Many areas will face increased flooding due to climate change which in turn can also contribute to contaminated water supplies. 149 141 *Id.* 142 See U.S. Environmental Protection Agency, *Water and Climate Change Research*, at <https://www.epa.gov/water-research/water-and-climate-change-research> (last visited July 21, 2016). 143 National Oceanic and Atmospheric Administration, *Sea Level Rise and Coastal Flooding Impacts*, at <https://coast.noaa.gov/slr/> (last visited July 21, 2016). 144 Center for Climate and Energy Solutions, *Drought and Climate Change*, at <http://www.c2es.org/science-impacts/extreme-weather/drought> (last visited July 21, 2016). 145 National Climate Assessment and Development Advisory Committee, *CLIMATE CHANGE IMPACTS IN THE UNITED STATES* at 70. 146 United States Geological Survey, *Groundwater and Drought*, at <http://water.usgs.gov/ogw/drought/> (last visited July 21, 2016). 147 National Climate Assessment and Development Advisory Committee, *CLIMATE CHANGE IMPACTS IN THE UNITED STATES* at 86-88. 148 See generally Peter S. Murdoch, Jill S. Baron, & Timothy L. Miller, *Potential Effects of Climate Change on Surface-water Quality in North America*, 36-2 *JOURNAL OF THE AMERICAN WATER RESOURCES ASSOCIATION* (2007) (broadly discussing the various impacts of poor water quality on various populations and ecosystems). 149 National Climate Assessment and Advisory Committee, *CLIMATE CHANGE IMPACTS IN THE UNITED STATES* at 80-81; U.S. Environmental Protection Agency, *Natural Disasters – Flooding* at <https://www.epa.gov/natural-disasters/flooding> (last visited July 21, 2016). 45 Consequently, largely varied regions

from southern Florida to northern Arizona will be exposed to water-related and climatologically caused risks. 150 These negative impacts are not limited to coastal water, as even the oceans themselves face increased temperatures and acidity. 151 As ocean acidity and temperature continue to stray further away from their norms they will create a variety of problems for aquatic and coastal areas. 152 Even minor fluctuations in ocean pH levels or temperature can lead to more severe hurricane seasons, tidal patterns, and coastal precipitation. 153 These impacts also persist deep below the ocean's surface. 154 This in turn threatens national marine sanctuaries. 155 As these sanctuaries provide a stable environment for marine ecosystems, a disruption of the sanctuary due to acidification, water temperature, current patterns, or any other oceanographic element of climate change, would not only adversely affect the ecosystem itself, but may also inhibit scientific research being done within the sanctuary that may otherwise help stem the tide of these negative impacts. 156 Like land-based indirect impacts, water-based indirect impacts of climate change are not easily contained, and their harm cannot easily be mitigated once the damage is done and current management practices may become insufficient. 157 As a result, it is imperative that actions be taken to reduce the harm to the nation's water resources before mitigation becomes improbable.

Degradation of aquatic habitats is a major impact of coal mining, and may be apparent many miles from a mining site. Sediment contamination of surface water is common with mining. Sediment yields may increase to a thousand times their former level as a result of strip mining. The heaviest sediment pollution of a drainage normally comes within 5 to 25 years after mining. In some areas, unreclaimed spoil piles continue to erode even 50 to 65 years after the area has been mined.

When developing the EIS on BLM's coal leasing program, we ask that you take into account the true cost of coal including the consumption of this fossil fuel on ocean acidification. The shellfish on the Pacific Coast are our "canary in a coal mine," and our Pacific shellfish are on the brink of a major disaster. The Whiskey Creek Shellfish Hatchery on Netarts Bay, our state's cleanest estuary, has recently invested hundreds of thousands of dollars in water quality equipment just to ensure that their oyster juveniles survive. Prior to the water quality equipment, they were losing up to 80 percent of their juvenile oysters that fuel a multi-million dollar industry on the Pacific Coast. That water quality equipment deals with ocean acidification. The Dungeness Crab Fishery on the Pacific Coast is worth million of dollars. The pacific shrimp harvest this year has closed off the Oregon coast. We have serious deterioration of the plankton that feeds our juvenile salmon as well as our forage fish. And probably most alarming is that now we're realizing ocean acidification from the effects of fossil fuel consumption 30 years ago, and we've more than tripled our consumption since then. We also need to take into account the chemical reaction that takes place from the coal dust that's left along our 150-mile drain system along the Columbia River affecting the chemical makeup of the waters that our salmon swim in.

A “lek,” or breeding ground, of the severely threatened sage grouse lies at the exact location of planned new coal expansion onto BLM land. Although the sage grouse species should have been listed for protection under the Endangered Species Act, it was not. Instead, an impractical plan has been agreed to by eleven western states to “manage” sage grouse habitat. This plan involves allowing key, essential sage grouse habitat to be taken over by coal strip--mining and other industrialization, while at the same time attempting to design new habitat, which, it is hoped, any sage grouse that survive may move on to.

This new habitat is being created by having machines crunch up miles and miles of beautiful native pinion and juniper trees, leaving the dead remains of the trees littering the ground, so that it is impossible even for a human to walk over them. It is hard to imagine the sage grouse doing their beautiful mating dance on top of broken, splintered trees. In some cases, nonnative grasses have been planted at these sites, which is ecologically inappropriate.

There is no proof that the sage grouse will move onto these miles and miles of destroyed trees, which do not in any way resemble sage grouse habitat. In the meantime, the habitat of all the native species who used to live there – the coyotes, the deer, the elk, the rabbits, the beavers, foxes, cougars, bobcats, and the many small mammal and avian species -- has been eradicated.

these public lands being considered for new coal expansion are right on a wildlife corridor that runs up through the Grand Canyon, through the Kaibab forest, through Kane County, Utah, and farther north on up to Canada. This is a key wildlife corridor for the annual mule deer migration, along with the animals that travel with them – including cougars and coyotes.

Coal mining also harms wildlife by polluting nearby water and air. Mining equipment emits sulfur dioxide, nitrous

oxide, and toxic trace metals such as lead in areas that oftentimes would otherwise be relatively free of these pollutants. In areas near access roads and other locations with heavy traffic, “increased levels of lead in vegetation and wildlife have been observed.” (15) Over time, increased exposure of wildlife to trace elements through dust from various mining activities can cause animals to “suffer from disorders of the mucous membranes and pulmonary complication.” (16) Surface water contamination from increased sediment loads and the leaching of toxic elements from exposed ores and rocks can cause decreases in aquatic oxygen content and light penetration, reducing the growth of aquatic plants and resulting in fish mortality as well as habitat degradation and destruction in streams. (17)

The study finds that both mule deer and pronghorn antelope in the Powder River Basin have “shown declines in population size or productivity or both in the past 32 years.” (89) For example, of eight mule deer herds examined, only one was found to be in good condition, three in fair condition, and half in poor condition. The report concludes that “[mule deer] populations are especially vulnerable to additional habitat loss or degradation.” (90) Similarly, of twelve pronghorn herds examined, none received a good rating. The rest were either fair or poor and one could not be rated for lack of data. (91) At-risk herds were again determined to be “especially vulnerable to loss of habitat.” (92)

Comment Excerpt Text:

It is of utmost importance that this PEIS provide the basis to reform the coal leasing program in a manner that protects wildlife from the vast impacts of federal coal mining and use. Wildlife are too often the first to be impacted by poor land management actions, unbridled energy development, and an increasingly warming world that threatens species extinction and decline. It is essential that the federal coal program be in sync with where this country is going toward building a clean energy future that is oriented to sustainable land and water conservation, and managed for the public's long term interest. It is also important that the federal coal program be updated to reflect the realities of the modern coal industry: an industry that is in a state of extreme instability and long-term decline, and one that has a standing legacy of failure to achieve basic promised and required environmental, wildlife and land use outcomes.

Wildlife is affected by coal mining in many ways. Mining and related activities cause direct wildlife mortalities and disturb and displace wildlife. Reptiles, amphibians and small mammals are generally not mobile enough to avoid mining equipment and are often directly killed during mining. Birds die when they collide with electrical transmission lines and other mine support structures. Fish and other aquatic wildlife are killed when streams are re-routed, and from construction and mining activities that occur near stream channels. (12)

(12) U.S. Forest Service General Technical Report INT-126, "Wildlife: User guide for mining and reclamation," (July 1982), available at <http://babel.hathitrust.org/cgi/pt?id=umn.31951d03009787s>.

Coal mining also fragments habitat and causes extreme disturbances that displace larger, more mobile wildlife. Displaced wildlife are placed at risk because, among other impacts like road crossings, they must move to locations already occupied by other wildlife and will experience greater competition for resources they need to survive.

Wildlife in habitat near mines like pronghorn and raptors are often forced to move given the intense noise and destructive activity associated with mining. For example, it has been shown that energy development taking place within 3 kilometers (1.86 miles) or less of greater sage grouse leks – areas where male sage grouse perform in front of females as part of the birds' mating ritual – can cause an increase in the distance females travel to nesting sites and result in lower rates of nest initiation. Despite federal laws passed in the 1970s that stopped some of the worst practices and put in place protections,

coal mining on federal lands – and the resulting combustion of that coal – continues to result in long-term damage to the soil, water, air, climate and wildlife. The major direct impacts of surface mining – the primary method used to extract most federally leased coal, particularly in the arid west –are massive disturbances of large areas of land and disruption of surface and groundwater patterns. Other significant impacts include emissions of fugitive dust and other air pollutants, carbon pollution emissions, disposal of overburden/waste rock, and water pollution. The disturbances have both immediate and long term impacts on people and wildlife populations.

Surface coal mining severely alters the landscape, disrupting virtually all ecological and aesthetic elements of the landscape and reducing the value of the natural environment in the mined area and surrounding land. Strip mining destroys the genetic soil profile, eliminates existing vegetation, displaces or destroys wildlife and habitat, and to some extent permanently changes the general topography of the area mined. This often results in a scarred landscape with no scenic value. Soil disturbance results in conditions conducive to erosion. Soil removal from the area to be mined alters or destroys many natural soil characteristics and reduces its biodiversity and productivity for revegetation and agriculture. Paleontological, archeological, cultural, and other historic features and values may be endangered due to the disruptive activities of mining coal.

Comment Excerpt Text:

Surface mining of coal causes direct and indirect damage to wildlife. The impact on wildlife stems primarily from disturbing, removing, and redistributing the land surface. Some impacts are short-term, and confined to the mine site; others have far-reaching, long-term effects. The most direct effect on wildlife is destruction or displacement of species in areas of excavation and spoil piling. Pit and spoil areas are not capable of providing food and habitat for most species of wildlife. Mobile wildlife species like game animals, birds, and predators leave these areas. More sedentary animals like invertebrates, reptiles, burrowing rodents, and small mammals may be destroyed. The community of microorganisms and nutrient-cycling processes are upset by movement, storage, and redistribution of soil.

Degradation of aquatic habitats is a major impact by surface mining, and may be apparent many miles from a mining site. Sediment contamination of surface water is common with surface mining. Sediment yields may increase to a thousand times their former level as a result of strip mining. The heaviest sediment pollution of a drainage normally comes within 5 to 25 years after mining. In some areas, unreclaimed spoil piles continue to erode even 50 to 65 years after mining.

The effects of sediment on aquatic wildlife vary with the species and the amount of contamination. High sediment levels can kill fish directly, bury spawning beds, reduce light transmission, alter temperature gradients, fill in pools, spread stream flows over wider, shallower areas, and reduce production of aquatic organisms used as food by other species. These changes destroy the habitat of valued species, and may enhance habitat for less-desirable species.

NABCI (North American Bird Conservation Initiative) created by the governments of Canada, the US, and Mexico in 1999, published a different study in mid-May, entitled "The State of North America's Birds" (http://www.stateofthebirds.org/2016/wp-content/uploads/2016/05/SotB_16-04-26-ENGLISH-BEST.pdf). The work concluded that of the 1154 species found in the three countries, 432 (one third) are in danger of extinction. NABCI's work focused on the North American Breeding Bird Survey (BBS) and eBird submissions, and sought to identify annual trends among all bird populations in North America.

The two studies, performed by different groups of scientists, using different methodologies and different data sets, came out with the same quantitative conclusions. Species in arid, grassland, and coastal habitats showed the greatest decline, especially those with small populations or ranges. The NABCI study identifies that "climate change, pollution, habitat loss, and predation are risks to these vulnerable populations."

Habitat and Wildlife Impacts

Coal mining – and particularly mining in the context of inadequate reclamation – also can have severe adverse impacts on habitats, wildlife, and ecosystems. The PEIS must provide a cumulative impacts analysis of these issues, and also provide guidance on how they should be addressed further in site-specific reviews.

For instance, the PEIS should disclose wildlife population trends in coal mining regions and generally discuss impacts to population and habitat as a result of coal leasing and mining activity.

Among the mining activities that impact wildlife and plant species, and must be examined in the PEIS, are: (a) exhaust from heavy equipment and transport vehicles, which contain sulfur dioxide, nitrous oxide, and lead; and (b) exposure of ores and rocks, which causes surface water contamination from increased sediment loads and the leaching of toxic elements, leading to decreases in aquatic oxygen content and light penetration, reductions in growth of aquatic plants, and consequent mortality of fish and other aquatic species dependent on those plants. Undermined Promise II at 25. As explained in Undermined Promise II (at 24):

Wildlife is affected by coal mining in a variety of ways. Construction and mining activities cause direct wildlife mortalities in addition to the disturbance and displacement of wildlife populations. Direct mortalities from mining activities occur primarily as the result of interactions between wildlife species and mining equipment, increased traffic and other development. Reptiles, amphibians and small mammals are generally not mobile enough to avoid mining equipment. Mortalities of birds are caused by collisions with electrical transmission lines and other mine support structures while fish mortalities result from the rerouting of streams or the activity from heavy construction near stream channels.

Because mined areas are also susceptible to non-native plants and weeds, the PEIS should also examine these habitat impacts. Id. at 28.

The PEIS must also address brush lands protection. Brush lands are very difficult to reestablish, and very little acreage of brush lands has been reclaimed at western coal mines. Schuman, Richmond, and Neuman, Sagebrush Establishment on Mined Lands: Ecology and Research, 2000. (26) Lack of brush land reclamation has adverse impacts to brush-dependent wildlife species, including the Greater Sage-grouse and mule deer, and an overall reduction in sagebrush results in a long term reduction of habitat for some species.

Federal coal leasing imposes significant adverse impacts on water and air resources, habitats and wildlife in the immediate regions where coal is mined. Climate change will further exacerbate many of these threats in decades to come. BLM's existing regulatory scheme fails to insure that operators fulfill the reclamation obligations necessary to ameliorate these impacts. To address these issues, BLM must perform a detailed NEPA analysis that considers several alternatives to improve decision-making concerning where mining occurs, and to improve the reclamation process.

Comment Excerpt Text:

In the western United States, higher temperatures and lower precipitation are expected to lead to drought conditions that will exacerbate forest stressors, especially fire and insect disturbance. The majority of land in Gunnison County is managed by the U.S. Forest Service as part of the Gunnison National Forest, which is administered jointly with the Grand Mesa and Uncompahgre National Forests. Over the course of only a decade on the Grand Mesa, Uncompahgre and Gunnison (GMUG) National Forests, approximately 223,000 acres of spruce forest have been affected by spruce beetle and 229,000 acres of aspen by Sudden Aspen Decline (SAD).¹³ These disturbances are occurring because of and in the context of a changing climate. Higher summer temperatures can foster spruce beetle outbreaks by allowing beetles to reproduce every year rather than every two years. Anticipated more frequent drought conditions make stands more vulnerable to insect and disease. And wildfire behavior in recently dead spruce-fir and areas with heavy fuel loadings can create more unpredictable fire behavior that is more hazardous to manage.¹⁴

Furthermore, 43 C.F.R. § 3461.4 allows for exploration on lands that have been deemed unsuitable under the current criteria. This is illogical and dangerous.²⁴⁶ Not only does this allow exploration activities that have the potential to cause harm to the environment and local habitats on lands already deemed unsuitable (potentially because of the presence of features or species that make the area sensitive to such activities), but this provision

can only be meant to allow mining companies the opportunity to find economic reserves in order to exert pressure on BLM to release lands already deemed unacceptable by finding some exemption. Encouraging the development of lands that have already been deemed unsuitable for mining is inconsistent with the best interests of the public and can only lead to unnecessary environmental harm.

(246) For example, the regulations state that all areas within 300 feet of any public building, school, church, community or institutional building or public park or within 300 feet of an occupied dwelling are unsuitable, yet this provision would allow exploration in these sensitive areas regardless.

Comment Excerpt Text:

To date, restoration and mitigation efforts have largely failed when it comes to protecting water quality and species. For this reason, we ask BLM to focus on protection of essential habitat areas and waterways first, and to rely on mitigation only in certain limited situations – i.e., when ESA-listed or proposed species or designated critical habitats are not present downstream or in the mine site area, and it can be shown with sufficient evidence that the functions and values of the impacted streams and native ecosystems can be fully restored.

Numerous studies document the failure of restoration to protect water quality, species, and local communities from the impacts of coal mining. These studies are too numerous for us to list in total so we provide relevant excerpts of scientific conclusions:

-“Overall, the data show that mitigation efforts being implemented in southern Appalachia for coal mining are not meeting the objectives of the Clean Water Act to replace lost or degraded streams ecosystems and their functions”²⁶⁹

-“Mitigation actions being undertaken are primarily geomorphic projects to enhance perennial streams yet the majority of streams impacted are intermittent and fewer linear feet of stream have been restored than impacted. Compliance is primarily based on visual habitat assessments performed by the mining company or their consultants which typically report marginal or suboptimal habitat status post restoration. Projects were not required to meet specified biological or water quality standards yet for the projects that reported such data, most were impaired.”²⁷⁰

-“The disturbance caused by MTR/VF is drastically changing the central Appalachian landscape, compromising the natural ecological and functional state of both terrestrial and aquatic environments. The reclamation process, emphasizing soil compaction and the establishment of non-native herbaceous species, has hindered the establishment of native tree species on MTR sites (Zipper et al., 2011). These terrestrial impacts in combination with changes in water chemistry and stream geomorphology lead to long-lasting changes to terrestrial and aquatic ecosystem function (Simmons et al., 2008). Full recovery of species diversity in streams impacted by MTR/VF has not been documented”²⁷¹

-“Indeed, the MTR/VF streams had, on average, 75% less forest cover than control streams”²⁷²

-“Reclaimed mine sites have soils containing unweathered rock that is heavily compacted to reduce erosion, resulting in altered water tables and disturbed flow paths (Bonta et al., 1992; Bernhardt and Palmer, 2011). In particular, compacted soils lead to high rates of storm water runoff. Negley and Eshleman (2006) and Ferrari et al. (2009) found that MTR/VF streams had tripled storm runoff and doubled flow rates compared to reference catchments.”

-“The extent to which these constructed channels provide important ecosystem services lost by burial of natural headwater streams as a result of mining is not well known. Fritz et al. (2010) reported significantly lower rates of litter breakdown and higher levels of iron, manganese, sulfate, and conductivity in constructed channels draining VF watersheds than in natural channels draining forested watersheds. Petty et al. (2013) observed lower organic matter (OM) decomposition rates and higher levels of conductivity, dissolved solids, and dissolved organic carbon (DOC) in West Virginia MTR/ VF constructed channels than in nearby reference channels. Based on their database containing descriptions of 38,000 stream and river restoration projects, Bernhardt and Palmer (2011) stated that they did not know of a single case where a constructed channel recreated the hydrology or ecological functions of natural streams.”²⁷³

As these examples illustrate, mitigation of coal mining activities has failed to reclaim the functions and values of impacted waterways. In particular, it has failed in Appalachia to restore water quality and fish, wildlife, and other species. Moreover, as discussed above coal mining has been one of several threats that has led to the need to protect species under the ESA, indicating that mitigation efforts have not been successful in protecting species, and should not be relied on by BLM to protect the environment.

Therefore, in light of the record before it, it is critical that BLM ensure that waterways affected by proposed mines with ramifications for species listed or proposed for listing under the ESA and their critical habitat are protected, rather than rely on mitigation plans to justify destruction of these important habitat areas, since restoration plans may not adequately address impacts to imperiled species and their habitat.²⁷⁴

(269) Palmer, M. A., & Hondula, K. L. (2014). Restoration as mitigation: analysis of stream mitigation for coal mining impacts in southern Appalachia. *Environmental science & technology*, 48(18), 10552-10560.

(274) According to the DOI Energy and Climate Change Task Force, avoidance should be the first goal: “If a project can reasonably be sited so as to have no negative impacts to resources of concern then that is generally the most defensible approach. By avoiding adverse impacts in the first place, there is no need to take further action to minimize or offset such impact.” See *A Strategy for Improving the Mitigation Policies and Practices of The Department of the Interior* at 2 (April, 2014).

BLM Must Undertake ESA Consultation on the Coal Program

Congress enacted the ESA in 1973 to provide for the conservation of endangered and threatened fish, wildlife, plants and their natural habitats.²⁸⁰ The ESA imposes and procedural obligations on all federal agencies with regard to listed and proposed species and their critical habitats.²⁸¹

Under section 7 of the ESA, federal agencies must “insure that any action authorized, funded, or carried out by such agency ... is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of habitat of such species which is determined ... to be

critical.”²⁸²

The definition of agency “action” is broad and includes “all activities or programs of any kind authorized, funded, or carried out, in whole or in part, by Federal agencies,” including programmatic actions, such as the BLM action at issue here.²⁸³

The duties in ESA section 7 are only fulfilled by an agency’s satisfaction of the consultation requirements that are set forth in the implementing regulations for section 7 of the ESA, and only after the agency lawfully complies with these requirements may an action that “may affect” a protected species go forward.²⁸⁴ Here, BLM is considering broad changes to the Federal coal program, which “includes land use planning, processing applications (e.g., for exploration licenses and lease sales), estimating the value of proposed leases, holding lease sales, and post-leasing actions....”²⁸⁵ According to BLM’s Notice, “[t]he Federal coal program has other potential impacts on public health and the environment, beyond climate impacts, that will also be assessed in the Programmatic EIS. These include the effects of coal production on . . . wildlife, including endangered species. . . .”²⁸⁶ Based on this admission, it is clear that BLM must undertake programmatic consultation in order to fulfill its duties pursuant to Section 7 of the ESA.

However, while formal programmatic consultation is required on BLM’s coal program, it would be improper and unlawful for any incidental take statement to be issued as part of the biological opinion.²⁸⁷ Numerous different ESA-protected species and their designated critical habitats are likely to be adversely affected. It remains unclear whether sufficient protections will be implemented to ensure that listed species are not jeopardized by cumulative impacts.

Moreover, there is no feasible way that the Services can predict, let alone quantify, the amount of incidental take of currently-listed species that will result from coal mining throughout the country under BLM’s program in the years to come. Further, the biological opinion cannot possibly analyze or quantify incidental take for future-listed species that will be adversely affected by coal mining. Rather, incidental take can only occur, and can only be analyzed an appropriately permitted, at the site-specific and species-specific level. Therefore, consistent with the Services’ revised regulations defining “framework programmatic action,” the programmatic consultation on BLM’s revised coal program should acknowledge that it is a framework programmatic consultation under which any incidental take will be subsequently authorized under a permit-specific Section 7 or Section 10 process.²⁸⁸

(280) *Id.* §§ 1531, 1532.

(281) See *id.* §§ 1536(a)(1), (a)(2) and (a)(4) and § 1538(a); 50 C.F.R. § 402.

(282) 16 U.S.C. § 1536(a)(2).

(283) 50 C.F.R. § 402.02. Likewise, the “action area” includes “all areas to be affected directly or indirectly by the Federal action and not merely the immediate area involved in the action.” *Id.*

(284) *Pac. Rivers Council v. Thomas*, 30 F.3d 1050, 1055-57 (9th Cir. 1994).

(286) *Id.* at 17726.

(287) It is well-settled that programmatic biological opinions do not require an incidental take statement where those opinions explicitly mandate future site-specific consultations for take authorizations. See *Gifford Pinchot Task Force v. USFWS*, 378 F.3d 1059, 1067–68 (9th Cir.) *am. by* 387 F.3d 968 (9th Cir. 2004); *Forest Serv. Employees for Env’tl. Ethics*, 726 F. Supp. 2d at 1224–1225; *W. Watersheds Project v. BLM*, 552 F. Supp. 2d 1113, 1139 (D.

Nev. 2008); *Swan View Coal, Inc. v. Turner*, 824 F. Supp. 923, 934–35 (D. Mont. 1992). Here, should the Services issue a no-jeopardy opinion on OSMRE’s regulations, it should not be accompanied by an incidental take statement because all incidental take (including any resulting from OSMRE-issued SMCRA permits) should only be authorized, if at all, via a Section 10 permit or Section 7 consultation.

(288) See 80 Fed. Reg. 26,832 (May 11, 2015) (adding definition of “framework programmatic action” to 50 C.F.R. §

402.02 and adding 50 C.F.R. § 402.14(i)(1)(6) on incidental take statements not being required at the programmatic level where subsequent actions resulting in incidental take will be separately consulted on).

Moreover, any to defer analysis of the potential impacts to listed species to a later decision would violate BLM's regulations regarding special status species as set forth in BLM Manual 6840 - Special Status Species Management. Pursuant to Manual 6840, it is the responsibility of State Directors to not only inventory BLM lands to determine the occurrence of BLM special status species, but also to determine "the condition of the populations and their habitats, and how discretionary BLM actions affect those species and their habitats."²⁹⁰ The leasing of federal lands for coal extraction is a discretionary BLM action that has the potential to adversely affect listed species. Deferring an analysis of the potential effects of selling coal leases to the ___ stage is entirely inconsistent with the requirements of Manual 6840. If a lease is sold, the lessee acquires certain contractual rights constraining BLM authority. For example, according to 43 C.F.R. § 3101.1-2, once a lease is issued to its owner, that owner has the "right to use as much of the lease lands as is necessary to explore for, drill for, mine, extract, remove and dispose of the leased resource in the leasehold" subject to specific nondiscretionary statutes and lease stipulations. Therefore, once the lease is sold, it will be too late for BLM to ensure that sufficient protections will be in place to protect this species from the cumulative impacts of extraction-related activities.

The development of species-specific and ecosystem-based conservation strategies implicitly necessitates a more holistic review of the cumulative impacts of the proposed lease sale, which cannot be accomplished through site-specific analysis alone. And, piecemeal analyses of individual lease sales do not provide the appropriate perspective for examining the cumulative effects of hydraulic fracturing and climate change impacts at the regional and landscape scale and for making land management decisions.

Where activities have the potential to adversely impact listed species, those impacts must be addressed "at the earliest possible time," in order to avoid delay, ensure that impacts are avoided and opportunities for mitigation are not overlooked.²⁹¹ Furthermore, under the ESA an analysis of the effects of an action must consider actions that are interrelated or interdependent.²⁹² This suggests that BLM should consider the effects of coal mining, transport, combustion and disposal activities at the lease sale stage, since those actions are inherent in leasing land for such purposes. It is therefore evident that in order to effectuate the policy of protecting Bureau sensitive species set forth in Manual 6840,²⁹³ and consistent with the established practice of early, comprehensive review of potential impacts to sensitive species, BLM must consider impacts to listed species at the lease sale, rather than waiting until the APD stage for project specific review.

In reviewing the federal coal leasing program, the Bureau of Land Management must consider the impacts, including climate impacts, on threatened and endangered species. Specifically, the Bureau must consult with the Fish and Wildlife Service and National Marine Fisheries Service as required by section 7 of the Endangered Species Act.

Comment Excerpt Text:

Impacts to Biodiversity and Ecosystems: Across the United States ecosystems and biodiversity, including those on public lands, are directly under siege from climate change—leading to the loss of iconic species and landscapes, negative effects on food chains, disrupted migrations, and the degradation of whole ecosystems.³¹ Specifically, scientific evidence shows that climate change is already causing changes in distribution, phenology, physiology, genetics, species interactions, ecosystem services, demographic rates, and population viability: many animals and plants are moving poleward and upward in elevation, shifting their timing of breeding and migration, and experiencing population declines and extirpations.³² Because climate change is occurring at an unprecedented pace with multiple synergistic impacts, climate change is predicted to result in catastrophic species losses during this century. For example, the IPCC concluded that 20% to 30% of plant and animal species will face an increased risk of extinction if global average temperature rise exceeds 1.5°C to 2.5°C relative to 1980-1999, with an increased risk of extinction for up to 70% of species worldwide if global average temperature exceeds 3.5°C relative to 1980-1999.³³

As greenhouse gas emissions and the resulting harms from climate change grow, the Fish and Wildlife Service and National Marine Fisheries Service are increasingly recognizing climate change as a significant threat to listed species. The Services determined that climate change is a threat (and a listing factor) in the listing rules for the vast majority of species listed as threatened and endangered in recent years. Our analysis of listing rules found that climate change was determined to be a threat for 96% and 91% of all species listed in 2012 and 2013, respectively.

In recent years, several species have been listed primarily because of climate change threats resulting from continued greenhouse gas emissions, including the polar bear in 2008, the bearded seal and ringed seal in 2012, and 20 coral species in 2014. The best-available science has concluded that the survival and recovery of these climate-vulnerable species depends on a return to lower atmospheric CO₂ concentrations than the present level of 400 ppm. As such, the massive greenhouse gas emissions stemming from the federal coal program are clearly not consistent with the survival and recovery of these species.

Corals: For example, NMFS' 2015 Final Recovery Plan for Elkhorn and Staghorn Coral includes a recovery criterion with specific targets for ocean temperature and ocean acidification conditions that must be achieved for these corals to survive and recover. As noted in the Final Recovery Plan, meeting this criterion is consistent with a return to an atmospheric CO₂ concentration of less than 350 ppm, as concluded by numerous scientific studies that have examined coral species viability in response to ocean warming and ocean acidification. Recognizing the responsibility of all federal agencies to promote listed species' conservation, the Final Recovery Plan further includes a recovery criterion calling for the adoption of "adequate domestic and international regulations and agreements" to abate threats from increasing atmospheric CO₂ concentrations. The plan also includes a recovery action to "develop and implement U.S. and international measures to reduce atmospheric CO₂ concentrations to a level appropriate for coral recovery."

Polar Bears: Similarly, the 2015 Draft Polar Bear Conservation Plan acknowledges that the polar bear cannot be recovered without decisive action to mitigate the primary threat to the species—greenhouse gas ("GHG") emissions driving sea-ice loss:

The single most important step for polar bear conservation is decisive action to address global warming (Amstrup et al. 2010, Atwood et al. 2015), which is driven primarily by increasing atmospheric concentrations of greenhouse gases. Short of actions that effectively addresses the primary cause of diminishing sea ice, it is unlikely that polar bears will be recovered.

Loggerhead sea turtles: Other marine species are also at risk from numerous consequences of GHG emissions and ensuing ocean temperature increase, sea level rise, disruption of ocean currents, and extreme weather events. The 2011 listing rule for the loggerhead sea turtle found climate change and sea level rise to be a significant threat to multiple distinct population segments of the loggerhead sea turtle, including the North and South Pacific populations.³⁴ The Services found that "Similar to other areas of the world, climate change and sea level rise have the potential to impact loggerheads in the North Pacific Ocean."³⁵ This includes beach erosion and loss from rising sea levels, skewed hatchling sex ratios from rising beach incubation temperatures, and abrupt disruption of ocean currents used for natural dispersal during the complex life cycle (Hawkes et al., 2009; Poloczanska et al., 2009). Scientific reviews of the impacts of climate change on sea turtles confirm that

climate change poses significant threats to the loggerhead (Fuentes et al. 2009, Hawkes et al. 2009, Witt et al. 2010). Hawkes et al. (2009) concluded that “[o]verall, climate change could supersede current documented threats posed to marine turtle populations” including bycatch, habitat destruction, and pollution (p.146). Fuentes et al. (2010) highlighted that sea turtles will be affected simultaneously by changes in multiple climatic processes which will create amplifying effects, especially in combination with other threats. Furthermore, many researchers have cautioned that sea turtles are especially vulnerable to climate change because they are slow to recover from disturbances due to their life history characteristics. The best available science on the impacts of observed and projected climate change on loggerhead sea turtles, reviewed below, clearly indicates that climate change--including sea level rise, increasing sand temperatures, increasing storm activity, rising ocean temperatures and changes in circulation pattern, and ocean acidification—is a significant threat to the survival of the species.

Monarch Butterfly: The Monarch butterfly, due to its narrow thermal requirements and specific microhabitat requirements, is also at exceptional risk due to climate change:36

The monarch is threatened by several other factors including global climate change, severe weather events, pesticides, and the spread of invasive species. Unfavorable weather conditions have been identified as a primary factor contributing to the recent drastic declines in monarch populations. Weather that is too hot or too cold at critical times in monarch development can cause massive mortality of caterpillars and adults. A single winter storm event in Mexican overwintering habitat in 2002 killed an estimated 450-500 million monarchs. This high death toll from a single storm event is particularly staggering given that the entire monarch population now numbers only about 35 million butterflies. Because of their narrow thermal tolerance and specific microhabitat requirements, climate change threatens monarchs in their summer and winter ranges. The threat from climate change in the monarch’s overwintering habitat in Mexico is so dire that monarchs may no longer occur in the Monarch Butterfly Biosphere Reserve by the end of the century due to climatic changes. The monarch’s summer breeding habitat in the United States is also predicted to become too hot in many areas for monarch’s to be able to successfully reproduce.37

Impacts from Algal Blooms: Toxic algal blooms are a public health menace and they have an obvious and distinct relationship with global warming.³⁹ Many types of algae release toxic compounds, or harbor other deadly bacteria, that can have a wide range of health consequences, especially neurotoxicity, and can even be fatal if swallowed.⁴⁰ The public health threat is enhanced because the toxicity of the blooms is not always proportional to their visibility.⁴¹ In fact, the blooms can be dilute and inconspicuous and still highly toxic to wildlife and human health.⁴²

(39) U.S. Environmental Protection Agency, Impacts of Climate Change on the Occurrence of Harmful Algal Blooms, EPA Office of Water 820-S-13-001 (May 2013), found at <https://www.epa.gov/sites/production/files/documents/climatehabs.pdf>.

(40) Anderson, M. Donald et al., Estimated Annual Economic Impacts from Harmful Algal Blooms (HABs) in the United States, Woods Hole Oceanographic Institution (September 2000) pg. 5-6, found at <https://www.whoi.edu/files/server.do?id=24159&pt=10&p=19132>.

(41) Id.

(42) Id.

Algae feed on nutrients like nitrogen and phosphorus whose presence in water may be the result of reckless agricultural practices, inadequate regulations, and leaky sewage systems.⁴³ But warmer temperatures ignite the process.⁴⁴ In fact, climate change promotes the growth and dominance of harmful algal blooms through a cascade of multiple mechanisms, including: warmer water temperatures, changes in rainfall patterns, increases in the acidity of ocean waters, and sea level rise.⁴⁵

(43) U.S. Environmental Protection Agency, Nutrient Pollution Sources and Solutions, EPA Office of Water (January 2016), found at <https://www.epa.gov/nutrientpollution/sources-and-solutions>.

(44) See generally EPA, Impacts of Climate Change.

(45) See Id.

Algae need carbon dioxide to survive. Higher levels of carbon dioxide in the air and water accelerate algae growth, especially toxic blue-green algae which can float to the water's surface, depriving other marine life of oxygen and sunlight.⁴⁶ When global warming unleashes heavy rainfall and flooding more nitrogen/phosphorus pollution from farms and sewage seeps into waterways, serving up the nutrient banquet for the algae to thrive on.⁴⁷ Where global warming leads to drought, the salinity of fresh water bodies is increased.⁴⁸ This can cause marine algae to invade freshwater ecosystems. In the southwestern and south central United States, toxic marine algae have been killing fish in freshwater lakes since 2000.⁴⁹

(46) See Id.

(47) See Id.

(48) See Id.

(49) See Anderson, Estimated Annual Economic Impacts, at 24.

Warmer temperatures inhibit mixing of water layers, allowing stagnation of warmer layers near the surface, promoting thicker and faster algae growth.⁵⁰ Algal blooms actually increase water surface temperatures by

absorbing more sunlight, creating a feed-back spiral of more blooms, absorbing more sunlight, warming the water further, and promoting more blooms.⁵¹

(50) See generally EPA, Impacts of Climate Change.

(51) See Id.

Warmer temperatures reduce the viscosity of water, increasing the speed at which small aquatic organisms can vertically migrate.⁵² This makes it easier for the small, toxic, cyanobacteria to float to the surface to form the dangerous blooms.⁵³

(52) See Id.

(53) See Id.

While algal blooms are not new, there has been a worldwide increase in their frequency, severity and geographic distribution, in concert with the rise in global temperatures.⁵⁴ Significant outbreaks have occurred in the last few years in Ohio, Florida, New York, and Utah. Last year, a mass of record breaking warm water triggered a bloom that extended from southern California to Alaska, damaging the entire marine food web throughout the West Coast, especially the crab industry.⁵⁵ The bloom was 40 miles wide and 650 ft deep in some places.⁵⁶ Marine scientists said last year's toxic algal bloom was "unprecedented" and "diagnostic of what we can expect more of in the future."⁵⁷ The EPA notes that these blooms are now a serious environmental problem plaguing all 50 states, not just those on the coasts.⁵⁸

(54) See Id.

(55) Mapes, Lynda V., Toxic Algae Creating Deep Trouble on West Coast, The Seattle Times, November 15th, 2015,

(58) See generally U.S. EPA, Nutrient Pollution Sources and Solutions.

The blooms also have a significant economic impact. In 2000, the Woods Hole Oceanographic Institution estimated that the annual economic cost to the US economy at that time was about \$450 million dollars.⁵⁹ That figure would be markedly increased today.

Impacts to oceans: Oceans have absorbed the vast bulk of warming to date, and will continue to suffer increasingly severe impacts on temperature, acidity, circulation, and marine ecosystems from climate change.⁶⁰ A recent survey of science regarding climate change impacts to the world's oceans finds that:

Marine ecosystems are centrally important to the biology of the planet, yet a comprehensive understanding of how anthropogenic climate change is affecting them has been poorly developed. Recent studies indicate that rapidly rising greenhouse gas concentrations are driving ocean systems toward conditions not seen for millions of years, with an associated risk of fundamental and irreversible ecological transformation. The impacts of anthropogenic climate change so far include decreased ocean productivity, altered food web dynamics, reduced abundance of habitat-forming species, shifting species distributions, and a greater incidence of disease. Although there is considerable uncertainty about the spatial and temporal details, climate change is clearly and fundamentally altering ocean ecosystems. Further change will continue to create enormous challenges and costs for societies worldwide, particularly those in developing countries.⁶¹

Comment Excerpt Text:

The IPCC's Fifth Assessment Report on Climate Change Impacts, Adaptation, and Vulnerability similarly summarizes the state of scientific research on foreseeable impacts to marine systems and reaches the following conclusions:

Due to projected climate change by the mid 21st century and beyond, global marine-species redistribution and marine-biodiversity reduction in sensitive regions will challenge the sustained provision of fisheries productivity and other ecosystem services (high confidence). Spatial shifts of marine species due to projected warming will cause high-latitude invasions and high local-extinction rates in the tropics and semi-enclosed seas (medium confidence). Species richness and fisheries catch potential are projected to increase, on average, at mid and high latitudes (high confidence) and decrease at tropical latitudes (medium confidence). . . . The progressive expansion of oxygen minimum zones and anoxic "dead zones" is projected to further constrain fish habitat. Open-ocean net primary production is projected to redistribute and, by 2100, fall globally under all RCP scenarios. Climate change adds to the threats of over-fishing and other nonclimatic stressors, thus complicating marine management regimes (high confidence).

For medium- to high-emission scenarios (RCP 4.5, 6.0, and 8.5), ocean acidification poses substantial risks to marine ecosystems, especially polar ecosystems and coral reefs, associated with impacts on the physiology, behavior, and population dynamics of individual species from phytoplankton to animals (medium to high confidence). Highly calcified mollusks, echinoderms, and reef-building corals are more sensitive than crustaceans (high confidence) and fishes (low confidence), with potentially detrimental consequences for fisheries and livelihoods. . . . Ocean acidification acts together with other global changes (e.g. warming, decreasing oxygen levels) and with local changes (e.g. pollution, eutrophication) (high confidence). Simultaneous drivers, such as warming and ocean acidification, can lead to interactive, complex, and amplified impacts for species and ecosystems.⁶²

Comment Excerpt Text:

Impacts from Ocean Acidification: The ocean's absorption of anthropogenic CO₂ has already resulted in more than a 30% increase in the acidity of ocean surface waters, at a rate likely faster than anything experienced in the past 300 million years, and ocean acidity could increase by 150% to 200% by the end of the century if CO₂ emissions continue unabated.⁶⁴ Ocean acidification negatively affects a wide range of marine species by hindering the ability of calcifying marine creatures to build protective shells and skeletons and by disrupting metabolism and

critical biological function.⁶⁵ The adverse effects of ocean acidification are already being observed in wild populations, including reduced coral calcification rates,⁶⁶ reduced shell weights of foraminifera in the Southern Ocean,⁶⁷ and mass die-offs of larval Pacific oysters in the Pacific Northwest.⁶⁸

Coral reef ecosystems, which are estimated to harbor one-third of marine species and which support the livelihoods of a half billion people, are particularly threatened by ocean acidification. Some corals are already experiencing reduced calcification.⁶⁹ Due to the synergistic impacts of ocean acidification, mass bleaching, and other stresses, reefs are projected to experience “rapid and terminal” declines worldwide at atmospheric CO₂ concentrations of 450ppm.⁷⁰ Prominent coral scientists have called for reducing atmospheric CO₂ to less than 350 ppm to protect coral reefs from collapse.⁷¹

Numerous U.S. and international scientific and policy bodies have identified ocean acidification as an urgent threat to ocean ecosystems, food security, and society.⁷² The United Nations Environment Program concluded that ocean acidification’s impact on marine organisms poses a threat to food security and the billions of people that rely on a marine-based diet.⁷³ Moreover, a recent study estimated that the damage our oceans will face from emissions-related problems will amount to \$428 billion a year by 2050 and nearly \$2 trillion per year by the century’s end.⁷⁴

Impacts to wildlife: “Over the 21st century, changes in climate will cause some species to shift north and to higher elevations and fundamentally rearrange U.S. ecosystems. Differential capacities for range shifts and constraints from development, habitat fragmentation, invasive species, and broken ecological connections will likely alter ecosystem structure, function, and services, leading to predominantly negative consequences for biodiversity and the provision of ecosystem goods and services.”²⁵

The Impacts of Coal Mining on Species and Habitats

There are myriad environmental impacts from mining coal, transporting it by rail, burning it, and disposing of the resulting waste, all which must be fully analyzed in the EIS. Exploiting coal resources causes a broad array of environmental harms through contamination of air, surface and groundwater, and publicly owned lands.²⁴⁰ The EIS must include an analysis of impacts to biological, marine, and aquatic resources on both public and private lands and waters affected by coal mining, transportation and combustion ? that is, in the areas where mining of the coal takes place, through rail or other corridors, through the loading and shipping of the coal, to its final destination, burning, and disposal. Such resources include marine and terrestrial mammals, game and non-game resident and migratory bird species, raptors, songbirds, amphibians, reptiles, fisheries, aquatic invertebrates, wetlands, and vegetative communities ? including species listed pursuant to the Endangered Species Act (ESA). For species protected under the ESA, BLM must consult with the U.S. Fish and Wildlife Service (FWS) and the National Marine Fisheries Service (NMFS) under § 7 of the Act to determine whether BLM regulated coal mining activities will adversely affect these species or their designated critical habitat.²⁴¹ Because this programmatic decision implicates a significant share of not only domestic but global greenhouse gas emissions whose effects occur globally, the relevant “action area” for purposes of consultation is global.

The BLM must ensure that up-to-date information on all potentially impacted flora and fauna is made available in the Draft PEIS, so that adequate impact analyses can be completed and to ensure robust public participation. Habitat degradation, fragmentation, and loss must all be assessed, along with any resulting impacts to wildlife and marine species. Cumulative impacts, such as increased wildlife mortality from mining related activities (including, but not limited to, increased human conflicts, habitat loss, and increased hunting pressure), transport of coal, pollution from coal combustion, and coal combustion waste disposal, must be fully analyzed. Impacts to wildlife

migration corridors must also be evaluated.

The PEIS must also consider all potential water quality impacts (e.g., increased sediment loads, possible spills, coal dust impacts, mercury deposition, changes to alluvial groundwater quality, degradation of drinking well water) and water quantity impacts (e.g., drawdown of aquifers, diversions or diminutions of surface flow, hydrologic changes affecting seeps and springs, drinking water impacts), as well as impacts to water resources that would be expected from burning the coal and disposing of coal combustion waste, whether domestically or overseas, and the impacts that potential alterations in water quality and quantity will have on listed species.

Transportation of coal over long distances also has significant environmental impacts, including the fossil fuel consumption of moving large volumes of material over long distances. Data shows that open coal trains lose huge volumes of coal dust during transportation. Such discharges add to air quality problems along the rail route, and cause contamination of waterbodies and other habitat areas. According to BNSF studies, 500 to 2,000 lbs of coal can be lost in the form of dust for each rail car, and coal trains are typically composed of at least 120 cars per train. In other studies, again according to BNSF, as much as three percent of the coal in each car (around 3,600 lbs per car) can be lost in the form of dust.²⁴² This is a huge volume of coal that will escape into the air and water, potentially affecting many listed species and essential habitat areas, which must be fully analyzed in the EIS. Moreover, as with the greenhouse gas impacts, this analysis must be viewed in the context of all existing and reasonably foreseeable similar impacts.

The PEIS's analysis of coal dust should also include a discussion of the efficacy of surfactants to control coal dust, potential impacts of the use of surfactants to control dust emissions, as well as consequences from not using surfactants. Although use of surfactants in some contexts is common, their efficacy and safety for use on coal-carrying trains is unproven. Further, surfactants contain myriad undisclosed chemicals, many of whose biological and ecological effects have not yet been adequately studied. Surfactants could cause a number of potential harms, including: danger to human health during and after application; surface, groundwater and soil contamination; air pollution; changes in hydrologic characteristics of the soils; and impacts on native flora and fauna populations. See Environmental Protection Agency, Potential Environmental Impacts of Dust Suppressants: Avoiding another Times Beach § 3 (May 30-31, 2002).

The net results of the impacts of coal mining have been significant water pollution, loss of natural areas, and great reductions in biological diversity in mined places. We thank BLM for recognizing that the current implementation of the Federal coal program has failed to protect our waterways, wildlife, and natural ecosystems from coal mining and related pollution. We provide the following information to support the need for more protective regulations to ensure that mining operations are conducted so as to minimize disturbances and adverse impacts on fish, wildlife, and related environmental values.

Home to the greatest freshwater biological diversity in the U.S., Appalachia is a true species hot spot. Yet, coal mining is contributing to the alarming loss of biological diversity in the Appalachian Mountains. This has been evidenced by the vast upswing in aquatic dependent species requiring ESA protection in the southeast region. The USFWS's findings in protecting such species illustrate that coal mining is a significant threat leading to species listings. Further, already listed species in the region are also experiencing ongoing declines due to downstream impacts from surface mining, such as sedimentation, and existing regulations are utterly failing to protect species from these impacts.

For example, in listing the Cumberland darter as endangered, the USFWS found that sediment/siltation is “the most common stressor of aquatic communities in the upper Cumberland River basin” and the “primary source of sediment” is “resource extraction” – i.e., coal mining and logging.²⁵⁹ The USFWS identified “water quality degradation” and the addition of “high concentrations of dissolved metals and other solids that lower stream pH or lead to elevated levels of stream conductivity” as another “significant threat” to the Cumberland darter.²⁶⁰ Likewise, in listing the blackside dace, the USFWS recognized “that impacts associated with the development of [coal and timber] resources in the past has caused the loss of many blackside dace populations.”²⁶¹

Coal mining was also identified as a threat to, and among the reasons for listing, rayed bean and snuffbox mussels. The USFWS found that “low pH commonly associated with coal mine runoff can reduce glochidial encystment rates, thus impacting mussel recruitment” and that adverse impacts from heavy-metal-rich drainage from coal mining and associated sedimentation have been documented in portions of historical rayed bean and snuffbox habitat in the upper Ohio River system in western Pennsylvania, West Virginia, and southeastern Ohio. Likewise, coal mining has impacted rayed bean habitat in the upper Tennessee River system, Virginia, and snuffbox habitat in eastern Kentucky (lower Ohio and Mississippi River systems in southeastern Illinois and western Kentucky; upper Cumberland River system in southeastern Kentucky and northeastern Tennessee; and upper Tennessee River system in southwestern Virginia).²⁶²

Similar conclusions were reached in listing the sheepsnose and spectaclecase mussels.²⁶³ Water quality degradation from surface coal mining also contributed to the need to list the diamond darter in West Virginia,²⁶⁴ the addition of the Kentucky arrow darter to the candidate list,²⁶⁵ and the proposed listing for the Big Sandy and Guyandotte River crayfishes.²⁶⁶

The biological impacts of coal mining are not limited to the Powder River Basin. These impacts are felt in coal mining areas throughout our country. For example, recent coal leasing proposals in Utah also highlight the ongoing failure to address impacts to species, including greater sage-grouse and Utah prairie dog, that are vulnerable to habitat loss.²⁶⁷ Thus, coal mining activities are impacting species that have been recognized as vulnerable to such activities across the country, and efforts to mitigate these impacts have not been successful.

This is due to the basic fact that effectively mitigating the impacts of coal mining is fundamentally not possible. Surface coal mining is accomplished by logging or clearing the mine site, then removing overburden from the coal seam and then blasting and removing the coal. This includes strip mining and open pit mining practices, as well as mountain top removal mining, wherein excess mining waste is dumped into fills in nearby hollows or valleys, smothering streams and habitat. Surface coal mining requires large areas of land to be disturbed, destroying mountains and forest habitat, and results in deposition of sediment and heavy metals into water bodies, which results in adverse impacts on streams and local biodiversity.²⁶⁸ It is the height of human arrogance to suggest that these impacts can be sufficiently mitigated. Rather, it is clear that the lost functions and values of the areas decimated by coal mining are near impossible to recover.

(259) Endangered status for the Cumberland Darter, Rush Darter, Yellowcheek Darter, Chucky Madtom, and Laurel Dace, Final Rule. 76 Fed. Reg. 48,722, 48,732 (2011). Although federal coal holdings are not as pervasive as in the Powder River Basin, federal coal leases affect Cumberland Basin waters and species. See BLM and USFS,

Environmental Assessment, Bledsoe Coal Lease.

(263) Determination of endangered status for the Sheepnose and Spectaclecase mussels throughout their range, final rule. 77 Fed. Reg. 14914 (2012). In addition, the FWS designated 27 miles of the main stem of the Big South Fork and 9 miles of the New River in Tennessee as critical habitat for three endangered mussels: Cumberland elktoe, oyster mussel, and Cumberlandian combshell. 60 Fed. Reg. at 53,148.

(264) U.S. Fish and Wildlife Service (FWS). (2013). Endangered species status for diamond darter, final rule. 78 FR 45079 (“While the overall percentage of the entire Elk River watershed subjected to mining activities may be small, watersheds of some Elk River tributaries, such as Leatherwood Creek, are highly dominated by mining activity and include mining permits encompassing 81 to 100 percent of the subwatersheds (WVDEP 2011b, p. 37). Mining is

likely a significant factor affecting the water quality of streams, such as Leatherwood Creek, that are principle tributaries to the Elk River. The effects of these mining activities conducted both within the Elk River mainstem and in Elk River tributaries, coupled with the effects from other activities described in Factor A, are continuing threats to the diamond darter.”).

(265) U.S. Fish and Wildlife Service FWS. (2010). Candidate Notice of Review. 75 Fed. Reg. 69,224 (“The subspecies’ habitat and range have been severely degraded and limited by water pollution from surface coal mining and gas-exploration activities; removal of riparian vegetation; stream channelization; increased siltation associated with poor mining, logging, and agricultural practices; and deforestation of watersheds. The threats are high in

magnitude because they are widespread across the subspecies’ range. In addition, the magnitude (severity or intensity) of these threats, especially impacts from mining and gas- exploration activities, is high because these activities have the potential to alter stream water quality permanently throughout the range by contributing sediment, dissolved metals, and other solids to streams supporting Kentucky arrow darters, resulting in direct mortality or

reduced reproductive capacity. The threats are imminent because the effects are manifested immediately and will continue for the foreseeable future.”).

(266) U.S. Fish and Wildlife Service. (2015). Endangered species status for the Big Sandy and Guyandotte River Crayfishes, proposed rule. 80 Fed. Reg. 18,726 (“Coal mining—The past and ongoing effects of coal mining in the Appalachian Basin are well documented, and both underground and surface mines are reported to degrade water quality and stream habitats. Notable water quality changes associated with coal mining in this region include increased concentrations of sulfate, calcium, and other ions (measured collectively by a water’s electrical conductivity); increased concentrations of iron, magnesium, manganese, and other metals; and increased alkalinity and pH, depending on the local geology. The common physical changes to local waterways associated with coal mining include increased erosion and sedimentation, changes in flow, and in many cases the complete burial of headwater streams. These mining-related effects are commonly noted in the streams and rivers within the ranges of the Big Sandy and the Guyandotte River crayfishes. The response of aquatic species to coal mining-induced degradation are also well documented, commonly observed as a shift in a stream’s macroinvertebrate (e.g., insect larva or nymphs, aquatic worms, snails, clams, crayfish) or fish community structure and resultant loss of sensitive taxa and an increase in tolerant taxa. As mentioned above, coal mining can cause a variety of changes to water chemistry and physical habitat; therefore, it is often difficult to attribute the observed effects to a single factor. It is likely that the observed shifts in community structure (including the extirpation of some species) are, in many cases, a result of a combination of factors.” (internal references omitted)).

It is well-established that programmatic decisions are subject to the ESA’s consultation requirement.²⁸⁹ A programmatic decision to continue or modify the federal coal leasing program is an “agency action” for purposes of the ESA. The ESA defines agency action as “any action authorized, funded, or carried out” by a federal agency. 16 U.S.C. § 1536(a)(2). The phrase is further defined in ESA regulations as “all activities or programs of any kind authorized, funded, or carried out, in whole or in part, by Federal agencies.” 50 C.F.R. § 402.02. These include: “(b) the promulgation of regulations” and “(d) actions directly or indirectly causing modifications to the land, water or air.” *Id.*

Comment Excerpt Text:

The indirect effects of coal leasing and mining include atmospheric emissions of mercury from coal combustion. Mercury is a potent and widely distributed neurotoxin with serious adverse health effects on human health and development as well as the behavior, reproduction, and survival of threatened and endangered species. The United Nations estimates that 26% of global mercury emissions (339-657 metric tons/ year) come from the combustion of coal in power plants.²⁹⁴ A recent decision held that agencies must consider the indirect effects of even microscopic levels of mercury from coal leasing, mining and combustion decisions:

(294) J. Pacyna, et al., *Study on Mercury Sources and Emissions and Analysis of Cost and Effectiveness of Control Measures: “UNEP Paragraph 29 Study”*, UNEP (Nov. 2010).

“the record reveals that even microscopic changes in the amount of mercury deposition can have significant impacts on threatened and endangered species in the area impacted by the Four Corners Power Plant. See AR 1-2-14-1990 (concluding that a .1% increase in mercury deposition in the basin is likely to jeopardize the continued existence of the Colorado pikeminnow). Given the potentially significant impacts of mercury pollution, OSM’s failure to discuss or analyze the deleterious impacts of combustion-related mercury deposition in the area of the Four Corners Power Plant is troubling.²⁹⁵”

(295) *Dine Citizens Against Ruining Our Environment v. U.S. Office of Surface Mining Reclamation and Enforcement*, 82 F.Supp. 3d 1201, 1215 (D. Colo. 2015).

The deposition of mercury and selenium within the Colorado River Basin continues to threaten both human health and endangered species, including the four Colorado River endangered fish. Current scientific information indicates continuing mercury and selenium contamination in the Colorado River Basin, which has the potential to detrimentally affect these species.

Consumption through the food chain is the primary mechanism of bioaccumulation of mercury in the endangered fish, and particularly affects the Colorado pikeminnow's diet as the largest of the endangered Colorado River fish (Herrmann et al. 2016 at 204). Sources of mercury include high levels of atmospheric mercury deposition called "cold condensation" from coal-fired power plant emissions (Id. at 205). This atmospheric deposition and watershed runoff is the most prevalent source of mercury in the Colorado River, but mercury pollution from old gold smelters in the Basin have also infiltrated this river system through decades of runoff from smaller tributaries (Id. At 215). In Grand Canyon, there is a high concentration of mercury in the atmosphere due to emissions from the coal burning Navajo Generating Station in Page, Arizona, resulting in direct negative effects on the endangered fishes' habitat in the lower Colorado River Basin (Walters 2015 at 2385).

Mercury contamination is especially concerning because all four species depend on aquatic invertebrates as a food source. Other piscivorous animals and non-native fish that prey on these juvenile fish, in turn, accumulate mercury, which continues up the food chain, bioaccumulating in adult fish. Concentrations of mercury exceeding 8 micrograms ($\mu\text{g/g}$) in fish organs or eggs may result in reproductive dysfunction and abnormalities (Herrmann et al. 2016 at 204). Walters et al. (2015) found that mean mercury concentrations for three native species and three non-native species from a Colorado River sample site exceeded the risk threshold for piscivorous mammal consumption (Id. at 2390).

Because of the scale of the federal coal leasing program (over 40% of U.S. coal production), BLM must quantify, consider, and consult on, the indirect mercury emissions from combustion of coal, its contribution to global mercury atmospheric concentrations and deposition rates, and its ensuing effects on sensitive, threatened, and endangered species, including the four Colorado River listed fish.

Comment Excerpt Text:

The ESA was enacted, in part, to provide a "means whereby the ecosystems upon which endangered species and threatened species depend may be conserved...[and] a program for the conservation of such endangered species and threatened species."²⁹⁶ Section 2(c) of the ESA establishes that it is "the policy of Congress that all Federal departments and agencies shall seek to conserve endangered species and threatened species and shall utilize their authorities in furtherance of the purposes of this Act."²⁹⁷ The ESA defines "conservation" to mean "the use of all methods and procedures which are necessary to bring any endangered species or threatened species to the point at which the measures provided pursuant to this Act are no longer necessary."²⁹⁸ Similarly, Section 7(a)(1) of the ESA directs that the Bureau and other federal agencies shall use their programs and authorities to conserve endangered and threatened species.²⁹⁹

To fulfill the purposes of the ESA, federal agencies are required to "insure that any action authorized, funded, or carried out by such agency...is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the adverse modification of habitat of such species... determined...to be critical."³⁰⁰ When an agency action "may affect listed species or critical habitat" the agency must consult with expert wildlife agencies, Fish and Wildlife Service and National Marine Fisheries Service, using the "best scientific and commercial data available."³⁰¹ ESA consultation serves as an essential function to guide federal actions and identify mitigation to avoid harming listed species. Through consultation, the Services may specify reasonable and

prudent alternatives that will avoid jeopardizing listed species and “suggest modifications” to the action to “avoid the likelihood of adverse effects” to the listed species.³⁰²

Here, the Bureau must consult on the federal coal leasing program to ensure that coal leasing does not further imperil endangered species. Agencies are required to consult on programs that manage federal lands and leasing, including this coal leasing program.³⁰³ The ESA expressly and broadly requires an agency to comply with Section 7 for “any action” it authorizes or funds.³⁰⁴ “Action” is broadly defined to include “all activities or programs of any kind authorized, funded, or carried out, in whole or in part” by federal agencies and includes actions that may directly or indirectly cause modifications to the land, water, or air.”³⁰⁵

NMFS' 2015 Final Recovery Plan for Elkhorn and Staghorn Coral includes a recovery criterion with specific targets for ocean temperature and ocean acidification conditions that must be achieved for these corals to survive and recover.³⁰⁶ As noted in the Final Recovery Plan, meeting this criterion is consistent with a return to an atmospheric CO₂ concentration of less than 350 ppm, as concluded by numerous scientific studies that have examined coral species viability in response to ocean warming and ocean acidification.³⁰⁷ Recognizing the responsibility of all federal agencies to promote listed species' conservation, the Final Recovery Plan further includes a recovery criterion calling for the adoption of “adequate domestic and international regulations and agreements” to abate threats from increasing atmospheric CO₂ concentrations.³⁰⁸ The plan also includes a recovery action to “develop and implement U.S. and international measures to reduce atmospheric CO₂ concentrations to a level appropriate for coral recovery.”³⁰⁹

(306) NMFS. 2015. Recovery Plan for Elkhorn (*Acropora palmata*) and Staghorn (*A. cervicornis*) Corals. Prepared by the Acropora Recovery Team for the National Marine Fisheries Service, Silver Spring, Maryland. See Recovery Criterion 5: “Sea surface temperatures across the geographic range have been reduced to Degree Heating Weeks less than 4; and Mean monthly sea surface temperatures remain below 30°C during spawning periods; and Open ocean

aragonite saturation has been restored to a state of greater than 4.0, a level considered optimal for reef growth.”

(307) These studies include: (1) Veron et al. (2009) which recommends an atmospheric CO₂ concentration of less than 350 ppm to protect coral reef health, and suggests a target of 320 ppm which is the level that pre-dates the onset of mass bleaching events; (2) Donner (2009) which suggests an atmospheric CO₂ concentration target below 370 ppm to avoid degradation of coral reef ecosystems; (3) Simpson et al. (2009) which correlates a Caribbean open-ocean

aragonite saturation state of 4.0, which is recommended by the plan, with an atmospheric CO₂ level at 340 to 360 ppm; and (4) Frieler et al. (2012) which shows that limiting warming to ~1°C above pre-industrial levels is needed to protect Caribbean coral reefs from degradation. A 1°C target is consistent with an emissions trajectory that peaks in the next few years at 400 ppm, declines sharply thereafter (~6% decline per year), and returns atmospheric CO₂ to below 350 ppm in the early 2100s (Hansen et al. 2013).

(308) See Recovery Criterion 8.

the 2015 Draft Polar Bear Conservation Plan acknowledges that the polar bear cannot be recovered without decisive action to mitigate the primary threat to the species—greenhouse gas (“GHG”) emissions driving sea-ice loss:

The single most important step for polar bear conservation is decisive action to address global warming (Amstrup et al. 2010, Atwood et al. 2015), which is driven primarily by increasing atmospheric concentrations of greenhouse gases. Short of actions that effectively addresses the primary cause of diminishing sea ice, it is unlikely that polar bears will be recovered.³¹⁰

The best-available science on polar bear viability and sea-ice loss under climate change indicates that returning the atmospheric CO₂ concentration to ~350 ppm is needed for polar bear survival and recovery. Amstrup et al. (2010), published in the journal *Nature*, provides the best available science on the greenhouse gas emissions pathways and atmospheric concentrations needed for polar bear recovery. This study found that polar bear probability of persistence increases when greenhouse gases are reduced significantly in the near future, and that the best possible on-the-ground management to reduce other threats plays an important, although secondary, role in increasing persistence probabilities.³¹¹ Importantly, Amstrup et al. (2010) showed that the commitment scenario—in which CO₂ stays at a constant level of 368 ppm and radiative forcing remains at ~2.2 watts/m²—is consistent with polar bear recovery in all ecoregions. These findings are compatible with studies that have found that returning the atmospheric CO₂ concentration to between 350 and 400 ppm by 2100, and subsequently below 350 ppm, is needed to recover Arctic sea ice.³¹²

(310) U.S. Fish and Wildlife. 2015. Polar Bear (*Ursus maritimus*) Conservation Management Plan, Draft. U.S. Fish and

Wildlife, Region 7, Anchorage, Alaska. 59 pp, at 6.

(311) Amstrup, S.C. et al. 2010. Greenhouse gas mitigation can reduce sea-ice loss and increase polar bear persistence.

Nature 468: 955-960. Because sea-ice habitat decreases relatively linearly with increases in mean global temperature rise in their models, the study concluded that the loss of sea-ice habitat and corresponding “declines in polar bear distribution and numbers are not unavoidable” if immediate and rapid GHG reductions were to be implemented, thus emphasizing the need for rapid, decisive action on emissions reductions.

A recent lease of 160 acres was awarded to Narley Mine No. 3, operated by Best Coal, Inc. That surface mine has discharges through six sediment basins to an unnamed tributary to Trouble Creek, which flows into Trouble Creek, and then into the Locust Fork of the Black Warrior River in Jefferson County, AL. This stretch of the Locust Fork is federal ESA Critical Habitat for six species of freshwater mussels, and is also home to the Endangered Cahaba Shiner, the Endangered plicate rocksnail, the Threatened flattened musk turtle, and the Candidate Black Warrior Waterdog, among other rare aquatic species. Alabama is number one in the U.S. for aquatic biodiversity, and the Locust Fork is a key priority watershed for rare species habitat, reintroductions, and recovery.

Coal mining in Wyoming has a temporary impact on livestock and wildlife grazing and management. Wyoming surface coal operators reclaim lands in a timely manner and in compliance with the permitted mine and reclamation plans. Wyoming has primacy from the OSMRE for regulating compliance of these mining operations. Mine and reclamation acres for coal operations in Wyoming as of January 1, 2016 are: 169,639 disturbed acres, 90,214 acres (53%) in active mining/facilities or partially reclaimed; 79,425 acres (47%) reclaimed through final seeding; and 38,000 acres (22%) in agricultural or hay production. Wyoming operators have received national recognition for their excellence in reclamation in 7 out of the past 10 years and range from shrub establishment to stream channel design and function. Wyoming has been and continues to be a national leader in reclamation of disturbed lands and places high importance on returning reclamation to livestock grazing, agricultural production and wildlife habitat in a timely manner.

Successful reclamation in Wyoming is at least two times more productive than pre-mine native rangeland and provides a valuable mechanism for carbon capture and sequestration which must be evaluated by BLM in the PEIS. See Wick, et al., Aggregate and organic matter dynamics in reclaimed soils as indicated by stable carbon isotopes, *Soil Biology and Chemistry*, pp. 1-9 (2008); (WY0-02814 to 02822); and Stahl, et al., Accumulation of

organic carbon in reclaimed coal mine soils of Wyoming (2003); (WY0-02824 to 02836). Reclamation of surface mines can provide an avenue for atmospheric CO₂ to be captured as organic carbon in the soil and vegetative community. See Ganjgunte, et al., Accumulation and composition of total organic carbon in reclaimed coal mine lands, *Land Degradation and Development*, 20: 156-175 (2008); (WY0-02838 to 02857); and Miyamoto, et al., Long-term effects of mechanical renovation of a mixed-grass prairie: II. Carbon and Nitrogen Balance, *Arid Land Research and Management*. 18:141-151 (2004); (WY0-02869 to 02880). Reclaimed surface mine soils not only capture significant levels of carbon but also provide higher levels of organic nutrient storage, and thus vegetative biomass, allowing for additional carbon capture. These factors show the importance and benefits reclamation, and subsequent management of soil and vegetation has on the carbon cycle. Id.; (WY0-02869 to 02880); McDermott c, Elavarthi S., Rangelands as carbon sinks to mitigate climate change: A review, *Earth science & climate change*, 5:8 1-12 (2014); (WY0-02882 to 02893); and Rhoades et al., Carbon Sequestration of Surface Mine Lands, Department of Forestry, University of Kentucky, Department of Soil Science, North Carolina State University; (WY0-02895 to 02916).

In Wyoming, coal operations tend not to interfere with big game species. See Medcraft, J.R. and W. R. Clark, Big Game Habitat Use on Diets on a Surface Mine in Northeastern Wyoming, *Journal of Wildlife Management*, 50:135-142 (1986); (WY0-03052 to 03060); and Garno, R.S. and S. Anderson, Use of Reclaimed Mine Lands by Pronghorn and Mule Deer, *Intermountain Journal of Sciences*, Vol 8 4:213-222 (2002); (WY0-03062 to 03068). Coal operations may temporarily impact small mammals. See Hingten, T.M. and W.R. Clark, Small Mammal Recolonization of Reclaimed Coal Surface-mined Land in Wyoming, *Journal of Wildlife Management*, 48:1255-1261 (1984); (WY0-03070 to 03076). When new or large expansions of coal operations are proposed, the WGFD recommends that an evaluation of delineated big game migration corridors be considered if applicable to the mine area and appropriate considerations taken when leasing or expanding the mine to protect migration corridors.

The U.S. Fish and Wildlife Service coordinates an extensive and highly successful raptor program for nest removal and nest structure placement in coal country. This program alleviates most concerns with raptor-related impacts. For example, the North Antelope Rochelle Mine's commitment to protect raptors through successful implementation of this program was recognized by OSMRE through a National Award for Excellence in Surface Mining in 2012. "The company surveyed raptor populations, identified potential disturbances for nesting raptors, and developed multiple plans to mitigate those impacts. The company moved several nesting locations, built special nesting towers for raptors, and successfully maintained viable eagle, hawk, owl and kestrel populations."

OSMRE National Award for Excellence in Surface Mining, North Antelope Rochelle Mine (2012); [19] (WY0-03858 to 03861).

The BLM requires management directions for Greater sage-grouse in Approved RMP amendments and revisions be applied to new permits and leases. The DEQ, LQD also requires that new permits comply with Wyoming Executive Order 2015-4, Greater Sage-Grouse Core Area Protection. (WY0-03078 to 03122). Both of these management directives minimize potential impacts to Greater sage-grouse habitat and breeding cycles and will limit "claims" to areas that cannot be developed without very limited impacts to Greater sage-grouse.

The U.S. Fish and Wildlife Service (FWS) has found "the core area strategy...if implemented by all landowners via regulatory mechanisms, would provide adequate protection for sage-grouse and their habitats in [Wyoming]." 75 Fed. Reg. 13910, 13974 (March 23, 2010). Further, in a November 10, 2010 letter to Ryan Lance, Deputy Chief of Staff, Office of the Governor (WY)- the FWS made the following statement: "The provisions for conservation of Federal trust species, including candidates such as the Greater sage-grouse, under SMCRA and its implementing regulations, are sufficient for conservation of this species." See Hicks, S., U.S. Department of the Interior- Fish and Wildlife Service, Letter to Ryan Lance (Nov. 10, 2010); (WY0-03125). Now that the BLM has revised its RMPs in Wyoming to incorporate Wyoming's core area strategy, the FWS has found that the "adoption of the [core area strategy] into Federal land plans provides additional assurances that protections of Core Areas will be achieved on all lands, regardless of land ownership." Notice of 12-month petition finding, 80 Fed. Reg. 59858, 59883 (Oct. 2, 2015).

V. BLM MUST COMPLY WITH ENDANGERED SPECIES ACT CONSULTATION REQUIREMENTS FOR THE FEDERAL COAL PROGRAM The BLM is obligated to conserve species listed under the Endangered Species Act ("ESA"), 16 U.S.C. § 1536. Under section 7 of the ESA, federal agencies must "insure that any action authorized, funded, or carried out by such agency ... is not likely to jeopardize the continued existence of any endangered species or threatened species or result in the destruction or adverse modification of habitat of such species which is determined ... to be critical." 16 U.S.C. § 1536(a)(2). 311 Because alternatives to be considered in the PEIS "may affect" threatened or endangered species and their critical habitat, 50 C.F.R. § 402.14(a), BLM is required to consult with the U.S. Fish and Wildlife Service and the National Marine Fisheries Service (together, "Services") under ESA section 7 to avoid adversely affecting these resources. Under ESA section 7, an agency undertaking an action determines, usually with the assistance of the Services, whether listed species or designated critical habitat exist in the area affected by the action. BLM has recognized the importance of engaging with the Services early in this process. 312 If the agency(s) identify resources protected by the ESA, they proceed to formal consultation over the proposed action unless it is determined that the potential effects of the action are insignificant, discountable or wholly beneficial to listed species and their habitat. Working with the Services, the action agency develops a Biological Assessment that describes how the proposed action may affect threatened and endangered species and critical habitat. The Services (either or both, as appropriate) evaluate the effects of the proposed action on listed species and critical habitat, which is communicated in a Biological Opinion ("BO"). The BO may identify reasonable and prudent alternatives for the proposed action that would avoid jeopardizing species listed under the ESA. 311 See also BLM Manual 6840.IE3 (committed to "ensuring that actions are not likely to jeopardize the continued existence of any endangered species or threatened species or destroy or adversely modify designated critical habitat"). 312 BLM Manual 6840.IF. 81 The threshold for effects that trigger

ESA section 7 consultation is low, and is met when an action “may affect” threatened or endangered species and their critical habitat. 50 C.F.R. § 402.14(a); see also *Western Watershed Project v. Kraayenbrink*, 632 F.3d 472, 498 (9th Cir. 2011) (citation omitted) (describing “may affect” threshold); *Pacific Rivers Council v. Shepard*, No. 03:11-CV-00442-HU, 2011 WL 7562961, at *9 (D. Or. Sept. 29, 2011), report and recommendation adopted as modified, No. 03:11-CV-442-HU, 2012 WL 950032 (D. Or. Mar. 20, 2012)) (affirming “how low the threshold is for triggering such consultation”). The “may affect” standard is broadly interpreted, and includes proposed actions that may indirectly affect listed species, and regardless of whether a species or habitat occurs on BLM lands. 313 ESA regulations define “effects of the action” as: Effects of the action refers to the direct and indirect effects of an action on the species or critical habitat, together with the effects of other activities that are interrelated or interdependent with that action, that will be added to the environmental baseline. The environmental baseline includes the past and present impacts of all Federal, State, or private actions and other human activities in the action area, the anticipated impacts of all proposed Federal projects in the action area that have already undergone formal or early section 7 consultation, and the impact of State or private actions which are contemporaneous with the consultation in process. Indirect effects are those that are caused by the proposed action and are later in time, but still are reasonably certain to occur. Interrelated actions are those that are part of a larger action and depend on the larger action for their justification. Interdependent actions are those that have no independent utility apart from the action under consideration. 50 C.F.R. § 402.02. The Services have clarified that “[a]ny possible effect, whether beneficial, benign, adverse or of an undetermined character, triggers the formal consultation requirement.” The federal coal program meets these criteria for triggering ESA section 7 consultation.

Impacts to Wildlife NEPA requires BLM’s PEIS to identify and evaluate all impacts of the federal coal leasing program on wildlife. Specifically, this includes not only the direct impacts of coal 150 See National Climate Assessment and Development Advisory Committee, *CLIMATE CHANGE IMPACTS IN THE UNITED STATES* at 83. 151 U.S. Environmental Protection Agency, *Climate Change Indicators in the United States – Ocean Acidity*, at <https://www3.epa.gov/climatechange/science/indicators/oceans/acidity.html> (last visited July 21, 2016); National Oceanic and Atmospheric Administration, *Sea Surface Temperature (SST) Contour Charts*, at <http://www.ospo.noaa.gov/Products/ocean/sst/contour/> (last visited July 21, 2016); Government Accountability Office, *Climate Change*, at 7. 152 PMEL Carbon Program, *What is Ocean Acidification?*, at <http://www.pmel.noaa.gov/CO2/story/What+is+Ocean+Acidification%3F> (last visited July 21, 2016); National Climate Assessment and Development Advisory Committee, *CLIMATE CHANGE IMPACTS IN THE UNITED STATES* at 583. 153 National Climate Assessment and Development Advisory Committee, *CLIMATE CHANGE IMPACTS IN THE UNITED STATES* at 20 154 Id. at 48-49. 155 National Oceanic and Atmospheric Administration, *Sanctuaries and Climate Change*, at <http://sanctuaries.noaa.gov/management/climate/welcome.html> (last visited July 21, 2016). 156 See id. 157 National Climate Assessment and Development Advisory Committee, *CLIMATE CHANGE IMPACTS IN THE UNITED STATES*, at 70. 46 leasing and coal mining on public land, but also the indirect and cumulative impacts to wildlife due to transporting and burning the coal. BLM summarized many of the direct impacts of surface coal mining on wildlife in its Final EIS for the Powder River Basin Wright Area lease in 2010: They include road kills by mine-related traffic, direct losses of less mobile wildlife species, restrictions on wildlife movement created by fences, spoil piles and pits, displacement of wildlife from active mining areas (including abandonment of nests or nesting and breeding habitat for birds), increased competition between animals in areas adjacent to mining operations, and increased noise, dust, and human presence. Habitat for aquatic species would also be lost during mining operations. Displaced animals [may] find equally suitable habitat that is not occupied by other animals, or occupy poorer quality habitat than that from which they were displaced. 158 These same direct impacts can be

expected for all surface coal mines on federal land and must be analyzed in the PEIS. BLM has recognized similar impacts post-mining, including an overall “decrease in carrying capacity for some species and a decrease in vegetation diversity.”¹⁵⁹

However, in the past BLM excluded consideration of a host of indirect impacts that are the reasonably foreseeable consequences of federal coal leasing. These include:

Impacts to wildlife from transportation infrastructure, primarily railroads, used to transport federal coal either to power plants in the U.S. or to export facilities. Impacts to wildlife caused by the ports – existing and proposed – that could receive shipments of federal coal for export.

Increased dust along the entire route of the railroad, as well as the route of connecting railroads that will experience more train traffic made up largely of coal trains.

Increased air and water pollution resulting from increased shipments of and mining of coal resulting from activities from the mine site to the port.

Increased GHG emissions from enabling the extraction and combustion of federal coal. The PEIS must examine these impacts wherever they may occur. ¹⁵⁸ Bureau of Land Management, Wright Area FEIS, at ES-52 (July 2010); see also Alton Coal Tract Lease by Application Draft Environmental Impact Statement, at ES-14 (“Direct and indirect impacts from either action alternative would include habitat fragmentation, alteration, loss, and displacement due to surface disturbance, noise, ground vibration, night lighting, and increased risk of vehicle mortality associated with coal-haul trucks.”). ¹⁵⁹ Bureau of Land Management, Wright Area FEIS, at ES-52. ⁴⁷ The PEIS must also examine the impacts the federal coal leasing program has on wildlife in the context of climate change, which exacerbates many of the stressors on wildlife that coal mining directly causes. Climate change poses a direct threat to wildlife and communities. If carbon pollution continues unabated, scientists predict that higher temperatures will lead to the extinction of 50% of species around the globe. ¹⁶⁰ With a warming world come habitat shifts, and many wildlife species are finding themselves without suitable habitat to occupy. The latest National Climate Assessment report shows that wildlife and communities are already feeling the impacts of climate with rising seas, heavier precipitation, changes in growing seasons, fewer cold snaps, decreased snow pack, increased incidence of pests, devastating wildfires and droughts, and other significant impacts. ¹⁶¹ Plant and animal species are shifting their entire ranges in search of colder locales, in many cases two-to-three-times faster than scientists anticipated. ¹⁶² Due to irreversible changes, cold-water fish such as trout are already disappearing from streams, big game populations such as moose are being pushed out of their historic range, and certain wetland habitats are vanishing. ¹⁶³ In the Western United States, climate change-related stresses, including severe droughts, have driven mule deer population declines. ¹⁶⁴ Vulnerability of these and other large ungulates are expected to increase as “human development causes additional impacts to wildlife habitat” and “these populations are forced to exist on less habitat or lower quality habitat [than] has existed in the past.”¹⁶⁵ Of course, the impacts of climate change are not limited to wildlife in the interior West. Among other problems facing coastal areas, rising sea levels increase salinity intrusion into freshwater ecosystems, such as the Everglades, which provide important habitat for birds, fish, and other wildlife. Freshwater wetlands that offer important foraging habitat for wading birds ¹⁶⁰ International Panel on Climate Change, 4th Assessment Report, available at http://www.ipcc.ch/pdf/assessment-report/ar4/syr/ar4_syr.pdf (last visited July 28, 2016) ¹⁶¹ See National Climate Assessment and Development Advisory Committee, CLIMATE CHANGE IMPACTS IN THE UNITED STATES at 7. ¹⁶² National Wildlife Federation, *Wildlife in a Warming World* (2013), available at http://www.nwf.org/~media/PDFs/Global-Warming/Reports/NWF_Wildlife-Warming-World_Report_web.aspx (last visited July 27, 2016). ¹⁶³ Lisa Eby, et al., Evidence of Climate-Induced Range Contractions in Bull Trout *Salvelinus confluentus* in a Rocky Mountain Watershed U.S.A., *PLOS ONE* (2014), available at <http://www.plosone.org/article/info%3Adoi%2F10.1371%2Fjournal.pone.0098812> (last visited July 28, 2016). ¹⁶⁴ Clay Schwartz, Studies, states seek to halt mule deer population decline, *BILLINGS GAZETTE*, October 17, 2013 available at http://billingsgazette.com/lifestyles/recreation/studies-states-seek-to-halt-mule-deer-population-decline/article_e6a17e99-01dd-50ed-9edb-f39c976d9db3.html (last visited July 28, 2016); Ellenberger and Byrne (2015) (Exhibit) at 3. ¹⁶⁵ Ellenberger and Byrne (2015) (Ex. 20) at 3. ⁴⁸ and other wildlife may decrease. ¹⁶⁶ In the Chugach National Forest in Alaska, Forest Service researchers predict that “changes in climate could result in salmon that are smaller and face more to their survival, according to Forest Service researchers. These projected

climate impacts may affect various users, including residents in the region who rely on snow-based tourism and salmon for their livelihoods and Alaska Native residents in the region who rely on forest resources for subsistence hunting, fishing, trapping, and gathering.”¹⁶⁷ Accordingly, all of the direct consequences to wildlife of mining federal coal—including habitat loss, displacement, and restrictions on movement, among others—will be worsened as a result of climate change. In light of the direct devastation coal mining has on lands, water, and wildlife near mined areas, and the indirect but equally destructive impacts to these resources due to greenhouse gas emissions from burning federal coal, the PEIS must examine whether federal coal leasing may be accomplished in a manner consistent with BLM’s mandate to protect these resources for future generations.

Comment Excerpt Text:

Impacts to Public Lands and Land Uses The direct and indirect harm to public lands and land uses from the federal coal leasing program are substantial, unavoidable, unnecessary, undue, and unacceptable under FLPMA, which governs the Department’s management of federal coal resources. Between 5 and 8.4 million acres have been disturbed by surface mining in the United States. ¹¹⁵ Coal mining companies currently have control of federal coal underlying nearly half a million acres of public and private lands, ¹¹⁶ approximately 80 percent of which will be strip-mined. ¹¹⁷ These lands are closed to the public—and all non-mining uses—during active mining. Barred public uses include outdoor recreation, hunting, grazing and agriculture. While some mined land may be reclaimed, some of it is permanently altered and rendered unsuitable for pre-mine uses. ¹¹⁸ In addition to these direct impacts to lands from coal mining, greenhouse gas emissions from the burning of coal and consequential climate disruption wreak havoc on ecosystems, not just within the mining area but on all lands. The federal government manages approximately 30 ¹¹⁵ Sourcewatch, The footprint of coal, available at [://www.sourcewatch.org/index.php/The_footprint_of_coal#How_much_land_has_been_disturbed_by_all_surface_mining_in_the_United_States](http://www.sourcewatch.org/index.php/The_footprint_of_coal#How_much_land_has_been_disturbed_by_all_surface_mining_in_the_United_States) (last visited July 19, 2016). ¹¹⁶ Bureau of Land Management., Total Federal Coal Leases in Effect, Total Acres Under Lease, and Lease Sales by Fiscal Year Since 1990, available at http://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy/coal_lease_table.html (last visited July 19, 2016) (306 federal coal leases covering 482,691 acres in 2015). ¹¹⁷ White House Fair Return Report, at 22. ¹¹⁸ See *infra* § II.E, detailing unmet reclamation obligations. 41 percent—650 million acres—of our nation’s land along with offshore marine resources. ¹¹⁹ On federal public lands, including lands managed by BLM, the Forest Service, Fish and Wildlife Service, and National Park Service, the effects of climate change are already being felt and will only increase as our climate continues to respond to growing concentrations of greenhouse gases in our atmosphere. ¹²⁰ Climate change, spurred by fossil fuel combustion including burning of federal coal, catalyzes or exacerbates many harms to lands across the country, including federal public lands. For example, a combination of climate change factors including drought and high temperatures has set off a recent historical trend of more frequent and larger wildfires, a trajectory that is expected to continue as the impacts of climate change become more severe. ¹²¹ The impacts of more wildfires are not limited to the physical destruction of the fires themselves. Wildfires may also cause respiratory difficulties and lung disease in humans, and the ash from the fire may adversely affect water supplies. ¹²² Additionally forest fires can be worsened by the presence of increased insect populations and their adverse effects on timber. These insect populations are expected to grow in the areas most at risk for fire, particularly high-altitude forests. ¹²³ In fact, climate change is expected to cause changes to insect populations in various regions of the country. ¹²⁴ For example, milder winters will result in higher populations of less frost-resistance ¹¹⁹ U.S. Government Accountability Office, GAO-13-253, Climate Change: Various Adaptation Efforts Are Under Way at Key Natural Resources Management Agencies, at 2 (2013), <http://www.gao.gov/assets/660/654991.pdf>, attached as Ex. 31. ¹²⁰ The Interior Department’s website acknowledges that “[c]limate change affects every corner of the American continent. It is making droughts drier and longer, floods more dangerous and hurricanes more severe,” and that “[t]he impacts of climate change are forcing [the Interior Department] to change how we manage these resources. Climate change may dramatically affect water supplies in certain watersheds, impact coastal wetlands and barrier islands, cause relocation of and

stress on wildlife, increase wildland fires, further spread invasive species, and more.” See <https://www.doi.gov/climate> (last visited July 27, 2016). 121 The National Science and Technology Council, Committee on Environment, Natural Resources, and Sustainability Subcommittee on Disaster Reduction, Wildland Fire Science and Technology Task Force Final Report, November 2015, 6; U.S. Government Accountability Office, Climate Change - Agencies Should Develop Guidance for Addressing the Effects on Federal Land and Water Resources, August 2007, 5-6. As climate change creates longer fire seasons, the damages caused by wildfires also increase. A. L. Westerling, H.G. Hidalgo, D. R. Cayan, & T. W. M. Schmid & D. L. Parker, Fire and Forest Insect Pests, at http://www.fs.fed.us/rm/pubs_rm/rm_gtr191/rm_gtr191_232_233.pdf (last visited July 21, 2016); E. E. Strange & M. P. Ayres, Climate Change Impacts: Insects, 11-10 ELS (2010). 124 See U.S. Government Accountability Office, Climate Change, at 6. 42 species, which in turn can negatively affect local vegetation, agriculture, and even other insect populations that usually might rise during the spring in areas traditionally prone to colder winters. 125 Climate change has also been linked to insect migrations, which can cause issues with invasive populations as they expand beyond their historical ranges due to climatological changes. 126 These migrations can be detrimental to local vegetation, which can in turn affect entire ecological systems. 127 Climate disruption’s effects on vegetation are not limited to the effects of changing insect populations. Changing temperatures are expected to increase the range of many invasive weed species across a variety of landscapes. 128 As one example, invasive weeds from California have been discovered advancing into northern Nevada as temperatures have increased. 129 In the Eastern U.S., some invasive species are projected to migrate all the way from Pennsylvania to Maine to by 2084 under current climatological patterns. 130 As these invasive plant species spread they will cause millions, if not billions, of dollars in damage and may outcompete to destroy local vegetation and crops. 131 As these processes unfold and ecosystems are altered, vulnerable species will face an increased risk of extinction as even minor changes to their habitat might offset population growth. 132 These types of changes can also have adverse effects on shorelines, as critical vegetation is reduced and natural barriers to erosion are weakened, dilemmas that are only further compounded by climate change’s impact on rising sea levels. 133 125 J.S. Bale, G. J. Masters, et al., Herbivory in Global Climate Change Research: Direct Effects of Rising Temperature on Insect Herbivores, 8-1 GLOBAL CHANGE BIOLOGY, 1-16 (2002). 126 C. McDonald, Climate Change and the Geography of Weed Damage. 131 See U.S. Fish and Wildlife Service, The Cost of Invasive Species, at <https://www.fws.gov/verobeach/PythonPDF/CostofInvasivesFactSheet.pdf> (last visited July 21, 2016). 132 T. A. Crowl, et al., The Spread of Invasive Species and Infectious Disease as Drives of Ecosystem Change, at 6-5 FRONTIERS IN ECOLOGY AND THE ENVIRONMENT, 238-246 (2008). 133 Rusty Feagin, Douglas Sherman, & William Grant, Coastal Erosion, Global Sea-level Rise, and the Loss of Sand Dune Plant Habitats, at 3-7 FRONTIERS IN ECOLOGY AND THE ENVIRONMENT (2005). 43 The true problem with these and other harmful impacts to land from climate change is that they are not finite; as climate change worsens, so too will the adverse impacts to the land and its fauna. As the GAO recognized, climate change “poses significant financial risks to the federal government ... in its role as the manager of large amounts of land and other natural resources.” 134 As such, proactive and imminent actions are required in order to avoid, reduce, and/or mitigate long-term damage to land resources. 135 Already, federal land management agencies have begun developing strategies to identify, monitor, and adapt to resource changes brought about by climate disruption. 136 In

evaluating needed reforms to the federal coal leasing program, the PEIS must examine these impacts from climate change on federal public lands and land management, which continued coal leasing will only worsen.

A failure to protect our public lands.

Our public lands are already heavily impacted by drought, wildfire, pine bark beetles, and elevated temperatures resulting from climate change. Increasing emissions from coal would accelerate these adverse impacts. This is incompatible with the BLM's mission "to sustain the health, diversity, and productivity of America's public lands for the use and enjoyment of present and future generations."

Antelope and mule deer populations are in decline because of the destruction of their habitat. Also, many ordinary citizens depend on the meat of these animals harvested during the season to feed their families. Coal mining and damage that it does to the habitat necessary for these wild ungulates to live is very detrimental to everyone except mining companies.

Comment Number: 0000725_Kirchner_NWF-2

Commenter I: Jane Kirchner

Comment Excerpt Text:

The presence of acid-forming materials exposed as a result of mining can affect aquatic wildlife by eliminating

habitat and by causing direct destruction of some species. Lesser concentrations can suppress productivity, growth rate and reproduction of many aquatic species. Acids, dilute concentrations of heavy metals, and high alkalinity can cause severe damage to wildlife in some areas. The duration of acidic-waste pollution can be long; estimates of the time required to leach exposed acidic materials in the Eastern United States range from 800 to 3,000 years. This is way beyond a business life-cycle calculation.

Comment Excerpt Text:

Mule deer, pronghorn antelope, sage grouse, elk and hundreds of bird species including eagles make their home in the Powder River Basin of Wyoming and Montana. The National Wildlife Federation and Natural Resources Defense Council commissioned a study of the health of wildlife in this major coal producing region. This region is also the location of the nation's largest surface coal mine. More than 70% of the mule deer and pronghorn herds evaluated were found to be unhealthy. Notably, of the mule deer herds evaluated, the only one that was found to be healthy was the one living in an area without any energy development within its boundaries

Comment Excerpt Text:

An anchor of the regional economy, agricultural operations like L.J. are plagued by uncertainty over the longterm availability of adequate grass and water. Continued mine expansions in the near reclamation of lands in the State of Wyoming magnify this uncertainty. Less than one percent of disturbed acres have achieved final reclamation and bond release. One of the breakdowns in the implementation of our surface mining laws is the failure to force these companies to release mine lands and return them to agriculture production. L.J. hopes the Department of Interior will consider these issues and develop solutions to them during the scope of the programmatic coal review.

Comment Excerpt Text:

Coal combustion, without corresponding sequestration technologies, destabilizes and degrades the conditions that make other uses possible. Given the long-term atmospheric impact of carbon dioxide, the effects of mining public coal today will affect public lands for centuries; damaging recreation opportunities, water supplies, wildfire resilience, and even other extractive uses such as timber and grazing. A disparity exists between the high, long-term costs of coal usage and the low, short-term windfalls from sale. The BLM must consider this disparity when making its decisions.

Comment Excerpt Text:

In the state of Utah, tourism brings in far more revenue and creates far more jobs that does the coal industry. If we preserve the natural environment, these areas will continue to be places of beauty for tourists and visitors who are drawn here from all over the world, on into the future. If these areas are ruined and destroyed, as is now happening, this will simply lead us to a dead--end, with no future. If we rely on a death- dealing industry, such as coal, instead of a life--sustaining industry such as tourism, then when the coal is gone, and when the coal

companies have all gone bankrupt, as is already beginning to happen, we will be left with nothing. There will then be no jobs, no income, and no wild lands either

Comment Excerpt Text:

In conducting the Programmatic Environmental Impact Statement (PEIS) of the federal coal leasing program, the Pew Charitable Trusts recommends that BLM consider the potential impacts new policy direction will have on the agency's mission to manage the lands with wilderness characteristics as part of BLM's multiple use mission. Pristine BLM lands provide a range of uses and benefits in addition to their value as settings for solitude or primitive and unconfined recreation. These lands are some of our nation's most sought after hunting and fishing grounds, most popular mountain biking trails, home to an extensive network of ungulate migration corridors, essential habitat for imperiled species like the greater sage grouse and habitat for 450 listed species. The protection of these values deserves consideration when reforming the federal coal leasing program on BLM lands. Recreation on natural BLM-managed lands has a significant positive impact on rural economies across the West. A study conducted by the independent firm ECONorthwest and commissioned by The Pew Charitable Trusts recently highlighted this value, finding non-motorized recreation on the 246 million acres of our nation's land overseen by the Bureau of Land Management supports 25,000 jobs and generates \$2.8 billion for the U.S. economy. (See: <http://www.pewtrusts.org/en/research-and-analysis/analysis/2016/03/31/the-economic-value-ofquiet-recreation-on-blm-lands>)

Organization I: Natural Resources Defense Council

Commenter I: Geoffrey Fettus

Comment Excerpt Text:

While the majority of federal coal is developed from large surface mines, federal coal is also mined underground. Underground mining creates different impacts, including first and foremost subsidence of surface lands after mining occurs. These cracks can pose a safety hazard to surface users, from small cracks that can break the legs of horses, cattle, and wildlife that step into them, to larger cracks that can render surface lands uncrossable for some distance. Some ranchers in Montana have measured subsidence cracks that are up to 15 feet wide. These issues can be compounded when cracking occurs on steep slopes, which increases the risk of slope failure, rockfalls, and landslides. In addition, subsidence cracks can damage springs and streams, draining surface water resources that are beneficial to agriculture and wildlife. The PEIS should analyze subsidence problems on previously leased acreage and disclose impacts.

Comment Number: 0002467_Fettus_20160728-40

Organization I: Natural Resources Defense Council

Commenter I: Geoffrey Fettus

Comment Excerpt Text:

In addition to climate change impacts, federal coal leasing and subsequent mining creates significant – and in many cases irreversible – impacts to air and water resources, wildlife habitat, and ecosystems in the areas where mining occurs. Federal coal is mined through the large strip mines of the Powder River Basin, as well as underground and longwall mines in other parts of the Western U.S. All coal mines create impacts, which must be addressed in the PEIS.

Comment Number: 0002467_Fettus_20160728-8

Comment Excerpt Text:

In addition to public lands forests dying from beetle proliferation and other stressors, wildfires are a growing factor on the landscape, affecting ecology, communities and budgets. The U.S. Forest Service is spending more than 50 percent of its budget to suppress the nation's wildfires.¹⁹ Simultaneously, more than 40 percent of our nation's coal is being mined on public lands. The continued leasing of federal lands for coal will only continue to have disastrous impacts in the form of wildfires and budget problems. Over the past 100 years, southwestern Colorado temperatures have increased, and modeled climate projections for the region include warmer and longer frost-free summers, snowline moving up in elevation, earlier snowmelt, and consequently, a longer fire season.²⁰ Fire has always been a reality on the western landscape, but a changing climate is exacerbating the situation.

Comment Excerpt Text:

Master Leasing Plans are created at a smaller landscape level to manage oil and gas development, focusing on areas where there are likely impacts to and potential conflicts with other resources. See, Handbook H-1624-I (Planning for Fluid Mineral Resources), Chapter V. MLPs incorporate a number of tools to reduce conflicts and guide development to appropriate areas that could be incorporated into the Coal PEIS, including:

- Identifies resource condition objectives to provide standards for subsequent development and reclamation; these may apply to management for air quality, wildlife habitat, riparian areas. H-1624-I.V.C.1. Setting standards prior to approving coal leasing and development will enable BLM to identify and address potential impacts.
- Incorporates resource protection measures to reduce environmental impacts and help achieve resource condition objectives. These measures may include closing areas to leasing, phased leasing, or other lease stipulations or conditions of approval restricting the timing, location, or method of operations; or conditions of approval. H-1624-I.V.C.2. In practice, these measures have included prioritizing mineral leasing in areas with high development potential and minimal resource conflicts, and using phased leasing and development, which can be accomplished through identifying areas to be leased in order and by using limitations on the amount of cumulative surface disturbance that can occur and requiring reclamation prior to additional development. These types of approaches could be used as part of managing both leasing and development in the Coal PEIS.
- Extends to BLM surface and split estate lands. See, Instruction Memorandum 2010-117. The Coal PEIS can and should address leasing and development of federal coal resources including where BLM may not manage the surface.
- Extends to both new and existing leases. H-1624-I.V.C.2. The Coal PEIS can and should incorporate protective measures, including mitigation, which will apply to new leases and approvals of development on existing leases.

Most of these key concepts are embedded in coal regulations and policy already, including the unsuitability criteria, multiple use considerations, special stipulations for leases, and “due regard” language in standard lease terms and the regional leasing framework.

Commenter I: Winifred Hepler

Comment Excerpt Text:

I call attention to the terrific misconception that "clean coal" production (sequestering the carbon air pollution) is at all possible due to the fact that extraction remains a total disaster, considering the loss of trees, the water pollution from overburden filling of headwater streams, the erosion and possible slides from (following) the removal of roots, the leaching of toxins from disturbed land and the disappearance of wildlife habitat and the increase of greenhouse gas from the absence of forest cover.

Comment Number: 003068_Good_1772016-1

Commenter I: Albert Good

Comment Excerpt Text:

Accessing bituminous coal, in particular mountaintop removal, involves severe ecological degradation, not to mention preventing other more sustainable uses of public land such as recreation, wildlife habitat, CO₂ absorption from trees, etc. Accessing anthracite coal is often not much better. Both lead to acid mine drainage, destruction of land for tailings disposal, visual pollution, degradation of infrastructure from heavy equipment and truck traffic, and acid mine drainage causing downgradient damage that may extend off of federally owned land. Not only that, the impact on the U.S. and global environment when the coal is burned is no longer viable on this planet. The CO₂ released clearly contributes to global warming, as well as immediate and long-term health effects on humans and other animals. A side effect of accessing coal is the venting of methane, exacerbating global warming

Examining how BLM's decisions to lease taxpayer-owned coal affect wind and solar generation

Comment Number: 00000116_Johnson_20160517-1

Commenter I:Alan Johnson

Other Sections: 1

Comment Excerpt Text:

In fact, as Robert Bryce senior fellow of the Manhattan Institute for Policy Research stated in his February 2012 paper, "The High Cost of Renewable-Electricity Mandates," he states: "The renewable industry has received over twice in tax credits than other energy producers are paying in taxes. In fact, where the cost for coal averages \$38 per million BTUs, the same million BTUs from onshore wind power could cost between 75 and \$138. And for solar-generated electricity, the cost rises to 242 to \$455 for the same million BTUs. The only way renewable energy appears to be competitive is to receive subsidies and credits." The problem, as my wife and I talked about, is the tax credits do not build an education program for future generations. However, taxes paid by coal companies do. Tax credits for the renewable energy industry do not build infrastructure, provide parks, recreation opportunities, or many of other things that communities enjoy. Coal mining does.

Comment Number: 00000140_Puntene_20160517-1

Commenter I:Shawna Puntene

Comment Excerpt Text:

1. Economic impact of electric power cost rising three fold or more if solar or wind replace coal energy. Study & Release Impartially ASAP!

2. Release the true economic and environmental impact of wind energy. The special treatment of industry.

-Highlight cost to wildlife

-Highly subsidizes, no royalties, low rents on land In leasing program BLM must evaluate costs, impacts, returns of alternative energies.

Comment Number: 0000765_Jahshan_NRDC_20160623-2

Organization I: Natural Resources Defense Council

Commenter I: Amanda Jahshan

Comment Excerpt Text:

The solar industry now employs over 200 thousand people—vastly more than the coal industry. Reforms should also better reflect these kinds of changes that we are seeing our nation make regarding where and how we should get our energy to secure a more sustainable future for generations that follow. To that end, we need to ensure that clean, inexpensive energy sources are able to compete instead of focusing on flooding the market with subsidized coal sold at cut-rate prices.

Comment Number: 0000773_Stevens_20160519-1

Commenter I: Wayne Stevens

Comment Excerpt Text:

Instead of opening public lands to coal extraction, these lands could be opened for commercial renewable energy production sites. This would leave hundreds of thousands acres of vegetation to remove carbon dioxide from the air, limit methane gas from coal mining from getting into the atmosphere, and leave lands for wildlife, recreation, and tourism. More than sixty percent of Scotland's power comes from wind turbines. Most of Morocco's electrical power is produced from solar energy. The United States could do the same, if the government opened lands for renewable energy sites.

Comment Number: 0000778-3

Organization I: Bowie Resources

Commenter I: Jeff Erickson

Comment Excerpt Text:

Coal mining produces taxes. Solar, wind farms and biomass fuel are subsidized by the government, making an unfair economic decision for the public users.

Organization I: Voices for Utah Children

Commenter I: Lincoln Nehring

Comment Excerpt Text:

Acknowledging that a national transition to renewable energy will take time and concerted effort, is nonetheless critical that the shift away from fossil fuels be facilitated as expeditiously as possible—beginning with the most toxic and carbon intensive types.

Comment Number: 0000815-2

Organization I: Dugout Canyon Mine

Commenter I: William King

Other Sections: I

Comment Excerpt Text:

Researchers at the Massachusetts Institute of Technology (MIT) have confirmed what many in the energy world already knew: Without government support or high taxes, green energy will never be able to compete with conventional, more reliable fossil fuel power plants. The study concludes that the government could make green energy competitive by offering enormous amounts of taxpayer support. The study confirms that green energy can only work when energy prices are extremely high. The International Energy Agency estimate that developing wind and solar power enough to substantially impact global warming could cost up to \$16.5 trillion. Windmills, solar panels, and ethanol could not compete with coal, natural gas, and oil without mandates and subsidies even when the price of the conventional fuels are relatively high. Now that prices for fossil fuels have plummeted, very little new renewable energy capacity will be installed unless the mandates and the subsidies are raised even higher.

Comment Number: 0000829-4

Organization I: Utah Citizens Advocating Renewable Energy (UCARE)

Commenter I: Stanley Holmes

Comment Excerpt Text:

UCARE has seen cost-shifting by the fossil fuels industry in utility rate cases, where coal-driven utilities use antiquated state regulatory systems to overstate the value of their coal assets while undervaluing renewable energy. Federal coal leasing enables this bias toward fossil fuels to the detriment of renewables, such as wind and solar. The BLM should look at how underpriced coal reduces the competitiveness of renewable energy fuels and the appeal of energy efficiency measures.

Comment Number: 0000831-1

Commenter I: Sharon St. Joan

Comment Excerpt Text:

How can we afford to invest in clean energy?

By cutting out subsidies to the fossil fuel industry - estimated at \$20 billion a year - we can invest instead in a just transition on two fronts.

First - programs for new, clean, healthy, good-paying jobs, for re-training and assistance for workers and their families. Secondly, we need to invest in clean energy - solar and geo-thermal energy.

Comment Number: 0000840-1

Commenter I: Craig J. Provost

Comment Excerpt Text:

The continued use of coal mining only worsens the problems with our environment. Although coal mining has been important for income for some of our hard working population, we should focus on helping them to shift their skills to other important and growing areas of power production, such as wind and solar power, which are

more environmentally friendly. Utah has plenty of sunshine and has the potential to provide energy without the harmful effects on the environment that coal has.

Commenter I: Lori Shaw

Comment Excerpt Text:

People with anti-coal agendas claim to be very concerned about the effect that coal mining has on our earth, but at the same time they don't like to think about the impact that rare earth metal mining has on our planet as well. The list of rare earth metals required to create solar panels and wind turbines is a long one. It includes metals like Lithium, Platinum, and Tellurium (a metal that is more rare than gold.) A tiny amount of neodymium is needed to create the ear-buds of your smartphone, but for a high-performance wind turbine they can need about two tons of it. How are energy sources that require the mining of these substances sustainable or even renewable? The answer is that they are not. (See articles 1 & 2)

By stifling the coal industry and attempting to embrace these so-called "renewable" energy sources, we are essentially trading the mining of one thing for the mining of another. The difference is that wind and solar energy are less reliable and much more expensive. (See article 3)

In the hundreds of years we have before coal reserves are said to run out I am sure that technological advances in wind and solar energy will be made. That is what humans are good at. Nevertheless, the technology for CONSISTENT wind and solar energy currently isn't there yet. Trying to force that unreliable technology on our society before it is ready for it (or even able to afford it for that matter) is as shortsighted as it is unethical.

do whatever is in your power to make a just and speedy transition to clean energy. This will be possible by eliminating the hidden subsidies to the fossil fuel energy and by requiring existing coal and other fossil fuel companies to pay their fair share of taxes. With these hidden subsidies, estimated at around 19 billion dollars a year, eliminated, it will be possible to make significant investments in clean energy (also to bring about the technical innovations required for solar power to eliminate toxicity and, in the case of wind, to construct wind mills that do not cause bird deaths).

Comment Number: 0002441_Hyche_20160724-2

Commenter I: Roe Hyche

Comment Excerpt Text:

Why is the USA not protecting the livelihood of our workers? Natural gas is also nonrenewable, but less dirty;

perhaps it could fill in the void during the transition from coal to clean energy; and only temporarily. If the government needs to make money, they should spend the time figuring out how to do it without spoiling the communities and the environment. Even some clean energy sources could be placed on federal lands and while that brings in BLM funds, it will not spoil the land as much as coal mining. Nor will renewable sources run out like coal and natural gas.

Comment Number: 0002449_Lyon_20160727_NWF-58

Organization I: National Wildlife Federation Action Fund

Commenter I: Jim Lyon

Comment Excerpt Text:

The federal coal program must be reformed to allow from a just transition to cleaner sources of energy. With the future of coal declining and the market for coal drying up, it is important that the federal coal leasing program take into account the concerns of communities that will be most impacted by the shift away from coal. This means, as recommended above, protecting resources these communities must depend on long-term, like water. It means ensuring that the destruction from coal mines is cleaned up and mine sites are reclaimed. BLM should identify regional mitigation strategies to avoid, minimize, and when unavoidable, compensate for resource impacts at regionally selected mitigation sites. The mitigation strategy should include identifying areas that are sources or sinks for carbon. BLM should further direct funding and revenue decisions should be made in a manner that assists these communities in a shift to a healthy, prosperous and just post-coal economy.

Comment Excerpt Text:

The Federal government's focus on substantially disrupting coal mining development is contradictory to its public promotion of wind and solar energy development. There is concern about the environmental impacts of coal mining, but the Federal government ignores the loss of habitat that occurs from the development of wind and solar farms, as well as the number of bird mortalities that occur from wind farms. For example, the Blythe Solar Power Project in California requires 4,070 acres of public land for its plant and the Tule Wind Project requires 12,200 acres of public land for the operation of its wind farm. There are also estimates that around 140,000 to 328,000 birds are killed annually by wind turbines. See Scott R. Loss, Tom Will, Peter P. Marra, Estimates of Bird Collision Mortality at Wind Facilities in the Contiguous United States, 168 Biological Conservation 201 (Dec. 2013).

Comment Excerpt Text:

The Solar PEIS ultimately made a number of decisions that can and should be considered for updating the agency's approach to leasing in the Coal PEIS, including:

- Identifying Solar Energy Zones (SEZ) that are “relatively large areas that provide highly suitable locations for utility-scale solar development: locations where solar development is economically and technically feasible, where there is good potential for connecting new electricity-generating plants to the transmission distribution system, and where there is generally low resource conflict.” Solar Final PEIS, pp. ES-7 – ES-11. Similarly, the Coal PEIS could identify areas that are “highly suitable” for coal in terms of having high resource potential and low resource conflicts, while also being economically and technically feasible.
- Identifying exclusion areas from solar development, which “allows the BLM to support the highest and best use of public lands by avoiding potential resource conflicts and reserving for other uses public lands that are not well suited for utility-scale solar energy development.” Solar Final PETS, p. ES-7. These areas are significant because of “the size and scale of utility-scale solar energy development (typically involving a single use of public lands).” Id. Instead of leaving the vast majority of lands open to coal leasing, the BLM can and should identify categories of lands that should be excluded, especially since coal mining also limits the use of land to a single use.
- Identifying variance lands that could be made available subject to a stringent process and showing of need in case the SEZs are “insufficient to accommodate demand.” Solar Final PEIS, p. ES-14.
- Incorporating programmatic design features that would be incorporated into all future development in order “to avoid or reduce adverse impacts.” Solar Final PETS, p. ES-6. Similarly, incorporating mandatory best practices for coal development could reduce environmental impacts.
- Setting out a mitigation framework and incorporating the mitigation hierarchy of avoidance, minimization and offset/compensation and preparation of regional mitigation strategies through the following actions:
 - o “Avoidance will be achieved through siting decisions and the identification of priority SEZs.”
 - o “Minimization will be achieved through the application of design features and adherence to applicable federal, state, and local laws and regulations such as the Endangered Species Act (ESA).”
 - o “For those impacts that cannot be avoided or minimized, the BLM will determine, in consultation with affected stakeholders, if measures to offset or mitigate adverse impacts would be appropriate.”
 - o “BLM proposes to establish regional mitigation plans that will facilitate development in SEZs. As envisioned, these regional mitigation plans will simplify and improve the mitigation process for future projects in SEZs.” Solar Final PEIS, p. ES-6. Mitigation should similarly be incorporated into the Coal PEIS, including a regional mitigation strategy to evaluate and design needed mitigation at the programmatic level.

Comment Excerpt Text:

By systematically and incrementally increasing the cost to operate, and reducing lands available for mineral leasing, the Federal government is essentially “closing-the-door” on coal. Coal is a necessary part of our Nation's energy portfolio, maintaining access to affordable energy is of the utmost importance—this necessarily includes the need for coal. This is particularly important due to the recent finalization of the BLM and United States Forest Services' greater sage-grouse land use plan amendments, which closed 24.2 million acres to solar and wind energy development. (4) Much like coal resources, land available for renewable energy resides predominantly in the West. As such, the practical effect of these closures means that there is even more of a need to foster development of coal resources, because the Eastern portion of this nation will not be able to offset these closures to renewable energy in the West.

(4) See Generally, FR Notice of Availability: <https://federalregister.gov/a/2015-24213>; FR Notice of Availability: <https://federalregister.gov/a/2015-24208>.

Comment Excerpt Text:

Order No. 3338 suggests that the BLM's PEIS should examine where to lease federal coal and proposes as an example the BLM's Solar PEIS (Western Solar Plan) which "amended land use plans across six southwestern states and established preferred locations for solar development." Order, p. 7. The BLM must consider its current and adequate regulatory process to examine preferred locations for coal development, including coal planning completed as part of the Resource Management Plan (RMP) process. The BLM's coal planning process includes, but is not limited to, a screen for coal development potential, unsuitability, multiple use and surface ownership consultation. In Wyoming, this was recently completed as part of the revision to the BLM's Buffalo RMP.

The use of twenty unsuitability criteria at 43 C.F.R § 3461.5 represent only one of five screens employed by BLM to determine "where and where not" to lease coal. The other four found at 43 C.F.R. § 3420.1-4(e)(1) through (4) are the principal decisions used to determine which lands are suitable for further consideration. These screening criteria have been and continue to be more than adequate to identify the most appropriate locations for federal coal leasing. If the BLM is intent on considering the Western Solar Plan, the BLM must consider that coal resource development is confined to the location of commercial quantities and qualities of coal. Solar resources are presumably more widespread across the landscape, which allows a greater degree of flexibility in establishing preferred locations for development.

Commenter I: Sheila Bowers

Comment Excerpt Text:

I am requesting that you immediately stop leasing them to rapacious Big Energy companies of all types - coal, oil, gas, solar, wind, transmission, pipelines, etc. We no longer need new leases and old leases should be phased out while the DOE, EPA, FHA and other sister agencies to the DOI work harder on local, democratically owned energy efficiency, rooftop solar and storage, and dynamic, 21st century microgrids and load balancing. The 19th Century Big Centralized Energy model is an embarrassment to America, not to mention a devastating environmental and economic blight on our once-great nation. We want to save, store, and produce our OWN energy where and when it is needed, and do not want OUR open spaces destroyed for dirty profiteering by energy companies. They are critically needed as carbon sinks, oxygen and clean air generation, not to mention our sanity and the biodiversity that the planet depends upon. To be clear, Big Solar, Big Wind and Big Transmission are as unacceptable as Big Gas, Oil and Coal.

Commenter I: Joe Stein

Other Sections: I I

Comment Excerpt Text:

Opponents of the coal moratorium correctly argue that the coal industry provides jobs and economic benefits to working class towns that need it. According to the U.S. Energy Information Administration, about 56,700 Americans are employed in coal mining; down from 80,000 in 2014. These workers are drawn to coal because jobs are a plenty. The U.S. still gets one-third of its energy from coal. Coal companies claim that we cannot replace the jobs that they provide with jobs in the green industry. The data says something different. Worldwide, there are more jobs in renewables than coal mining, oil, and gas combined. As fossil fuels dry up, workers are turning to the solar sector. There are already twice as many solar workers in the U.S. as there are coal miners. 31,000 new solar jobs were created in 2014 alone. With wise policies centered around green energy subsidies, we could create thousands of jobs, effectively nullifying the job loss experienced during the inevitable and necessary divestment from fossil fuel based energy.

The North Fork also possesses a wealth of renewable energy sources, like micro-hydro, solar, and biomass. We would welcome an opportunity to pilot some innovative ways to leverage those sources of energy from our -- for our homes, farms, businesses, governments, and community centers. This could similarly diversify our economy, create new jobs, and realize the mass potential for renewable energy

Comment Number: 00001272_Armstrong_20160623-1

Commenter I: Jeremiah Armstrong

Comment Excerpt Text:

One glaring example of this failure of the alternative energy source is the \$2.2 billion Ivanpah solar power project. This was funded by taxpayer money in California's Mojave Desert. And it's supposed to be generating more than a million megawatt hours of electricity each year. But, 15 months after starting, the plant is producing only 40 percent of that. Again, we see the hypocrisy from this, this administration. This doesn't seem to be about revenue. It seems about -- be about destroying and damaging America's energy infrastructure. One big

miscalculation that this particular power plant is -- that it requires far more steam to run smoothly and efficiently than originally thought. According to a document filed with the California Energy Commission, instead of ramping up the plant each day before sunrise by burning about one hour's worth of natural gas to generate the steam, Ivanpah needs more than four times that help from natural -- from fossil fuels to get going. Another unexpected problem is not enough sun. Some of the studies and weather predictions overestimated the amount of sun. It had more cloud cover. It doesn't work when the sun's not shining. Ivanpah isn't the only solar project struggling to energize the grid. According to greentechmedia.com, 64 worldwide solar companies have either gone bankrupt or closed their doors. Even with over \$40 billion subsidized dollars, they can't make it and compete with coal energy.

Comment Number: 00001282_Seiter_20160623-1

Commenter I: Jake Seiter

Comment Excerpt Text:

It has been stated by the United States Fish and Wildlife Service that the Ivanpah Facility kills one bird every two minutes. So, if you do the math and you extrapolate that out to a year, that equals out to 131,400 birds killed by one power -- solar power plant per year.

Comment Number: 00001282_Seiter_20160623-2

Commenter I: Jake Seiter

Comment Excerpt Text:

Now, I also want to include in that the cost of building and operating one of these plants is \$2.2 billion, not including the subsidies that we've already heard about today, that they are given to operate. So, now if you take the 60 [solar] plants required, that accounts to \$132 billion that it costs to run these plants and to build them. Now, that does not include the tax incentives. And I think that's something that needs to be looked at.

Comment Number: 00001283_Unknown_20160623-2:

Comment Excerpt Text:

We can look to several countries around to see how their experiment with green energy has gone. According to the Institute of Energy Research, which stated, in Sweden without government subsidiaries, wind turbine owners have dismantled about 50 turbines and selling them abroad. In Germany, on May 8th, 2016, the power grid was almost fried because the problem with wind and solar is that the intermittent; and, thus, it's uncontrollable by the system operator. The German government has paid wind farms \$548 million last year to cut their power in order to prevent damage to its electric grid because of the damaging effects of renewable energy has on German's grid, according the Daily Collar [phonetic]. Denmark's government abandoned plans to build five offshore wind turbine farms Friday admit fears that its electricity produced, that it would become too expensive for Danish consumers.

Comment Number: 00001285_Abshire_20160623-2

Commenter I: Jim Abshire

Comment Excerpt Text:

The State of California has lost over 700,000 manufacturing jobs in recent years due to the implementation of the renewable portfolio standard. California's industrial electricity rates are 62 percent above the U.S. average. The government has spent billions of dollars, taxpayer dollars, to subsidize renewable energy. Even though their own estimates project that this will only supply 10 percent of the energy demands by the year 2040. That's three percent over today's total. That's a pretty dismal rate of return, considering 65 percent of all Federal subsidies go towards renewables

Comment Number: 00001286_LeValley_20160623-3

Organization I:Delta County

Commenter I:Robbie LeValley

Comment Excerpt Text:

Also, in that Programmatic EIS, we specifically ask -- Delta County asks that the interconnectness between what the coal mine produces and what the solar energy and micro-hydro and methane and all of that need for their infrastructure, also be included in that EIS. There are several things that the coal mine produces for the renewable industry

Abbey, R. 2011. US Department of the Interior, Washington, DC. January 28, 2011, letter.

A letter from the US Department of the Interior, Bureau of Land Management, to Jeremy Nichols denying a request to reclassify the Powder River Basin as a coal production region and to establish a carbon fee and global warming impact fund.

Agency for Toxic Substances and Disease Registry. 2014. 2005 ATSDR Substance priority list. Internet website: <http://www.atsdr.cdc.gov>.

Chart from the Agency for Toxic Substances. Includes the 2005 ATSDR Substance Priority List, with the 2005 rank, substance name, total points, 2003 rank, and CAS RN. Significant, because arsenic, lead, and mercury rank top three.

Ahlstedt, S. A., et al. 2005. Long-Term Trend Information for Freshwater Mussel Populations at Twelve Fixed-Station Monitoring Sites in the Clinch and Powell Rivers of Eastern Tennessee and Southwestern Virginia, 1979-2004. USFWS.

Report to the US Fish and Wildlife Service looking at the impacts of coal mining on water quality in the Clinch and Powell Rivers, which contain 14 federally protected mussels and 4 fish, along with another 3 mussel species that are candidates for federal listing.

Allen, P. G., and M. Cantwell. 2016. "Stop selling off federal coal at taxpayer expense." *The Seattle Times*. June 20, 2016. Internet website: <http://www.seattletimes.com/opinion/stop-selling-off-federal-coal-at-taxpayer-expense/>.

This news article urges readers to attend public meetings and speak out against selling federal coal at taxpayer expense.

American Exploration & Mining Association. 2016. Comments on proposed amendments to Resource Management Planning Regulations (BLM 2.0). Spokane, Washington.

Unique comments in response to the BLM's notice of proposed amendments to its resource management planning regulations, published in the *Federal Register* on February 25, 2016 (81 FR 9674).

Amstrup, S. C., et al. 2010. "Greenhouse gas mitigation can reduce sea-ice loss and increase polar bear persistence." *Nature* Vol. 468.

Research letter contending that greenhouse gas mitigation could lead to retention of more sea ice habitat, meaning that polar bears could persist throughout the century in greater numbers and in more areas.

Anderson, S. 2015. Letter to D. Berry, Colorado Office of Surface Mining Reclamation and Enforcement, on Alpha Natural Resources self-bonding. Powder River Basin Resource Council.

Letter requests information on the status of permits and requirements for financial sureties, in light of Alpha Natural Resources bankruptcy filing in August 2015.

Anderson, D. M., et al. 2000. Estimated Annual Economic Impacts from Harmful Algal Blooms (HABs) in the United States. WHOI-2000-11, Woods Hole Oceanographic Institution.

Technical report funded by the National Oceanic and Atmospheric Administration and the National Science Foundation about the significant and expanding threat to human health, fisheries resources, and economies throughout the United States and the world from blooms of toxic or harmful microalgae, commonly called “red tides.”

Anderson, K., and A. Bows. 2011. “Beyond ‘dangerous’ climate change: Emission scenarios for a new world.” *Philosophical Transactions of the Royal Society* 369:20–44.

Paper focuses on how the Copenhagen Accord’s goal of keeping global temperature increases below 2 degrees Celsius is now likely unachievable, due to rapid emission growth in nations such as China and India, along with a lack of cumulative emission budgets and mitigation strategies.

Anderson, R. M., et al. 1991. “Recent catastrophic decline of mussels (*Bivalvia: Unionidae*) in the Little South Fork Cumberland River, Kentucky.” *Brimleyana* 17 (the Journal of the North Carolina State Museum of Natural Sciences).

Journal article summarizing the results of fieldwork on the Little South Fork Cumberland River in 1987, where two federally endangered species were found to have been extirpated from certain river segments, possibly due to increased coal mining in the area.

Anderson, S. 2010. Sage-grouse RMP Amendments Scoping Comments. Sheridan, Wyoming. August 30, 2010.

Letter with comments on the scope of the proposed RMP amendments and associated environmental impact statement for the Casper, Kemmerer, Pinedale, Rock Springs, Newcastle, and Rawlins Field Offices from the Powder River Basin Resource Council.

Anonymous. No date. US coal in the 21st century: Markets, bankruptcy, finance and law.

Report with information on coal industry bankruptcies and bankruptcies in general.

Applied Analysis. 2016. Energy and Energy-Related Mining in Utah. Utah Governor’s Office of Energy Development. Salt Lake City, Utah.

This report by the Utah governor’s office reviews and analyzes the economic and fiscal impacts sourced to Utah’s energy sector, including mining development. It concludes that the industry provides a significant portion of the state’s jobs, personal income for its residents, economic activity, and public revenues.

Argonne National Laboratory. 2015. GREET model. Internet website: <https://greet.es.anl.gov>.

Greenhouse gases, regulated emissions, and energy use in transportation model.

Associated Press. 2016. "More coal mine layoffs in Wyoming." Washington Times. June 15, 2016. Internet website: <http://www.washingtontimes.com/news/2016/jun/15/more-coal-mine-layoffs-in-wyoming/>.

This news article discusses layoffs from Buckskin Mine in Wyoming.

Australian Broadcasting Corp. 2016. Linc Energy executives under investigation, may be charged over alleged land contamination, May 18. Internet website: <http://mobile.abc.net.au/news/2016-05-18/linc-energy-queensland-government-investigates-possible-charges/7425174>.

Article from Australian public broadcasting related to Linc Energy executives and contamination charges. Linc executives may be charged for contaminating swaths of prime agricultural land next to its underground coal gasification plant in Queensland.

Backlund, P., et al. US Climate Change Science Program. *The Effects of Climate Change on Agriculture, Land Resources, Water Resources, and Biodiversity in the United States*.

Chapter 3 on land resources, forests, and arid lands, from assessment on the effects of climate change. Full report not found.

Baris, I., et al. 1987. "Epidemiological and environmental evidence of the health effects of exposure to erionite fibres: A four-year study in the Cappadocian region of Turkey." *International Journal of Cancer* 39:10-17.

Abstract of article from the *International Journal of Cancer* on the epidemiological and environmental evidence of health effects from exposure to erionite fibers. The study took place over the span of four years in the Cappadocian region of turkey. It was done in response to a noticed high incidence of malignant mesotheliomas in areas with exposure to naturally occurring erionite fibers.

Barnett, A. G., et al. "Air pollution and child respiratory health: A case-crossover study in Australia and New Zealand." *American Journal of Respiratory and Critical Care Medicine* 171:1272-1278.

Journal article on a study of the urban centers of Australia and New Zealand showing a strong and consistent association between hospital admissions for asthma in children and outdoor air pollutants, such as nitrogen dioxide and sulfur dioxide.

Barrasso, J. 2016. US Senate, Washington, DC. July 14, 2016.

Letter to Secretary of the Interior Sally Jewell from Senator Barrasso and others asking to alleviate the coal leasing moratorium.

Barraza-Villareal, A., et al. 2008. "Air pollution, airway inflammation, and lung function in a cohort study of Mexico City schoolchildren." *Environmental Health Perspective* 116 (6).

Journal article on a study of Mexico City schoolchildren showing acute airway inflammation and decrease in lung function when exposed to fine particulates (PM_{2.5}) from air pollution.

Barton, A., et al. 2012. "The Pacific oyster, *Crassostrea Gigas*, shows negative correlation to naturally elevated carbon dioxide levels: Implications for near-term ocean acidification effects." *Limnology and Oceanography* 57(3):698–710.

Journal article on oysters showing the negative effects of ocean acidification from elevated carbon dioxide levels in the atmosphere.

Bates, N. R., et al. 2010. "Feedback and responses of coral calcification on the Bermuda reef system to seasonal changes in biological processes and ocean acidification." *Biogeosciences* 7:2509–2530.

Journal article on the impacts of ocean acidification on coral, demonstrating that the Bermuda coral reef has had a 50 percent reduction in calcification rates, compared to pre-industrial times.

Baugher, M., and De Rocco, T. 1995. BLM press release: Interior Established Royalty Policy Committee, names members and sets first meeting for Denver. For release August 1, 1995.

News release from the Secretary of the Interior notifying the creation of the Royalty Policy Committee for the Minerals Management Advisory Board and the members being appointed.

Becker, D. A., et al. 2015. "Impacts of mountaintop mining on terrestrial ecosystem integrity: Identifying landscape thresholds for avian species in the central Appalachians, United States." *Landscape Ecology* 30:339-356.

Journal article on how avian species have a range of responses, primarily negative, to reclaimed land resulting from mountaintop removal/valley fill coal mining in central Appalachia.

Beehive Collective. 2016. Internet website: www.beehivecollective.org.

Website with studies on global and local issues related to coal.

Bernhardt, E. S., and M. A. Palmer. 2011. "The environmental costs of mountaintop mining valley fill operations for aquatic ecosystems of the central Appalachians." *Annals of the New York Academy of Sciences* 1223:39-57.

Journal article on the impacts of mountaintop mining with valley fill on southern Appalachian forests and their endemic species, such as aquatic salamanders and mussels.

Bernhardt, E. S., et al. 2012. "How many mountains can we mine? Assessing the regional degradation of central Appalachian rivers by surface coal mining." *Environmental Science & Technology*

Journal article on the negative impacts of alkali mine drainage from surface coal mines on regional river networks in central Appalachia.

Bernstein, A. S. 2011. "Climate change and children's health." *Current Opinion in Pediatrics* 23:221-226.

Journal article on how climate change could impact children's health.

Bernstein, M. A., and J. Griffin. 2005. Regional Differences in the Price-Elasticity of Demand for Energy. RAND Corporation, Santa Monica, California.

Report on the Department of Energy (DoE) Office of Energy Efficiency and Renewable Energy (EERE), which has a portfolio of energy efficiency research and development programs intended to spur development of energy-efficient technologies. It estimates the benefits of its programs by analyzing their effects, using the DoE's National Energy Modeling System, a complex model of the US energy system.

Black, D., T. McKinnish, and S. Sanders. 2005. "The economic impact of the coal boom and bust." *The Economic Journal* 115(503):449-476.

Peer-reviewed journal article examines the impact of the coal boom in the 1970s and the subsequent coal bust in the 1980s on local labor markets in Kentucky, Ohio, Pennsylvania, and West Virginia. Addresses two main questions: How were non-mining sectors affected by the shocks to the mining sector, and how did these effects differ between sectors producing local goods and those producing traded goods. Finds evidence of modest employment spillovers into sectors with locally traded goods but not into sectors with nationally traded goods.

Black, G. 2011. "Coal on a roll: Plundering America to power the Asian boom." *Onearth Natural Resources Defense Council*. Fall 2011.

The article describes the practices of extracting coal in the Powder River Basin and other areas at low domestic royalty rates and exporting it to lucrative Asian markets.

Bloomberg New Energy Finance. 2016. Sustainable Energy in America Factbook. Bloomberg. Factbook for 2016.

Records and highlights the important developments that transpired in US energy over the prior 12 months. It also provides a look back over the past seven years, and in some cases decades, to show trends.

Blumm M., and K. Mosman. 2012. "The overlooked role of the National Environmental Policy Act in protecting the western environment: NEPA and the Ninth Circuit." *Washington Journal of Environmental Law & Policy*, May 29, 2012.

The paper discusses recent NEPA case law and explores treatment of range of alternatives, including in the Ninth Circuit's Kootenai Tribe case. It held that "The NEPA alternatives requirement must be interpreted less stringently when the proposed agency action has a primary and central purpose to conserve and protect the natural environment, rather than to harm it . . . [c]ertainly, it was not the original purpose of Congress in NEPA that government agencies in advancing conservation of the environment must consider alternatives less restrictive of developmental interests."

BNSF Railway. 2011. Coal Cars. Internet website: [Http://www.Bnsf.Com/Customers/Equipment/Coal-Cars/](http://www.Bnsf.Com/Customers/Equipment/Coal-Cars/).

BNSF Railway specifications for the coal cars used across its system.

_____. 2011. **Coal Dust Frequently Asked Questions. Internet website: [Http://www.coaltrainfacts.org/docs/BNSF-Coal-Dust-Faqs1.pdf](http://www.coaltrainfacts.org/docs/BNSF-Coal-Dust-Faqs1.pdf).**

BNSF Railway answers to frequently asked questions about the effects of coal dust.

Boden, T., and B. Andres. 2015. Ranking of the world's countries by 2013 total CO₂ emissions from fossil-fuel burning, cement production, and gas flaring. Internet website: [Http://Cdiac.Ornl.Gov/Trends/Emis/Top2013.Tot](http://Cdiac.Ornl.Gov/Trends/Emis/Top2013.Tot).

Ranking of the world's countries by 2013 total CO₂ emissions from fossil fuel burning, cement production, and gas flaring.

Bohan, S. 2012. EPA Compliance and Review Program, Denver, Colorado. July 11, 2012.

Response Letter addressed to Ms. Hazelhurst, the Acting Forest Supervisor Grand Mesa, Umcompahgre and Gunnison National Forest from the EPA Region 8. Contains comments on the Draft Environmental Impact Statement for the Federal Coal Lease Modifications of West Elk Mine. Topic of focus is greenhouse gas mitigation.

Bonogofsky, A., A. Jahshan, H. Yu, D. Cohn, and M. MacDonald. 2015. Undermined Promise II. National Wildlife Federation. Denver, Colorado.

This joint publication by two conservation organizations analyzes the status of coal surface mine reclamation in five western states and updates the 2007 report, Undermined Promise.

Boucher, D., and K. Ferretti-Gallon. 2015. "Halfway there? What the land sector can contribute to closing the emissions gap."

This article discusses agreements on large reductions in global warming emissions to help prevent the world impacts caused from climate change. It also discusses mitigations they plan to achieve in the 2020s.

Bounds, W. J., and K. H. Johannesson. 2007. "Arsenic addition to soils from airborne coal dust originating at a major coal shipping terminal." *Water Air Soil Pollution* 185:195-207.

Journal article on how airborne dust from coal shipping is contributing additional arsenic to local soils in Norfolk, Virginia.

BP (British Petroleum). 2016. BP Statistical Review of World Energy June 2016. BP, London, England.

High-quality objective and globally consistent data on world energy markets. The review is one of the most widely respected and authoritative publications in the field of energy economics, used for reference by the media, academia, world governments, and energy companies. A new edition is published every June.

Bradbury, J., et al. 2013. WRI, Clearing the air: Reducing upstream GHG emissions from US natural gas systems. Internet website: <http://www.wri.org/publication/clearing-air>

Natural gas production in the United States has increased rapidly in recent years, growing by 23 percent from 2007 to 2012. Advances combining horizontal drilling and hydraulic fracturing have enabled producers to access vast supplies of natural gas deposits in shale rock formations. This phenomenon has helped to reduce energy prices. However, fugitive methane emissions from natural gas extraction and processing contribute to global warming. Reducing fugitive methane would make natural gas a cleaner energy source than coal.

Brigham, M., et al. 2003. Mercury in Stream Ecosystems—New Studies Initiated by the US Geological Survey. Fact Sheet 016-03, US Department of the Interior and US Geological Survey.

Fact sheet by the US Geological Survey studying mercury in the environment and how it enters the environment.

Bruckner, T., I. A. Bashmakov, and Y. Mulugetta. 2014. Energy Systems. “Climate change 2014: Mitigation of climate change.” Contribution of Working Group III to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change. Cambridge University Press, Cambridge, United Kingdom, and New York, New York, USA.

This report addresses issues related to the mitigation of greenhouse gas emissions (GHGs) from the energy supply sector.

Brunner, D. J., and K. Schultz. 1999. “Effective gob well flaring.” Paper presented at the International Coalbed Methane Symposium.

Article providing details on a safe and controlled system of gob well flaring, intending to persuade against venting gas from gob wells into the atmosphere. Gob well flaring provides environmental, safety, and financial benefits to mining operations. The article provides a mining operation in Australia as an application of gob well flaring.

Bryce, R. 2012. The High Cost of Renewable-Electricity Mandates. Manhattan Institute.

Report about the unaccounted for costs of renewable electricity mandates that states did not account for when making them.

Bucks, D. 2013. “Federal coal: Déjà vu all over again.” November 25, 2013.

The paper argues that federal coal policy represents broken promises to the public, similar to broken promises to Native Americans in the Powder River Basin area.

Bucks, D. R. 2015. Oversight Hearing, Ensuring Certainty for Royalty Payments on Federal Resource Production. Before the Subcommittee on Energy and Mineral Resources Committee on Natural Resources, United States House of Representatives. Washington, DC.

This is a testimony from Dan R. Bucks, Former Director of the Montana Department of Revenue, urging action to ensure a fair return on natural resources.

_____ . 2016. Public Management of Federal Coal in the Public Interest.

This report, by the Former Montana Director of Revenue, is a response to the request for comments by the BLM on the scope and analysis to be undertaken for the federal coal programmatic environmental impact statement (PEIS) established under Secretarial Order 3338. In substantive terms, this report presents a pathway for the PEIS to evaluate and prepare for the successful implementation of new public management systems for the federal coal program

Burakowski, E., and M. Magnusson. 2012. Climate Impacts on the Winter Tourism Economy in the United States. National Resource Defense Council, Washington, DC.

NRDC funded study to help policymakers understand both the ski and snowmobile industries' current economic scale, as well as the potential economic impacts that climate change may cause.

Burger, M., and J. Wentz. 2016. Downstream and Upstream Greenhouse Gas Emissions: The Proper Scope of NEPA Review. Columbia Law School .Internet website: <http://blogs.law.columbia.edu/climatechange/2016/04/05/upstream-and-downstream-greenhouse-gas-emissions-from-fossil-fuel-production-and-transportation-new-working-paper-examines-scope-of-federal-analysis-required-under-nepa/>.

Article from Columbia Law School examining the impacts of greenhouse gas emissions and NEPA review. Examines whether and how agencies should account for emissions from activities that occur “downstream” of the proposed action, such as from the combustion of fossil fuels and emissions from activities that occur “upstream” of the proposed action, such as from the extraction of fossil fuels. This article argues that such emissions do typically fall within the scope of indirect and cumulative impacts that must be evaluated under NEPA. It provides recommendations on how agencies should evaluate such emissions in environmental review documents.

Burger, M. 2016. A Mitigation-Based Rationale for Incorporating a Climate Change Impacts Fee into the Federal Coal Leasing Program. Sabin Center for Climate Change Law, New York, New York.

Paper by the Columbia Law School that develops an argument for using a mitigation-based rationale to deliver a climate change impacts fee on coal extracted from federal lands. It provides suggestions for how the Department of the Interior and the BLM can approach an analysis of the possibility in its programmatic environmental impact statement.

Burke, R. A., et al. 2014. “Impacts of mountaintop removal and valley fill coal mining on C and N processing in terrestrial soils and headwater streams.” *Water Air Soil Pollution* 185:195-207.

Journal article on the significant impacts of mountaintop removal and valley fill in coal mining on the carbon and nitrogen processing in soils, stream sediments, and stream water in Appalachia.

Burkhead, N. M., et al. 2001. "Effects of suspended sediment on the reproductive success of the tricolor shiner, a crevice-spawning minnow." *Transaction of the American Fisheries Society* 130(5):959-968.

Journal article on the impacts of excessive sedimentation in rivers and creeks on the reproductive success of the tricolor shiner and other benthic-spawning fishes in the southeastern United States.

Burt, E., et al. 2013. Scientific Evidence of Health Effects from Coal Use in Energy Generation. School of Public Health, University of Illinois at Chicago.

This document includes scientific evidence of health effects from the use of coal for energy generation. It is a resource for those interested in evidence from the health research literature addressing the health effects of the use of coal, focusing primarily on air emissions from coal combustion.

Burtraw, D., et al. 2014. Comments to the US Environmental Protection Agency on Its Proposed Clean Power Plan. Resources for the Future, Washington, DC.

Comments to the US EPA on its Clean Power Plan proposal.

Cal/EPA and The American Lung Association of California. No date. Health Effects of Diesel Exhaust. Cal/EPA's Office Of Environmental Health Hazard Assessment and the American Lung Association of California.

Factsheet describing the adverse effects of diesel exhaust due to particulates identified as toxic air contaminants by the California Air Resources Board.

Caldeira, K., et al. July 27, 2016. Carnegie Institution for Science.

Comment letter submitted and signed by group of scientists expressing the opinion that there should not be coal leasing on public lands. They write to urge the Department of the Interior to take meaningful action by ending federal coal leasing, extraction, and burning. They cite many sources and offer scientific information supporting limiting coal, which they propose is done by ending federal coal leasing.

Caldwell et al. 2009. "Total blood mercury concentrations in the US population: 1999-2006." *Int J Hyg Environ Health* 212:588-598.

Article describing the distribution and demographic characteristics of total blood mercury levels in the US general population. Article also breaks down age, gender, and racial distribution. They found that mercury levels were highest in women and white children.

California, State of. 2007. California, State of. 2007. Settlement Agreement, ConocoPhillips Company and Edmund G. Brown, Jr. Internet website: http://ag.ca.gov/globalwarming/pdf/ConocoPhillips_Agreement.pdf.

Settlement agreement between ConocoPhillips Company and Edmund G. Brown, Jr., Attorney General of California, on behalf of the People of the State of California, to go forward with the Clean Fuels Expansion Project, designed to use the heavy gas oil that is already produced at the Rodeo Refinery to instead produce cleaner burning gasoline and diesel fuels. Agreement includes ConocoPhillips permanently surrendering its operating permit for plant, conducting a facility-wide energy efficiency audit, and doing a greenhouse gas emission audit.

Cantwell, M. 2016. Letter to Sally Jewell, Secretary of the Interior, regarding self-bonding under SMCRA. United States Senate.

Letter from Senator Cantwell expresses concern over misuse of self-bonding provisions under the Surface Mining Control and Reclamation Act of 1977, which provide a loophole to leave taxpayers responsible for reclamation costs in the event of a coal company bankruptcy and requests investigation and increased enforcement.

Cantwell, M. 2016. The Coal Cleanup Taxpayer Protection Act of 2016. US Senate Committee on Energy & Natural Resources, Washington, DC.

Summary of proposed Coal Cleanup Taxpayer Protection Act of 2016.

Cantwell, M., and R. Durbin. 2016. Letter to Comptroller General requesting investigation of self-bonding practices by coal companies. United States Senate.

The letter from Senators Cantwell and Durbin requests the US Comptroller to initiate an investigation into self-bonding under the Surface Mining Control and Reclamation Act of 1977, in light of the bankruptcies of Arch Coal and Alpha Natural Resources.

Carbon Tracker Initiative. 2015. Assessing Thermal Coal Production Subsidies. September 2015. Internet website: <http://www.carbontracker.org/report/coal-subsidies/>.

Report presents a framework for assessing thermal coal production subsidies in a 2035 framework. It evaluates supply and demand in the Powder River Basin and Australia and finds substantial subsidies in the Powder River Basin.

_____. 2016. Enough Already: Meeting 2 [degrees] C PRB [Powder River Basin] Coal Demand without Lifting the Federal Moratorium. July 2016. Internet website: <http://www.carbontracker.org/report/enough-already-2c-powder-river-basin-coal-demand-federal-moratorium/>.

In this paper, potential coal supply from the Powder River Basin is compared with a demand profile restricting global warming to a two degrees Celsius outcome, in line with the upper limit at the recent agreement in Paris. Demand for coal over the period is found to be far outweighed by supply from existing leases alone, meaning that no new federal acreage in the Powder River Basin needs be leased by the federal government through the end of 2040, and the moratorium should be extended.

Carbon Tracker Initiative. 2015. The \$2 trillion stranded assets danger zone: How fossil fuel firms risk destroying investor returns. Internet website: <http://www.carbontracker.org/report/stranded-assets-danger-zone/>.

Website discussing 2 trillion dollars worth of assets/natural resources that need not be used in order to stay under 2 degrees Celsius of global warming.

Carnegie Institution. 2008. "Jet streams are shifting and may alter paths of storms and hurricanes." *Science Daily*, April 17, 2008.

Article with materials provided by the Carnegie Institution. Examines the shift in Earth's jet streams, believing that it may be in response to global warming. The shifting jet streams have implications for the frequency and intensity of future storms, particularly hurricanes.

Center for American Progress. Cutting Subsidies and Closing Loopholes in the US Department of the Interior's Coal Program. January 6, 2015. Internet website: <https://www.americanprogress.org/issues/green/report/2015/01/06/103880/cutting-subsidies-andclosing-loopholes-in-the-u-s-department-of-the-interiors-coal-program/>.

White paper examining how coal companies have learned to maximize subsidies by shielding themselves from royalty payments through increasingly complex financial and legal mechanisms. States that reform is urgently needed to cut these subsidies and to close loopholes that disadvantage other coal producing regions and distort US energy markets.

_____. 2014. Modernizing the Federal Coal Program. December 2014. Internet website: <https://www.americanprogress.org/issues/green/report/2014/12/09/102699/modernizing-the-federal-coal-program/>.

Paper finds that the royalty rate significantly undervalues coal and recommends a task force or commission to determine fair market value and assess the social cost of carbon.

Center for Biological Diversity. 2015. Grounded: The President's Power to Fight Climate Change, Protect Public Lands by Keeping Publicly Owned Fossil Fuels in the Ground. September 2015. Internet website: https://www.biologicaldiversity.org/campaigns/keep_it_in_the_ground/pdfs/Grounded.pdf.

This report details the legal authority by which the president can immediately stop new federal fossil fuel leasing in the United States, thereby keeping up to 450 billion tons from the global pool of potential greenhouse gas pollution. This is equivalent to 13 times the global carbon emissions in 2013 or the annual emissions from 118,000 coal-fired power plants. The president can do this now, without Congress, either independently or in the context of a binding international agreement. This report details the existing executive authority under the three major statutes that govern extraction of federal fossil fuels: the Mineral Leasing Act, the Outer Continental Shelf Lands Act, and the Federal Land Policy and Management Act.

Center for Climate and Energy Solutions. 2016. Internet website: <http://www.c2es.org>.

Coal facts website.

_____. 2016. **US Drought Monitor**. Internet website: <http://www.c2es.org/science-impacts/extreme-weather/drought>.

website showing the extent of drought conditions across the US, including the potential impacts to agriculture, transportation, wildfire, and energy.

Center for Health, Environment and Justice. 2015. Health Impacts of Mountaintop Removal Mining. Internet website: <http://chej.org/2013/04/26/health-impacts-of-mountaintop-removal-mining/>.

This is the introduction page that summarized the health impacts of mountaintop removal mining. It is written by an advocacy organization with a focus on environmental health.

Center for Health and the Global Environment. 2011. Mining Coal Mounting Costs: The Life Cycle Consequences of Coal. Harvard Medical School. Boston, Massachusetts.

Report detailing the cost to the environment and human health of using coal as energy. Provides statistics that expand on the argument. Document also provides visual aids to the coal life cycle.

Centers for Disease Control and Prevention. 2016. Coal Dust. Internet website: <Http://www.Cdc.Gov/Niosh/Npg/Npgd0144.Html>.

Pocket guide to the chemical hazards associated with coal dust.

Centre for Research on the Epidemiology of Disasters. 2016. Internet website: www.emdat.be.

Database of information on disasters around the globe.

Chen, I., et al. 2011. "Rapid range shifts of species associated with high levels of climate warming." *Science* 333

Journal article detailing how the distribution of many terrestrial organisms are shifting in latitude or elevation in response to changing climate.

Chen, Y., et al. 2004. "Influence of relatively low level of particulate air pollution on hospitalization for COPD in elderly people." *Inhalation Toxicology* 16:21-25.

Journal article describing the association of low levels of particulate matter air pollution on hospitalization of elderly people with chronic obstructive pulmonary disease.

Cheng, M. 2013. "WHO agency: Air pollution causes." *USA Today*. Internet website: <http://usat.ly/1aRY2oY>.

Website article on air pollution in London, in response to International Agency for Research on Cancer's declaration that air pollution is a carcinogen. This was the first time air pollution in its entirety has been classified as cancer causing.

Christian, M., and H. Fawad. 2015. Despite Its Cost Edge, PRB Coal Production Fell Almost 10%. SNL Energy.

Article with details on the state of coal production in the Powder River Basin area. Production is falling, despite coal cost advantage over other US coal areas.

Cimons, M. 2016. Keep It in the Ground. Greenpeace International.

Report examining the coal, oil, and natural gas deposits around the world that pose the greatest risk to the climate if burned for fuel. Includes an overview of efforts by fossil fuel companies and their political allies to develop these resources.

Clark, J. 1996. Office of Surface Mining Reclamation and Enforcement.

Letter with the biological opinion of the US Fish and Wildlife Service in regard to surface mining and Endangered Species Act consultation.

**Clean Air Task Force. 2001. Cradle to Grave: The Environmental Impacts from Coal. June 2001. Internet website:
http://www.catf.us/resources/publications/files/Cradle_to_Grave.pdf.**

Report discusses pollution from electric power, especially coal. The process of mining and combusting coal releases numerous toxic pollutants into the soil, air, water, and human bodies. The report discusses the toxins found in coal products and the health hazards associated with them and recommends cleaner coal production.

_____. 2013. Comparison of CO₂ Abatement Costs in the United States for Various Low and No Carbon Resources.

This is a report that uses levelized costs of electricity to assess the abatement costs of low to no carbon resources.

Clean Energy Action. 2009. Coal: Cheap and abundant - or is it? Why Americans should stop assuming that the US has a 200-year supply of coal.

The report evaluates the practicality of accessing coal reserves that are deeply buried or on federal land. It and concludes that rather than having a 200-year supply of coal, the United States has a much shorter planning horizon for moving beyond coal-fired power plants; the planning horizon could be as short as 20-30 years.

**_____. 2013. Trends in US Delivered Coal Costs, October. Internet website:
https://cleanenergyaction.files.wordpress.com/2013/10/us_coal_costs-2004-2012.pdf.**

The report tracks coal costs from 2004, when the price decline began to reverse, through 2012, showing upward trends in price in each coal-producing state.

Clement, J. P., et al. 2014. A Strategy for Improving the Mitigation Policies and Practices of the Department of the Interior Energy and Climate Change Task Force.

Report on the challenges and opportunities associated with developing and implementing an effective mitigation policy. It describes key principles and actions necessary to successfully shift from project-by-project management to consistent, landscape-scale, science-based management of the lands and resources for which the Department of the Interior is responsible.

Climate Accountability Institute. 2015. Memorandum to the Center for Biological Diversity and Friends of the Earth – USA.

Monograph presenting the results of an analysis of the oil, natural gas, and coal produced by private companies that have leases on federal lands for fiscal years 2003 through 2014. It estimates the emission of carbon dioxide that results from the marketing and end-use of the carbon fuels made available through federal leases.

Climate Accountability Institute. 2016. Scientists Support Ending Coal Leasing on Public Lands to Protect the Climate, Public Health, and Biodiversity. Internet website: https://www.biologicaldiversity.org/programs/public_land/energy/dirty_energy_development/coal/pdfs/16_7_26_Scientist_sign-on_letter_Coal_PEIS.pdf.

This is a letter from a group of scientists to Sally Jewell, Neil Kornze, and Mitchell Leverette stating support for ending the federal coal leasing program on public lands.

Climate Action Tracker. 2016. Internet website: [Http://Climateactiontracker.Org/Countries/USA](http://Climateactiontracker.Org/Countries/USA).

Website tracking the United States intended nationally determined contribution to reduce net greenhouse gas emissions.

Climate Advisors. 2016. Finalized Policies Get US Halfway to Meeting Climate Goal. Internet website: http://www.climateadvisers.com/2025_target_updated/.

Article discussing historic climate agreement, emission regulations, and how that will help the United States reach climate goals.

Climate Interactive. No date. Climate Scoreboard UN Climate Pledge Analysis. Internet website: [Https://www.Climateinteractive.Org/Programs/Scoreboard/](https://www.Climateinteractive.Org/Programs/Scoreboard/).

Website showing the progress that national contributions to the United Nations climate negotiations will make, assuming no further action after the end of the country's pledge period.

CO₂ Now. 2016. Annual Global Carbon Emissions. Internet website: [Https://www.Co2.Earth/Global-Co2-Emissions?](https://www.Co2.Earth/Global-Co2-Emissions?).

Website showing the annual global carbon emissions and their sources.

Cohan, D. 2016. “When coal companies go bankrupt, the mining doesn’t always stop.” *The Hill*, Washington, DC.

News article about the recent bankruptcies in the US coal industry and how coal companies going bankrupt does not mean mining stops and the negative impacts this situation can cause.

Colorado Energy Office. 2016. Coal Mine Methane in Colorado Market Research Report. March 2016.

Market research report by Ruby Canyon Engineering to identify opportunities to use coal mine methane as a fuel source to generate electricity. Coal mine methane is considered to be eligible as a renewable energy source. Three main points are investigated: assessment of current coal mine methane opportunities in Colorado, analysis of potential market size in Colorado, and identification of key barriers. The study concludes that there are 89 megawatts of energy potential from Colorado mines and that there is opportunity in methane-to-energy projects there.

Colorado Division of Reclamation, Mining and Safety. 2016. Month Coal Summary Report. Colorado. Internet website: <http://mining.state.co.us/SiteCollectionDocuments/07Summary16.pdf>.

This is a datasheet of production, workers, and other statistics from each mine in Colorado, as prepared by the state regulatory agency.

Colorado Mining Association. 2015. 2015 Colorado Coal Report Production and Employment. Colorado Mining Association Denver, Colorado.

Coal report with information on production and employment related to coal in Colorado.

Commission on Fair Market Value Policy for Federal Coal Leasing. 1984. Fair Market Value Policy for Federal Coal Leasing. Commission on Fair Market Value Policy for Federal Coal Leasing, Washington, DC. February 1984.

Report on finding fair market value policy recommendations for the federal coal leasing program. The Commission on Fair Market Value Policy for Federal Coal Leasing, an interagency governmental commission, produced a report as mandated by the 1983 Supplemental Appropriations Act (PL 98-63). The report outlines the commission’s recommendations for enhancing management of the federal coal leasing process and improving the prospects for the nation to recover a fair market value for leased coal reserves.

Committee Majority Staff. 2016. Hearing entitled “A Review of EPA’s Regulatory Activity During the Obama Administration: Energy and Industrial Sectors.”

Meeting agenda to the hearing entitled “A Review of EPA’s Regulatory Activity During the Obama Administration: Energy and Industrial Sectors.”

Considine, T. J. 2013. "Powder River Basin coal: Powering America." *Natural Resources* 2013(4):514-533.

Journal article details that the Powder River Basin produces a huge amount of coal that powers the United States and makes the case that the economic nature of the coal reserves is beneficial for the United States.

Cooper, T. F., et al. 2008. "Declining coral calcification in massive porites in two nearshore regions of the northern Great Barrier Reef." *Global Change Biology* 14:529-538.

Journal article describing how recent increases in sea water temperatures have led to unprecedented declines in coral calcification on the northern Great Barrier Reef.

Council on Environmental Quality. 2014. Revised Draft Guidance for Federal Departments and Agencies on Consideration of Greenhouse Gas Emissions and the Effects of Climate Change in NEPA Reviews. CEQ, Washington, DC. *Federal Register* 79(247):77802-77831.

Federal Register notice that the Council on Environmental Quality is publishing revised draft guidance on how National Environmental Policy Act analysis and documentation should address greenhouse gas emissions and the impacts of climate change.

Crowl, T. A., et al. 2008. "The spread of invasive species and infectious disease as drivers of ecosystem change." *Frontiers in Ecology and the Environment* 6(5):238-246.

Journal article on how climate change, land use, and transport vectors interact in complex ways to determine the spread of native and nonnative invasive species and pathogens and their effects on ecosystem dynamics. Understanding the interactions of invasive species, disease vectors, and pathogens with other drivers of ecosystem change is critical to human health and economic well-being.

Dale Jones, E. B., et al. 1999. "Effects of riparian forest removal on fish assemblages in southern Appalachian Streams." Institute of Ecology and Program in Conservation Ecology and Sustainable Development.

Paper looking at deforestation of riparian zones and how removing the forest leads to shifts in the structure of stream fish assemblages, due to decreases in fish species that do not guard hidden eggs or that depend on swift, shallow water and increases in fishes that guard their young in pebble or pit nests or that live in slower, deeper water.

Davenport, C. 2014. "Climate change deemed growing security threat by military researchers." *The New York Times*. May 13, 2014.

The New York Times investigating the threat climate change poses on national security and global political conflict. Mentions building political support for President Obama's climate change agenda, which includes a regulation to cut pollution from coal-fired power plants. The ways in which climate change is affecting military policy include increasing global instability, opening the Arctic, raising sea level, and increasing extreme storms. The article calls climate change a "threat multiplier" and a "catalyst for conflict."

de Hartog, J. J., et al. 2009. "Effects of fine and ultrafine particles on cardiorespiratory symptoms in elderly subjects with coronary heart disease: The ULTRA study." *American Journal of Epidemiology* 157(7).

Journal article summarizing the results of the ULTRA Study, which looked at the association between fine and ultrafine particulate air pollution and cardiorespiratory health. Researchers concluded some negative effects to the cardiac system do occur, mostly from PM_{2.5}.

De'ath, G., et al. 2009. "Declining coral calcification on the Great Barrier Reef." *Science* 333:116-119.

Journal article describing how coral calcification at the Great Barrier Reef has been reduced recently due to declining pH of the upper sea water layers from absorption of increasing atmospheric carbon dioxide.

DeForest, C. E. 1999. *Watershed Restoration, Jobs-in-the-Woods, and Community Assistance: Redwood National Park and Northwest Forest Plan.* Spokane, Washington.

This report distills the legacies of the Redwood National Park expansions legislation and compares them with the Northwest Forest Plan. It also highlights information gaps about the efficacy of watershed restoration, worker retraining, and community redevelopment funding.

Dingell, D. 2015. Letter to L. Gohmert, Chair of Subcommittee on Oversight and Investigations for House Committee on Natural Resources.

The letter urges an investigation into the practice of self-bonding by coal companies, especially the use of subsidiary companies to meet self-bonding requirements, which puts taxpayer dollars at risk when coal companies lack sufficient funds for reclamation.

Dingell, D., et al. 2016. Letter to Sally Jewell, Secretary of the Interior, re: Coal Self-bonding. US House of Representatives. June 10, 2016.

US Representatives express concern over practice of self-bonding among coal companies after Peabody Energy becomes the third major coal producer to file for bankruptcy protection, after Arch Coal and Alpha Natural Resources. Taxpayers are at risk of having to shoulder reclamation costs at these mines as a result of lax enforcement of self-bonding rules. The Department of the Interior is urged to strengthen self-bonding requirements and discourage the practice.

Donner, S. D. 2009. "Coping with commitment: Projected thermal stress on coral reefs under different future scenarios." *PLOS ONE* 4(6).

Journal article about how mass coral bleaching can occur due to periods of anomalously warm ocean temperatures, which can occur from human-caused climate change, and how greenhouse gas mitigation altering the near-term forecast for coral reefs would be limited by time lags in physical climate response.

Donoghue, A. M. 2004. "Occupational health hazards in mining: An overview." *Occupational Medicine* 54:283-289.

Review article outlining the physical, chemical, biological, ergonomic, and psycho-social occupational health hazards of mining and associated metallurgical processes, including exposure to coal dust and crystalline silica.

Douberly, E. 2013. "Fire protection guidelines for handling and storing [Powder River Basin] coal." *Power Magazine*.

The Powder River Basin Coal Users' Group has developed recommended fire-prevention practices/guidelines for plants that burn Powder River Basin coal by itself or in blends. The guidelines are not equipment-specific, because the physical layouts of coal-handling facilities vary significantly and because all fires are unique. The guidelines are not comprehensive; their purpose is to recommend general practices.

Doug. 2009. Work safety blog. Internet website: <http://www.blog4safety.com/2009/10/dangerousjobcoalmining/>.

Blog post informing on coal mining accidents. Describes coal mining as one of America's top ten most dangerous jobs. Discusses precautions that are being taken to improve safety in coal mining and details on what makes the job so dangerous.

Doyle Trading Consultants. 2016. Coal Industry Turns the Corner. Doyle Trading Consultants, Grand Junction, Colorado.

Report with overview of coal industry, capital structures reset, and conclusion.

Dubas, G., and D. Mallory. 2010. Assessment of Water Quality Impacts from Coalbed Methane-Produced Water Discharge in the Purgatoire River Watershed. Metro State College of Denver, ENV 4970.

Metro state study examines extraction of coal bed methane (CBM) and water quality impacts. States that CBM brings large volumes of water, containing solutes or suspended sediments, to the surface. The produced water is usually disposed of by being discharged into surface waters. This study in the Purgatoire River watershed found that CBM water discharge may slightly increase salinity downstream from CBM production sodium concentrations, which may result in ecosystem degradation and water management issues for downstream users.

Earthjustice. No date. Coal Mines Clouding America's Air. Internet website: Earthjustice.org/news/press/2011/coal-mines-clouding-america-s-air.

Article states that a group of conservation organizations has sued the US EPA over its failure to protect public health from air pollution from coal mines. The EPA has set clean air standards for coal-fired power plants, coal processing plants, and gravel mines, but not for coal mines. Emissions include methane, nitrogen dioxide, volatile organics, and particulate matter.

Eby, L. A., et al. 2014. "Evidence of climate-induced range contractions in bull trout (*Salvelinus confluentus*) in a Rocky Mountain watershed, USA." *PLOS ONE* 9(6).

Journal article on how bull trout are moving to higher, cooler thermal refuges as water temperatures increase in the Rocky Mountains of the United States, as a result of climate change and global warming.

EcoShift Consulting. 2016. Over-leased: How production horizons of already leased federal fossil fuels outlast global carbon budgets. July 2016. Internet website: www.biologicaldiversity.org/campaigns/keep_it_in_the_ground/pdfs/Over-leased-Report-EcoShift.pdf.

Report documents that already leased federal coal will last through 2041, beyond the time frame needed for steep carbon cuts. Argues that no new federal coal should be leased to meet global climate objectives.

Ecosystem Marketplace. 2015. Converging at the Crossroads, State of Forest Carbon Finance.

This paper discusses the convergence of avoided deforestation shifts toward payments for results and the ramp up in payments for emissions reductions.

_____. 2016. Not so niche: Co-benefits at the Intersection of Forest Carbon and Sustainable Development.

Report on small developments and projects in the forest marketplace and tracked impacts and co-benefits.

Ecotrust. No date. Oregon's Restoration Economy, Investing in natural assets for the benefit of communities and salmon. Internet website: <https://ecotrust.org/media/WWRI-Restoration-Economy-Brochure.pdf>

This report discusses restoring watersheds as a starting point for a different kind of economic prosperity. It was prepared by Ecotrust, a conservation organization.

Ellenberger, J. H., and A. E. Byrne. 2015. Population Status and Trends of Big Game and Greater Sage-Grouse in Southeast Montana and Northeast Wyoming.

Consultant report analyzing status and trends in populations of big game and greater sage-grouse populations in southeast Montana and northeast Wyoming. Harvest data were used for analysis, from 1980 through 2012. Deer and pronghorn populations appear vulnerable, while elk appear less so. In Montana, greater sage-grouse populations appeared stable, while in Wyoming their numbers had declined significantly.

Energy Venture Analysts. 2015. Coal Sales Prices used for Valuation and Payment of Federal Royalties. Energy Ventures Analysis, Inc. Arlington, Virginia.

Peer review of previous studies by Headwaters Economics. Concludes that Headwaters studies were flawed and of poor quality.

Epstein, A. No date. The Moral Case for Fossil Fuels. Internet website: <http://industrialprogress.com/wp-content/uploads/2013/10/The-Moral-Case-for-Fossil-Fuels.pdf>.

This report discusses the perception of the fossil fuel industry and suggests that we refute the central idea that fossil fuels destroy the planet. It was prepared by Center for Industrial Progress, a for-profit think-tank.

Epstein, P. R., et al. 2011. "Full cost accounting for the life cycle of coal." *Annals of the New York Academy of Sciences* 1219:73-98.

Journal article about the hazards of coal and the resultant waste stream, including estimates of the costs of coal's externalities to the US public, where, if these costs were included, would double to triple the price of coal to make wind, solar, and other forms of nonfossil fuel power generation economically competitive.

Erickson, P., and M. Lazarus. 2014. "Impact of the Keystone XL pipeline on global oil markets and greenhouse gas emissions." *Nature Climate Change* DOI: 10.1038.

Article detailing how energy transportation structures shape energy systems, specifically discussing the Keystone XL pipeline.

_____. 2016. How would phasing out US federal leases for fossil fuel extraction affect CO₂ emissions and 2 [degree] C goals? Stockholm Environment Institute working paper.

Working document for the Stockholm Environment Institute that looks into US fossil fuel production, detailing recent trends and outlook, the 2 degree Celsius global warming cap, the effect of federal leasing decisions on fossil fuel production, and reductions in CO₂ emissions from restricted leasing. Paper examines the potential emissions implications of a supply-side measure under consideration in the United States: ceasing to issue new leases for fossil fuel extraction on federal lands and waters, and avoiding renewals of existing leases for resources that are not yet producing. The analysis finds that under such a policy, US coal production would steadily decline, moving closer to a pathway consistent with a global 2 degree Celsius temperature limit.

Espey, J. A., and M. Espey. 2004. "Turning on the lights: A meta-analysis of residential electricity demand elasticities." *Journal of Agricultural and Applied Economics*. 36(1):65-81.

Journal article on how price and income elasticities of residential demand for electricity from previous studies are used as the dependent variables, with data characteristics, model structure, and estimation technique as independent variables. The findings of this research can help better inform public policy makers, regulators, and utilities about the responsiveness of residential electricity consumers to price and income changes.

Esposito, V., et al. 2011. "Climate change and ecosystem services: The contribution of and impacts on federal public lands in the United States." USDA Forest Service Proceedings RMRS-P-64.

Paper completed to contribute to better understanding of how US conservation lands may be affected by climate change. Outlines a method and preliminary estimates of the value of ecosystem services harbored or produced in abundance on those lands, as well as how that value may change under climate change scenarios.

Esteves, A. M., D. Franks, and F. Vanclay. 2012. "Social impact assessment: The state of the art." *Impact Assessment and Project Appraisal* 30(1):34-42. DOI:10.1080/14615517.2012.660356

Peer-reviewed journal article. analyzes the strengths, weaknesses, opportunities, and threats facing Social Impact Assessment (SIA). Article asserts that the SIA community needs to revisit core concepts, such as culture, community, power, human rights, gender, justice, place, resilience, and sustainable livelihoods. It is incumbent on SIA practitioners to educate proponents, regulators, and colleagues about these concepts and to embed them into practice norms. Stronger engagement with the emerging trends of free, prior, and informed consent (FPIC); human rights impact assessment; social performance standards; supply chain management; governance; local content; and economic development will improve the relevance and demonstrable value of SIA to all stakeholders.

Ewing, S. A., et al. 2010. "Pb isotopes as an indicator of the Asian contribution to particulate air pollution in urban California." *Environmental Science & Technology* 44(23):8911-8916.

Journal article testing whether lead isotope ratios in airborne particles can be used to directly evaluate the Asian contribution to airborne particles of human origin in western North America.

Executive Office of the President of the United States. 2016. *The Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to Taxpayers*. White House, Washington, DC.

This report focuses on the issue of whether the federal coal leasing program provides a fair return to the taxpayer and draws on relevant academic research to provide an economic perspective. A review of the coal leasing program indicates that it has been structured in a way that misaligns incentives going back decades, resulting in a distorted coal market with an artificially low price for most federal coal and unnecessarily low government revenue from the leasing program.

_____. 2013. *The President's Climate Action Plan*. Internet website: <https://www.whitehouse.gov/sites/default/files/image/president27sclimateactionplan.pdf>.

President Obama's climate action plan to cut carbon pollution in the United States, to prepare the United States for the impacts of climate change, and to lead international efforts to combat global climate change and prepare for its impacts.

Ezzati et al. 2004. Comparative Quantification of Health Risks. Volume I. World Health Organization. Geneva.

Book produced by the World Health Organization on disease and mortality rates. Includes topics on how to reduce risk and the role and relative magnitude of diseases and injuries. Intended to guide policy and programs.

Fabry, V. J., et al. 2008. "Impacts of ocean acidification on marine fauna and ecosystem processes." *ICES Journal Of Marine Science* 65(3):414-432.

Journal article analyzing the effects of ocean acidification and the synergistic impacts of other anthropogenic stressors, which provide great potential for widespread changes to marine ecosystems.

Farrell, C. 2012. "A just transition: Lessons learned from the environmental justice movement." *Duke Forum for Law and Social Change* 4:45 (2012).

Article examining the role of the Environmental Justice Movement in the fossil fuel economy. It points out how the fossil fuel economy has disproportionately impacted low-income communities and communities of color. The article uses two case studies to explore the role of environmental justice approaches in a just transition to a green economy. Three main points are highlighted: the need for environmental policy transformation, the necessity for communities to be engaged in the change, and the need for a holistic approach in designing the transition.

Feely, R. A. 2009. "Ocean acidification: Present conditions and future changes in a high-CO₂ world." *Oceanography* 22(4).

Journal article about the uptake of anthropogenic CO₂ by the global ocean with resultant fundamental changes in seawater chemistry that could have dramatic impacts on biological ecosystems in the upper ocean.

Ferret.com.au. 2014. Article: Addressing a noxious issue—making blasting safer. Internet website: <http://www.ferret.com.au/articles/in-focus/addressing-a-noxious-issue-making-blasting-safer-n2506747>

The article discusses episodes of nitrogen dioxide exposure from blasting at coal mines. Nitrogen dioxide can form nitric acid in lungs and has required hospitalization of miners. Investigations are underway on how to minimize the formation of the gas in blasting operations.

Finkelman, R. B. 2004. "Potential health impacts of burning coal beds and waste banks." *International Journal of Coal Geology* 59:19-24.

Journal article on the uncontrolled release of pollutants from burning coal beds and waste banks, which present potential environmental and human health hazards. Emissions of large volumes of greenhouse gases from burning coal beds possibly contribute to climate change, which alters ecosystems and patterns of disease occurrence across the globe.

Finkelman, R. B., et al. 2002. “Health impacts of coal and coal use: Possible solutions.” *International Journal of Coal Geology* 50:425-443.

Journal article considering several studies on the connection between human health and potential environmental problems—particularly related to coal—by cooperators in the geoscience and medical disciplines.

Fisher, J. et al. 2010. “Co-benefits of energy efficiency and renewable energy in Utah.” *Synapse*.

Report discussing current energy generation in Utah and future directions with economic values.

Flegal, A., and D. Smith. 1992. “Lead levels in pre-Industrial humans.” *New England Journal of Medicine* 326:1293-1294.

Article detailing the concentration of lead in the blood and bones of humans, comparing pre-Industrial humans to modern humans.

_____. 1992. “Current needs for increased accuracy and precision in measurements of low levels of lead in blood.” *Environmental Research* 50:125-133.

Abstract from article assessing the need for increased accuracy and precision in measurements of low levels of lead in blood. Provides information on current methods and reasons why they are inadequate. Blames analytical limitations on contamination bias during sample collection. Suggests that trace metal-clean procedures be adopted.

Folder. Various dates. Letters from citizen Groups. 2012-2015.

Folder containing 21 letters from citizen groups.

Folder. Various dates. Letters regarding coal leasing delays. April 2015, November 2013, and November 2015.

Folder containing three subfolders: April 2015 Leasing Delays FOIA response, Nov 2013 Leasing Delays FOIA, Nov 2015 Leasing Delays FOIA response. Seventeen total documents on coal lease delays.

Foti, R., et al. 2013. “Signs of critical transition in the Everglades wetlands in response to climate and anthropogenic changes.” *Proceedings of the National Academy of Sciences* 110(16):6296-6300.

Journal article focusing on the Everglades National Park and assessing the impact of changes in the hydrologic regime, as well as habitat loss, on the spatial configuration of vegetation species.

Fox, P. 2015. *Environmental, Health and Safety Impacts of the Proposed Oakland Bulk and Oversized Terminal*. Prepared for the Sierra Club. September 21, 2015.

Report prepared for the Sierra Club by a consulting engineer on the proposed Oakland bulk and oversized terminal. The author concludes that many adverse impacts would result if coal were imported at the proposed terminal and that none of these impacts were anticipated in the CEQA review of this project.

Friedmann, J. No date. An open letter to the US coal industry. Lawrence Livermore National Laboratory.

Open letter to US coal industry from Dr. Julio Friedmann, Senior Advisor for Energy Innovation at the Lawrence Livermore National Laboratory. Letter is an indictment of the path that the US coal industry has taken and suggests that a low-carbon pathway should be pursued.

Frieler, K., et al. 2013. "Limiting global warming to 2 degrees C unlikely to save most coral reefs." *Nature Climate Change* (3):165-170. Internet website: <http://www.nature.com/nclimate/journal/v3/n2/pdf/nclimate1674.pdf>.

This report provides a comprehensive global study of coral bleaching in terms of global mean temperature change, based on an extended set of emissions scenarios and models. It is from a peer-reviewed scientific journal.

Fuchs, B. USDA. 2016. Internet website: <http://droughtmonitor.unl.edu/>.

USDA website with drought monitor map that refreshes daily. Color coded to show areas from abnormally dry through exceptional drought. Shows the most drought in California and in the South.

Funes, Y. 2016. "What leaving fossil fuels behind can do for inequality." *Yes! Magazine*, 2016. Bainbridge Island, Washington.

Essay about the reliance and negative impacts of fossil fuel booms and that the transition to more energy efficient and renewable choices needs to happen to help solve inequality impacts.

Funk, J., and S. Saunders. 2014. "Rocky Mountain forests at risk: Confronting climate-driven impacts from insects, wildfires, heat, and drought." *Union of Concerned Scientists and Rocky Mountain Climate Organization*. September 2014.

The report describes threats to the forests of the Rocky Mountain region from tree-killing insects, wildlife, and heat/drought stress. These stresses are influenced by global warming, which is bringing hotter and drier conditions, thereby amplifying other stresses.

Garfin, G., A. Jardine, R. Merideth, M. Black, and S. LeRoy, eds. 2013. *Assessment of Climate Change in the Southwest United States: A Report Prepared for the National Climate Assessment. A report by the Southwest Climate Alliance*. Washington, DC: Island Press. 531 pp.

Technical report published as one of a series of technical inputs to the National Climate Assessment 2013 report. Report is an assessment of climate change for the Southwest region of the United States.

Geiling, N. 2016. *The Plan To Revive Big Coal's Fortunes Isn't Panning Out. Think Progress*.

New article about the difficulties faced in exporting Powder River Basin coal to foreign markets and the changing conditions that lead to it

Geiser, M. et al. 2005. Ultrafine Particles Cross Cellular Membranes by Nonphagocytic Mechanisms in Lungs and in Cultured Cells. Environmental Health Perspectives. 113: 1555-1560.

Journal article investigating ultrafine particles in lungs and their toxic potential. Study was done using rats and aerosol inhalation. The results agreed with human studies that inhalation of ultrafine carbon particles affected pulmonary diffusing capacity.

Gerarden, T., W. S. Reeder, and J. H. Stock. 2016. Federal Coal Program Reform, the Clean Power Plan, and the Interaction of Upstream and Downstream Climate Policies. The Harvard Project on Climate Agreements. Discussion Paper 16-82. June 2016.

Paper studying government coal leasing and the interaction between specific upstream policy, incorporating a carbon adder into federal coal royalties, and downstream emissions. The paper offers statistics and models to provide quantitative results.

Gerking, S., et al. Mineral Tax Incentives, Mineral Production And the Wyoming Economy. University of Wyoming.

Report that presents economic models for analyzing effects of tax incentives and environmental regulations as well as the relationship between mineral production and the Wyoming economy on a larger scale

Gerking, S., and S. F. Hamilton. 2008. What explains the increased utilization of Powder River Basin coal in electric power generation? American Journal of Agricultural Economics 90(4):933-950.

This article examines possible explanations for increased utilization of Powder River Basin coal in electric power generation that occurred over the last two decades. Did more stringent environmental policy motivate electric power plants to switch to less polluting fuels? Or, did greater use of Powder River Basin coal occur because relative price changes altered input markets in favor of this fuel. A key finding is that factors other than environmental policy such as the decline in railroad freight rates together with elastic demand by power plants were major contributors to the increased utilization of this fuel. Peer-reviewed journal article.

Gilber, R. et al. 1988. "Radionuclide transport from soil to air, native vegetation, kangaroo rats and grazing cattle on the Nevada test site." Health Phys. 55: 869-87.

Abstract from journal article on studies conducted at two nuclear fission sites and two nonnuclear sites. The sites were reviewed on soil particle-size distribution and physical-chemical characteristics of radioactive particles investigating the transfer of transuranic radionuclides.

Gillette News Record. 2008. Nitrogen dioxide from mine blast causes orange cloud. Internet website: http://www.gillette newsrecord.com/news/article_6ba2343a-63ff-5dce-a987-2c426e41339c.html?mode=print.

News report of a blasting explosion at an Australian mine causing release of nitrogen dioxide and fuel oil, toxic to humans. The company stated it has rules to limit blasts to minimize exposure to local residents.

Gillingham, K. 2016. Future Direction of Coal Markets: A Focus on Federal Coal Policy. Yale University.

Presentation from Yale University with focus on coal in the market system. It gives overview of DOI PEIS Process, Fair Return, and Climate Change

Gillis, J. 2013. "Global temperatures highest in 4,000 Years." *The New York Times*. March 7, 2013.

Article on global temperatures being higher than any time in the last 4,000 years. The article reports that scientists expect this to get worse, and human activity is to blame. Brings up the point that living things can adapt to change, but the rate of change is what poses a challenge.

_____. 2016. "Climate model predicts west Antarctic ice sheet could melt rapidly." *The New York Times*, March 30, 2016.

News article about a new model suggesting that the West Antarctic ice sheet is vulnerable to global warming and could have catastrophic impacts within the next 100 years on society

Gledhill, D. K., et al. 2008. "Ocean Acidification of the Greater Caribbean Region 1996–2006." *Journal of Geophysical Research* 113.

Journal article about the uptake of atmospheric carbon dioxide in the ocean and resultant acidification and decrease in carbonate mineral saturation state, which could affect some of the most fundamental biological and geochemical processes of the sea in coming decades.

Glick, P. 2006. Fueling the Fire: Global Warming, Fossil Fuels and the Fish and Wildlife of the American West. National Wildlife Federation.

Document on global warming being driven by burning coal, oil and gas. Includes facts about the effects of climate change, and the expansion of oil and gas development

Glustrom, L. 2013. Warning: Faulty Reporting of US Coal Reserves. A Report by Clean Energy Action.

Article investigating remaining US coal deposits. Using geological and financial data they believe that there is reason to believe that we are reaching the end of US coal deposits. Addresses the public opinion that the United States has a "200 year supply of cheap coal."

Godby, et al. 2015. The Impact of the Coal Economy on Wyoming. Center for Energy Economics and Public Policy. February 2015.

Paper examining the impacts of coal economy in Wyoming. This study addresses this information gap by describing the importance of the coal sector to Wyoming's economy today. It documents the risks and challenges facing the coal industry in the future due to market conditions and regulatory threats, and using the most recent data available, conducts an impact analysis to determine how these risks could affect the Wyoming economy and state revenues through 2030. The potential impacts of proposed carbon regulations introduced by the Environmental Protection Agency's (EPA) Clean Power Plan are also estimated, as are the potential impacts that large-scale international coal exports could have on Wyoming's economy. This report concludes with analysis of the policy choices Wyoming faces in response to these market challenges.

Gohlke, J. M., et al. 2011. "Estimating the global public health implications of electricity and coal consumption." *Environmental Health Perspectives* 119(6):821-826.

Journal article about how increased electricity consumption in countries with infant mortality of less than 100 in 1,000 live births does not lead to greater health benefits, whereas coal consumption has significant detrimental health impacts.

Golder Associates. 2012. Environmental Assessment: Bledsoe Coal Lease KYES-53865. Golder Associates, Inc., Lakewood, Colorado.

Environmental assessment for the Bledsoe Coal lease in Kentucky, which presents an analysis for offering KYES-53865 for leasing by the BLM with consent by the USFS Daniel Boone National Forest. Includes affected environment and environmental consequences related to this potential lease, and, more generally, the issues around coal leasing and impacts related to coal mining.

Gomez, J. 2014. United States Government Accountability Office. Office of Public Affairs, Washington, DC. July 24, 2014.

GAO report describes the participating entities and processes and methods the Interagency Working Group on Social Cost of Carbon used to develop the 2010 and 2013 estimates. GAO reviewed executive orders, Office of Management and Budget guidance, the Technical Support Document, its 2013 update, and other key documents.

Grandjean, and Landrigan, P. 2014. "Neurobehavioural effects of developmental toxicity." *Lancet Neurol.* 13:330-338

Article from the University of Southern Denmark on neurodevelopmental disabilities and their relation to industrial chemicals. Article proposes a global prevention strategy, where untested chemicals should not be presumed to be safe for brain development, so all chemicals in use and new chemicals must be tested for developmental neurotoxicity.

Grantham Research Institute on Climate Change and the Environment. 2014. Closing Coal: Economic and Moral Incentives. May 2014. Internet website: <http://www.lse.ac.uk/GranthamInstitute/wp-content/uploads/2014/05/Closing-Coal-economic-and-moral-incentives.pdf>

This paper makes the case for implementing climate change policy to close the global coal industry. Coal is singled out because of its high emissions intensity, low rents per unit value, local environmental costs, and sheer scale. Direct supply policy—the sequenced closure of coal mines—may lead to less policy leakage across countries and time than other policies, based on demand or price management.

Greenpeace. 2016. Internet website: <http://issuu.com/greenpeaceinternational/docs/energy-revolution-2015-full-hr/?e=2537715/30188730>.

Greenpeace website on the energy revolution. Contains an interactive 364-page document called Energy [R]evolution: A Sustainable World Energy Outlook 2015. 100% energy for all. Provides a guide to what they believe the future of energy should look like and how to get there.

_____. No date. Leasing Coal, Fueling Climate Change: How the Federal Coal Leasing Program Undermines President Obama’s Climate Plan.

Paper analyzing the issue of how a federal program that increases the supply of coal, as with BLM leasing public lands, would be reconciled with President Obama’s Climate Action Plan and what are the potential impacts of carbon pollution from these leases.

Greenpeace USA. 2016. Corporate Welfare for Coal: The Biggest Coal Mining Companies Depend on Subsidized Federal Coal, even as They Attack Federal Climate and Clean Air Policies. March 2016. Internet website: <http://www.greenpeace.org/usa/research/corporate-welfare-for-coal/>.

Greenpeace paper examines federal subsidies for coal.

Grijalva, R., et al. 2016. Letter to Secretary Jewell on Coal Reforms. Washington, DC. Internet website: <http://democrats-naturalresources.house.gov/letter-to-secretary-jewell-on-coal-reforms>

House Natural Resources Committee Ranking Member Raúl M. Grijalva (D-Ariz.) and Energy and Mineral Resources Subcommittee Ranking Member Alan S. Lowenthal (D-Calif.) sent a letter to Interior Secretary Sally Jewell to thank her for reviewing the Interior Department’s broken coal leasing program and to highlight issues that still need to be addressed, including an accurate accounting of the program’s climate and environmental impacts.

Gruenspecht, H. 2016. Coal in the United States: Recent Developments and Outlook. US Energy Information Administration, New York, New York.

Presentation given by the US Energy Information Administration on the current and future outlook of coal in the United States.

Gutierrez, S. 2011. "Getting there: How long can trains legally block intersections?" *Seattle Post Intelligencer*. May 31, 2011.

Newspaper article about the length of time that trains can legally at-grade crossings, which is no more than 10 minutes, per Washington State laws.

Haggerty, J., and K. McBride. 2016. "Does local monitoring empower fracking host communities? A case study from the gas fields of Wyoming." *Journal of Rural Studies* 43:235-247.

Peer-reviewed journal article that evaluates an experimental approach to monitoring and mitigating social and economic impacts of high volume hydraulic fracking (HVHF) development in Wyoming, between 2005 and 2009. Concludes that a community-based approach to planning and impact assessment can be effective as a response to HVHF development, provided there is adequate scaffolding in the form of technical and financial assistance and supporting meta-governance. The intensity of HVHF development creates special problems that can be mitigated by well-supported community-based and participatory processes to social and economic impact assessment.

Haggerty, M. 2015. *The Impact of Federal Coal Royalty Reform on Prices, Production, and State Revenue*. Headwaters Economics, Bozeman, Montana.

This report presents data and analysis that evaluate the revenue, price, and production implications of federal royalty reform on coal deliveries to the domestic power sector. The report models three scenarios for how the final rule could be implemented: 1.) valuing coal based on the first arm's length sale price, 2.) valuing coal based on delivered prices, net of transportation costs, and 3.) valuing coal based on delivered prices, net of transportation costs, which are capped at 50 percent of the value of coal. Report published by Headwaters Economics, an independent nonpartisan research firm.

Haggerty, M. N., and J. H. Haggerty. 2015. "Energy development opportunities and challenges in the rural West." In *Bridging the Distance: Common Issues of the Rural West* (D. B. Danbom, editor). University of Utah Press, Salt Lake City.

Hansen, J., et al. 2008. "Target atmospheric CO₂: Where should humanity aim?" *The Open Atmospheric Science Journal* Vol. 2.

Journal article arguing if humanity wishes to preserve a planet similar to the one that civilization developed on and that life on Earth is adapted to, then paleoclimate evidence and ongoing climate change suggest that CO₂ will need to be reduced from its current 385 ppm to at most 350 ppm, but likely less than that.

Harbine, J., and N. Shoaff. 2015. *Earthjustice and Sierra Club Environmental Law Program*, Bozeman, Montana, and San Francisco, California. May 8, 2015.

Comments submitted on behalf of Earthjustice, Sierra Club, and 350 Colorado, regarding proposed regulatory changes on the collection of royalties from coal, oil, and gas production on public lands by the Office of Natural Resource Revenue. The organizations express support for ONRR's efforts, urging them to adopt the additional reforms described in this letter for the sake of the taxpayer.

Hare, W. L., et al. 2011. "Climate hotspots: Key vulnerable regions, climate change and limits to warming." *Regional Environmental Change* 11(1):1–13.

Journal article offering an overview of the latest scientific findings in the context of risks and uncertainties and assessing some key vulnerabilities that might lead to dangerous climate change in four areas: adverse declines in regional food and water security, loss of arctic sea ice with projected extinction of species, large-scale sea level rise, and loss of coral reef systems.

Harrigan, R. J., et al. 2014. "A continental risk assessment of West Nile Virus under climate change." *Global Change Biology* 20:2417-2425.

Journal article looking at how global climate change could increase the areas of suitable habitat for the disease and how to tailor mitigation to these new regions.

Harvard School of Public Health. 2012. Internet website: <http://www.chgeharvard.org/resource/exploretruecostscoal>.

Interactive website model produced by the Harvard School of Public Health on the topic of The Measurable, Economic, and Qualitative Cost of Coal. Expands on energy use in the United States. Produced as a supplement to the report Full Cost Accounting for the Life Cycle of Coal. Allows for expansion on topics specific to coal, such as subsidies, climate change, and transport.

Headwater Economics. 2015. An Assessment of US Federal Coal Royalties, Current Royalty Structure, Effective Royalty Rates, and Reform Options. January 2015. Internet website: <http://headwaterseconomics.org/energy/coal-royalty-valuation>.

Paper that provides an overview of government-owned coal reserves by analyzing how revenues from federal coal are obtained, estimating current effective rates, reviewing problems with the current system, and assessing policy reform.

_____. 2015. The Impact of Federal Coal Royalty Reform on Prices, Production, and State Revenue. May 2015.

This report presents data and analyses that evaluate the revenue, price, and production implications of federal royalty reform on coal deliveries to the domestic power sector. It models three scenarios for how the final rule could be implemented: 1.) valuing coal based on the first arm's length sale price, 2.) valuing coal based on delivered prices, net of transportation costs, and 3.) valuing coal based on delivered prices, net of transportation costs. The report reviews anticipated changes in revenue, production, and price.

Heede, R., and N. Oreskes. 2016. "Potential emissions of CO₂ and methane from proved reserves of fossil fuels: An alternative analysis." *Global Environmental Change*. January 2016: 12-20.

Journal article analyzing the potential emissions of CO₂ and methane from the proved reserves, as reported by the world's largest producers of oil, natural gas, and coal, with a focus on the 70 companies and eight government-run industries that produced 63 percent of the world's fossil fuels, from 1750 to 2010.

Hein, J. 2015. Harmonizing Preservation and Production June 2015. Institute for Policy Integrity. Internet website: [Hein_2015_DOI_LeasingReporthttp://policyintegrity.org/publications/detail/harmonizing-preservation-and-production/](http://policyintegrity.org/publications/detail/harmonizing-preservation-and-production/).

The report focuses on a deficiency in the federal management of natural resources: The terms of federal leases do not require developers to internalize the environmental and social costs of fossil fuel extraction. In line with their statutory mandates, the BLM and Bureau of Ocean Energy Management must account for these social and environmental costs when leasing and managing federal natural resources to ensure a fair return to taxpayers.

_____. 2016. Priorities for Federal Coal Reform—Twelve Policy and Procedural Goals for the Programmatic Review. Institute for Policy Integrity. New York University School of Law.

This report highlights twelve policy and procedural recommendations for the review of the federal coal program. The programmatic EIS, conducted pursuant to the National Environmental Policy Act (NEPA), must be prepared carefully, transparently, and by using the best economic and modeling tools available. The analysis should provide accurate information on how different royalty rates and coal production scenarios would affect greenhouse gas emissions, revenue, jobs, and energy markets—particularly substitution among energy resources. Interior should pay particular attention to policy changes that it can implement now, without the need for new legislation, in order to secure a more fair return and manage federal energy production to meet twenty-first century needs.

Hein, J., and P. Howard. 2015. Reconsidering Coal's Fair Market Value. NYU Institute for Policy Integrity. Oct. 2015. Internet website: http://policyintegrity.org/files/publications/Coal_fair_market_value.pdf.

This report describes how the federal coal leasing program is not structured to ensure that taxpayers receive “fair market value,” as the law requires, for coal extracted from public lands. Recent investigations have shown that coal companies exploit loopholes to avoid paying their fair share of royalties, costing taxpayers up to \$1 billion each year in lost revenue. Outdated fiscal policies fail to remedy uncompetitive bidding practices or properly account for coal’s export value. And the Department of the Interior’s fiscal terms do not account for the prevalent environmental externalities and option values associated with coal production that impose uncompensated costs on the public.

_____. 2015. Illuminating the Hidden Costs of Coal: How the Interior Department Can Use Economic Tools to Modernize the Federal Coal Program. Institute For Policy Integrity, New York University School of Law.

Paper analyzing how current regulations about coal leasing and industry interactions have deprived state and federal governments of billions of dollars. It provides common sense, market-based reforms to the federal coal leasing program.

_____. 2015. **Reconsidering Coal's Fair Market Value. The Social Costs of Coal Production and the Need for Fiscal Reform.** Institute for Policy Integrity. New York University School of Law.

This report suggests that a robust definition of “fair market value” should include the market price of the coal resource, the option value of mining that resource, and the social cost of mining—the cost to American taxpayers—of mining on public lands, due to environmental and social externalities. This definition would be consistent with the Department of the Interior’s dual mandate to earn a fair return on development of energy resources and to preserve and protect the environment for future generations.

Heron, E. 2014. Linc Energy charged with causing serious environmental harm, April 12.

Linc Energy charged with causing serious environmental harm at its underground coal gasification plant in Queensland, Australia.

Higginbotham, et al. 2013. Coal Train Pollution Signature Study. Briefing paper prepared for the Coal Terminal Action Group Dust and Health Committee. August 2013.

Paper on monitoring particle pollution levels in residential areas to find the particulate profile of coal trains and the increase in particulate matter with the addition of coal trains. Results of the study were that all coal train signatures were associated with a significant increase in particle pollution levels. The paper calls out these levels as alarming and asks for further studies.

Hill, J. 2012. Internet website: <https://youtu.be/Qpup5VTUkr0>

Video of speech given by Dr. Michelle Hofmann at the Utah Clean Air Conference. Dr. Hofmann is medical director of the Primary Children’s Medical Center at Riverton Hospital, as well as a professor at the University of Utah. She advocates for air quality standards.

Hitt, N. P., and D. B. Chambers. “Temporal changes in taxonomic and functional diversity of fish assemblages downstream from mountaintop mining.” *Freshwater Science* 33(3):915-926.

Journal article on mountaintop coal mining and how it impacts fish assemblages, particularly how effects on water quality can limit the quality and availability of benthic macroinvertebrate prey.

Hoegh-Guldberg, O., et al. 2010. “The impact of climate change on the world’s marine ecosystems.” *Science* 328:1523-1528.

Journal article on how rising greenhouse gas concentrations and anthropogenic climate change are leading to decreased ocean productivity, altered food web dynamics, reduced abundance of habitat-forming species, shifting species distributions, and a greater incidence of disease.

Hönisch, B., et al. 2012. "The geological record of ocean acidification." *Science* 3335:1058-1063.

Journal article on the geological record and its long-term evidence of a variety of global environmental perturbations, including ocean acidification. Also considers the associated biotic responses, including a review of events exhibiting evidence for elevated atmospheric CO₂, global warming, and ocean acidification over the past ~300 million years.

Hood River News. 2013. "Another voice: Coal transport comments needed now." January 11, 2013.

Newspaper article about comments needing to be submitted on the proposed shipping of coal to Asia through the Columbia River Gorge to the Gateway Pacific Terminal in Bellingham, Washington.

Houp, R. E. 1993. "Observations on long-term effects of sedimentation on freshwater mussels (*Mollusca: Unionidae*) in the north fork of the Red River, Kentucky." *Transactions of the Kentucky Academy of Science* 54(3-4):93-97.

Study comparing historical data for mussels in the Red River. Concludes that many mussel species are intolerant of chronic sedimentation and are being impacted or extirpated.

Howard, P. 2016. *The Bureau of Land Management's Modeling Choice for the Federal Coal Programmatic Review*. NYU Institute for Policy Integrity. June 10, 2016. Internet website: http://policyintegrity.org/files/publications/BLM_Model_Choice.pdf

Paper examines modeling choices for coal program reform. There are multiple power sector models available to the BLM for analyzing the effect of current and alternative coal regulations and leasing policies during preparation of its programmatic EIS. This document lays out model selection criteria to assist the BLM in weighing the benefits and costs of these available models. It and offers recommendations for model selection, highlighting the tradeoff between model complexity and transparency.

Howarth, R. B., M. D. Gerst, and M. E. Borsuk. 2013. Risk mitigation and the social cost of carbon. *Global Environ. Change* (2013). Internet website: <http://dx.doi.org/10.1016/j.gloenvcha.2013.11.012>

Article looking into the social cost of carbon, using a stochastic climate-economy model that has been adapted to account for the costs of greenhouse gas emission reductions, the relationship between those emissions and future mean global temperature, and the economic impacts of climate change. This study shows contrast with the findings of previous studies by showing that the social cost of carbon is dependent on the time path for emissions. The study models that the social cost of carbon is \$25,700 per metric ton when emissions are unregulated and \$4 per ton as the stringency of control measures is successively increased. The results suggest even more so that there is no perfectly defined value for carbon emissions.

Hulac, B., and D. Brown. 2016. Arch Coal paid execs \$8M in bonuses on eve of bankruptcy. Internet website: <http://www.eenews.net/stories/1060034093>.

This website article discusses CEOs from Arch Coal getting paid more than \$8 million in bonuses the day before the company filed for bankruptcy.

ICF International. 2016. Federal Coal Leasing Reform Options: Effects On CO2 Emissions And Energy Markets--Summary Of Modeling Results Final Report. Vulcan, Inc. Report.

Report modeling the potential impacts of changes to the federal coal royalty system using a variety of possible scenarios of coal prices and Clean Power Plan implementation.

IHS. 2014. IHS Study: Diversity of United States Power Supply Could be Significantly Reduced in Coming Decade. Internet website: <http://press.ihs.com/pressrelease/Energypowermedia/ihsstudydiversityunitedstatespowersupplycouldbesignificant>.

Article on IHS study of the diversity of US power supply declining in coming decades. Points to the importance of diversity in the power sector and how it is at risk. The research was supported by the Edison Electric Institute, the Nuclear Energy Institute, and the Institute for 21st Century Energy.

Institute for Energy Economics and Financial Analysis. 2012. The Great Giveaway: An analysis of the United States' Long-Term Trend of Selling Federally Owned Coal for Less than Fair Market Value.

Report examining the coal leasing fair market value appraisal program of the BLM.

_____. **2015. Executive summary of testimony by Tom Sanzillo. September 21, 2015.**

Testimony from Finance Director for the Institute for Energy Economics and Financial Analysis. Provides a basic background on the status of US and global coal markets pertaining to potential exports out of the Oakland Army Base Redevelopment Project, as well as comments on the financial risks of the introduction of coal for the Oakland Army Base Redevelopment Project.

_____. **2016. Comments on the Department of the Interior Notice of Intent to Conduct a Programmatic Environmental Impact Sate of Federal Coal Leasing Programs.**

Letter suggesting wholesale alternatives to the federal coal lease program, which include recommending that the Department of the Interior eliminate the current fair market value criteria and replace it with a new partnership model between government agencies and private industry, operating under new rules to protect the interest of US taxpayers.

_____. **2016. Internet website: <http://ieefa.org/category/subject/powder-river-basin-coal/>.**

List of all work related to Powder River Basin done by IEEFA

Intended Nationally Determined Contribution. 2015. Internet website: <http://www4.unfccc.int/submissions/indc/Submission%20Pages/submissions.aspx>.

Website with all nationally determined contributions compiled in one place.

Interagency Working Group on Social Cost of Carbon. 2013. Technical Update of the Social Cost of Carbon for Regulatory Impact Analysis - Under Executive Order 12866. US Government, Washington, DC.

Document provides an update of the SCC estimates, based on new versions of each IAM (DICE, PAGE, and FUND). It does not revisit other interagency modeling decisions, such as those regarding the discount rate reference case socioeconomic and emission scenarios, or equilibrium climate sensitivity. Improvements in the way damages are modeled are confined to those that have been incorporated into the latest versions of the models by the developers themselves in the peer-reviewed literature.

Intergovernmental Panel on Climate Change. 2007. Climate Change 2007: Synthesis Report.

Report providing an integrated view of climate change that summarizes observed changes in climate and their effects on natural and human systems; assesses the causes of the observed change; presents projections of future climate change and related impacts under different scenarios; discusses adaptation and mitigation options over the next few decades; and assesses the relationship between adaptation and mitigation.

_____. 2014. Climate Change 2014: Impacts, Adaptation, and Vulnerability—Summary for Policymakers.

Report evaluating how patterns of risks and potential benefits are shifting, due to climate change, and considering how impacts and risks related to climate change can be reduced and managed through adaptation and mitigation.

_____. 2014. Summary for Policymakers, Contribution to Working Group III to the Fifth Assessment Report of the International Panel on Climate Change. Cambridge University Press, Cambridge, United Kingdom, and New York, New York, USA.

This report assesses literature on the scientific, technological, environmental, economic, and social aspects of mitigating climate change and builds on previous versions of the report. It was prepared by the Intergovernmental Panel on Climate Change (IPCC), a scientific and intergovernmental body under the auspices of the United Nations

_____. 2014. Climate Change 2014: Synthesis Report.

Report that confirms human influence on the climate system is clear and growing, with impacts observed across all continents and oceans. Findings also state that the more human activities disrupt the climate, the greater the risks of severe, pervasive, and irreversible impacts for people and ecosystems and long-lasting changes in all components of the climate system.

_____ . 2014. "Energy Systems." In: "Climate change 2014: Mitigation of climate change." Contribution of Working Group III to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change.

Report on energy systems in climate change. Addresses issues related to the mitigation of greenhouse gas emissions from the energy supply sector, which is the largest contributor to greenhouse gas, including renewable energy and decarbonizing of electricity generation to reduce air pollution.

International Council on Mining & Metals. 2011. "Fugitive methane emissions in coal mining." Climate Change. London, United Kingdom.

This report discusses the challenges in estimating and measuring fugitive emissions and placing a carbon price on coal mining.

International Energy Agency. 2015. World Energy Outlook 2015. Internet website: <http://www.iea.org/publications/scenariosandprojections/>.

This website discusses new policy scenario, current policies scenario, 450 scenario, and energy technology perspectives.

_____ . 2015. World Energy Outlook 2015. Internet website: http://www.worldenergyoutlook.org/media/weowebiste/2015/WEO2015_Chapter01.pdf.

This edition of the World Energy Outlook presents an assessment of the prospects for global energy markets to 2040 and draws out implications for energy security. (Only the introduction is available online, and the full report can be ordered here: <http://www.worldenergyoutlook.org/weo2015/>.)

Interstate Mining Compact Commission. 2014. Self-Bonding Survey.

State-by-state review of the extent of self-bonding for reclamation.

Ives, M. 2013. Internet website: http://e360.yale.edu/feature/boom_in_mining_rare_earths_poses_mounting_toxic_risks/2614/.

Paper examines the rare earth metals mining and environmental impacts. The mining of rare earth metals, used in everything from smart phones to wind turbines, has long been dominated by China. But as mining of these key elements spreads to countries like Malaysia and Brazil, scientists warn of the dangers of the toxic and radioactive waste generated by the mines and processing plants.

Jacobson M., and M. Delucchi. 2011. "Providing all global energy with wind, water, and solar power. Part I: Technologies, energy resources, quantities and areas of infrastructure, and materials." *Energy Policy* 39(2011):1154–1169.

Article analyzing the feasibility of providing worldwide energy from wind, water, and sunlight (WWS). The study is done in two parts, first discussing WWS sources, demand, and availability and second addressing variability, economics, and policy of WWS energy. The authors suggest producing all new energy with WWS by 2030 and replacing the existing energy by 2050 discussing political and social barriers to this transformation. The cost of using WWS they state should be similar to current energy sources.

Jacquet, J. B. 2014. *A Short History of Social Impact Assessment*. Department of Social and Rural Studies, South Dakota State University, Brookings, South Dakota.

A white paper from a faculty member at South Dakota State University, Department of Social and Rural Studies. Paper briefly outlines the social impact assessment and provides history of application in NEPA, oil and gas, international contexts, and new applications. Beginning in the early 1970s, a formalized set of practices and procedures called Social Impact Assessment (SIA) emerged to document and predict the socioeconomic impacts from large-scale projects. While originally focused primarily on impacts on such variables as population, employment, and housing, the scope of social and economic variables analyzed through SIA has greatly expanded,

_____. 2014. *The Battlement Mesa Health Impact Assessment: A Case Study and Oral History of Process and Lessons Learned*. Department of Social and Rural Studies, South Dakota State University, Brookings, South Dakota.

Paper outlines the Garfield County, Colorado, Health Impact Assessment (HIA) for Battlement Mesa, the first HIA of its kind in the area of oil and natural gas development. This paper offers an in-depth case study of the Battlement Mesa HIA, focusing less on the controversial findings of the report and instead concentrating on the historical context, the regulatory process, and the project design and implementation of the HIA. A white paper from a faculty member at South Dakota State University, Department of Social and Rural Studies.

Jenkinson, J. J. 2005. "Specific gravity and freshwater mussels." *Freshwater Mollusk Conservation Society Symposium*.

Handout about the specific gravity (SG) of native mussels and how their SG allows them to maintain a position in surrounding substrate with similar SG; thus, changes to substrate SG can affect the mollusk distribution.

John T. Boyd Company. 2011. Powder River Basin Coal Resource and Cost Study. Denver, Colorado.

The report addresses the availability of resources and the cost of recovery of those resources and forecasts Free on Board mine prices for coal from 2011 through 2040. The study is based on information available in the public domain, and on Boyd's extensive familiarity and experience with Powder River Basin operations

Johnson, L., and C. Hope. "The social cost of carbon in US regulatory impact analyses: An introduction and critique." *Journal of Environmental Studies and Sciences* 2:205-221.

Abstract on article that estimates the values from the models produced in the US government's published social cost of carbon article. These new values are calculated using a range of discount rates and methods considered more appropriate for the long-term scale of climate change, and a method that assigns "equity weights," based on relative income levels between regions.

Jones & DeMille Engineering. 2016. CIB Funded Projects.

List of Commercial International Bank funded projects.

Jones, C., et al. 2009. "Committed terrestrial ecosystem changes due to climate change." *Nature Geoscience* 2:484-487.

Journal article about how some aspects of the Earth's system, such as global mean temperatures and sea level rise due to thermal expansion or the melting of large ice sheets, continue to respond long after the stabilization of radiative forcing. A climate-vegetation model of the terrestrial biosphere shows significant inertia in its response to climate change and can continue to change for decades after climate stabilization; therefore, subsequent policy development must include this response in order to avoid it.

Jones, G. 2011. National IQ and National Productivity: The Hive Mind Across Asia. *Asian Development Review*. George Mason University, Fairfax, Virginia.

Article arguing that human capital spillover is the cause of cognitive skills having a modest influence on individual wage but strong correlation with national outcomes. Uses arguments for intelligence influence on decision-making.

Joo, N., et al. 2014. 5 Things You Should Know about Powder River Basin Coal Exports.

Internet website:

<https://cdn.americanprogress.org/wpcontent/uploads/2014/08/PowderRiver-factsheet.pdf>.

Fact sheet provided by the Center for American Progress on the massive climate impacts of low-cost coal mined in the Powder River Basin and how, as a result of federal policies, the Powder River Basin coal is selling at below market rates.

Kalderia, K., et al. 2016. Carnegie Institution for Science. July 27, 2016.

Letter from a group of scientists to the Department of the Interior, asking for the ending of coal leasing on public lands to protect the climate, public health, and biodiversity

Katestone Environmental. 2011. NSW Coal Mining Benchmarking Study: International Best Practice Measures to Prevent and/or Minimise Emissions of Particulate Matter from Coal Mining. Prepared for Office of Environment and Heritage. Milton, Queensland, Australia.

This report reviews and compares international best practice measures to prevent and/or minimize particle emissions from all activities associated with New South Wales coal mines. It was prepared by a government organization.

Keith, D. 2013. *A Case For Climate Engineering*. MIT Press, Cambridge, Massachusetts.

This book provides a clear and accessible overview of what the costs and risks might be and how climate engineering might fit into a larger program for managing climate change. Abstract only.

Kiesecker, J. M., et al. 2011. "Energy by design: Making mitigation work for conservation and development." Chapter 9 of *Energy Development and Wildlife Conservation in Western North America*.

Chapter exploring the prospect of a mass extinction event that threatens 10 to 30 percent of all mammal, bird, and amphibian species from anthropogenic stressors, such as invasive species, overexploitation, pollution, and climate change. Habitat destruction is by far the most influential factor in this unprecedented loss of biodiversity. Thus, given the importance of economic development for improving human well-being, it is therefore crucial that we have substantial improvement in our ability to balance development needs with environmental conservation.

Kitzhaber J. A., and J. Inslee. 2013. Letter to CEQ re: coal leasing costs.

Letter requests reevaluation of coal leasing costs to incorporate greenhouse gas and other air quality effects before building proposed terminals in Washington and Oregon for international export of coal.

Kreiger, E. et al. 2016. *The Clean Power Plan in Pennsylvania: Analyzing Power Generation for Health and Equity*. PSE Healthy Energy, Oakland, California.

Report analyzes the health, environmental, and equity dimensions of the Clean Power Plan. Assesses the socioeconomic and environmental health burdens and hazards for populations living near plants regulated under the Clean Power Plan. Models the potential public health impacts of fine particulate matter attributable to combustion at Pennsylvania's power plants. Findings point to where carbon emission reductions may have the greatest public health benefits and help identify where increased or decreased power generation may add to or alleviate burdens on vulnerable communities.

Kroeker, K. J., et al. 2013. "Impacts of ocean acidification on marine organisms: Quantifying sensitivities and interaction with warming." *Global Change Biology* 19(6):1884-1896.

Journal article on how ocean acidification represents a threat to marine species worldwide, and a synthesis of 228 studies shows decreased survival, calcification, growth, development, and abundance in response to acidification, when the broad range of marine organisms is pooled together.

Krupnick, A., et al. 2015. Putting a Carbon Charge on Federal Coal: Legal and Economic Issues. Resources For the Future Mar. Internet website: <http://www.rff.org/research/publications/putting-carbon-charge-federal-coal-legal-and-economic-issues>

The paper considers the legal and economic feasibility of imposing an “upstream” CO₂ charge on coal production at its extraction site. Specifically, it focuses on leased coal from federal lands managed by the BLM. Such a carbon charge is designed to embody the cumulative life cycle externalities from coal mining to combustion (or other “downstream” utilization). Legal analysis concludes that the BLM has the statutory and regulatory authority to impose such a charge and that it would be best to add it to the royalty rate. But a large fee that would dramatically reduce revenues could invite judicial concern. Furthermore, production on state, private, and tribal lands (60 percent of total production) would not be subject to the charge and so could ramp up in response to the economic disadvantage the charge would cause for coal on federal lands.

Krupnick, A., N. Richardson, J. Darmstadter, and K. McLaughlin. 2015. Should We Price Carbon from Federal Coal? Resource for the Future. Washington, DC. Internet website: <http://www.rff.org/research/publications/should-we-price-carbon-federal-coal>

This article discusses whether the BLM should impose an upstream carbon charge on coal production. It was prepared by Resources for the Future, which conducts economic research and objective analysis to help leaders craft smarter policies about natural resources, energy, and the environment.

Krupnick, A., et al. 2016. Applying EIA’s National Energy Modeling System to US Coal Projections: Strengths and Weaknesses for BLM’s Programmatic Environmental Impact Statement. Resources for the Future.

This policy brief explores the strengths and weakness of the Energy Information Administration’s (EIA’s) National Energy Modeling System (NEMS), paying special attention to its application in long-term policymaking. The goal of the paper is to provide insight into how NEMS can contribute to the BLM’s programmatic environmental impact statement for federal coal leasing.

Kuykendall, T. 2016. Headwinds Facing US Coal. SNL Energy. March 29, 2016.

Article forecasting what coal industry may look like in the future. Abstract only.

Kuykendall, T., and A. Cotting. 2016. Companies recently filing bankruptcy produce more than 2/3 of PBR coal. April 13, 2016. Internet website: <https://www.snl.com/InteractiveX/Article.aspx?cdid=A-36118340-12086>.

This article details coal companies that mine the Powder River Basin filing for bankruptcy. It was prepared for S&P global market intelligence, an organization providing market analysis.

_____ . 2016. Headwind that pushed coal to bankruptcy potentially changing course. SNL Energy. April 29, 2016.

Article describes recent trends in the metallurgical coal market. Met coal prices have been on a steady decline until the most recent quarter, driven in part by China's reduced demand for steel. Article provides case study for Peabody Coal, which recently entered into Chapter 11 bankruptcy, and is significantly exposed to met and thermal coal. Article published by SNL Energy, a part of S&P Global Market Intelligence, a consulting firm.

Labor Network for Sustainability and Strategic Practice. Year unknown. "Just Transition"—Just What Is It? An Analysis of Language, Strategies, and Projects

Collaborative report defining "just transition," as it relates to the economic transition, including energy, a carbon-neutral economy, communications, manufacturing, transportation, health care, and waste management. The report includes 17 interviews on the "just transition" framework.

Laks, D. 2009. "Assessment of chronic mercury exposure within the US population, National Health and Nutrition Examination Survey, 1999–2006." *Biometals* 22:1103-1114.

Abstract on study that assesses chronic mercury exposure within the US population. Results provide evidence that I-Hg deposition in the human body is a cumulative process and is associated with significant biological markers. There is a time-dependent rise in the populations risk for associated disease.

Langham, et al. 2015. National Audubon Society, New York, New York.

The National Audubon Society has completed a continental analysis of how North America's birds may respond to future climate change. Using extensive citizen science data and detailed climate layers, they developed models that characterize the relationship between the distribution of each species and climate. Then, they used the models to forecast species distributions to future periods, based on climate estimates described by the Intergovernmental Panel on Climate Change (IPCC).

Lashof, D. A., et al. 2007. "Coal in a Changing Climate." Natural Resources Defense Council issue paper.

Paper examining the changing climate for coal production and use in the United States and China, the world's two largest producers and consumers of coal. Emissions from both countries are far higher than from any other country and will together constitute more than 60 percent of global CO₂ emissions from coal. While imperfect and unable to make coal "clean," technologies ready for widespread commercial application can dramatically reduce emissions of carbon dioxide, mercury, sulfur, and nitrogen oxides to reduce the resultant air pollution and global warming effects.

Lattanzio R. K. 2015. Life-Cycle Greenhouse Gas Assessment of Coal and Natural Gas in the Power Sector. Congressional Research Service.

Report compares coal and natural gas environmental and economic impacts, finding that natural gas produces 40 to 60 percent of the CO₂ emissions of coal. However, the fugitive emission of methane greatly increases the greenhouse gas potential of natural gas. The comparative life-cycle emissions of both existing and advanced natural gas technology may be comparable to coal-fired technology.

Lazarus, M., et al. 2015. "Supply-side climate policy: The road less taken." Working paper 2015-13. Stockholm Environment Institute, Seattle, Washington.

Paper explores reasons why supply-side policies have not been pursued and why they deserve more attention. It provides a typology of supply-side policies and frameworks for assessing their effectiveness, efficiency, and feasibility. It finds that supply-side policies, such as removal of producer subsidies, compensation of resource owners for leaving fuels unburned, or outright restrictions on resource development, could bring important benefits.

**Lee-Ashley, M., and N. Thakar. 2015. Cutting Subsidies and Closing Loopholes in the U.S. Department of the Interior's Coal Program. Center for American Progress. Internet website:
<https://www.americanprogress.org/issues/green/reports/2015/01/06/103880/cutting-subsidies-and-closing-loopholes-in-the-u-s-department-of-the-interiors-coal-program/>.**

This report investigates coal companies maximizing subsidies on federal lands through increasingly complex financial and legal mechanisms. The report calls for reform to cut subsidies and close loopholes. Center for American progress is a Washington D.C. based think-tank.

Lemly, A. D. 2009. "Aquatic hazard of selenium pollution from coal mining." Chapter 6 in Coal Mining: Research, Technology, and Safety. Nova Science Publishers, New York, New York.

Chapter on how selenium, an element found in coal that can leached out during coal processing, can be mobilized and spread to nearby surface waters, leading to bioaccumulation in food chains, with possibly toxic consequences.

Leong, C. 2001. "Retrograde degeneration of neurite membrane structural integrity of nerve growth cones following in vitro exposure to mercury." Neuroreport 12:733-737.

Abstract of study presenting whether mercury ions could affect membrane dynamics of neurite growth cone morphology and behavior. Results conclude that mercury works as a potential etiological factor in neurodegeneration.

Leonhardt, D. 2015. "There's a formula for deciding when to extract fossil fuels." New York Times. New York, New York.

News article published about using a formula to decide when to extract fossil fuels. Uses the social cost of carbon method.

Lepeule, J. 2012. "Chronic exposure to fine particles and mortality: An extended follow-up of the Harvard six cities study from 1974 to 2009." Environmental Health Perspectives 12:965-970.

Article taking epidemiological studies that have reported associations between fine particles and mortality and adding 11 years of follow-up, incorporating recent lower exposures to fine particles. Article concludes that further public policy efforts that reduce fine particulate matter air pollution are likely to have continued public health benefits.

LeResche, B. 2014. Letter to Wyoming DEQ on Linc Aquifer Exemption. Powder River Basin Resource Council, WORC.

Letter writer argues against allowing an aquifer exemption for Linc Energy's proposed underground coal gasification project in Wyoming. The exemption would contaminate groundwater in the region.

Levin and Forbes. 2014. Visualizing the Global Carbon Budget (blog). World Resources Institute. Internet website: <http://www.wri.org/blog/2014/03/visualizing-global-carbon-budget>.

Online article, evaluating the global carbon budget. Provides a visual aid, describing what the carbon budget is, impacts we are seeing today, what would happen if we do not stick to the budget, and ways that we can meet the budget.

Lewtas, J. 2007. "Air pollution combustion emissions: Characterization of causative agents and mechanisms associated with cancer, reproductive, and cardiovascular effects." *Mutation Research* 636:95-133.

Journal article about combustion emissions that account for over half of the fine particle (PM_{2.5}) air pollution and most of the primary particulate organic matter. Studies have shown that short- and long-term exposures to combustion emissions and ambient fine particulate air pollution are associated with measures of genetic damage and increased risks of all causes of mortality, cardiopulmonary mortality, and lung cancer mortality over the long-term.

Lifson, T. 2014. "Debunking the 97% 'consensus' on global warming." *American Thinker* 4, February 2014.

Blog that disputes the consensus in the scientific community about the validity of climate change.

Lin, J., et al. 2014. "China's international trade and air pollution in the United States." *Proceedings of the National Academy of Sciences* 111(5):1736-1741.

Journal article about China, the world's largest emitter of anthropogenic air pollutants, and how Chinese pollutants are transported via the atmosphere to other countries, including the United States. As the United States outsourced manufacturing to China, sulfate pollution in 2006 increased in the western United States but decreased in the eastern United States, reflecting the competing effect between enhanced transport of Chinese pollution and reduced US emissions.

Live Science. 2016. Internet website: www.livescience.com.

Article that details the greenhouse gas emissions tied to solar power generation.

Loarie, J. 2012. AERMOD Modeling of Air Quality Impacts of the Proposed Marrow Pacific Project. Prepared for the Sierra Club. October 2012.

Document on the Marrow Pacific Project in Oregon, presenting the methods and results of modeling analysis of air quality impacts. The regulatory dispersion model AERMOD is used to predict project impacts of criteria pollutants. The results state that the proposed Marrow Pacific Project will cause adverse air quality impacts.

Lockwood, A. H., et al. 2009. Coal's Assault on Human Health. Physicians for Social Responsibility.

Report on how coal pollutants affect all major body organ systems and contribute to four of the five leading causes of mortality in the United States (heart disease, cancer, stroke, and chronic lower respiratory diseases). Each step of the coal lifecycle—mining, transportation, washing, combustion, and disposing of post-combustion wastes—impacts human health.

Logan, J. A., and J. A. Powell. 2001. "Ghost forests, global warming, and the mountain pine beetle (Coleoptera: Scolytidae)." *American Entomologist* 47(3):160-173.

Journal article on how outbreaks of the mountain pine beetle are an important part of ecological cycles in western pine forests and have provided researchers with insights into both the beetle's and the forest's evolutionary adaptability.

Lombardi, K. 2016. Former cleanup workers blame illnesses on toxic coal ash exposures. Internet website:

<https://www.publicintegrity.org/2016/07/20/19962/formercleanupworkersblameillnessestoxiccoalahexposures>.

Article from Kingston, Tennessee, on toxic exposures to arsenic, lead, and mercury, substances concentrated in coal ash that workers are exposed to in Tennessee Valley Authority power plant. Specifically details the experience of Mr. Wilkinson, who worked to help clean up a massive coal-ash spill, and mentioning thousands of others like him.

Loss, S. R., T. Will, and P. Marra. 2013. Estimates of bird collision mortality at wind facilities in the contiguous United States. *Biological Conservation* 168 (2013) 201-209. Internet website: <http://www.sciencedirect.com/science/article/pii/S0006320713003522>.

This journal article discusses bird fatalities from collisions with US wind turbines annually. It was produced by a peer-reviewed scientific journal.

Louie, E. P., and J. M. Pearce. 2016. "Retraining investment for US transition from coal to solar photovoltaic employment." *Energy Economics*. 2016. doi:10.1016/j.eneco.2016.05.016.

Paper provides an analysis of the cost to retrain current coal workers for solar photovoltaic (PV) industry employment in the United States. The current coal industry positions are determined, the skill set is evaluated, and the salaries are tabulated. For each type of coal position, the closest equivalent PV position is determined and then the retraining time and investment are quantified. These values are applied on a state-by-state basis for coal producing states employing the bulk of coal workers as a function of time, using a reverse seniority retirement program for the current American collection of coal-powered plants. The results show that a relatively minor investment in retraining would allow most coal workers to switch to PV-related positions even in the event of the elimination of the coal industry.

Luber, G., et al. 2014. "Human health." Chapter 9 of *Climate Change Impacts in the United States*. National Climate Assessment.

Chapter noting that climate change threatens human health, including impacts from increased extreme weather, wildfire, decreased air quality, threats to mental health, and illnesses transmitted by food, water, and disease carriers, such as mosquitoes and ticks. Climate change will amplify existing health threats, although public health actions can do much to protect people from some of these impacts, and responding to climate change provides opportunities to improve human health and well-being across many sectors.

Lucchini, R., et al. 2012. "Inverse association of intellectual function with very low blood lead but not with manganese exposure in Italian adolescent." *Environmental Res.* 118:65-71.

Abstract on pediatric lead exposures impact on the cognitive function and behavior and co-exposure to manganese possibly enhancing neurotoxicity. Results find that even low levels of lead exposure have significant negative impacts on cognitive function in adolescents. At low levels manganese did not cause cognitive effects.

Luppens, J., and D. Scott. 2015. *Assessment of Coal Geology, Resources, and Reserve Base in the Powder River Basin, Wyoming and Montana*. United States Geological Survey.

Fact sheet from the USGS about the general state of coal in the Powder River Basin.

Lynch, P. 2016. 2016 climate trends continue to break record. NASA. Internet website: <http://www.nasa.gov/feature/goddard/2016/climate-trends-continue-to-break-records/>

NASA website article using satellite image data to explain that climate change is breaking records in the arctic. It is warmer than ever, with an expectation of more warming to come. This warming is causing ice melt that is noticeable in the images the article provides. Gives indications of the direction of NASA research in the future and on operation Ice Bridge.

Lyon, A. G., and S. H. Anderson. 2003. "Potential gas development impacts on sage grouse nest initiation and movement." *Wildlife Society Bulletin* 31(2):486-491. Internet website: http://www.jstor.org/stable/3784329?seq=1#page_scan_tab_contents.

This report discusses the decline of the greater sage-grouse and how natural gas development would impact the population. *Wildlife Society Bulletin* a peer-reviewed publication of the wilderness society.

MacDougall, A. H., et al. 2012. "Significant contribution to climate warming from the permafrost carbon feedback." *Nature Geoscience* 5:719-721.

Journal article on how permafrost soils contain almost twice the present atmospheric carbon pool. As these soils thaw owing to climate warming, respiration of organic matter within these soils will transfer carbon to the atmosphere, potentially leading to a positive feedback, leading to significant warming, even under less intensive emissions trajectories.

Machol, B., and S. Rizk. 2013. "Economic value of US fossil fuel electricity health impacts." *Environmental International* 52:75-80.

Journal article about how fossil fuel energy has several externalities not accounted for in the retail price, including associated adverse human health impacts, future costs from climate change, and other environmental damages. Includes quantification of the economic value of health impacts associated with PM_{2.5} and PM_{2.5} precursors (NO_x and SO₂) on a per kilowatt-hour basis.

Maclean, I. M., and R. J. Wilson. 2011. "Recent ecological responses to climate change support predictions of high extinction risk." *Proceedings of the National Academy of Sciences Early Edition*. Pp. 1-6.

Journal article analyzing empirical support for extinction risk for many species as a result of climate change using a global and multitaxon metaanalysis. Mean extinction probability by 2100 across studies making predictions of the future effects of climate change was 10 percent across taxa and regions and empirical evidence gave a mean probability of 14 percent.

Madsen, T., et al. 2016. "We have the power: 100% renewable energy for a clean, thriving America." *Environment America Spring* 2016.

Report on the shift to renewable energy in America. The report details the course for 100 percent renewable energy in order to benefit the climate, environment, health, and economy.

Mahaffey, K. 2004. "Blood organic mercury and dietary mercury intake: National health and nutrition examination survey, 1999 and 2000." *Environmental Health Perspectives* 112:562-570.

Article on blood organic mercury concentrations among women. Compares concentrations in different ethnicities and looks at how a diet containing fish impacts concentrations.

Mahaffey, K. 2004. *Methyl Mercury: Epidemiology Update*. EPA. San Diego, California.

Presentation for the Fish Forum with an epidemiology update on methyl mercury. Slide 9 was cited in the comment.

Map of Powder River Basin Overburden Depths. 2006.

Map showing Powder River Basin overburden.

Mapes, L. 2016. *Toxic Algae Creating Deep Trouble on West Coast*. Internet website: <http://www.seattletimes.com/seattle-news/environment/toxic-algae-creating-deep-trouble-on-west-coast/>.

Newspaper article about a toxic algae bloom off the west coast of the United States in 2015 that shut down certain fisheries seasons for months due to the neurotoxin produced by *Pseudo-nitzschia*.

Marcott, S., et al. 2013. "A reconstruction of regional and global temperature for the past 11,300 years." *Science* 339:1198-1201.

Abstract from article about regional and global temperatures for the past 11,300 years. This is done so that current trends can be compared to historical trends. The constructed record of global mean surface temperatures provides patterns of warming and cooling. Results find that current global temperatures are higher than those during 90 percent of the entire Holocene.

Markandya, A., and P. Wilkinson. 2007. "Electricity generation and health." *Lancet* 370:979-990.

Journal article reviewing the current body of knowledge regarding the health effects of different methods of generating electricity.

Markey, E. J., and P. DeFazio. 2014. Summary of GAO Report on Federal Coal Leasing Feb. 4. Internet website: <http://www.markey.senate.gov/news/press-releases/markey-report-on-public-coal-leasing-shows-taxpayers-losing-money>.

A review by Senator Markey's office found that for every cent per ton that the BLM undervalues federal coal, there is nearly a \$7 million loss to American taxpayers.

Marten, A., and S. Newbold. 2011. Estimating the Social Cost of non-CO₂ GHG Emissions: Methane and Nitrous Oxide. US EPA, Washington, DC.

In this paper a simplified integrated assessment model gets used that combines MAGICC and (elements of) DICE to estimate the social costs of the three most important greenhouse gases—CO₂, CH₄, and N₂O—for 2010 through 2050.

Marten, A., E. Kopits, C. Griffiths, S. Newbold, and A. Wolverton. Incremental CH₄ and N₂O mitigation benefits consistent with the US Government's SC-CO₂ estimates. *Climate Policy* 15(2):272-298. Internet website: <http://www.tandfonline.com/doi/abs/10.1080/14693062.2014.912981>.

This article discusses the social costs of non-CO₂ GHGs and develops a set of social cost estimates. *Climate Policy* is an international, peer-reviewed journal on responses to climate change

May, H. 2012. Utah asthma action plan: Avoid pollution. Internet website: <http://archive.sltrib.com/story.php?ref=/sltrib/news/54743373-78/asthma-utah-health-quality.html.csp>.

News article from The Salt Lake Tribune, detailing Utah's asthma action plan, which emphasizes limiting exposure to pollution.

Mccabe, and K. Wolock. "Recent declines in western US snowpack in the context of twentieth-century climate variability." *EPA. Earth Interactions* 13:1-15.

Article that looks at monthly snow accumulation and a melt model to determine the impact of changing winter temperatures. Findings include higher temperatures and lower snow water equivalent.

McDonald, A., et al. 2009. "Climate change and the geography of weed damage: Analysis of US maize systems suggests the potential for significant range transformations." *Agriculture, Ecosystems and Environment* 130:131-140.

Journal article about how global warming will impact cropping systems and cause significant geographic range transformations among damaging endemic weeds, thereby resulting in new vulnerabilities to exotic weed invasions. To anticipate these changes and to devise management strategies for proactively addressing them, it is necessary to characterize the environmental conditions that make specific weed species abundant and competitive, and therefore damaging particular crops.

McGlade, C., and P. Ekins. 2015. "The geographical distribution of fossil fuels unused when limiting global warming to 2 degrees C." *Nature* 517:187-204. January 2015.

Research letter informing on the role of fossil fuels in global warming and the suggested limits on reserves, such as coal reserves, to meet the target of a global temperature increase not exceeding 2 degrees C. The letter writer addresses the IPCC's suggested carbon budget and the implications that it would have on future use of fossil fuels. The writer concludes that a transformation in the understanding of fossil fuel is necessary in order to keep temperature rise below 2 degrees Celsius.

McKenzie, et al. 2004. "Climate change, wildfire, and conservation." *Conservation Biology* 18:890-902.

Article on climate change's impact on wildfires. The article determines that climate change will extend fire seasons, as well as increase amplitude and duration of extreme fire weather. These results will depend on management of vegetation structure and fuels.

McKibben, B. 2016. "Global warming's terrifying new chemistry." *The Nation*, March 23, 2016.

Article explaining the rise in natural gas as coal declines, replacing the greenhouse gas CO₂ with the greenhouse gas methane. The article's intent is to bring attention to methane as a harmful gas. The main point of this article is that global warming cannot just be about carbon dioxide any longer, and that natural gas is not a solution for coal.

McKinsey & Company. 2013. Pathways to a low-carbon economy: Version 2 of the global greenhouse gas abatement cost curve. Internet website: <http://www.mckinsey.com/business-functions/sustainability-and-resource-productivity/our-insights/pathways-to-a-low-carbon-economy>.

This report builds on the 2007 report and includes an updated assessment of the development of low-carbon technologies and macro-economic trends and more detailed understanding of abatement potential in different regions and industries.

McKittrick, R. 2016. Internet website: <http://business.financialpost.com/fp-comment/junk-science-week-whats-the-right-price-for-carbon-take-a-guess-everyone-else-is>.

Online article on how the price of carbon is estimated.

Mehl, C. 2015. Know Your Economy: Economic Tools Updated for Every County. Headwaters Economics blog. Internet website: <http://headwaterseconomics.org/economic-development/trends-performance/insights-economic-tools-updated/>.

Internet website providing tools to query economic data and trends for every county in the country. Headwaters Economics is an independent, nonpartisan research firm.

Meinshausen, M., et al. 2009. "Greenhouse-gas emission targets for limiting global warming to 2 degrees C." *Nature* 458:1158-1163.

Journal article providing a comprehensive probabilistic analysis aimed at quantifying greenhouse gas emission budgets for 2000-2050 that would limit warming throughout the twenty-first century to below 2 degrees C, based on a combination of published distributions of climate system properties and observational constraints.

Melillo, J. M., et al. 2014. Climate Change Impacts in the United States: The Third National Climate Assessment. US Global Change Research Program.

Report that assesses the science of climate change and its impacts across the United States, now and throughout this century. It integrates findings of the US Global Change Research Program with the results of research and observations from across the United States and around the world, including reports from the US National Research Council. Documents climate change impacts and responses for various sectors and regions, with the goal of better informing public and private decision-making at all levels.

Miller, R., and R. Tausch. 2000 The Role of Fire in Juniper and Pinyon Woodlands: A Descriptive Analysis.

Article expanding on the increase in both distribution and density of juniper and pinyon across the Intermountain West. Historically, juniper and woodlands have been treated to control expansion, but for wildlife and environmental concerns, this suppression has stopped. This causes risk for large crown fires and tree-dominated woodlands becoming difficult and expensive to fix.

Ministry of Municipal Affairs British Columbia. 1999. Public Private Partnership a Guide for Local Government.

This guidebook is designed to assist local governments considering taking advantage of 1998 amendments to the Municipal Act that expand opportunities for public-private partnerships for the delivery of public facilities and services.

Montana Department of Environmental Quality. 2011. A review of the rationale for EC and SAR Standards, Aug. 5, 2011. Internet website: <http://deq.mt.gov/Portals/112/Energy/CoalbedMethane/Documents/FinalRationale.pdf>.

The report reviews standards for electrical conductivity (EC) and sodium adsorption ratio (SAR) in water in the Tongue and Powder River basins of Montana. The board determined that rules were necessary to ensure that the designated uses of these waters for agricultural purposes would be protected during the development of coal bed methane (CBM). Water produced during CBM development has an average EC value of 2,200 Siemens per centimeter and a SAR value often greater than 40. These values, especially the SAR values, are well above almost all of the ambient water quality values of the rivers and streams in CBM country. In addition, the SAR value of CBM water is well above the value that will adversely impact irrigated agriculture.

_____. No Date. Rule 17.24.1116: Bonding: Criteria and Schedule for Release of Bond. Internet website: <http://www.mtrules.org/gateway/ruleno.asp?RN=17.24.1116>.

This rule details the release of bond, including schedule and criteria. It was prepared by a state environmental organization.

Moore, F. C., and D. B. Diaz. 2015. Temperature impacts on economic growth warrant stringent mitigation policy. Nature Climate Change, advance online publication.

Journal article comparing the costs of greenhouse gas mitigation with damages from climate change to evaluate the social welfare implications of climate policy proposals and inform optimal emissions reduction trajectories.

Moran, C., et al. 2013. Independent scientific panel report on underground coal gasification pilot trials. Queensland Independent Scientific Panel for Underground Coal Gasification.

The panel report evaluates the feasibility of commercial scale underground coal gasification technology and concludes that pilot studies should not be allowed to progress to commercial scale until safe decommissioning processes are verified.

Morgan, Morgan. 2016. Comments on Petition to Initiate Self-Bonding Rulemaking, Docket ID: OSM-2016-0006. Sierra Club Environmental Law Program.

Comments submitted by Staff Attorney, Peter Morgan, of the Sierra Club Environmental Law Program on behalf of Sierra Club, Earthjustice, Appalachian Citizens Law Center, Appalachian Voices, Coal River Mountain Watch, Ohio Valley Environmental Coalition, Southern Appalachian Mountain Stewards, Statewide Organizing for Community empowerment, Tennessee Clean Water Network, West Virginia Highlands Conservancy, and West Virginia Rivers Coalition.

Morris, A. C. 2016. "Build a better future for coal workers and their communities." Climate and Energy Economics discussion paper. Brookings Institution, Washington, DC.

This report addresses concerns for coal workers and communities in a changing coal landscape and uncertain future. The Brookings Institution is a nonprofit public policy organization based in Washington, DC.

Morton, T. 2016. Update: Peabody, Arch Cut Nearly 480 Jobs At North Antelope, Black Thunder Mines. K2radio, Wyoming.

Due to several factors. Peabody Energy and Arch Coal had to let go several hundred workers.

Mountain Pact. 2016. How Federal Coal Reform Could Help Mountain Communities Mitigate the Costs of Climate Change. July 2016.

Report produced by the Mountain Pact, a 501c3 nonprofit coalition of mountain communities in the American West, seeking to address the impacts of climate change. Mountain communities are experiencing first hand the costs of climate change. Greenhouse gases from coal are a major contributor to climate change and associated costs. The report recommends that in order to ensure a fair return to taxpayers and improve economic efficiency, the royalty rate on federal coal should incorporate costs related to climate impact mitigation and adaptation.

Moy, A. D., et al. 2009. Reduced Calcification in Modern Southern Ocean Planktonic Foraminifera. Nature Geoscience, advance online publication.

Journal article about how reduced calcification from acidified sea water—a result of anthropogenic carbon dioxide concentrating in the oceans—has decreased the shell weights for planktonic foraminifer. These single-celled calcite-secreting organisms are between 25 and 50 percent of the total open-ocean marine carbonate flux. They influence the transport of organic carbon to the ocean interior; therefore, a possible decline in the abundance of foraminifera caused by acidification could affect both marine ecosystems and the oceanic uptake of atmospheric carbon dioxide.

Muller, N. Z., R. Mendelsohn, and W. Nordhaus. 2011. “Environmental accounting for pollution in the United States economy.” *American Economic Review* 101:1649–1675. August 2011.

Economic review presenting framework to include environmental externalities into a system of national accounts. This study looks at air pollution with an integrated-assessment model to quantify the damages of air pollution for each industry. The results of this study are that many industries have air pollution damages larger than their value added, the greatest loss found in coal-fired electric generation.

Mullins, N. 2016. “A coal miner’s goodbye.” *Yes! Magazine*, 2016. Bainbridge Island, Washington.

Essay of the author’s life of working in a coal mine and then life after leaving the coal mine.

Multnomah County Health Department. 2013. The Human Health Effects of Rail Transport of Coal Through Multnomah County, Oregon, Mar. 1, 2013. Internet website: http://media.oregonlive.com/environment_impact/other/Coal%20Report%20.pdf.

The Multnomah County (Oregon) Health Department found that “coal dust may travel approximately 500 meters to 2 kilometers (1/3 to 1 1/4 miles or 1,640.42 feet to 6,561.68 feet) from the tracks, depending on weather conditions and train speed.” The study found that coal dust from rail transport has the potential to result in growth and development problems, heart and lung problems, cancers, and safety-related injury and death. It also identified that “coal dust may contain traces of heavy metals, such as lead, mercury, chromium, and uranium that are toxic to the human nervous system. Children are particularly vulnerable to heavy metals . . .” and that the populations living within 500 meters of the rail lines in the county are “communities of color, children, older adults, and people earning low incomes.”

_____. 2013. The Human Health Effects of Rail Transport of Coal Through Multnomah County, Oregon: A Health Analysis and Recommendations for Further Action. Health Assessment and Evaluation/Office of Policy and Planning Multnomah County Health Department.

Report evaluating the health risk associated with coal rail transport through Multnomah County, Oregon. Potential environmental effects of concern related to coal transportation included emission of particulate matter in the form of coal dust and diesel locomotive exhaust, along with adverse health effects, such as heart and lung problems, cancers, and growth and development problems.

Mulvaney, D., et al. 2015. The Potential Greenhouse Gas Emissions from US Federal Fossil Fuels. EcoShift Consulting. August 2015. Internet website: <http://www.ecoshiftconsulting.com/wp-content/uploads/Potential-Greenhouse-Gas-Emissions-U-S-Federal-Fossil-Fuels.pdf>.

The report estimates the greenhouse gas emissions from the volume of leased and unleased federal fossil fuels. The estimated volume of these resources is used to compute the life-cycle greenhouse gas emissions associated with developing fossil fuels—including emissions from extraction, processing, transportation, and combustion. Results indicate that a cessation of new federal fossil fuel leasing could keep up to 450 Gt CO₂e from the global pool of potential future greenhouse gas emissions. This is equivalent to 13 times the global carbon emissions in 2014 or annual emissions from 118,000 coal-fired power plants.

Mulvaney, D., et al. 2016. Over-Leased: How Production Horizons of Already Leased Federal Fossil Fuels Outlast Global Carbon Budget. Center for Biological Diversity, Friends of the Earth, and EcoShift Consulting.

Report concluding that existing federal leases will still be producing fossil fuels long after global carbon budgets have been exhausted. As previous studies suggest, federal fossil fuel leasing policy should be aligned with US climate goals. The analysis strongly suggests that staying within the global carbon budgets will likely require not only ending new federal leases but keeping significant amounts of already leased federal fossil fuels in the ground.

Muncy, B. L., et al. 2014. "Mountaintop removal mining reduces stream salamander occupancy and richness in southeastern Kentucky (USA)." *Biological Conservation* 180:115-121.

Journal article about mountaintop removal coal mining with valley fills (MTR/VF) in central Appalachia, which threatens the integrity of stream ecosystems. Numerous mechanisms may be responsible for decreased occupancy and species richness at MTR/VF streams, although water chemistry may be particularly important. Results indicate that MTR/VF operations lead to significant decreases in salamander occupancy and species richness.

Munthe, J., et al. 2010. Study on Mercury Sources and Emissions, and Analysis of Cost and Effectiveness of Control Measures: UNEP Paragraph 29 Study. Division of Technology, Industry and Economics, Chemicals Branch, Geneva, Switzerland.

Report providing an overview of mercury emissions to air, control options in selected sectors, and their efficiencies and costs. It is prepared with the intention of supporting the ongoing negotiation process to prepare a global legally binding instrument on mercury. Provides an evaluation of global emission trends, including a harmonization of data and improved completeness of previously published inventories from 1990 to 2005.

Murdoch, P. S., et al. 2000. "Potential effects of climate change on surface-water quality in North America.: *Journal of the American Water Resources Association* 36(2):347-366.

Journal article about how changes in climate can have a significant effect on surface water quality and exceed ecosystem thresholds, which leads to chronic water quality changes.

Mutter, J. et al. 2010. "Does inorganic mercury play a role in Alzheimer's disease? A systematic review and an integrated molecular mechanism." *J Alzheimer's Dis.* 22:357-374.

The abstract of article looking at the roll of inorganic mercury in Alzheimer's disease. This article conducts a systematic review using a comprehensive search study, screening other studies by protocol. Article urges industrial and medical usage of mercury to be eliminated as soon as possible.

NAACP. Year unknown. Equity in Building Resilience in Adaptation Planning.

Report by the National Association for the Advancement of Colored People on the equity in climate adaption planning and resilience indicators. Includes list of social, cultural, economic, and political factors that are considered preexisting vulnerabilities or assets to the results of climate change.

NASA. 2016. Internet website. <http://climate.nasa.gov/effects/>.

NASA website on global climate change. Provides facts and details on future effects of climate change. Also provides user with more climate change-related articles. Main focus of the page is on the noticeable effects of global climate change.

_____. 2016. Internet website. <http://www.giss.nasa.gov/staff/gschmidt/>.

Website with biography on Dr. Gavin A. Schmidt. Provides links to his research, articles, and press release. Dr. Schmidt is known for his role in the GISS Model E Earth System Model, investigating past, present, and future climate change.

National Center for Environmental Health. 2005. "Blood lead levels—United States, 1999-2002." CDC. MMWR 50:513-516.

Online article from the CDC on the adverse health effects caused by lead exposure. Examines intellectual and behavioral defects in children and hypertension and kidney disease in adults. Provides specific statistics on percent increases and lead levels.

_____. 2013. "Blood lead levels in children aged 1–5 years — United States, 1999–2010." CDC. MMWR. 62:245-248.

Update on previous statistics detailing the harm lead in the blood can cause. Provides statistics and details on how levels of lead in the blood were monitored. Determines lead to be harmful in the blood, with highest levels found in non-Hispanic black children.

National Climate Assessment. 2016. Internet website: <http://nca2014.globalchange.gov/report>.

Interactive website from the US Global Change Research Program. Breaks down the National Climate Assessment, allowing you to easily move between sections. Subdivided by response strategies, regions, sectors, and climate facts, with full report also available.

National Energy Technology Laboratory. 2014. Life Cycle Analysis of Natural Gas Extraction and Power Generation. US Department of Energy.

Although natural gas has lower greenhouse gas emissions than coal during combustion, life cycle analysis, including fugitive methane emissions, also makes a substantial contribution to global warming. Methane recapture technology can reduce leakage rates. Natural gas is evaluated as an energy source based on environmental, economic, and social considerations.

National Marine Fisheries Service and US Fish and Wildlife Service. 2011. Endangered and Threatened Species; Determination of Nine Distinct Population Segments of Loggerhead Sea Turtles as Endangered or Threatened. Department of Commerce, National Marine Fisheries Service, Silver Spring, Maryland. Federal Register 76(184):58868-58952.

Federal Register notice for the National Marine Fisheries Service and the US Fish and Wildlife Service publishing a determination of threatened or endangered status for nine distinct population segments of loggerhead sea turtles.

National Marine Fisheries Service. 2015. Recovery Plan for Elkhorn Coral (*Acropora Palmata*) and Staghorn Coral (*A. Cervicornis*). Southeast Regional Office, Saint Petersburg, Florida.

Recovery plan for the elkhorn coral (*Acropora palmata*) and the staghorn coral (*A. cervicornis*), which were listed by NMFS as threatened species under the ESA on May 9, 2006. Section 4(f) of the ESA directs NMFS and USFWS to develop and implement recovery plans for species under their jurisdiction, leading to the development of this document by the Acropora Recovery Team, which included coral scientists and management experts from state, territorial, and federal government agencies and the nongovernmental sector.

National Mining Association. 2016. Federal Coal Leasing Moratorium: An Examination of the Reasons Driving a Disruptive Policy. Washington, DC.

The National Mining Association, with the assistance of Norwest, evaluated the claims that the current coal leasing program is not delivering fair value to the taxpayers, as well as the policy suggestions advocated to address the purported shortcomings.

National Oceanic and Atmospheric Administration. 2015. Interagency Cooperation—Endangered Species Act of 1973, as Amended; Incidental Take Statements. National Oceanic and Atmospheric Administration, Washington, DC. *Federal Register* 80(90):26832-26845.

Federal Register listing detailing how the US Fish and Wildlife Service and the National Marine Fisheries Service are amending the incidental take statement provisions of Section 7 of the Endangered Species Act of 1973. The two primary purposes of the amendments are to address the use of surrogates to express the amount or extent of anticipated incidental take and to refine the basis for development of incidental take statements for programmatic actions.

_____. 2016. Sea Level Rise and Coastal Flooding Impacts. Internet website: <https://coast.noaa.gov/slr/>.

Website with interactive GIS feature, showing the results of coastal flooding impacts from 1 to 6 feet of sea level rise.

_____. 2016. Sea Surface Temperature (SST) Contour Charts. Internet website: <http://www.ospo.noaa.gov/Products/ocean/sst/contour/>.

Website showing sea surface temperatures across the globe, with specific details on the coastlines of the United States.

_____. 2016. What Is Ocean Acidification? Internet website: <http://www.pmel.noaa.gov/co2/story/What+is+Ocean+Acidification%3F>.

Website explaining ocean acidification, which results when carbon dioxide (CO₂) is absorbed by seawater and chemical reactions occur that reduce seawater pH, carbonate ion concentration, and saturation states of biologically important calcium carbonate minerals.

National Research Council. 1990. Surface Coal Mining Effects on Ground Water Recharge. Committee on Ground Water Recharge in Surface-Mined Areas, Water Science and Technology Board, Commission on Engineering and Technical Systems.

The report interprets groundwater recharge for the Office of Surface Mining Reclamation and Enforcement. The report concludes that groundwater recharge capacity refers to ability of soils to allow runoff infiltration and that no single technique for assessing recharge can be required in Surface Mining Control and Reclamation Act. Additional research is recommended to improve understanding of recharge pre- and post-mining.

_____. 2010. Hidden Costs of Energy: Unpriced Consequences of Energy Production and Use. Washington, DC.

Report on external effects of energy production, both beneficial and negative, in the decision-making process. This is a study requested by Congress in the Energy Policy Act of 2005. The committee was asked to evaluate and define external costs and benefits associated with the production, distribution, and use of energy and not reflected in market prices or policy, related to health, environment, security, and infrastructure.

_____. 2000. Ocean Acidification: A National Strategy to Meet the Challenges of a Changing Ocean. National Academy Press, Washington, DC.

Report examining the anticipated consequences of ocean acidification due to rising atmospheric carbon dioxide levels on fisheries, protected species, coral reefs, and other natural resources in the United States and internationally. Recommends priorities for a national research, monitoring, and assessment plan to advance understanding of the biogeochemistry of carbon dioxide uptake in the ocean and the relationship to atmospheric levels of carbon dioxide, and to reduce uncertainties in projections of increasing ocean acidification and the potential effects on living marine resources and ocean ecosystems.

_____. 2000. Toxicological Effects Of Methyl Mercury. National Academy Press, Washington, DC.

Report on the impacts of methyl mercury (MeHg), a by-product of emissions from coal-fired power plants as mercury (Hg) breaks down. Methyl Mercury bioaccumulates up the food chain and can lead to high concentrations in predatory fish. Because of these concerns, Congress directed the EPA to contract with the National Research Council to prepare recommendations on the appropriate reference dose for Hg exposure, which this report presents.

National Wildlife Federation. 2013. Wildlife in a Warming World: Confronting the Climate Crisis. National Wildlife Federation, Reston, Virginia. 48 pp.

Report on how plants, fish, and wildlife in the United States are facing a crisis from climate change and how wildlife conservation will require preparing for and manage climate change impacts.

National Wildlife Federation. 2014. Issue Brief: Accounting for Carbon Pollution from Coal Mining on Federal Lands. Internet website: http://www.nwf.org/~media/PDFs/Global-Warming/Policy-Solutions/2014/nwf_issue_briefs_layout_web.pdf.

This report discusses the carbon implications of US coal leasing policies on federal lands and coal exports. The National Wildlife Federation is a conservation organization.

National Wildlife Federation and Natural Resources Defense Council. Losing Ground: Energy Development's Impacts on Wildlife, Landscapes, and Hunting Traditions of the American West. Denver, Colorado, and Bozeman, Montana.

This report details game species in the American West losing ground and habitat to energy development. National Wildlife Federation and Natural Resources Defense Council are conservation organizations.

National Wildlife Federation, et al. 2015. Undermined Promise II

Joint publication of the National Wildlife Federation, the Natural Resources Defense Council, and the Western Organization of Resource Councils. This report is an update of Undermined Promise: Reclamation and Enforcement of the Surface Mining Control and Reclamation Act 1977-2007. Discusses reclamation and bonding, water, wildlife, inspections and enforcement, and recommendations for reform.

National Wildlife Federation. Wildlife in Hot Water: America's Waterways and Climate Change. Internet website: http://www.nwf.org/~media/PDFs/Water/2015/NWF-Report_Wildlife-In-Hot-Water.pdf.

This report examines how climate change is affecting and is expected to affect the nation's waterways and wildlife. The National Wildlife Federation is a conservation organization.

Nelson, R. 1984. "The Making of federal coal policy." *Busi. Hist. Rev.* 58

Abstract only. Makes claim that federal coal leasing has failed due to conflicting ideologies.

New Mexico Energy, Minerals, and Natural Resources Department. 2016. FAQ - Coal Mine Reclamation Program.

Online document detailing the coal mine reclamation program and answering commonly asked questions.

New Scientist. 2007. Climate Myths Special. May 16, 2007.

Blog post with information on why climate change is a myth and resources that assert that claim.

Newcombe, C. P, and D. D. Macdonald. 1991. "Effects of suspended sediments on aquatic ecosystems." *North American Journal of Fisheries Management* 11(1):72-82.

Journal article providing managers with a formula to calculate the effects of suspended sediments on fish and aquatic ecosystems by looking at the concentration of sediments and duration of exposure.

Newcombe, C. P., and J. O. Jensen. 1996. "Channel suspended sediment and fisheries: A synthesis for quantitative risk and impact." *North American Journal of Fisheries Management* 16:693-727.

Journal article with a meta-analysis of 80 published and adequately documented reports on fish responses to suspended sediment in streams and estuaries, showing a formula to calculate the range of effects, from no effect to sublethal and lethal.

Newton, T. J., and M. R. Bartsch. 2007. "Contaminant sensitivity of freshwater mussels: Lethal and sublethal effects of ammonia to juvenile *Lampsilis* mussels (Unionidae) in sediment and water-only exposures." *Environmental Toxicology and Chemistry* 26(10):2057-2065.

Journal article on the sensitivity of two juvenile unionid mussels (*Lampsilis cardium* and *L. higginsii*) to ammonia and sediment, demonstrating that juvenile freshwater mussel growth is sensitive to ammonia toxicity and that growth should be measured via sediment tests.

NextGen Climate. 2016. Our Air Health and Equity Impacts of Ohio's Power Plants. PSE Healthy Energy.

This report is based on a comprehensive public health and environmental hazard analysis authored by the energy, science, and policy institute, PSE Healthy Energy. The study examines demographic, social, and economic characteristics of communities located near fossil fuel plants, as well as the environmental health burdens and environmental hazards these neighborhoods face. The study models the national, regional, and local public health impacts of particulate matter associated with combustion at Ohio's power plants in 2015.

Nichols, J., and A. Paul. July 28, 2016. WildEarth Guardians, Denver, Colorado.

Comments in response to the March 30, 2016 notice of intent to prepare a programmatic environmental impact statement to review the federal coal program consistent with Secretarial Order 3338, issued on January 15, 2016. See 81 *Fed. Reg.* 17,720 (March 30, 2016). Expounds on comments made at hearings.

Noone, K., et al. 2012. Valuing the Ocean: Draft Executive Summary. Stockholm Environment Institute, Sweden.

Executive summary identifying the six major threats to the ocean from anthropogenic climate change: ocean acidification, ocean warming, hypoxia, sea level rise, pollution, and overuse of marine resources. Also looks at how these threats can combine to have even more adverse impacts as these threats can combine to be multiple stressors.

North American Bird Conservation Initiative. 2016. the State of North America's Birds 2016. Environment and Climate Change Canada: Ottawa

Infographic on North American birds and their habitats and how climate change will threaten them.

Northern Plains Resource Council. 2011. A Hidden Cost of Coal: Exporting Our Coal to Asia. Northern Plains Resource Council, Billings, Montana.

Paper examining the costs of expanded coal strip mining and exports on the communities of Montana, particularly given the increasing amounts of coal exports to Asia.

Office of Inspector General. 2013. Coal Management Program, US Department of the Interior CR-EV-BLM-0001-2012. US Office of the Inspector General, Washington, DC

Report to determine if the Department of the Interior's coal leasing process obtains a fair return for the public's coal; assesses the effectiveness of the department's coal lease inspection and enforcement program; and assesses whether the department is sufficiently addressing financial concerns about venting methane gas from coal mines.

_____. 2013. Letter to Senator Wyden regarding coal leasing program.

The letter addresses Sen. Wyden's questions regarding violations in selling coal below fair market value and safeguards to avoid future violations.

Office of Management and Budget. 2014 Technical Support Document: Technical Update of the Social Cost of Carbon for Regulatory Impact Analysis Under Executive Order 12866. Submitted on behalf of Sierra Club. February 26, 2014

Comments by the Sierra Club on the Interagency Working Group's Technical Support Document on the Social Cost of Carbon.

Office of Natural Resources Revenue. 2015. Consolidated Federal Oil & Gas and Federal & Indian Coal Valuation Reform. *Federal Register* 80(3):608-675.

ONRR proposed to change government regulations governing valuation for royalty purposes of oil and gas produced from federal onshore and offshore leases and coal produce from federal and Indian leases.

_____. 2016. Statistical Information Site. Internet website: <http://statistics.onrr.gov/Default.aspx>

Provides the following datasets, which are available for download or query: disbursement data, reported revenue data, and production data.

Office of the Press Secretary. 2015. Remarks by the President at the Glacier Conference, Anchorage, Alaska. Internet website: <https://www.whitehouse.gov/the-press-office/2015/09/01/remarks-president-glacier-conference-anchorage-ak>.

President Obama addresses Alaskan and indigenous communities about climate change and impacts in Arctic regions.

Office of the Press Secretary. 2016. North American Climate, Clean Energy, and Environment Partnership Action Plan. Internet website: <https://www.whitehouse.gov/the-press-office/2016/06/29/north-american-climate-clean-energy-and-environment-partnership-action>.

This website details the partnership of North American leaders to implement a plan to advance clean and secure energy, to drive down short-lived climate pollutants, to promote clean and efficient transportation, to protect nature and advance science, and to show global leadership in addressing climate change.

Office of the Secretary of the Interior. 2011. Press release: Interior Releases Report Highlighting Impacts of Climate Change to Western Water Resources. Internet website: <https://www.doi.gov/news/pressreleases/Interior-Releases-Report-Highlighting-Impacts-of-Climate-Change-to-Western-Water-Resources>.

This press release for the US Department of the Interior announces a report that assesses climate change risks and how these risks could impact water operations, hydropower, flood control, and fish and wildlife in the western United States.

Office of the Secretary of the Interior. 2015. Press release: Secretary Jewell Offers Vision for Balanced, Prosperous Energy Future. Internet website: <https://www.doi.gov/news/pressreleases/secretary-jewell-offers-vision-for-balanced-prosperous-energy-future>.

Press release about the remarks Secretary of the Interior Sally Jewell presented at the Center for Strategic and International Studies on March 17, 2015. She laid out the Department of the Interior's priorities for strengthening the US economy with a balanced, prosperous energy future over the next two years.

Ogle, R. S., K. J. Maier, P. Kiffney, M. J. Williams, A. Brasher, L. A. Melton, and A. W. Knight. 1988. "Bioaccumulation of selenium in aquatic ecosystems." *Lake and Reservoir Management* 4(2):165-173. Internet website: <http://www.tandfonline.com/doi/abs/10.1080/07438148809354824>.

This peer-reviewed journal article investigates how elevated levels of selenium have degraded several ecosystems.

OIG Report No. CR-EV-BLM-0001-2012. 2013. Coal Management Program, US Department of the Interior. June 11, 2013. Internet website: <https://www.doioig.gov/reports/coal-management-program-us-department-interior>.

The federal government and state and local beneficiaries are losing significant revenue due to the undervaluation of taxpayer-owned coal. Based on a small review sample, the report preparers estimated at least \$60 million has been lost.

Onederra, I., et al. 2012. “Understanding main causes of nitrogen oxide fumes in surface blasting.” *Mining Technology* September 2012.

Post-blast fumes are a direct product of the detonation process, which can be easily identified as the resultant yellow to orange post-blast clouds. There is general agreement that the conditions leading to fumes are associated with fuel deficiencies or incomplete detonation of the explosives. From a practical perspective this can be due to one or a combination of factors, such as explosives characteristics, confinement effects, ground conditions, inappropriate blast design parameters, explosives selection, on-bench practices, and potential contamination of explosives in the blast hole.

Orr, J. C., et al. 2005. “Anthropogenic ocean acidification over the twenty-first century and its impact on calcifying organisms.” *Nature* 437:681-686.

Journal article on ocean acidification and how key marine organisms—such as corals and some plankton—will have difficulty maintaining their external calcium carbonate skeletons if this trend continues. Using a variety of models of the ocean-carbon cycle, results seem to indicate that conditions detrimental to high-latitude ecosystems could develop within decades, not centuries, as suggested previously.

Painter, T., et al. 2010. “Response of Colorado River runoff to dust radiative forcing in snow.” *PNAS* 107:17125-17130.

Study that uses the variable infiltration capacity model with post- and pre-disturbance of dust on albedo to estimate the runoff from the Upper Colorado River Basin. The authors find that peak runoff occurs earlier with dust loading. This they suggest could be avoided with mitigation through surface stabilization in the deserts.

Palmer, M. A., and K. L. Hondula. “Restoration as mitigation: Analysis of stream mitigation for coal mining impacts in southern Appalachia.” *Environmental Science and Technology* 48:10552-10560.

Journal article on compensatory mitigation, which is commonly used to replace aquatic natural resources being lost or degraded, and the relative success of stream mitigation. Provides a synthesis of information about 434 stream mitigation projects in Appalachia. Overall, the data show that mitigation being implemented in southern Appalachia for coal mining are not meeting the objectives of the Clean Water Act to replace lost or degraded stream ecosystems and their functions.

Parmesan, C., and G. Yohe. 2003. “A globally coherent fingerprint of climate change impacts across natural systems.” *Nature* 421:37-42.

Journal article exploring systematic trends across diverse species and geographic regions in response to climate change. Shows that recent biological trends match climate change predictions and that climate change is already affecting living systems.

Partnership for a Secure America. 2016. Internet website: <http://www.psaonline.org/2015/10/22/republicans-democrats-agree-u-s-security-demands-global-climate-action/>.

Website with signatories and a statement that US security needs action on climate change.

Paterson, L. 2016. "More coal layoffs in Wyoming." Inside Energy News. Internet website: <http://insideenergy.org/2016/04/28/more-coal-layoffs-in-wyoming/>.

This article discusses more layoffs from Wyoming coal mines, specifically from Alpha Natural Resources. Inside Energy is collaborative journalism initiative among public media, funded by a grant from the Corporation for Public Broadcasting.

Paz, S. 2015. "Climate change impacts on West Nile virus transmission in a global context." *Philosophical Transactions of the Royal Society*, Vol. 370.

Journal article about West Nile virus (WNV) and how weather conditions have direct and indirect influences on WNV vector competence (the ability to acquire, maintain and transmit the virus) on the vector population dynamic and on the virus replication rate in the mosquito, which are mostly weather dependent. The importance of temperature, precipitation, relative humidity, and winds as drivers in WNV epidemiology is increasing under conditions of climate change.

Penfold, M. 2014. Letter to BLM. Our Montana, Inc.

The letter discusses rights of surface owners to consent to coal strip mining on their property and supports extending this right of consent to privately held coal transferred from federal ownership.

Peters, A. 2009. Air Quality and Cardiovascular Health Smoke and Pollution Matter. *Circulation*. 120: 924-927.

Article comparing cigarette smoke and ambient particulate matter. This article estimates the cumulative dose of different degrees of smoking and cardiovascular disease morbidity and mortality, attempting to find a scale to compare.

Peters, K. 1992. "The Clean Air Act and the Amendments of 1990." *Santa Clara High Technology Law Journal* 8(1):233-242.

Law journal note provides brief overview of the provisions of the Clean Air Act.

Petty, J. T., et al. 2010. "Landscape indicators and thresholds of stream ecological impairment in an intensively mined Appalachian watershed." *Journal of the North American Benthological Society* 29(4):1292-1309.

Journal article on the development of an index of mining intensity (MI) that could be used to predict stream water quality and biological conditions; to quantify the extent to which geology and the geographic position of mines modulate the effects of mining on in-stream conditions; and to identify thresholds of MI that produce quantifiable changes to benthic macroinvertebrate communities.

Pfister, T., et al. 2014. "Projections of future summertime ozone over the US." *Journal of Geophysical Research: Atmospheres* 119: 5559-5582.

Study using a regional coupled chemistry-transport model to assess changes in surface ozone over summertime in the United States between the present and 2050.

Physicians for Social Responsibility. 2009. Coal's Assault on Human Health, Nov. 18. Internet website: <http://www.psr.org/news-events/press-releases/coal-pollution-damages-human-health.html>

Policy paper examining the impacts from pollutants emitted during coal combustion; pinpoints negative health consequences at each step of the coal life cycle.

Pond, G. J. 2010. "Patterns of Ephemeroptera taxa loss in Appalachian headwater streams (Kentucky, USA)." *Hydrobiologia* 641:185-201.

Journal article about how expected mayfly communities are disappearing from streams where mining disturbance and residential development has occurred, and that, because of the long-term impacts incurred by both land uses, recovery is uncertain.

Pond, G. J., et al. 2008. "Downstream effects of mountaintop coal mining: Comparing biological conditions using family- and genus-level macroinvertebrate bioassessment tools." *Journal of the North American Benthological Society* 27(3):717-737.

Journal article on how surface coal mining with valley fills has impaired the aquatic life in numerous streams in the central Appalachian Mountains. Four lines of evidence indicate that mining impairs biological condition of streams, a shift in species assemblages, loss of Ephemeroptera taxa, changes in individual metrics and indices, and differences in water chemistry. Results show that mining has had subtle to severe impacts on benthic macroinvertebrate communities.

Pope, A., III. 2000. "Epidemiology of fine particulate air pollution and human health: Biologic mechanisms and who's at risk?" *Environmental Health Perspectives* 108:713-723.

Article that summarizes the epidemiology of the health effects of fine particulate air pollution. Provides opinion that there are adverse health effects of particulates on susceptible populations.

Powder River Basin Resource Council and Western Organization of Resource Councils. No date. When Is Federal Coal Leasing Contrary to the Public Interest?

Final paper discussing coal leasing not being in the public's interest. Points out that the BLM has not defined "public interest" by rule or handbook. Proposes that the lack of guidance and criteria from the BLM on the issue of what coal leases are in the public interest has prevented decision-making. Asks that guidance be developed.

_____. No date. Abuse of Taxpayer-Owned Powder River Basin Coal.

This fact sheet describes the export of coal from the Powder River Basin, while royalties to taxpayers are paid based on domestic prices.

Powder River Basin Resource Council, et al. 2015. Letter to Office of Surface Mining Reclamation and Enforcement re: Stream Protection Rule, Washington DC.

Letter from 32 nonprofit groups commenting on the Office of Surface Mining Reclamation and Enforcement proposed Stream Protection Rule (80 FR 44436 [July 27 2015]) and the accompanying DEIS. The rule would increase monitoring and bonding requirements for mountaintop removal mining, but commenters suggest it needs to clarify downstream water quality standards, increase restoration requirements, assess impacts on climate change, and protect watercourses.

Powder River Basin Resource Council, et al. 2016. Comments on Proposed Self-Bonding Rule Changes, Docket ID: OSM-2016-0006.

Comments to the Office of Surface Mining Reclamation and Enforcement submitted by 27 organizations, including the Powder River Basin Resource Council and Sierra Club. Asks Office of Surface Mining Reclamation and Enforcement to use its authority to close the loopholes.

Powder River Basin Resource Council, et al. 2016. Letter to Office of Surface Mining Reclamation and Enforcement re: Proposed Self-Bonding Rule Changes, Washington DC.

Letter from 32 nonprofit environmental and community groups from coal-producing areas, thanking Office of Surface Mining Reclamation and Enforcement for review of self-bonding regulations under SMCRA. The letter requests improved enforcement and closure of the loophole of self-bonding in reclamation liability.

Power, T. M. 2011. The Greenhouse Gas Impact of Exporting Coal from the West Coast: An Economic Analysis. Power Consulting, Missoula, Montana.

Report concluding that the proposed coal export facilities in the Northwest will result in more coal consumption in Asia and will undermine China's progress toward more efficient power generation and usage. Approving proposed coal export facilities would also undermine Washington State's commitment to reducing its own share of greenhouse gas emissions.

Power, T. M., and D. S. Power. 2013. The Impact of Powder River Basin Coal Exports on Global Greenhouse Gas Emissions. Power Consulting, Missoula, Montana.

Report considering the various opinions that increased American coal production and exports will have no net impact on global greenhouse gas emissions, while others have argued that such exports would actually reduce global greenhouse gas emissions. Analyzes and responds to these arguments that there will be no net increase in global greenhouse gas emissions as a result of the expansion of Powder River Basin coal mining and the construction of rail and port infrastructure on the West Coast to support the export of that coal to Asia.

Power, T., D. Power, and J. Brown. 2010. Comments on the Greenhouse Gas Impacts and the Modeling of Coal Flows in the Millennium Bulk Terminals Longview SEPA Draft Environmental Impact Statement. A Report Prepared for Earthjustice and Sierra Club. June 10, 2016.

Comment report on the greenhouse gas impacts and the modeling of coal flows in the Millennium Bulk Terminals Longview SEPA Draft Environmental Impact Statement by Power Consulting, Inc., and Aesir Consulting, LLC. Comments focus on greenhouse gas emissions related to changes in coal and natural gas combustion that would be caused by the project.

_____. 2015. Assessing the Ability of Contemporary Models to Calculate the GHG Implications of Federal Coal Leasing Decisions and Other Federal Energy Management Decisions. A Report Prepared for Earthjustice and Sierra Club. May 21, 2015.

A report prepared by consultants familiar with power and modeling by authors familiar with the power industry and modeling. The report details the logistics and economics of coal, the structure of the National Energy Modeling System (NEMS) and its use for the coal market. Concluding that there is the most appropriate model for the Forest Service to use for modeling the greenhouse gas emission impacts of the coal mine road exemption to the Colorado Roadless Rule.

_____. 2016. Economic Consequences of the Federal Coal Leasing Program: Improving the Quality of the Economic Analysis. A Report Prepared for Earthjustice and Sierra Club. July 27 2016.

A report prepared by consultants familiar with power and modeling, responding to the Notice of Intent to Prepare a Programmatic Environmental Impact Statement to Review Federal Coal Program. The authors look into the promises and realities of coal mining, the economics of coal mining communities, economic consequences associated with Federal Land Management decisions, and the importance of considering economics in coal leasing policy.

Queensland Department of Natural Resources and Mines. 2013. Healthy Headwaters Coal Seam Gas Water Feasibility Study: Assessing the Salinity Impacts of Coal Seam Gas Water on Landscapes and Surface Streams. February 2013.

Report describes a framework to assess the salinity risk associated with the use of coal seam gas water for irrigation in the Queensland Murray-Darling Basin. The framework has four components—biophysical hazard, salinity stage, current management influence, and post-irrigation land use. Salinity risk must be considered for any irrigation development affected by coal seam gas.

Rasker, R., P. H. Gude, J. A. Gude, and J. van den Noort. 2009. "The economic importance of air travel in high-amenity rural areas." *Journal of Rural Studies* 25:343-353.

Peer-reviewed journal article tests a new county classification system to reflect differing degrees of access to population centers and account for the increasing importance of airports, examines the validity of this new classification, and tests for differences in economic performance among the three county types. Finds that there are three distinct Wests that can be classified using economic performance measures and socioeconomic characteristics: metro, isolated, and connected. The findings illustrate the importance of airports in rural development and the limitations facing those communities that are isolated from markets and population centers.

Raupach, M. R., et al. 2014. "Sharing a quota on cumulative carbon emissions." *Nature Climate Change* 4:873-879.

Journal article on translating global carbon quotas to regional and national scales. For a carbon quota consistent with a 2 degree C warming limit (relative to pre-Industrial levels), the necessary long-term mitigation rates are very challenging, both because of strong limits on future emissions from the global carbon quota and also the likely short-term persistence in emissions growth in many regions.

Ray, K. 2016. "Colorado's worst methane polluter is an Arch Coal mine." *Colorado Independent*. May 3, 2016.

Article on the West Elk Mine's methane production places blame on the lack of both state and federal regulations for the underground coal mines. West Elk Mine was the single largest methane polluter in Colorado, and there are plans to expand it, which the article points out would roll back a large portion of the progress made in tackling methane.

Real, E., et al. 2007. "Processes influencing ozone levels in Alaskan forest fire plumes during long-range transport over the North Atlantic." *Journal of Geophysical Research* 112: D10S41.

Article investigating plumes from Alaskan forest fires to see how they influence ozone levels in the North Atlantic. Results found the ozone impact of Alaskan fires can be potentially significant over Europe.

Regan, C. 2016. *US Coal: Pushed to the Margins*. Bloomberg New Energy Finance.

Coal report with a comprehensive look at coal in the twenty-first century. Main topics are coal retirements overview, wholesale power price suppression, cheap natural gas, plummeting renewables.

Rehbach, S., and R. Samek. 2015. *Downsizing the US coal industry: Can a slow-motion train wreck be avoided?* Mining & Minerals Practice. November 2015.

Report describing the US coal industry's current state of overcapacity, or surplus in the face of falling demand, and long-term outstanding financial liability, including long-term debt, contractual obligations, asset-retirement obligations, and pension funding obligations. Outlines possible strategies for correcting supply-demand imbalance and reducing liability. Report produced by a management consulting firm.

REMI and Synapse. 2014. The Economic, Climate, Fiscal, Power, and Demographic Impact of a National Fee-and-Dividend Carbon Tax. Prepared for Citizens' Climate Lobby. Coronado, California.

Report investigating the impacts of implementing a revenue-neutral carbon tax for nine regions of the United States. Looked at economics, climate, budget, power generation, and demographics. Results determine that there are probable benefits to taxing carbon dioxide emissions.

Research Council of Norway. 2010. Persistent organic pollutants in large concentrations in Arctic areas: Fires spread environmental toxins over the Arctic. ScienceDaily. Internet website: <https://www.sciencedaily.com/releases/2010/06/100601072630.htm>

Online article on organic pollutants in Arctic areas, specifically from forest fires and straw and stubble burning in North America and Eastern Europe. Specifically focuses on the environmental toxin polychlorinated biphenyl, and persistent organic pollutants.

Rice, D. 2016. "Global temperatures soar for record 12th straight month." USA Today, May 18, 2016, McLean, Virginia.

News article with information and resources stating that the average carbon dioxide and temperatures have increased for the last 12 months,

Rich, H. 2013. Internet website: <http://www.forbes.com/sites/realspin/2013/03/14/germanys-green-energy-disaster-a-cautionary-tale-for-world-leaders/#3a721c7f14a6>.

An article on how Chancellor Angela Merkel's energy review and how it has affected the German energy sector.

Rieman, B. E., D. Isaak, S. Adams, D. Horan, D. Nagel, C. Luce, and D. Myers. 2007. "Anticipated climate warming effects on bull trout habitats and populations across interior Columbia River Basin." American Fisheries Society 136:1552-1565. Internet website: http://www.fs.fed.us/rm/boise/publications/fisheries/rmrs_2007_riemanb001.pdf.

This peer-reviewed scientific journal article investigates how a warming climate will influence regional and local bull trout distributions.

Riordan, M. 2014. "Don't sell cheap US coal to Asia." The New York Times. February 13, 2014, New York, New York, p. A27.

Op-ed article written in opposition of exporting US coal to Asian markets. The author expresses opposition to the proposed Cherry Point shipping terminal north of Seattle, Washington, and describes economic and environmental impacts of coal transportation and exports.

Robert Scribbler. 2013. Internet website: <https://robertscribbler.com/2013/07/16/drjenniferfrancistopclimatologistsexplainhowglobalwarmingwreckstheandampsuphydrologicalcycleto causedangerousweather/>.

Website with information on top Climatologist Dr. Jennifer Francis and her explanation of global warming's impact on the jet stream and extreme weather. Includes video on the topic.

_____. 2014. Internet website: https://robertscribbler.com/2014/01/23/arcticheatwave_torippolarvortexinhalفشatteralaskasalltimerecordhighforjanuary/.

Internet article discussing the record high temperatures in January in Alaska. Author blames the jet stream pattern for higher temperatures, as well as the reduction of land and sea ice. Provides NASA satellite image of heat wave in Alaska.

_____. 2014. Internet website: <https://robertscribbler.com/tag/drjenniferfrancis/>.

Online article linking gravity waves that interfered with atmospheric clock to climate change. Identifies the two climate change effects of Arctic warming—weakened zonal winds and increased wave amplitude—as possible causes. Provides sources and links to other opinions on the topic, as well as maps.

Rocky Mountain Climate Organization. 2008. Hotter and Drier: The West's Changed Climate. Internet website: <http://www.rockymountainclimate.org/website%20pictures/Hotter%20and%20Drier.pdf>.

This report documents that the American West has gotten hotter at a faster rate than the planet as a whole. Across the 11 states, temperatures from 2003 to 2007 were 1.7°F higher than the twentieth century average for the region. By contrast, global temperatures in that five-year period were 1.0°F hotter than the planet's twentieth-century average. The report also presents similar data for each of the 11 states and documents other ways in which the West's climate is already changing and the impacts of those changes.

Rocky Mountain Institute. 2010. Internet website: http://www.rmi.org/RFGGraphhealth_effects_from_US_power_plant_emissions.

Website with graph of the estimated health effects from US coal-fired power plant emissions. Formatted as a bar graph, with health effects classified into six categories: premature deaths, hospital admissions, heart attacks, chronic bronchitis, asthma attacks, and lost work days, and reported as the estimated number of cases in 2010. The report also claims that the total monetary costs of the health impacts is over \$100 billion annually.

Roessler. 2006. Las Vegas and the Groundwater Development Project Where does it start? Where will it end? A Progressive Leadership Alliance of Nevada (PLAN) Report.

Report discusses pipeline projects in Las Vegas, Tucson, and Albuquerque and the importance of water. Mentions the water crisis.

Rogelj, J., et al. 2015. "Energy system transformations for limiting end-of-century warming to below 1.5 degree C." *Nature Climate Change* 5:519-538.

Journal article on how particularly vulnerable countries may have more impacts projected for a global warming level of 2 degrees C. Therefore, many countries advocate limiting warming to below 1.5 degrees C, which will require a faster scale-up of mitigation action in most sectors and energy efficiency and stringent early reductions.

Rogelj, J., et al. 2015. “Paris agreement climate proposals need a boost to keep warming well below 2 degrees C.” *Nature* 534:631-639.

Journal article on the Paris climate agreement aims to hold global warming to well below 2 degrees Celsius and to “pursue efforts” to limit it to 1.5 degrees Celsius. Argues more can be achieved, because the agreement stipulates that targets for reducing greenhouse gas emissions are strengthened over time, both in ambition and scope, and that additional national, sub-national and non-state actions are required to maintain a reasonable chance of meeting the target.

Rogers, A. D., and D. A. Laffoley. 2011. *International Earth System Expert Workshop On Ocean Stresses And Impacts: Summary Report. IPSO Oxford.*

Workshop summary report examining the different effects we are having on the ocean, compromising its ability to support us. Concludes that we have underestimated the overall risks, that the whole of marine degradation is greater than the sum of its parts, and that degradation is now happening at a faster rate than predicted. The scale of the stresses on the ocean means that deferring action will increase costs in the future, leading to even greater losses of benefits.

Root, T. L., et al. 2003. “Fingerprints of global warming on wild animals and plants.” *Nature* 421:57-60.

Journal article about a meta-analysis of how species have responded to climatic changes from global warming. These studies strongly suggest that a significant impact of global warming is already discernible in animal and plant populations. The synergism of rapid temperature rise and other stresses, in particular habitat destruction, could easily disrupt the connectedness among species and lead to a reformulation of species communities, numerous extirpations, and possibly extinctions.

Roth, S. 2016. “Sally Jewell: ‘Keep it in the ground’ protests ‘naïve’.” *The Desert Sun*. Internet website: <http://desert.sn/2707PYX>.

Article on President Obama’s Interior Secretary’s response to the “keep it in the ground” movement. This movement urges the federal government to stop issuing new leases for coal, oil, and gas extraction on public lands. Jewell comments that she agrees that a shift to renewables is needed but states that it will be a slow process and is not reasonable to expect 100% renewables.

Rucker, P. 2012. “Coal export trade raises alarms for western state.” *Business and Financial News*.

Western states that rely on coal revenues are concerned that royalty payments are being undervalued by valuing at domestic prices rather than higher international rates. Coal companies skirt the higher rates by selling to sister companies, which then sell abroad.

_____. 2016. “Arch Coal asks US bankruptcy court to ease its cleanup.” *Reuters*, January 11, 2016. Internet website: <http://www.reuters.com/article/usa-arch-coal-cleanup-idUSL2N14V11520160111>

News article related to Arch Coal bankruptcy.

_____. **“US taxpayers due to subsidize Koch-controlled coal mine.” Reuters. January 12, 2016. Internet website: <http://www.reuters.com/article/usa-koch-coal-idUSL2NI4W1JJ20160112>**

Online article on the \$14 million refund from the Obama Administration to a coal company run by William Koch for closing his mine on federal land. Article discusses royalty rates of coal in detail.

S&P Global Platts. 2015. “PRB coal producers must cut production to boost prices: Analyst.” *S&P Global Platts*.

Article stating that, for coal prices to rise, production must be cut sharply in the Powder River Basin.

_____. **2016. “PRB coal stockpiles at roughly 102 days, 35 days above average: UP.” *S&P Global Platts*.**

Article about coal stockpiles being much larger than usual, due to mild weather, market forces, and other reasons.

Sanzillo, T. 2012. *The Great Giveaway: An Analysis of the United State’s Long-Term Trend of Selling Federally Owned Coal for Less than Fair Market Value*. Institute for Energy Economics and Financial Analysis. June 2012.

Report examining the coal-leasing fair market value appraisal program. Uses the limited information that is currently available on the public record. Specifics of this report are from the Powder River Basin. The report concludes that there is no evidence that the BLM receives a market price for coal.

_____. **2016. *Comments on the Department of Interior (DOI) Notice of Intent to Conduct a Programmatic Environmental Impact Statement of Federal Coal Leasing Programs*. Institute for Energy Economics and Financial Analysis, Cleveland, Ohio.**

Proposal commenting on programmatic environmental impact statement of federal coal lease program. Prepared by the Institute for Energy Economics and Financial Analysis.

Schaeffer, M., et al. 2013. *Adequacy and Feasibility of the 1.5 Degree C Long-Term Global Limit*. Climate Action Network Europe, Brussels, Belgium.

Paper examining whether the goal of limiting global warming to 1.5 degrees C is feasible or helps given socioeconomic and technical constraints.

Schleussner, C-F., et al. 2016. “Differential climate impacts for policy-relevant limits to global warming: The case of 1.5 degrees C and 2 degrees C.” *Earth System Dynamics* 7:327-351.

Journal article providing an assessment of key impacts of climate change at warming levels of 1.5 and 2 degrees C, including extreme weather events, water availability, agricultural yields, sea-level rise, and risk of coral reef loss. Results reveal substantial differences in impacts between a 1.5 and 2 degree C warming that are highly relevant for the assessment of dangerous anthropogenic interference with the climate system.

Schlissel, D. 2016. “A Sustained Coal Recovery? When You Get There, There’s No There There.” Institute for Energy Economics and Financial Analysis.

Report published by Institute for Energy Economics and Financial Analysis that contains a comprehensive overview of the coal industry as a whole, from consumption and demand to financial viability.

Schmid, M., and D. L. Parker. No date. Fire and Forest Insect Pests. Internet website: http://www.fs.fed.us/rm/pubs_rm/rm_gtr191/rm_gtr191_232_233.pdf.

Paper on how fire is used to kill bark beetle infestations in logging residual or infested trees but is rarely used to suppress extensive infestations. Forest fires predispose stands to attack by wood boring and bark beetles and create stand conditions conducive to infestations in the future.

Schulte Roth & Zabel. 2016. Labor Liabilities in Coal Bankruptcies. Schulte Roth & Zabel Washington, DC.

Presentation about labor issues in coal bankruptcies. Gives an overview of the industry and what bankruptcy is, then dives into labor issues.

Schuman, G. E., et al. 2000. Sagebrush Establishment on Mined Lands: Ecology and Research. Billings Land Reclamation Symposium, Billings, Montana.

This report discusses how restoring degraded big sagebrush communities and reducing further losses pose major challenges to landowners. It was prepared by The Wyoming Abandoned Coal Mine Land Research Program funded by the Wyoming Department of Environmental Quality, Abandoned Mine Land Division and administered by the Office of Research, University of Wyoming.

Schwartz, C. 2013. “Studies, states seek to halt mule deer population decline.” *Billings*, October 17, 2013.

Newspaper article about the decline in mule deer populations in four western US states and the efforts of those states to halt this decline.

Sheffield, P. E., and P. J. Landrigan. 2011. “Global climate change and children’s health: Threats and strategies for prevention.” *Environmental Health Perspectives* 119(3):291-298.

Journal article on how climate change is increasing the global burden of disease, primarily in children, and that further quantification of the effects of climate change on children’s health is needed globally and also at regional and local levels through enhanced monitoring of children’s environmental health and by tracking selected indicators. Climate change preparedness strategies need to be incorporated into public health programs.

Shelanski, H., and M. Obstfeld. 2015. Estimating the Benefits from Carbon Dioxide Emissions reductions. The White House. July 2, 2015.

Whitehouse summary of social cost of carbon.

Shi, G., et al. 2012. “Estimating Elasticity for residential electricity demand in China.” *The Scientific World Journal* 2012.

Article on how residential demand for electricity responds to its own price in China. Suggests potential to use the price instrument to conserve electricity consumption. The high-income group was found to be more price elastic than the low-income group, implicating a need for policy designed with an increasing block tariff.

Shindell, D. T. 2015. “The social cost of atmospheric release.” *Climatic Change* 130:313-326.

Journal article exploring the economic damages associated with a marginal change in the atmospheric release of individual pollutants owing to their effects on climate and air quality. Prior studies have provided compelling demonstrations of the importance of links between climate change and air quality valuation and of the incorporation of economics into emission metrics, but typically have not fully represented the climate impact of short-lived emissions, especially aerosols and methane.

Shoemaker, J. K., D. P. Schrag, M. J. Molina, and V. Ramanathan. 2013. “What role for short-lived climate pollutants in mitigation policy?” *Science* 342, December 13, 2013.

Article investigating the role of Short-lived climate pollutants, such as methane, in mitigation policy. The article compares and contrasts these climate pollutants to long-lived climate pollutants and incorporates them in the plan to achieve climate goals. This article suggests methane should be discouraged.

Shubert, J., et al. 1978. “Combined effects in toxicology: A rapid systematic testing procedure—cadmium, mercury, and lead.” *J. Toxicol Environ Health* 4:763-776.

Abstract from article on the combined effects of cadmium, mercury, and lead. The article looks at the toxicological response of any combination of the listed toxins. Found that, generally, a combination was synergistic.

Sierra Club, Earthjustice, Center for Biological Diversity, Powder River Basin Resource Council, Western Organization. 2014. 1004-AE23 Waste Mine Methane Capture, Use, Sale, or Destruction, Advance Notice of Proposed Rulemaking, 79 Fed. Reg. 23923 (April 29, 2014).

Comments submitted to the BLM on the Advanced Notice of Proposed Rulemaking concerning Waste Mine Methane Capture, Use, Sale, or Destruction.

Sierra Club, et al. 2015. Comments on Draft Stream Protection Rule. OSM–2010–0018. October 26, 2015.

Letter from the Sierra Club to the BLM, with comments on the Office of Surface Mining Reclamation and Enforcement’s proposed Stream Protection Rule. Urges the agency to move forward with implementation of the Stream Protection Rule.

Sierra Club, et al. 2015. Comments on Proposed ONRR Rule: Consolidated Federal Oil and Gas and Federal and Indian Coal Valuation Reform, Docket No. ONRR-2012-0004 Regulation Identifier Number: 1012-AA13. Internet website: http://www.onrr.gov/Laws_R_D/PubComm/PDFDocs/AA13/Earthjustice-Sierra%20Club.pdf.

Comments submitted on behalf of Earthjustice, Sierra Club, and 350 Colorado, regarding the Office of Natural Resource Revenue's proposed regulatory changes on the collection of royalties from coal, oil, and gas produced on public lands. It addresses the closing of an accounting loophole that in recent years has enabled coal companies to sell federal coal to their own subsidiaries, pay royalties on the initial sale, then reap windfall profits when those subsidiaries sell the same coal at a much higher price without any additional royalty.

Sierra Club, et al. 2016. Comments to Office of Surface Mining Reclamation and Enforcement on Petition to Initiate Self-Bonding Rulemaking, Docket ID: OSM-2016-0006. Internet website: https://www.sierraclub.org/sites/www.sierraclub.org/files/blog/Self-bonding%20comments%20to%20OSMRE_7-20-16.pdf.

Comments to Office of Surface Mining Reclamation and Enforcement regarding the inappropriateness of coal mines being able to self-bond, due to the high risk of insolvency within the coal mining industry, even when an applicant satisfies the financial criteria in the existing regulations.

Sierra Club. 2014. Comments on the Interagency Working Group's Technical Support Document: Social Cost of Carbon for Regulatory Impact Analysis Under Executive Order 12866 (Docket No. OMB-2013-0007-0083). Internet website: <https://fossil.energy.gov/App/DocketIndex/docket/DownloadFile/196>.

Sierra Club comments on the Interagency Working Group's Technical Support Document: Social Cost of Carbon (SCC) for Regulatory Impact Analysis Under Executive Order 12866. See 78 *Fed. Reg.* 70,586 (November 26, 2013) and 79 *Fed. Reg.* 4359 (January 27, 2014).

_____. 2016. Keep it in the Ground.

Report builds on Point of No Return, a groundbreaking 2013 investigation commissioned by Greenpeace International and undertaken by Ecofys. Using a similar approach, this updated report reflects that a number of carbon threats from the 2013 report have abated, and it assesses emerging projects and trends that put the climate and planet at risk.

Sightline Institute. 2014. Unfair Market Value. Internet website: http://www.sightline.org/research_item/unfair-market-value/.

The BLM's coal valuation practices ignore added-profit from exports. By ignoring exports, the BLM has been selling many federal coal leases at just a fraction of their true economic value. The report is updated with new information on current, past, and projected coal export forecasts.

Simmons, E., et al. 2015. Potential Climate Change Impacts and the BLM Rio Puerco Field Office's Transportation System: A Technical Report. Bureau of Land Management, Rio Puerco Field Office, Albuquerque, New Mexico.

Report presents climate change projections from 2025 to 2055. This period is centered on 2040, with 15 years of projections on either side, to smooth the data and avoid noise from year-to-year variations. Focusing on the year 2040 allows the analysis to be compatible with the planning time frames for the RPFO TTMP and the central New Mexico region's Metropolitan Transportation Plan time horizons.

Simpson, D. A. 2011. Letter to T. Sturdevant, Washington State Department of Energy. Response from BLM regarding South Hilight Coal Lease Application.

Letter from the BLM responding to Washington State Department of Energy letter stating that preparation of an Supplemental EIS for South Hilight was not warranted, because the connection of port facilities to Wyoming coal leasing was speculative.

Simpson Weather Associates. 1993. Norfolk Southern Rail Emission Study. Simpson Weather Associates, Charlottesville, Virginia.

Report on fugitive coal dust emissions from rail cars during transport and the primary concerns of lost material, thus revenue, and coal dust complaints. Results include that most coal shipments produce no measurable or visible dust and that coal loss from cars can be achieved through slope management of load top profiles and chemical binders.

Smh.com.au. 2014. Mine blast gone wrong spews toxic cloud. Internet website: <http://www.smh.com.au/environment/mine-blast-gone-wrong-spews-toxic-cloud-20140221-335rf.html>

Online article related to mine blast in Australia. The mine emitted toxic fumes of ammonium nitrate and fuel oil after a blast, which left people with sore throats. The blast comes after the company was earlier fined for a similar episode and prompted calls for stricter regulation.

Smith, J. B., et al. 2009. "Assessing dangerous climate change through an update of the Intergovernmental Panel On Climate Change (IPCC) "Reasons For Concern." *Proceedings of the National Academy of Sciences* 106(11):4133-4137.

Journal article describing revisions of the sensitivities of the reasons for concern (RFCs) identified by the IPCC to increases in global mean temperature (GMT) and a more thorough understanding of the concept of vulnerability that has evolved over the past eight years. Compared with results reported in the IPCC Third Assessment Report, smaller increases in GMT are now estimated to lead to significant or substantial consequences in the framework of the five RFCs.

SourceWatch. 2016. Internet website: www.sourcewatch.org.

Website with general information on federal coal subsidies.

_____. 2016. **The Footprint Of Coal.** Internet website: http://www.sourcewatch.org/index.php/The_footprint_of_coal#How_much_land_has_been_dist.

Website estimating nationwide figures for the number of acres disturbed in the process of mining coal. It was completed by adding the now-outdated USGS figures to more current data provided by individual states to the US Office of Surface Mining Reclamation and Enforcement, as part of the annual reporting process required by the Surface Mining Control and Reclamation Act.

Spath, P. L., et al. 1999. Life Cycle Assessment of Coal-Fired Power Production (No. NREL/TP-570- 25119). National Renewable Energy Lab., Golden, Colorado. Internet website: <http://www.nrel.gov/docs/fy99osti/25119.pdf>.

Report provides a life cycle assessment on the production of electricity from coal to examine the environmental aspects of current and future pulverized coal boiler systems. The authors found that CO₂ accounts for 98 to 99 percent by weight of the total air emissions from each system examined. Two other climate change gases, methane and nitrous oxide, are also emitted from the system. Although the global warming potential (GWP) of these gases is much higher than that of CO₂, they are emitted in much smaller quantities and therefore do not significantly change the GWP of the overall systems.

Spracklen, D., et al. 2008. "Impacts of climate change from 2000 to 2050 on wildfire activity and carbonaceous aerosol concentrations in the western United States." *Journal of Geophysical Research* 114:D20301.

Article investigating the impact of climate change on wildfires and carbonaceous aerosol concentrations in the western United States from 2000 to 2050. The article uses models to determine that climate change will increase summertime organic carbon aerosol concentrations over the western United States and the elemental carbon concentrations. These changes can be traced to an increase in wildfires and changes in meteorology.

Spross, J. 2013. Would Limiting Carbon Emissions Destroy The Economy? Think Progress. Web. October 16, 2013. Internet website: <https://thinkprogress.org/would-limiting-carbon-emissions-destroy-the-economy-ac7c36e89872#.v9pxojuxd>

Article in response to Obama asking the EPA to place limits on carbon pollution emissions from the nation's power plants. This article looks at the economics behind that decision.

Squillace, M. 2009. The Strip Mining Handbook. Internet website: <https://sites.google.com/site/stripmininghandbook/chapter-1-introduction>

This citizen's guide includes seven chapters detailing the impacts of strip mining, The Surface Mining Control and Reclamation Act of 1977, permitting, and monitoring. The intent is to inform citizens about potential impacts of mining near their home or community.

Squillace, M. 2013. The Tragic Story of the Federal Coal Leasing Program, American Bar Association Natural Resources & Environment, Winter 2013. Internet website: http://www.eenews.net/assets/2016/01/21/document_gw_05.pdf.

Report providing a history of federal coal ownership and leasing, reviewing issues related to competition and fair market value and finding significant losses to taxpayers in how coal is currently leased and sold.

_____. 2016. Testimony of Professor Mark Squillace, University of Colorado Law School before the Subcommittee on Energy and Mineral Resources of the House NRC On HR 5259, 14th Cong., 2nd Sess. 2016.

Testimony regarding how the federal coal leasing program has never worked as it was designed: as a leasing program that was intended to be managed proactively by the federal government for the vast majority of federal coal. Instead it became a reactive program, with the federal government simply responding to industry applications (many of which have only one bidder and are therefore not market value). Provides a critique of H.R. 5259 as well.

_____. No date. Reclamation Liability under the Surface Mining Control and Reclamation Act (SMCRA). The Sabin Center for Climate Change Law.

Report published by The Sabin Center for Climate Change Law and the Center on Global Energy Policy at Columbia University. Discusses many different enforcements, new initiatives, requirements, bonding, and bankruptcy.

Squillace, M., and A. Hood. 2012. NEPA, Climate Change, and Public Lands Decision-Making.

Article offers the guidance that is currently lacking in federal land management agencies and other agencies making decisions impacting natural resource systems. It begins by describing NEPA and focusing especially on those legal requirements most relevant for federal land managers and other agencies making decisions with significant impacts on natural resources. Specifically, Part II discusses the CEQ regulations pertaining to programmatic assessments and tiering, uncertainty, and mitigation; Part III then explains the unique difficulties of applying NEPA to climate change. In particular, this part notes that NEPA's cumulative impacts requirement applied literally to climate change is a seemingly impossible burden for land use decision-makers. Part III also addresses the inherent uncertainty related to climate change, how to understand that uncertainty in the context of predictive climate models, the use of adaptive management to respond to that uncertainty, and the different meanings of the terms adaptation and mitigation in the NEPA and climate change contexts. Part III concludes with the useful insights that land managers might glean from the otherwise inapplicable draft CEQ climate change guidance.

Stanford School of Earth, Energy, and Environmental Sciences. No date. OPGEE: The Oil Production Greenhouse Gas Emissions Estimator Internet website: <https://pangea.stanford.edu/researchgroups/eao/research/opgee-oil-production-greenhouse-gas-emissionsestimator>

Research summary, focusing on building tools to reduce the environmental impacts of energy systems, with an emphasis on greenhouse gas emissions from fossil energy systems. Research methods include engineering based life cycle assessment modeling and computational optimization. Targets include transportation fuels (conventional oil and oil substitutes) and carbon dioxide capture and storage.

Stephens, C., and M. Ahern. 2002. Worker and Community Health Impacts Related to Mining Operations Internationally. Mining, Minerals, and Sustainable Development. London School of Hygiene & Tropical Medicine, London, United Kingdom.

This is a review of literature on mining and health by mineral type, mining process, occupational exposures and impacts, and mining and community health impacts and policy.

Stevenson, A. 2016. Taxpayer Exposure to Bankrupt Coal.

Report examines the taxpayers' exposure to bankrupt coal. Discusses costs in short and long terms and makes suggestions for handling the industry

Stock J., et al. 2106. Federal Coal Program Reform, the Clean Power Plan, and the Interaction of Upstream and Downstream Climate Policies. Harvard Kennedy School. Internet website: http://belfercenter.hks.harvard.edu/publication/26766/federal_coal_program_reform_the_clean_power_plan_and_the_interaction_of_upstream_and_downstream_climate_policies.html.

US EPA study of the interaction between a specific upstream policy, incorporating a carbon adder into federal coal royalties, and downstream emissions regulation under the Clean Power Plan.

Stockholm Environment Institute. 2015. Supply-side climate policy: the road less taken. October 2015. Internet website: <http://www.sei-international.org/publications?pid=2835>.

Report evaluates supply-side approaches to climate policy and finds that supply-side policies, such as removal of producer subsidies, compensation of resource owners for leaving fuels unburned, and outright restrictions on resource development, could allow for greater emission reductions at the same (or lower) cost than demand-side policies, such as encouraging energy conservation.

_____. 2016. How would phasing out US federal leases for fossil fuel extraction affect CO₂ emissions and 2 C goals? May 2016. Internet website: https://www.sei-international.org/publications?pid=2937&utm_content=bufferf4b1b&utm_medium=social&utm_source=twitter.com&utm_campaign=buffer.

Report examining phasing out of federal coal leases. Concludes that this could reduce global CO₂ emissions by 100 million tonnes per year by 2030 and by greater amounts thereafter. The emissions impact would be comparable to that of other major climate policies under consideration by the Obama administration. These findings suggest that policymakers should give greater attention to measures that slow the expansion of fossil fuel supplies.

Storrow, B. 2016. Wyoming's two largest coal mines announce layoffs. Internet website: http://trib.com/business/energy/wyoming-s-two-largest-coal-mines-announce-layoffs/article_0d217a3a-5a9d-5b1d-8d0d-8a5081724bb2.html.

This article reports layoffs from the two largest coal mines in America in March 2016: Peabody Energy and Arch Coal.

_____. 2016. "The prospects for coal exports are dimming, but politics have little to do with it." *Casper Star Tribune, Casper, Wyoming.*

Article about the diminishing market for coal affecting the potential for exports.

Stratus Consulting. 2010. Potential Environmental Impacts of the Proposed CIRI Underground Coal Gasification Project, Western Cook Inlet, Alaska. January 27, 2010.

Report retained by the Center for Science in Public Participation to summarize the potential environmental risks associated with Underground Coal Gasification and Carbon Capture and Sequestration in general and the Cook Inlet Region, Inc., proposed project in particular.

_____. 2015. **Greenhouse Gas Emissions from Fossil Energy Extracted from Federal Lands and Waters: An Update Stratus Consulting, Boulder, Colorado.**

Report provides an updated analysis of the magnitude of greenhouse gas emissions currently accounted for from federal lands and waters. Produced by Stratus Consulting for The Wilderness Society.

_____. 2015. **Greenhouse Gas Emissions from Fossil Energy Extracted from Federal Lands and Waters: Final Report. Stratus Consulting, Boulder, Colorado.**

Report designed to develop a preliminary quantitative estimate of the magnitude of ultimate greenhouse gas emissions (including carbon dioxide, methane, and nitrous oxide) associated with these activities (i.e., the quantity of greenhouse gases emitted if, for example, coal mined from federal lands were combusted downstream in various applications, such as in coal-fired power plants). Also involved assembling information on the different types of indirect emissions associated with these activities (e.g., emissions from vehicles used at natural gas production sites).

Surety and Fidelity Association of America. 2016. Comments regarding Surety Bonds. July 6, 2016.

The comments discuss types of reclamation bonds allowed under SMCRA and why companies with a history of insolvency should not be allowed to self-bond.

Sustainable Systems Research, LLC. 2015. Technical Memorandum on Air Quality, Climate Change, and Environmental Justice Issues from Oakland Trade and Global Logistics Center. Prepared for Earth Justice. September 18, 2015.

Reviews potential air quality issues associated with Oakland Bulk and Oversized Terminal handling and exportation of coal. The proposed project would transport 10.5 million tons of coal from Utah to California, impacting Oakland directly. The study suggests that there will be significant health effects from the coal dust, with no found mitigation methods. Also suggested is an increase in warming caused by climate change from transporting the coal overseas.

Sutherland, A. B., and J. L. Meyer. 2007. "Effects of increased suspended sediment on growth rate and gill condition of two southern Appalachian minnows." *Environmental Biology of Fishes* 80:389-403.

Journal article on the effects of increased suspended sediment concentration (SSC) on fish growth and gill condition of two stream-dwelling minnows, which have been less studied than game fish species. Elevated SSC exposure in these minnows significantly decreases growth rates, most likely due to respiratory impairment.

Sutherland, A. B., et al. 2008. "Effects of suspended sediment on whole-body cortisol stress response of two southern Appalachian minnows, *Erimonax monachus* and *Cyprinella galactura*." *Copeia* 1:234-244.

Journal article on the effects of increased suspended sediment concentration (SSC) on whitetail shiners (*Cyprinella galactura*) and spotfin chubs (*Erimonax monachus*) and their total immunoreactive corticosteroid levels. Results demonstrated that exposure to SSCs greater than 100 mg/L can significant stress for young fish.

Svoboda, L. August 7, 2007. EPA, Denver, Colorado.

Response letter addressed to Mr. Richmond, the Forest Supervisor of Grand Mesa, Uncompaghre, and Gunnison National Forests from Larry Svoboda, the Colorado EPA director. Contains detailed comments by the EPA on the Preliminary Final EIS.

_____. October 27, 2007. EPA, Denver, Colorado.

Response letter addressed to Mr. Malecek, District Ranger of the Divide Ranger District. Contains EPA Region 8 comments on the Big Moose Vegetation Management Project on air quality, aquatic resources, and threatened and endangered species preliminary to the DEIS.

Swain, D., et al. 2013. "The extraordinary California drought of 2013/2014: Character, context, and the role of climate change." S3-S7. American Meteorological Society. Stanford, California.

Supplement to the Bulletin of the American Meteorological Society. The paper contains the results of 20 research groups that have explored 16 events that occurred in 2013. The cumulative results indicate that human-caused climate change greatly increased the risk for extreme heat waves assessed in the report. Also investigates human influence on droughts, heavy rain, and storms.

_____. 2013. **Federal Coal Leasing: Fair Market Value and a Fair Return for the American Taxpayer.** September 18, 2013. Internet website: <http://www.taxpayer.net/library/article/federal-coal-leasing-fair-market-value-and-a-fair-return-for-the-american-t>.

Report states that the lease-by-application system does not obtain fair market value for federal coal. The report recommends a reevaluation of the lease-by-application system, as well as other reforms, to ensure a fair return for taxpayers.

Sweetwater County. 2002. Sweetwater County Comprehensive Plan. Sweetwater County, Wyoming.

This plan updates and consolidates the 1977 Sweetwater County Land Use Plan, clarifies and reconfirms the county's land use and development objectives, and identifies specific implementation strategies for pursuing county-selected priorities.

Synapse Energy Economics. 2012. Comparing the Hidden Costs of Power Generation Fuels. Cambridge, Massachusetts.

This report discusses indirect and external costs associated with power generation.

Terhorst, J., and M. Berkman. 2010. Effect of Coal-Fired Power Generation on Visibility in a Nearby National Park. Berkeley Economic Consulting, Berkeley, California, and Department of Mathematics, San Francisco State University, San Francisco, California.

Paper examines coal power and air quality. Finding has important implications for the methods generally employed to attribute visibility reductions to air pollution sources.

Thakar, N., and M. Madowitz. 2014. Federal Coal Leasing in the Powder River Basin A Bad Deal for Taxpayers. Center for American Progress. June 2014.

This article states that that Powder River Basin coal is a major contributor to US climate change and carbon pollution and discusses the costs taxpayers pay for burning this coal. This article examines the social costs of burning coal, finding it to exceed the market price of coal, leaving a negative net social benefit. The article concludes that in its current form the federal coal-leasing program in the Powder River Basin is a bad deal for taxpayers, highlighting problems such as subsidizes and a lack of a plan for change.

The Global Commission. 2016. Internet website. <http://newclimateeconomy.report/>

Website offering details on the members of the Global Commission on the Economy and Climate. Provides a quick glance into those that have a hand in the New Climate Economy Project.

The Mountain Pact. 2016. How Federal Coal Reform Could Help Mountain Communities Mitigate the Costs of Climate Change. The Mountain Pact.

Report with data and background on the effects that climate change could have on the world. It uses an economic lense send the effects that coal reform could have on changing climate

The New York Times. 2016. "Global Temperatures Are on Course for Another Record This Year" Internet website: http://www.nytimes.com/2016/07/20/science/nasa-global-temperatures-2016.html?_r=1.

Online article on the trends of weather patterns across the United States and a summary of statement from Dr. Gavin A. Schmidt.

The Pew Charitable Trusts. 2016. The Economic Value of Quiet Recreation on BLM Lands. Internet website: http://www.pewtrusts.org/~media/assets/2016/03/wli_national_quietrec_final.pdf?la=en.

This is a factsheet detailing the value of recreation on BLM-administered lands.

The Wilderness Society. 2014. Greenhouse Gas Emissions from Fossil Fuel Energy Extracted from Federal Lands and Waters: An Update. Washington, DC.

This report includes a preliminary estimate of the magnitude of ultimate GHG emissions associated with fossil fuels from 2008 to 2010.

Thomas, C. D., et al. 2004. "Extinction risk from climate change." *Nature* 427:145-148.

Journal article assessing extinction risks for sample regions that cover some 20 percent of the Earth's terrestrial surface. Estimates show the importance of rapid implementation of technologies to decrease greenhouse gas emissions and strategies for carbon sequestration.

Tilman, D. 2000. "Causes, consequences and ethics of biodiversity." *Nature* 405:208-211.

Overview of biodiversity. Focuses on the effects of biodiversity on an ecosystem, effectiveness of strategies to preserve biodiversity, and ethics involved. Concludes that biodiversity should be faced with a more scientific approach.

Tran, K. T. 2012. AERMOD Modeling of Air Quality Impacts of the Proposed Morrow Pacific Project. AMI International, Henderson, Nevada.

Report presenting the results of modeling analysis of air quality impacts of the proposed Morrow Pacific Project in Oregon. The Sierra Club asked AMI Environmental to conduct an air quality modeling analysis, using the regulatory dispersion model AERMOD, to predict project impacts of criteria pollutants, such as nitrogen dioxide (NO₂), sulfur dioxide (SO₂), and fine particulates (PM_{2.5}).

Tsoar, H., and K. Pye. 1987. "Dust transport and the question of desert loess formation." *Sedimentology* 34:139-153.

Paper details the variables of dust formation and how human activities can influence them.

Uinta County. 2011. Uinta County Comprehensive Plan. Uinta County, Wyoming.

This plan updates and replaces existing Uinta County comprehensive plans and reconfirms the county's land use and development goals and policies.

Union of Concerned Scientists. 2011. Climate Change and Your Health—Rising Temperatures, Worsening Ozone Pollution. Union of Concerned Scientists, Cambridge, Massachusetts.

Report on the adverse effects on ground-level ozone pollution, which can exacerbate lung diseases, such as asthma, and how climate change and higher global temperatures have the potential to increase ozone pollution and increase respiratory symptoms, hospital visits for the young and old, lost school days, and premature mortality for most of those in the continental United States.

_____. 2012. Climate Change and Your Health—After The Storm: The Hidden Health Risks of Flooding in a Warming World. Union of Concerned Scientists, Cambridge, Massachusetts.

Report on the deadly and expensive effects of floods, the aftermath of which results in over half of all waterborne disease outbreaks, and how climate change with the potential for extreme rainfall has the potential for significant impacts on human health and property.

_____. No date. Internet website:

http://www.ucsusa.org/clean_energy/coalswind/c01.html#_V_fWLegrLcs.

Website on coal, with links to information on air pollution, waste generated, fuel supply, and water use. Interactive site allows readers to expand on topics.

United Nations. 2009. Report of the Conference of the Parties on Its Fifteenth Session, Held in Copenhagen from December 7 to 19, 2009. United Nations Framework Convention on Climate Change, Copenhagen, Denmark.

Report on the 2009 Copenhagen Accord, which focused on the challenge of climate change and the deep cuts that will be needed in global greenhouse gas emissions so as to hold the increase in global temperature below 2 degrees Celsius and take action to meet this objective consistent with science and equity.

United Nations Environment Programme. 2010. Report of the Conference of the Parties on Its Sixteenth Session, Held in Cancun from November 29 to December 10, 2010. United Nations Framework Convention on Climate Change, Cancun, Mexico.

Report on the 2011 Cancun Agreement, which affirmed that climate change is one of the greatest challenges of our time and reaffirms that deep cuts in global greenhouse gas emissions are required, according to science. Aims to reduce global greenhouse gas emissions to hold the increase in global average temperature below 2 degrees Celsius, above pre-Industrial levels. States that the urgent action to meet this long-term goal should be consistent with science and equity.

_____. 2010. Environmental Consequences of Ocean Acidification: A Threat to Food Security. United Nations Environment Programme, Nairobi, Kenya.

Report on how increased carbon dioxide from the burning of fossil fuels and other human activities is altering the chemistry of ocean surfaces and causing them to become more acidic, thereby reducing carbonate ion concentrations. This change makes it difficult for certain organisms to make shells and reef systems that other fish and marine animals depend on, with the likely result that entire marine systems could be significantly impacted, including the humans who depend on them for sustenance.

_____. 2015. The Emissions Gap Report 2015: A UNEP Synthesis Report. United Nations Environment Programme, Nairobi, Kenya.

Report providing a scientific assessment of the mitigation contributions from the submitted Intended Nationally Determined Contributions from the Paris Agreement. Report compares the resulting emission levels in 2030 with what science tells us is required to be on track toward the agreed on target of a global average temperature increase, below 2 degrees Celsius by 2100.

_____. 2015. Conference of the Parties Twenty-First Session, Paris, November 30 to December 11, 2015, Adoption of the Paris Agreement. United Nations Framework Convention on Climate Change, Paris, France.

Report on the 2015 Paris Agreement that provides a framework for participating parties to deal with climate change. This is an urgent and potentially irreversible threat to human societies and the planet and thus requires the widest possible cooperation by all countries and their participation in an effective and appropriate international response. This agreement is intended to accelerate the reduction of global greenhouse gas emissions, while acknowledging that climate change is a common concern of humankind. Actions to deal with climate change should respect, promote, and consider respective obligations on human rights, the right to health, and the rights of indigenous peoples.

_____. 2015. Intended Nationally Determined Contributions. Internet website: http://unfccc.int/focus/indc_portal/items/8766.php.

This is a database of nationally determined contributions submitted under the Paris Agreement.

_____. 2015. Subsidiary Body for Scientific and Technological Advice Forty-Second Session, June 1 to 11, 2015. Report on the Structured Expert Dialogue on the 2013–2015 Review. United Nations Framework Convention on Climate Change, Bonn, Switzerland.

Report summarizing the face-to-face dialogue between over 70 experts and parties on the adequacy of the long-term global goal, in light of the ultimate objective of the convention, and the overall progress made toward achieving the long-term global goal. The goal includes a consideration of the commitments under the convention and a technical summary and compilation of the reports on the four sessions of the structured expert dialogue.

US Bankruptcy Court. 2016. Notice of Filing of Executed Agreements Comprising Resolution of Reclamation Obligations for Alpha Natural Resources, Inc.

Notice from bankruptcy court for Alpha Natural Resources settlement with Office of Surface Mining Reclamation and Enforcement for water treatment and reclamation costs.

US Bureau of Labor Statistics. 2016. Quarterly census of employment and wages, private, NAICS 2121 coal mining, all counties in Wyoming. Internet website: http://data.bls.gov/cew/apps/table_maker/v4/table_maker.htm#type=2&st=56&year=2013&qtr=A&own=5&ind=2121&supp=0.

This website is a query of US Bureau of Labor Statistics employment and wage data. Data reflects the 2013 annual average wages of coal mining jobs in Wyoming of \$82,654.

US Census Bureau. 2016. Country Business Patterns (CBP). Internet website: <http://www.census.gov/programs-surveys/cbp.html>.

Website for the US Census Bureau, Country Business Patterns (CBP), an annual series that provides subnational economic data by industry. This series includes the number of establishments, employment during the week of March 12, first quarter payroll, and annual payroll.

US Climate Change Science Program. 2006. Methane as a Greenhouse Gas. Climate Change Program Office, Washington DC.

Report on the role of methane as a greenhouse gas, including a summary of human-influenced sources of methane, such as landfills, natural gas and petroleum production and distribution systems, agricultural activities, coal mining, stationary and mobile combustion, wastewater treatment, and certain industrial processes. About 60 percent of global methane emissions come from these sources, and the rest are from natural sources.

US Congress. 1920. Mineral Leasing Act. US Congress, Washington, DC.

The official Mineral Leasing Act, which pertains to mineral resources owned by the United States.

_____. 1984. Environmental Protection in the Coal Leasing Program. US Congress, Washington, DC.

Report responds to a request by the House and Senate Committees on Appropriations, as mandated in the Conference Committee Report on the Department of the Interior and Related Agencies Appropriations Bill for fiscal year 1984. It assesses the ability of the federal coal leasing program to ensure the development of leases in an environmentally compatible manner. This study builds on earlier OTA reports: *An Assessment of the Development and Production Potential of Federal Coal Leases* and *The Direct Use of Coal*. It will contribute to future work on surface mine reclamation.

The assessment addresses the recent controversy surrounding the implementation of the environmental protection aspects of the federal coal leasing program. It discusses the adequacy of the regulatory provisions of the program to ensure the environmental compatibility of federal lease tracts, including the 1982 changes in program policy and regulations. The BLM's implementation of the leasing program legislation and regulations is evaluated, with emphasis on the adequacy of data and analyses to support land use planning and environmental impact assessment. The report assesses the characteristics of tracts proposed for leasing since 1979, to determine whether any of those tracts will be particularly difficult to develop under current environmental laws and regulations. It also assesses the potential for cumulative environmental impacts on the development of several lease tracts in one area. Finally, the report presents policy options that Congress could consider that seek to restore predictability and stability to the leasing program.

US Council of Economic Advisors. 2016. The Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to Taxpayers. US Council of Economic Advisors, Washington, DC.

This report focuses on whether the federal coal leasing program provides a fair return to the taxpayer and draws on relevant academic research to provide an economic perspective. A review of the coal leasing program indicates that the program has been structured in a way that misaligns incentives, going back decades, resulting in a distorted coal market with an artificially low price for most federal coal and unnecessarily low government revenue from the leasing program. This report examines the market implications of changing royalty rates.

US Court of Appeals of the District of Columbia. 1931. *United States ex rel. McLennan v. Wilbur*, 283 US 414. May 1931. Internet website: https://scholar.google.com/scholar_case?case=14937211614653028640&hl=en&as_sdt=6&as_vis=1&oi=scholar.

Certiorari to the Court of Appeals of the District of Columbia. Court opinion of the Act of Congress approved February 25, 1920, 41 Stat. 437, intended to promote certain mining operations.

_____. Declaration of Christopher B. Field. USCA Case #15-1363 Document #1586661 Filed: December 3, 2015.

Declares that, with continuing climate change, the world faces increasing risks of impacts. States that any delay in reducing emissions adds risk of impacts. This declaration summarizes knowledge about three categories of risk.

_____. Declaration of Thomas Michael Power. USCA Case #1:11-cv-01481-RJL Document #38-7 Filed: December 13, 2012.

United States Court of Appeals Declaration of Natural Resource Economics specialist Thomas Power declares that decisions with the Powder River Basin will have significant impacts on American coal markets. Discusses prices and the Belle Ayr North and Caballo West coal tracts.

US Department of Agriculture, Forest Service. 2012. Rulemaking for Colorado Roadless Areas Supplemental Final Environmental Impact Statement. Internet website: http://www.fs.usda.gov/Internet/FSE_DOCUMENTS/stelprdb5365953.pdf.

FEIS prepared by the USFS to promulgate a state-specific rule to manage and conserve roadless area characteristics on approximately 4.2 million acres of National Forest System lands in Colorado. The proposal responds to a recognized need to balance local, state, and national interests in providing management direction for Colorado roadless areas.

_____. 2014. Pawnee National Grassland Oil and Gas Leasing Analysis Final Environmental Impact Statement. USDA Forest Service, Rocky Mountain Region.

This final environmental impact statement (FEIS) has been prepared to document and disclose the estimated environmental impacts of a decision to make available and apply lease stipulations to National Forest System lands in the Pawnee National Grassland. The FEIS analyzes the potential impacts of the Forest-wide land availability determination by using a reasonable foreseeable development scenario. The FEIS also proposes lease stipulations and identifies where those stipulations would be applied on future leases when needed on administratively available lands.

_____. 2015. Rulemaking for Colorado Roadless Areas Supplemental Draft Environmental Impact Statement. US Department of Agriculture, Forest Service, Colorado National Forests, Denver, Colorado.

Supplemental draft EIS about the proposal to reinstate the North Fork Coal Mining Area (NFCMA) exception of the Colorado Roadless Rule (CRR) on approximately 19,700 acres in the Grand Mesa, Uncompahgre, and Gunnison National Forests. The proposal is a response to deficiencies outlined in a court case. This draft EIS supplements the 2012 final EIS for the CRR with additional analyses. Alternative A is the No Action Alternative; Alternative B is the proposed action and would reinstate the NFCMA exception, allowing temporary road construction for coal mining. Alternative C would establish the NFCMA but would exclude lands identified as “wilderness capable.”

_____. 2016. Forests to Faucets. Internet website: http://www.fs.fed.us/ecosystems/services/FS_Efforts/forests2faucets.shtml.

Website from the Forest Service using GIS to model and map the continental United States land areas most important to surface drinking water, the role forests play in protecting these areas, and the extent to which these forests are threatened by development, insects and disease, and wildfire.

US Department of Commerce, Bureau of Economic Analysis. 2016. Regional Economic Accounts. Internet website: <http://www.bea.gov/regional/>.

The regional economic accounts talks about the geographic distribution of US economic activity and growth. The estimates of gross domestic product by state and state and local area personal income, and the accompanying detail, provide a consistent framework for analyzing and comparing individual state and local area economies.

US Department of Energy. 2014. Addendum to Environmental Review Documents Concerning Exports of Natural Gas. August 2014. Internet website: <http://energy.gov/fe/addendum-environmental-review-documents-concerning-exports-natural-gas-united-states>.

Reviews the potential environmental impacts of natural gas production, particularly the hydraulic fracturing of shale formations. Finds that the current rapid development of unconventional natural gas resources will likely continue, with or without the export of natural gas. This is a review of the literature and provides information on the resource areas potentially impacted by unconventional gas production (greenhouse gases).

_____. 2014. **Life Cycle Greenhouse Gas Perspective on Exporting Liquefied Natural Gas.** Internet website: <http://energy.gov/fe/downloads/life-cycle-greenhouse-gas-perspective-exporting-liquefied-natural-gas-united-states>.

This analysis determines that the use of US liquefied natural gas exports for power production in European and Asian markets will not increase greenhouse gas emissions, on a life cycle perspective, when compared to regional coal extraction and consumption for power production. Given the uncertainty in the underlying model data, it is not clear if there are any significant differences between the corresponding European and Asian cases, other than the liquefied natural gas transport distance from the United States and the pipeline distance from Russia. Differences between the US liquefied natural gas, regional liquefied natural gas, and Russian natural gas options are also indeterminate, so no significant change in net climate impact is anticipated from any of these scenarios.

US Department of Energy, Energy Information Administration. 2012. Annual Energy Review 2011. US Energy Information Administration, Washington, DC.

This annual report summarizes statistics on energy production, consumption, trade, stocks, and prices covering all major energy commodities.

_____. 2012. **Fuel Competition in Power Generation and Elasticities of Substitution. US Energy Information Administration, Washington, DC.**

Report analyzing the competition between coal, natural gas, and petroleum used for electricity generation, by estimating what economists refer to as the elasticity of substitution among the fuels. The elasticity of substitution concept measures how the use of these fuels varies, as their relative prices change.

_____. 2013. **Future power market shares of coal, natural gas generators depend on relative fuel prices.** Internet website: <http://www.eia.gov/todayinenergy/detail.php?id=10951>.

Website discusses how natural gas competed more effectively with coal as a fuel for electricity generation, as the cost of operating natural gas-fired generators fell below the cost of operating coal-fired generators in some regions. Includes graphs and diagrams to illustrate the ratio of fuel costs for power generation, including by region, and US electrical generation by fuel, for selected cases.

_____. 2015. **Annual Energy Outlook with Projections to 2040. DOE/EIA-0383(2015). EIA. Washington, DC.**

Document offering energy projections up until 2040. Intended as a starting point for analysis of potential changes in US energy policies, rules, and regulations. Provides conclusions about the direction of US energy.

_____. 2015. **Sales of Fossil Fuels Produced from Federal and Indian Lands, FY 2003 Through FY 2014. US Energy Information Administration, Washington, DC.**

Summary report concludes that fossil fuel production on federal lands decreased by 24 trillion BTUs and increased by 52 trillion BTUs on Indian lands.

_____. **2015. Short-Term Energy Outlook (STEO). US Energy Information Administration, Washington, DC.**

Overview of the short-term energy outlook for the United States, including prices, production, and inventories.

_____. **2015. Annual Coal Report 2013. US Energy Information Administration, Washington, DC.**

The Annual Coal Report provides information about US coal production, number of mines, productive capacity, recoverable reserves, employment, productivity, consumption, stocks, and prices to a wide audience, including Congress, federal and state agencies, the coal industry, and the general public.

_____. **2015. Scheduled 2015 capacity additions mostly wind and natural gas; retirements mostly coal. Internet website: <http://www.eia.gov/todayinenergy/detail.php?id=20292>.**

Website discusses the addition of wind and natural gas and the decline of coal in 2015. Includes graphs and diagrams to demonstrate energy usage and types, as well as a map showing plans for types of energy production in the United States in 2015.

_____. **2016. Average utilization for natural gas combined-cycle plants exceeded coal plants in 2015. Internet website: <http://www.eia.gov/todayinenergy/detail.php?id=25652>.**

Website discusses how 2015 was the first year that average capacity factor for natural gas combined-cycle plants exceeded that of coal steam plants. Includes graphs to illustrate 2005-2015 annual average capacity factor and distribution of annual capacity factor for coal steam and natural gas generators.

_____. **2016. Annual Energy Outlook 2016 Early Release: Annotated Summary of Two Cases. EIA, Washington, DC.**

Annual energy outlook for US energy, with overview of different energy sources and summaries of two cases: electricity and natural gas petroleum.

_____. **2016. Annual Energy Outlook 2016, Coal Production: Northern Appalachia. Internet website: https://www.eia.gov/forecasts/aeo/data/browser/#/?id=95-AEO2016&cases=ref2016~ref_no_cpp&sourcekey=0.**

Report includes a graph and table of annual coal production projections from northern Appalachia through 2040.

_____. **2016. Annual Energy Outlook 2016, Total Energy Supply, Disposition, and Price Summary. website: Internet website: https://www.eia.gov/forecasts/aeo/data/browser/#/?id=96-AEO2016@ion=0-0&cases=ref2016~ref_ref_no_cpp-d032316a.16-96-**

This website contains a graph of total energy production of crude oil and lease condensate projects through 2040.

_____. 2016. Internet website: <https://www.eia.gov/tools/faqs/faq.cfm?id=427&t=3>.

Website with information on US energy generation, based on source.

_____. 2016. Internet website: <http://www.eia.gov/electricity/>.

Table of data on electricity usage in the United States.

_____. 2016. **Annual Energy Outlook 2016 with projections to 2040. US EIA, Office of Energy Analysis, Washington, DC.**

This report presents long-term projects of energy supply, demand, and prices through 2040.

_____. 2016. **Quarterly coal production lowest since the early 1980s. Internet website: <http://www.eia.gov/todayinenergy/detail.php?id=26612>.**

Article discussing coal production in recent quarters and showing that the first quarter of 2016 had the lowest coal production since the 1980s.

_____. 2016. **Form EIA-923 detailed data. Internet website: <https://www.eia.gov/electricity/data/eia923/>.**

Survey Form EIA-923 collects detailed electric power data, monthly and annually, on electricity generation, fuel consumption, fossil fuel stocks, and receipts at the power plant and prime mover level. Data available for download.

_____. 2016. **Coal made up more than 80% of retired electricity generating capacity in 2015. Internet website: <http://www.eia.gov/todayinenergy/detail.php?id=25272>.**

Website discusses the electrical generating capacity retired in 2015 by fuel technology. Includes graphs and diagrams to illustrate retired energy generating capacity, existing coal units by operating year and coal unit range and capacity, and coal plant operating status in selected states.

_____. 2016. Internet website: <http://www.eia.gov/coal/markets/>.

Website with information on coal markets in the United States. The Coal Markets Report summarizes average weekly coal commodity spot prices by coal regions in the United States.

_____. 2016. Internet website: <http://www.eia.gov/electricity/monthly/update/archive/may2016/>.

Website with updates on the state of electricity in the United States.

_____. 2016. **Carbon Dioxide Emissions Coefficients. US Energy Information Administration, Washington, DC.**

This is a datasheet of carbon coefficients by volume and mass across different factors.

_____. 2016. **Primary Energy Consumption by Source. Monthly Energy Review. Washington, DC.**

This datasheet shows the consumption of fossil fuels and renewable energy by year.

_____. 2016. **Annual Coal Distribution Report 2014. US Energy Information Administration, Washington, DC.**

The report provides detailed information on domestic coal distribution by origin state, destination state, consumer category, and method of transportation. Also provided is a summary of foreign coal distribution by coal-producing state.

_____. 2016. **Internet website: <http://www.eia.gov/coal/production/quarterly/>.**

Website with a quarterly coal report that contains information and graphs on coal production, importation, exportation, and type of export.

_____. 2016. **Internet website: <http://www.eia.gov/todayinenergy/detail.cfm?id=24472>.**

Website with information on coal production and prices decline in 2015. Contains graphs with additional information on regional production.

_____. 2016. **Internet website: <http://www.eia.gov/todayinenergy/detail.cfm?id=26612>.**

Website with information that quarterly coal production is the lowest since the early 1980s. This is mainly due to challenging market conditions. Contains graphs with information.

_____. 2016. **Internet website: <https://www.eia.gov/forecasts/steo/report/coal.cfm>.**

Short-term energy outlook, with information on coal in the United States.

_____. 2016. **Internet website: <https://www.eia.gov/tools/faqs/faq.cfm?id=427&t=3>.**

FAQ sheet for energy generation by energy source in the United States.

_____. 2016. **Internet website: <http://www.eia.gov/todayinenergy/detail.cfm?id=26012>.**

Information that power sector coal demand has fallen in nearly every state since 2007, with maps and graphs that contain additional information.

US Department of Health and Human Services. 2007. Public Health Statement Lead. CAS#: 7439-92-1. ATSDR. Agency for Toxic Substances. Atlanta, Georgia.

Public health statement with summary chapter from the Toxicological Profile for Lead. Provides information on lead and the effects of exposure to it. Distinguishes between primary and secondary lead and what happens when it enters the environment and the body.

_____. 2010. **Births, Marriages, Divorces, and Deaths: Provisional Data for 2009. NVSS. United States.**

Statistic report on births, marriages, divorces, and deaths for 2009 in the United States in table format.

US Department of the Interior. 2015. 9 animals that are feeling the impacts of climate change. Internet website: <https://www.doi.gov/blog/9-animals-are-feeling-impacts-climate-change>.

This report details how nine specific species are feeling climate change impacts.

_____. **2015. Internet website: <https://www.doi.gov/pmb/ocean/highlights/sealevelrisecost>.**

US Department of the Interior website from its “Policy Management and Budget, Conservation, External News” section. Includes information on the ocean, Great Lakes, and coastal activities. Website provides a teaser on a \$40 billion of National Parks Service assets at risk from climate change. Also includes image of climate change-caused destruction and an external link for more information.

_____. **2016. Secretary Jewell Launches Comprehensive Review of Federal Coal Program. Internet website: <https://www.doi.gov/pressreleases/secretary-jewell-launches-comprehensive-review-federal-coal-program>.**

This press release discusses a pause on new coal leasing while review is underway, additional transparency, and good government initiatives to modernize the program.

US Department of the Interior, Bureau of Land Management. 1969. Planning for Fluid Mineral Resources. Bureau of Land management, Washington, DC.

This handbook provides detailed instructions for complying with the fluid minerals supplemental program guidance for resource management planning, as prescribed in BLM Manual Section 1624.2. It contains, among other things, procedural guidance for analyzing and documenting reasonably foreseeable fluid mineral development and the impacts of such development on the human environment.

_____. **2008. Manual 6840 – Special Status Species Management. US Department of the Interior, Bureau of Land Management, Washington, DC.**

BLM manual to provide policy and guidance for the conservation of BLM special status species and the ecosystems BLM-administered lands that they depend on. BLM special status species are those listed or proposed for listing under the Endangered Species Act (ESA) and those requiring special management consideration to promote their conservation and reduce the likelihood and need for future listing under the ESA, which are designated as BLM sensitive by the BLM state directors. All federal candidate species, proposed species, and delisted species in the five years following delisting will be conserved as BLM sensitive species.

_____. **2009. West Antelope II Coal Lease Application Final EIS Volume I. Internet website: <http://www.blm.gov/style/medialib/blm/wy/information/NEPA/cfodocs/westantelope/feis.Par.7431.File.dat/vol1.pdf>.**

FEIS prepared by the BLM to document and disclose the results of an environmental analysis for the leasing of a tract of federal coal, the West Antelope II tract, to the Antelope Mine in the Wyoming Powder River Basin.

_____. **2010. Record of Decision for the Belle Ayr North Lease by Application. Department of the Interior, Bureau of Land Management, Washington, DC.**

Record of Decision opens the tract for competitive sale so the coal can be sold on the market.

_____. **2011. Record of Decision Environmental Impact Statement for the North Porcupine Coal Lease Application. Department of the Interior, Bureau of Land Management, Washington, DC.**

The decision is that it is in the public interest to offer the North Porcupine LBA tract, as described below, for competitive sale. This is so that these reserves will be available for sale in the competitive open coal market, so as to meet the national coal demand that is expected to exist until at least 2035.

_____. **2011. Record of Decision Environmental Impact Statement for the South Porcupine Coal Lease Application. Department of the Interior, Bureau of Land Management, Washington, DC.**

The decision is that it is in the public interest to offer the South Porcupine LBA tract as described below, for competitive sale. This is so that these reserves will be available for sale in the competitive open coal market, so as to meet the national coal demand that is expected to exist until at least 2035.

_____. **2011. Record of Decision for the South Hilight Field Coal Lease Application. Department of the Interior, Bureau of Land Management, Washington, DC.**

The decision is to open the tract for competitive sale, so the coal can be sold on the market.

_____. **2011. Alton Coal Tract Lease by Application Draft Environmental Impact Statement. Internet website: http://www.blm.gov/style/medialib/blm/ut/lands_and_minerals/coal/alton_coal_project.Par.59867.File.dat/Combined%20Alton%20DEIS.pdf.**

DEIS prepared by the BLM to document and disclose the results of an environmental analysis for the leasing of a tract of federal coal, the Alton Coal Tract, in Utah.

_____. **2013. Bureau of Land Management Socioeconomics Strategic Plan 2012–2022. BLM/WO/GI-13/010+1131. Division of Decision Support, Planning, and NEPA, Washington, DC.**

BLM socioeconomics strategic plan addresses the changing emphasis from natural resources to social and economic focus and provides a roadmap to guide the BLM's socioeconomics program now and for the next 10 years.

_____. **2014. Waste Mine Methane Capture, Use, Sale, or Destruction; Advanced Notice of Proposed rulemaking. US Department of the Interior, Washington DC. *Federal Register* 79(82):23887-24310.**

Rulemaking notice from the BLM requests comments and suggestions that might assist in the establishment of a program to capture, use, or destroy waste mine methane that is released into the mine environment and the atmosphere as a direct consequence of underground mining on federal leases for coal and other minerals.

_____. 2014. Climate Change Adaptation Plan. Office of Policy Analysis and Climate Change Working Group. Washington, DC.

This report details the Department of the Interior's response to climate change and adaptation policy. It is a summary document prepared by the DOI. Highlights the challenges posed by climate change and provides an important update to the Department of the Interior's efforts to identify priorities that are necessary to construct a comprehensive framework that meets this challenge head on.

_____. 2014. Gunnison Sage-Grouse Habitat Management Policy on Bureau of Land Management-Administered Lands in Colorado and Utah. Department of the Interior, Bureau of Land Management, Washington, DC.

This memorandum provides interim guidance for protecting important habitat across the range of the Gunnison sage-grouse. The Bureau of Land Management will continue to apply conservation measures to manage and conserve Gunnison sage-grouse and their habitat.

_____. 2015. Environmental Assessment for the Little Willow Creek Protective Oil and Gas Leasing. Department of the Interior-BLM-ID-B010-2014-0036-EA. February 10, 2015.

The purpose of this proposal is to protect the federal mineral resource from uncompensated drainage and surface resources from potential damage, in and near Willow Field, Payette County, Idaho.

_____. 2015. Letter to Governor Hickenlooper re: Royalty Reduction Rate for Oxbow Mine. Elk Mountain Mine. December 4, 2015.

Letter requesting a royalty rate reduction for the Oxbow Mine.

**_____. 2015. Total Federal Coal Leases in Effect, Total Acres Under Lease, and Lease Sales by Fiscal Year Since 1990. Internet website:
http://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy/coal_lease_table.html.**

Website providing information about the number of total federal coal leases in effect, total acres under lease, and the number of lease sales at the end of each fiscal year since 1990.

_____. 2015. Authorization to Pay Advance Royalty in Lieu of Continued Operation Granted. April 28, 2015.

Letter notifying that request to pay advanced royalty in lieu of continued operation is approved.

_____. 2016. Regulatory Impact Analysis for Revisions to 43 CFR, Part 3100 (Onshore Oil and Gas Leasing) and 43 CFR, Part 3600 (Onshore Oil and Gas Operations), Additions of 43 CFR, Part 3178 (Royalty-Free Use of Lease Production) and 43 CFR, Part 3179 (Waste Prevention and Resource Conservation). January 2016.

Analysis examining the regulatory impacts of the BLM proposed rulemaking to update 43 CFR, Parts 3100 and 3160 and to propose new regulations at 43 CFR, Chapter II, Parts 3178 and 3179. The 43 CFR, Part 3610, proposed rule would require an application permit to drill for a new oil well, in order to minimize the waste of natural gas from the planned well to the degree reasonably possible. Part 3179 would modify the requirements that limit the venting and flaring of produced natural gas.

_____. 2016. **Waste Prevention, Production Subject to Royalties, and Resource Conservation.** US DOI, Washington, DC. *Federal Register* 81(25):6616-6686.

Federal Register notice detailing new BLM proposed regulations to reduce waste of natural gas from venting, flaring, and leaks during oil and natural gas production on onshore federal and Indian leases. The regulations would also clarify when produced gas lost through venting, flaring, or leaks is subject to royalties and when oil and gas production used on site would be royalty free.

_____. 2016. Internet website: http://www.blm.gov/style/medialib/blm/wo/Communications_Directorate/public_affairs/news_release_attachments.Par.98291.File.dat/Questions%20and%20Answers%20Coal.pdf.

Website with a question and answer format pertaining to federal coal reforms.

_____. 2016. Internet website: http://www.blm.gov/style/medialib/blm/wo/Communications_Directorate/public_affairs/news_release_attachments.Par.47489.File.dat/Coal%20Reform%20Fact%20Sheet%20Final.pdf.

Fact sheet for coal reform in the United States.

_____. 2016. **Programmatic Environmental Impact Statement on Federal Coal Program.** Internet website: http://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy/details_on_coal_peis.html.

Details some information on the programmatic environmental impact statement review process, including project details and public scoping meeting details.

_____. 2016. Internet website: http://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy.html.

Website with overview of the BLM's coal operations.

_____. 2016. **Coal Operations.** Internet website: http://www.blm.gov/wo/st/en/prog/energy/coal_and_non-energy.html.

Summarizes federal coal operationals, including how the government receives a return.

_____. 2016. **Notice of Intent to Prepare a Programmatic Environmental Impact Statement to Review the Federal Coal Program and to Conduct Public Scoping Meetings.** BLM, Washington, DC. *Federal Register* 81(61):17720.

This describes the program and informs the public that the BLM will be conducting public scoping meetings.

US Department of the Interior, Bureau of Reclamation. 2016. Reclamation: SECURE Water Act Section 9503(c) - Reclamation Climate Change and Water.

Report to Congress on anticipated impacts on water resources from climate change and adaptation strategies. It includes a summary of hydrology, climate, impacts on water supply and demand, and climate monitoring for the eight major Reclamation river basins of the west.

US Department of Interior, Fish and Wildlife Service. 1987. Endangered and Threatened Wildlife and Plants; Determination of Threatened Species Status for the Blackside Dace. Department of the Interior, US Fish and Wildlife Service, Washington, DC. Federal Register 52(113):22580-22585. Asheville, North Carolina.

Federal Register notice for the US Fish and Wildlife Service, publishing a determination of threatened status for the blackside dace.

_____. **1996. Formal Section 7 Biological Opinion and Conference Report on Surface Coal Mining and Reclamation Operations under the Surface Mining Control and Reclamation Act of 1977. US Fish and Wildlife Service, Washington, DC.**

Formal consultation between the Office of Surface Mining and Reclamation and the US Fish and Wildlife Service. ESA Section 7 biological opinion on the proposed action to approve and conduct surface coal mining and reclamation under state and federal regulatory programs adopted pursuant to Surface Mining Control and Reclamation Act of 1977, P.L. 95-87, where such operations may adversely affect threatened or endangered species. As of June 1, 1996, 308 species listed as threatened or endangered occur in states with primacy, and 337 listed species occur in states with federal regulatory programs. Surface coal mining and reclamation could impact only a subset of these species.

_____. **2011. Endangered Status for Five Southeastern Fish Species. Internet Website: <https://www.fws.gov/southeast/news/2011/11-054.html>.**

This news release announces that the Cumberland darter, rush darter, yellowcheek darter, chucky madtom, and laurel dace are now federally listed as endangered species throughout their respective ranges.

_____. **2012. Endangered and Threatened Wildlife and Plants; Determination of Endangered Status for the Rayed Bean and Snuffbox Mussels Throughout Their Ranges. Department of the Interior, US Fish and Wildlife Service, Washington DC. Federal Register 77(30):8632-8665.**

Federal Register notice of the US Fish and Wildlife Service publishing a determination of endangered status for rayed bean and snuffbox mussels throughout their ranges.

_____. **2012. Endangered and Threatened Wildlife and Plants; Determination of Endangered Status for the Sheepnose and Spectaclecase Mussels Throughout Their Range. Department of the Interior, US Fish and Wildlife Service, Washington DC. Federal Register 77(49):14914-14949.**

Federal Register notice of the US Fish and Wildlife Service publishing a determination of endangered status for sheepnose and spectaclecase mussels throughout their range.

_____. **2012. The Cost of Invasive Species. US Fish and Wildlife, Region 7, Anchorage, Alaska.**

Fact sheet on the negative consequences of invasive species are far-reaching, costing the United States billions of dollars in damages every year. Invasive species are also a leading cause of population decline and extinction in animals.

_____. 2013. **Endangered and Threatened Wildlife and Plants; Endangered Species Status for Diamond Darter.** Department of the Interior, US Fish and Wildlife Service, Washington DC. **Federal Register 78(144):45074-45095.**

Federal Register notice of the US Fish and Wildlife Service publishing a determination of endangered status for the diamond darter.

_____. 2015. **Polar Bear (*Ursus maritimus*) Conservation Management Plan, Draft.** US Fish and Wildlife, Region 7, Anchorage, Alaska.

Management plan developed as a practical guide to implementation of polar bear conservation in the United States. Articulates the conditions whereby polar bears would no longer need the protections of the ESA and to lay out a collective strategy that moves toward achieving those conditions. Also includes how to improve the status of polar bears under the Marine Mammal Protection Act.

_____. 2016. **Endangered and Threatened Wildlife and Plants; Threatened Species Status for the Big Sandy Crayfish and Endangered Species Status for the Guyandotte River Crayfish.** Department of the Interior, US Fish and Wildlife Service, Washington DC. **Federal Register 81(67):20450-20481.**

Federal Register notice of the US Fish and Wildlife Service publishing a determination of threatened species status for the big sandy crayfish and endangered species status for the Guyandotte River crayfish.

US Department of the Interior, National Parks Service. 2010. Understanding the Science of Climate Change Talking Points—Impacts to Arid Lands Natural Resource Report NPS/NRPC/NRR—2010/209. National Parks Service, Missoula, Montana.

Talking points on the impacts of climate change on arid lands from the National Parks Service. The document is part of a series of bioregional summaries that provide scientific findings about climate change. The statements are intended to be used to communicate and answer general questions on climate change.

_____. 2015. **Adapting to Climate Change in Coastal Parks.** Natural Resource Report NPS/NRSS/GRD/NRR—2015/961. National Parks Service. Fort Collins, Colorado.

Report published by the National Parks Service on the challenges posed over the next century from warming global temperatures. The greatest challenge is rising sea level. This report looks at coastal parks, assessing them for exposure to sea level rise.

US Department of the Interior, Office of the Secretary. 2016. Press Release: Interior Department Releases Report Underscoring Impacts of Climate Change on Western Water Resources. Internet website: <https://www.doi.gov/pressreleases/interior-department-releases-report-underscoring-impacts-climate-change-western-water>.

This press release announces a report that identifies climate change as a growing risk to Western water management.

US Department of the Interior, Office of Surface Mining Reclamation and Enforcement. 2014. EA For Proposed Revision and Renewal of Permit WA0007D for Resumption of Mining: John Henry No. 1 Coal Mine. Internet website: http://www.wrcc.osmre.gov/initiatives/johnHenryMine/JHM_EA.pdf.

EA on the proposed resumption of coal mining at the John Henry No. 1 Coal Mine in King County, Washington, where no coal has been mined 1999. The proposed mining would be conducted over a six-year period, removing 740,000 short tons of minable coal reserves, and would be followed by a year of reclamation.

_____. **2015. Bull Mountains Mine No. 1: Federal Mining Plan Modification Environmental Assessment. Internet website: <http://www.wrcc.osmre.gov/initiatives/bullMountainsMine/BullMountainsMineEA.pdf>.**

EA on the Bull Mountains Mine No.1 underground coal mine in Montana. Analyzed the potential impacts of leasing five tracts of federal coal on 2,679.76 acres, which would allow the mine to continue producing coal at the current rate, instead of ceasing production as recoverable private coal reserves are exhausted.

_____. **2015. Bull Mountains Mine No.1 Federal Mining Plan Modification Environmental Assessment. Office of Surface Mining Reclamation and Enforcement, Denver, Colorado.**

Recommends approval, disapproval, or approval with conditions of the proposed mining plan modification to the Assistant secretary of lands and mineral management If approved, the mining plan would allow the proponent to conduct coal mining and reclamation in the coal lease and to economically recover federal, state, and private coal reserves through a logical mining unit.

_____. **2015. Stream Protection Rule Environmental Impact Statement. Washington, DC.**

DEIS on the proposed revisions to regulations for implementing the Surface Mining Control and Reclamation Act of 1977 (SMCRA). This would better protect streams, fish, wildlife, and related environmental values from the adverse impacts of surface coal mining operations. It would also provide mine operators with a regulatory framework to avoid water pollution and the long-term costs associated with water treatment, would more completely implement the requirements of SMCRA, would remedy deficiencies in existing rules, and would remove obsolete or unneeded provisions from existing rules.

_____. **2016. Spring Creek Mine Federal Coal Lease MTM 94378 Mining Plan Modification Environmental Assessment. Internet website: <http://www.wrcc.osmre.gov/initiatives/SpringcreekMineLBAI/documents/EA0616.pdf>.**

EA on the Spring Creek surface coal mine in Montana, which rectified the specific procedural deficiencies in the Office of Surface Mining Reclamation and Enforcement's documentation and approval of the NEPA analysis for the 2012 federal mining plan modification. It also analyzed potential changes to the extent or nature of those potential impacts previously evaluated, based on information included in State Mining Permit C1979012 (2014) and new information related to the environmental consequences specific to this action.

US Departments of Interior, Energy, and Agriculture. 2007. Inventory of Assessed Federal Coal Resources and Restrictions to Their Development. August 2007. Internet website: http://www.blm.gov/wo/st/en/info/newsroom/2007/september/NR_0709_03.html.

Based on recent United States Geological Survey assessments, federal coal resources in the United States total 957,000 million short tons, with the Powder River Basin containing approximately 58 percent of these resources and accounting for approximately 88 percent of recent production.

US Department of Interior, Secretary of the Interior. 2016. Order No. 3338: Discretionary Programmatic Environmental Impact Statement to Modernize the Federal Coal Program. US Department of Interior, Washington, DC.

Secretarial Order directing the BLM to prepare a discretionary programmatic environmental impact statement (PEIS) that analyzes potential leasing and management reforms to the current federal coal program. The PEIS will help the Department of the Interior undertake a comprehensive review of the program and to consider whether and how the program may be improved and modernized. This would be done to foster the orderly development of BLM-administered coal on federal lands in a manner that gives proper consideration to the impact of that development on important stewardship values, while also ensuring a fair return to the American public.

US Department of State. 2016. Internet website: <https://keystonepipeline-xl.state.gov/nid/249254.htm#l>.

Website with the Record of Decision for the Keystone Pipeline, denying the presidential permit application.

_____. Background Briefing on the Paris Climate Agreement. US Department of State, Washington DC.

Transcript of conference call with senior Obama administration officials, briefing them just after the signing of the 2015 Paris Climate Agreement. Provides a context for the agreement, a summary of what was achieved, and the mechanisms for achieving the goals set forth in the agreement.

US District Court for the District of Columbia. 2015. Civil Action No. 14-1993 (RBW). Western Organization of Resource Council and Friends of the Earth v. Department of the Interior and Bureau of Land Management. August 27, 2015.

Record from United States District Judge Reggie Walton on the case of Western Organization of Resource Councils and Friends of the Earth v. Department of the Interior and Bureau of Land Management for failure to supplement its environmental impact analysis of federal coal management program. The court granted the defendant's motion to dismiss.

US District Court for the District of New Mexico. 2016. Wild Earth Guardians vs. US Office of Surface Mining Reclamation and Enforcement and San Juan Mining. Civ. No. 1:14-cv-00112-RJ-CG. July 18, 2016.

Court document from the United States District Court for the District of New Mexico outlining a course case between Wild Earth Guardians (Plaintiff) and United States Office of Surface Mining Reclamation and Enforcement et al. and San Juan Coal Company (Defendants) to modify a mining plan and allow a new environmental impact statement.

US Environmental Protection Agency. 1998. Study of Hazardous Air Pollutant Emissions from Electric Utility Steam Generating Units—Final Report to Congress. EPA-453/R-98-004a. US EPA, Office of Air Quality, Research Triangle Park, North Carolina.

Report for Congress in response to legislative mandate from Section 112 of the Clean Air Act. This study investigates the hazards to public health reasonably anticipated to occur from exposure to electric utility steam generated emissions. Provides alternative control strategies for hazardous air pollutants and rulemaking activities to control hazardous air pollutants.

_____. 1999. Climate Change and Public Lands. US Environmental Protection Agency, Washington, DC.

Report on how climate change could affect public lands in the United States, such as rising temperatures and changes in precipitation, soil moisture, and sea level.

_____. 2002. Clinch and Powell Valley Watershed Ecological Risk Assessment. US Environmental Protection Agency, Washington, DC.

Watershed ecological risk assessment of the unique Clinch and Powell River System in southwestern Virginia. Strongly suggests that (1) coal mining and agricultural practices, past and present, are having adverse impacts on stream habitats, resulting in unacceptable losses of valuable and rare native fish and mussels; and (2) prompt implementation of practical risk lowering actions, such as reclaiming abandoned mines, preventing spills, excluding livestock from streams, and establishing riparian vegetation zones, can mitigate these adverse effects in the future.

_____. 2008. Integrated Science assessment For Oxides of Nitrogen – Health Criteria. US Environmental Protection Agency, Washington, DC.

Synthesis of the most policy-relevant science forms the scientific foundation for the review of the primary (health-based) National Ambient Air Quality Standards for nitrous dioxide (NO₂) currently set at 0.053 parts per million, annual average.

_____. 2008. Integrated Science assessment For Sulfur Oxides – Health Criteria. US Environmental Protection Agency, Washington, DC.

Synthesis of the most policy-relevant science to form the scientific foundation for the review of the primary (health-based) National Ambient Air Quality Standards for monomeric sulfur oxides (SO_x).

_____. 2009. Integrated Science assessment For Particulate Matter. National Center for Environmental Assessment-RTP Division, Office of Research and Development, US Environmental Protection Agency, Research Triangle Park, North Carolina.

Integrated science assessment providing a review, synthesis, and evaluation of the most policy-relevant evidence. Communicates critical science judgments relevant to the National Ambient Air Quality Standards review. Forms the scientific foundation for the review of the primary (health-based) and secondary (welfare-based) National Ambient Air Quality Standards for particulate matter.

_____. 2011. The Benefits and Costs of the Clean Air Act from 1990 to 2020. US Environmental Protection Agency, Washington, DC.

Report to Congress and the public, with comprehensive, up-to-date, peer-reviewed information on the social benefits and costs of the Clean Air Act and its 1990 amendments (CAA), including improvements in human health, welfare, and ecological resources, as well as the impact of the CAA's provisions on the US economy. Analysis makes it clear that the benefits of the CAA exceed its costs by a wide margin, making it a very good investment for the nation.

_____. 2011. The Effects of Mountaintop Mines and Valley Fills on Aquatic Ecosystems of the central Appalachian coalfields. US Environmental Protection Agency, Washington, DC.

Report assessing the environmental impacts of mountaintop mines and valley fills (MTM-VFs) on streams in the central Appalachian coalfields. Conclusions, based on evidence from the peer-reviewed literature, and from the US Environmental Protection Agency's Programmatic Environmental Impact Statement released in 2005, are that MTM-VFs lead directly to five principal alterations of stream ecosystems.

_____. 2012. National Emission Standards for Hazardous Air Pollutants from Coal- and Oil-Fired Electric Utility Steam Generating Units and Standards of Performance for Fossil Fuel-Fired Electric Utility, Industrial-Commercial-Institutional, and Small Industrial-Commercial-Institutional Steam Generating Units; Final Rule. US EPA, Washington, DC. *Federal Register 77(32)*.

EPA national emissions standards final rule.

_____. 2013. Impacts of Climate Change on the Occurrence of Harmful Algal Blooms. US Environmental Protection Agency, Washington, DC.

Report on how climate change is predicted to change many environmental conditions that could affect the natural properties of freshwater and marine water, favor the growth of harmful algal blooms (HABs), and change habitat, such that marine HABs can invade and occur in freshwater. An increase in the occurrence and intensity of HABs may negatively impact the environment, human health, and the economy for communities across the United States and around the world.

_____. 2015. Regulatory Impact Analysis For The Clean Power Plan Final Rule. US Environmental Protection Agency, Washington, DC.

Regulatory Impact Analysis discussing potential benefits, costs, and economic impacts of the Final Carbon Pollution Emission Guidelines for Existing Stationary Sources: Electric Utility Generating Units.

_____. **2015. Inventory of US Greenhouse Gas Emissions and Sinks: 1990-2013. US Environmental Protection Agency, Washington, DC.**

This chapter summarizes the latest information on US anthropogenic greenhouse gas emission trends, from 1990 through 2013. To ensure that the US emissions inventory is comparable to those of other UNFCCC parties, the estimates presented here were calculated using methods consistent with those recommended in the 2006 Intergovernmental Panel on Climate Change Guidelines for National Greenhouse Gas Inventories. The structure of this report is consistent with the UNFCCC guidelines for inventory reporting.

_____. **2015. Regulatory Impact Analysis of the Proposed Emissions Standards for New and Modified Sources in the Oil and Natural Gas Sector. US Environmental Protection Agency, Office of Air Quality Planning and Standards, Research Triangle Park, North Carolina.**

EPA analysis estimates regulatory impacts for 2020 and 2025. The analysis of 2020 is assumed to represent the first year the full suite of proposed standards is in effect and thus represents a single year of potential impacts. Impacts in 2025 are estimated to illustrate how new and modified sources accumulate over time under the proposed New Source Performance Standards. The regulatory impact estimates for 2025 include sources newly affected in 2025, as well as the accumulation of affected sources from 2020 to 2024 that are also assumed to be in continued operation in 2025, thus incurring compliance costs and emissions reductions in 2025.

_____. **2015. Social Cost of Carbon. US Environmental Protection Agency, Washington, DC.**

This report discusses using the social cost of carbon to estimate climate benefits of rulemakings.

_____. **2015. Oil and Natural Gas Sector: Emission Standards for New and Modified Sources. *Federal Register* 80(181), Friday, September 18, 2015/Proposed Rules**

Federal Register notice with action that proposes to amend the new source performance standards for the oil and gas natural gas source category by setting standards for both methane and volatile organic compounds. Requirements for methane emissions stems from the realization that methane is a greenhouse gas, and the EPA has linked it to climate change.

_____. **2015. Climate Change in the United States: Benefits of Global Action. United States Environmental Protection Agency, Office of Atmospheric Programs, Washington, DC. EPA 430-R-15-001.**

Report reviews benefits of action on climate change in the United States, including avoiding extreme weather events, costly damages to certain sectors, and mitigation costs.

_____. **2016. Nutrient Pollution: Sources and Solutions. Internet website: <https://www.epa.gov/nutrientpollution/sources-and-solutions>.**

Summary of nutrient pollution, including excessive nitrogen and phosphorus, that washes into water bodies and is released into the air as a result of agriculture, stormwater, wastewater, fossil fuels, and homes. Addresses this pollution at its source.

_____. **2016. Inventory of US Greenhouse Gas Emissions and Sinks: 1990 – 2014. US Environmental Protection Agency, Washington, DC.**

Report summarizing the latest information on US anthropogenic greenhouse gas emission trends from 1990 through 2014. This report identifies and quantifies the country's prime anthropogenic sources and sinks of greenhouse gases to better address climate change.

_____. **2016. Internet website: <https://www.epa.gov/climateindicators/climatechangeindicatorssealevel>.**

Website including climate change indicators, specifically sea level rise in the United States. Contains graph of cumulative sea level change in inches for the years 1880 to 2020. Uses data from Commonwealth Scientific and Industrial Research Organization and National Oceanographic and Atmospheric Administration.

_____. **2016. Internet website: <https://www.epa.gov/coalash/coalashbasics>.**

Informational website on coal ash. Provides the basics on what coal is, the regulations that apply to it, how power plants use it, how much there is, and how the EPA regulates it. Provided in bullet point format for quick assessment.

_____. **July 2016. Internet website: <https://www.epa.gov/mats>.**

Database of Mercury and Air Toxics Standards for the United States.

_____. **September 2016. Internet website: <https://www3.epa.gov/crossstaterule/>**

Database of Cross-State Air Pollution Rates for the United States.

_____. **2016. Climate Change Indicators: Ocean Acidity. Internet website: <https://www.epa.gov/climate-indicators/climate-change-indicators-ocean-acidity>.**

Website that describes changes in the chemistry of the ocean that relate to the amount of carbon dioxide dissolved in the water.

_____. **2016. Coal Mine Methane – What EPA is Doing. June 29, 2016. Internet website: <https://www.epa.gov/epa-coalbed-methane-outreach-program/what-epa-doing>**

Website detailing the EPA's Coal Bed Methane Outreach Program and efforts to reduce coal mine methane emissions.

_____. **2016. Natural Disasters: Flooding. Internet website: <https://www.epa.gov/natural-disasters/flooding>.**

Website that describes what to do in the event of a flooding disaster, as relates to preparedness, during the flood, and during recovery.

_____. **2016. Water And Climate Change Research. Internet website: <https://www.epa.gov/water-research/water-and-climate-change-research>.**

Website that describes the way the EPA conducts research to better understand the growing impacts of climate change on water quality and availability. This cutting-edge science helps determine and support new strategies for managing watersheds and wastewater, while reducing water-related energy demands.

US Geological Survey. 1920. Title 30-Mineral Lands and Mining. US Government, Washington, DC.

Information on conditions of lease for coal. Contains information on term of lease, annual rentals, royalties, readjustment of conditions, diligent development, suspension, and operation and reclamation plan.

_____. **1998. A Digital Database of Coal Ownership Status. US Geological Survey.**

This database and its products are designed to help policymakers and land use planners make wise decisions regarding federal land use, while maintaining a healthy domestic energy industry by showing the coal ownership status across the United States.

_____. **2012. Assessment of Coal Geology, Resources, and Reserves in the Montana Powder River Basin. Open-File Report 2012-1113.**

Summarizes geology, coal resources, and coal reserves in the Powder River Basin assessment area in southeastern Montana.

_____. **2013. Assessment of Coal Geology, Resources, and Reserve Base in the Powder River Basin, Wyoming and Montana. Fact Sheet 2012-3143.**

Fact sheet from the USGS on the Powder River Basin's coal geology, resources, and reserve base.

_____. **2014. Modeling Uncertainty in Coal Resource Assessments, with an Application to a Central Area of the Gillette Coal Field, Wyoming. Scientific Investigations Report 2014-5196 US.**

Results of a study that help provide a better assessment of uncertainty than traditional qualitative resource classification.

_____. **2015. Coal Geology and Assessment of Coal Resources and Reserves in the Powder River Basin, Wyoming and Montana. Professional Paper 1809.**

Report presenting the final results of the first assessment of both coal resources and reserves for all significant coal beds in the entire Powder River Basin, northeastern Wyoming and southeastern Montana. Article estimates 304 billion short tons of underground coal resource in the Powder River Basin.

_____. **2015. Geospatial Data for Coal Beds in the Powder River Basin, Wyoming and Montana. Data Series 912. Reston, Virginia.**

Report that provides geospatial data for various layers and themes in a geographic information system format for the Powder River Basin, Wyoming and Montana.

_____. **2015. Energy Resources Program - Coal Assessments. Internet website: <http://energy.usgs.gov/Coal/AssessmentsandData/CoalAssessments.aspx>.**

The USGS Energy Resources Program research efforts yield modern, digital assessments of the quantity, quality, location, and accessibility of the nation's coal resources; 37 percent of electricity produced in the United States is generated by coal-fired plants. Understanding the amount of coal reserves that are economically recoverable and of sufficient quality to meet current emission standards is important to ensure adequate future energy supply. Regional coal assessments provide an accurate appraisal of the amount of US coal that is realistically available for production in the near and mid-term future.

_____. **2016. Internet website: <http://energy.usgs.gov/Coal/AssessmentsandData/CoalAssessments.aspx>.**

Website with information on coal assessments carried out by USGS.

_____. **2016. Groundwater And Drought. Internet website: <http://water.usgs.gov/ogw/drought/>.**

Website describing how groundwater, surface water, and the integrated nature of the hydrologic system enable resource managers and policymakers to better prepare for and respond to drought. Provides groundwater data and information that resource managers and policymakers can use to prepare for and respond to drought.

US Government Accountability Office. 1979. Issues Facing the Future of Federal Coal Leasing. Report to the Congress of the United States. Publication EMD-79-47. US GAO, Washington, D.C.

This report identifies and analyzes a broad range of issues affecting the development and implementation of a sound federal coal management program, particularly the use of Western coal in meeting America's energy needs. In 1979, the Secretary of the Interior announced a new federal coal program, calling for resumption of competitive leasing for the first time since a moratorium was imposed in 1971. Leasing was to resume in 1981. However, many questions remained unanswered, some of which GAO believed needed to be resolved before further long-term leasing could resume.

_____. **2012. Coal Leasing: BLM Could Enhance Appraisal Process, More Explicitly Consider Coal Exports, and Provide More Public Information. Report to Congress. December 2012. GAO-14-164SU.**

GAO report examining the coal leasing process. States that, because there is typically little competition for federal leases, the BLM plays a critical role in ensuring that the public receives fair market value for the coal that is leased. However, BLM state offices differ in the approaches they use to estimate fair market value and the rigor of these reports. The BLM should update and ensure consistency of coal appraisal reports and should account for export value of coal.

_____. 2013. Climate Change. Various Adaptation Efforts Are Under Way at Key Natural Resource Management Agencies. May 2013.

Study done by GAO with written comments from the Department of Agriculture, stating that the Forest Service agreed with the findings. The report examines steps that key federal natural resource management agencies have taken since 2007 to address adaptation. It also analyzes the agencies' climate change adaptation guidance and planning documents and interviewed agency officials.

_____. 2013. Coal Leasing: BLM Could Enhance Appraisal Process, More Explicitly Consider Coal Exports, and Provide More Public Information. Report GAO 14-140. US Government Accountability Office, Washington, DC.

This report examines (1) the number of tracts leased, along with the trends in associated coal production and revenues generated since 1990; (2) the BLM's implementation of the process to estimate fair market value for coal leases; (3) the extent to which the BLM considers coal exports and domestic coal reserves when estimating fair market value; and (4) the extent to which the BLM communicates information on federal coal lease sales to the public. GAO recommends, among other things, that the BLM require state offices to use more than one approach to estimate fair market value, where practicable, to develop a mechanism to ensure that reviews of appraisal reports take place, and to take steps to release additional summary information on its websites, including past lease sales.

_____. 2014. BLM Could Enhance Appraisal Process, More Explicitly Consider Coal Exports, and Provide More Public Information. Feb. 4, 2014. Internet website: <http://www.gao.gov/products/GAO-14-140>.

GAO report recommends, among other things, that the BLM require state offices to use more than one approach to estimate fair market value, where practicable, develop a mechanism to ensure that reviews of appraisal reports take place, and takes steps to release additional summary information on its websites, including past lease sales. The Department of the Interior concurred with these recommendations.

_____. 2014. Regulatory Impact Analysis. Development of the Social Cost of Carbon Estimates. United States GAO, Washington, DC.

Report from the governmental advisory organization, with data and information compiled on the social cost of carbon. Used interagency and previously published data as a framework.

US House of Representatives, Office of the Law Revisions Counsel. 1976. 43 US Code, Section 1701. Congressional declaration of policy. US Congress, Washington, DC.

Declaration of policy relating to federal lands and the management and use of such lands.

_____. 1990. Title 42. The Public Health and Welfare. US Government, Washington, DC.

Instruction for creating reports related to Source reduction and Recycling data collection and EPA reports. Contains information on requirements, items included, provisions, and availability. Also includes information on how often reports need to be submitted

_____. **1996. Title 30. Mineral Lands and Mining. US Government, Washington, DC.**

Information on the national mining and minerals policy, definition of minerals, and execution of policy under other authorized programs.

_____. **2005. Title 30. 30 US Code, Section 20. Leases and Exploration. US Congress, Washington, DC.**

US policy relating to leases and exploration. Contains policy information on leases for coal and exploration licenses.

US Office of Federal Register, National Archives and Records Administration, US Government Printing Office. Code of Federal Regulations. 1983. Minerals Management. Title 43, Section 3000.

Title 43 of the Code of Federal Regulations, Subchapter C, on minerals and management. Contains rules and regulations by the federal agencies regarding public land.

US Office of the Inspector General. 2013. Coal Management Program, US Department of the Interior. Report No.: CR-EV-BLM-0001-2012. June 2013.

Report with 13 recommendations for the BLM to enhance coal sales and inspections after assessing its effectiveness in managing its coal program.

US Office of the President. 2013. The President's Climate Action Plan. June 2013.

President Obama's Climate Action Plan to cut the carbon pollution that causes climate change and affects public health. Three-pillared plan to cut carbon pollution, to prepare the United States for the impacts of climate change, and to lead international efforts to combat global climate change and prepare for its impacts.

_____. **2014. Climate Action Plan Strategy to Reduce Methane Emissions. March 2014.**

Climate action plan detailing strategy to reduce methane emissions. Reducing methane emissions can reduce climate change, and using methane can support economies while providing clean energy. This document details sources of methane and emission trends and lays out the strategy to reduce both domestic and international emissions and highlights examples of technologies and practices that are already helping to cut methane emissions.

_____. **2014. The Cost of Delaying Action to Stem Climate Change. July 2014.**

Report pertaining to the costs associated with climate change. Focusing on the economic costs of climate change, it makes a case that delaying action will result in far greater costs.

_____. **2016. Leaders' Statement on a North American Climate, Clean Energy, and Environment Partnership.** Internet website: <https://www.whitehouse.gov/the-press-office/2016/06/29/leaders-statement-north-america>.

Website detailing the commitment of Prime Minister Justin Trudeau, President Barack Obama, and President Enrique Peña Nieto to a competitive, low carbon, and sustainable North American economy and society. Article announces goals for clean power generation and driving down short-lived climate pollutants.

_____. **2016. The Economics of Coal Leasing. Ensuring Fair Returns to Taxpayers. June 2016.**

This report informs on the coal market in the United States and provides an economic perspective on federal coal leasing and the effects of possible reforms. The report addresses programmatic review of the federal coal leasing program in 30 years, focusing on the taxpayer and concluding that there is an artificially low price for most federal coal. Two possible approaches are suggested to help achieve the ultimate goal of ensuring a fair return to the taxpayer from the federal coal leasing program.

_____. **2016. US-Canada Joint Statement on Climate, Energy, and Arctic Research. March 10, 2016.** Internet website: <https://www.whitehouse.gov/the-press-office/2016/03/10/us-canada-joint-statement-climate-energy-and-arctic-leadership>

Website with article describing President Barack Obama and Prime Minister Justin Trudeau of Canada sharing a common interest in a prosperous and sustainable North American economy by joining together and implementing the Paris Agreement.

US Senate. 2016. Concerns about the Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to Taxpayers. July 14, 2016.

Letter signed by multiple senators that expresses concern over the report entitled "The Economics of Coal Leasing on Federal Lands: Ensuring a Fair Return to Taxpayers," published by the President's Council on Economic Advisers. Cites conflicts with NEPA as main concern.

United States of America. 2015. US Cover Note, INDC and Accompanying Information. Internet website: <http://www4.unfccc.int/Submissions/INDC/Published%20Documents/United%20States%20of%20America/1/US%20Cover%20Note%20INDC%20and%20Accompanying%20Information.pdf>.

US transmittal to the UN Secretariat of its intended nationally determined contribution to global greenhouse gas emissions, with a target year of 2025.

University Cooperation for Atmospheric Research. 2001. Internet website. Internet website: <https://www.ucar.edu/communications/staffnotes/0107/mercury.html>.

Internet website containing staff notes for July 2001. This note explains research being done by Friedli and Radke on forest fires to determine what they have to do with mercury in fish.

University of Oxford. 2016. Internet website: <http://www.smithschool.ox.ac.uk/research-programmes/stranded-assets/background.php>.

Website with information on stranded assets, including definitions, timelines, and several other factors.

Unofficial Networks. 2016. Internet website: <http://unofficialnetworks.com/2016/07/noaa-graphic-shows-record-breaking-heat-dome-affecting-north-america>.

Brief summary of report released by the National Oceanographic and Atmospheric Administration on the heat dome affecting North America.

Utah Department of Health. 2016. Utah Asthma Program. Internet website: <http://www.health.utah.gov/asthma/>.

This website of the Utah Department of Health includes asthma information and links to asthma resources.

van Breevoort, P., et al. 2015. Climate Action Tracker—The Coal Gap: Planned Coal-Fired Power Plants Inconsistent with 2 Degrees C and Threaten Achievement of INDCs. Climate Action Tracker, Berlin, Germany.

Report on how holding temperature increase below 2 degrees Celsius, or below 1.5 degrees Celsius by 2100 requires a rapid decarbonization of the global power sector. This means phasing out emissions from coal-fired power by 2050. If the planned new coal capacity, estimated by the Global Coal Plant Tracker, were to be built, it would exceed the required levels by 400 percent.

Vannote, R. L., and G. W. Minshall. 1982. Fluvial processes and local lithology controlling abundance, structure, and composition of mussel beds. Internet website: <http://www.pnas.org/content/79/13/4103.full.pdf>.

This report details the study of bivalve molluscan fauna in the upper 40-kilometer canyon reach of the Salmon River.

Vano, J., et al. 2014. “Understanding uncertainties in future Colorado River streamflow.” *American Meteorological Society*. January 2014: 59-78.

This document synthesizes studies on Colorado River streamflow projections. Discusses differences in existing models and the implications of the models for water management. Article concludes with four major reasons for discrepancies in past projections of streamflow.

Vaughan, A. 2016. “Abolition of DECC ‘major setback for UK’s climate change efforts.” *The Guardian*. Internet website: <https://www.theguardian.com/environment/2016/jul/15/deccabolitionmajorsetbackforukclimatechangeefforts>.

Article on British efforts to combat global warming as the Department of Energy and Climate Change is being abolished. The article frames the abolition as a major setback. The reorganizing of departments has put climate change at risk of falling off of the policy agenda.

Veron, J. E. N., et al. 2009. The coral reef crisis: The critical importance of <350 ppm CO₂. Internet website: <http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.434.5355&rep=rep1&type=pdf>.

This study discusses how the temperature-induced mass coral bleaching is killing coral reefs on a wide geographic scale, due to climate change. The report discusses the importance of not rising above 350 ppm of CO₂ in the atmosphere in order to protect coral reefs.

Vine, D. 2016. Achieving the United States' Intended Nationally Determined Contribution. Center for Climate And Energy Solutions. 7 pp.

Paper looks at the progress that has been achieved since 2005, the effect existing and proposed policies will have by 2025, as well plausible steps to fill the gap and attain the proposed emission cuts for the United States.

Vulcan, Inc. 2016. Federal Coal Leasing Reform Options: Effects on CO₂ Emissions and Energy Market. Vulcan, Inc. and ICF International, Fairfax, Virginia.

This report summarizes the results of multiple base and policy cases. The base case is the reference case against which the policy cases are compared to assess the incremental impact of the policy.

_____ . 2016. Internet website: <http://www.vulcan.com/News/Articles/2016/Coal-Leasing-Report>.

Website with news release about potential changes to US Federal Coal Leasing Program. This article announces a new report that analyzes effects on CO₂ emissions and energy markets from coal reform.

Wagner, J. C., et al. 1985. "Erionite exposure and mesotheliomas in rats." *Br. J. Cancer* 51:727-730.

Peer reviewed journal with findings of study investigating epidemiological and environmental surveys in the Cappadocian region of Turkey and the link between high incidence of pleural and peritoneal mesothelioma and villages with the zeolite fibers released from volcanoes.

Walker, J., and B. Liebendorfer. 1998. Long-Term Stewardship at the Nevada Test Site. Prepared for the State Tribal Government Working Group.

Paper discusses the US Department of Energy's long-term stewardship responsibilities at the Nevada Test Site. Concludes that the Department's proposal to acquire, in perpetuity, control of certain selected areas is appropriate. Also determines necessary methods for the future.

Walters, D., et al. 2015. Mercury and Selenium Accumulation in the Colorado River Food Web, Grand Canyon, USA. US Geological Survey, Environmental Toxicology and Chemistry.

USGS report examining mercury and selenium and exposure risks to humans and wildlife in the Colorado River.

Warren, M. L., and W. R. Haag. 2004. "Spatio-temporal patterns of the decline of freshwater mussels in the Little South Fork Cumberland River, USA." *Biodiversity and Conservation* 14:1383-1400. Internet website: http://www.srs.fs.usda.gov/pubs/ja/ja_warren003.pdf

This report studies the density and number of species to evaluate the probable sequence and cause of observed mussel declines.

Warren, R., J. Price, and A. Fischlin. 2010. Increasing impacts of climate change upon ecosystems with increasing global mean temperature rise. *Climatic Change*. Internet website: http://www.sysecol.ethz.ch/Articles_Reports/Wa152.pdf.

This report looks at future projected ecosystem changes related to quantified, projected, local and global climate changes.

Washington State Department of Ecology. 2009. Health Effects and Economic Impacts of Fine Particle Pollution in Washington. Washington State Department of Ecology, Air Quality Program. Internet website: <https://fortress.wa.gov/ecy/publications/documents/0902021.pdf>.

This report describes a Department of Ecology analysis to quantify the health and monetary impacts of fine particle pollution in the state. The analysis was done by comparing estimates of the impacts at existing pollution levels to estimates of health effects at a "clean air," or background, level.

_____. 2011. Letter to Wyoming BLM Director Donald A. Simpson on the South Hilight field coal lease application. May 11, 2011.

Letter citing Secretary of the Interior Salazar's recent announcement of coal lease sales and pending applications for 3.7 billion tons of Powder River Basin coal. Calls for a supplemental EIS to consider the impacts of exporting coal, due to the likelihood that the new coal is destined for export markets.

Washington State Department of Ecology and Oregon Department of Environmental Quality. 2011. Letter to Lands and Minerals Management and the BLM.

The letter requests a supplemental EIS to evaluate impacts of transporting coal through Oregon and Washington for overseas export for the Wright Area Coal Lease and the South Hilight Field.

Weitzman, M. L. 2010. GHG Targets as Insurance against Catastrophic Climate Damages. National Bureau Of Economic Research. Working Paper 16136 Internet website: <http://www.nber.org/papers/w16136>.

Working paper focused on the "damages function" and keeping greenhouse gas levels down to ensure against climate risks from high temperatures. This paper provides numerical examples of the indirect value of greenhouse gas concentration targets for insight and prevention of climate change temperatures and damages. The results find that the welfare losses from uncertainty from using a quadratic damages function or thin-tailed temperature distribution have been underestimated.

Welch, R. December 4, 2015. Bureau of Land Management, Lakewood, Colorado.

Letter with attachments sent from the BLM to Colorado Governor John Hickenlooper. Letter states the proposed approval of the royalty rate reduction for up to 13.1 million tons for four years. Also contains attached draft decision and Form 1842-1.

Westerling, A., et al. 2003. "Climate and wildfire in the western United States." *American Meteorological Society BAMS* 594-604.

Paper describing wildfires, causes, and trends. Also models wildfires so that several fire seasons can be projected ahead of time. This is the first study to consider the larger picture of wildfire for the entire eastern United States.

Westerling, A., et al. 2006. "Warming and earlier spring increase western US forest wildfire activity." *Science* 313:940-943.

Article investigating the western United States forest wildfire activity's increase in recent decades. The article creates a comprehensive database of large wildfires in the western United States since 1970, comparing it with hydroclimatic and land-surface data. Results provide details on wildfire increases on a timescale, with hydrological information.

Whatcom Docs. 2016. Position Statement and Appendices: Coal Train Facts. Internet website: www.coaltrainfacts.org/whatcom-docs-position-statement-and-appendices.

Dozens of Whatcom County, Washington, medical professionals conducted a review of the health impacts of coal train traffic and found significant effects associated with both diesel particulate matter and coal dust, including impaired pulmonary development, increased cardiopulmonary mortality, increased severity and frequency of asthma attacks, increased rates of heart attacks, increased cancer rates, chronic bronchitis, emphysema, pulmonary fibrosis, and more. They include resources from the American Heart Association and American Lung Association.

Whitaker, M., G. Heath, P. O'Donoghue, and M. Vorum. 2012. "Life cycle greenhouse gas emissions of coal-fired electricity generation." *Journal of Industrial Ecology* 16:S53-S72. Internet website: <http://onlinelibrary.wiley.com/doi/10.1111/j.1530-9290.2012.00465.x/pdf>.

This journal article focuses on reducing variability and clarifying central tendencies in estimates of life cycle greenhouse gas emissions.

White House. 2013. Executive Order. Preparing the United States for the Impacts of Climate Change. Office of the Press Secretary, Washington, DC.

Executive Order issued by President Obama to better prepare the United States for the impacts of climate change in the areas of policy, modernization, management, information, planning, among other topics.

_____. 2013. Internet website: <https://www.whitehouse.gov/the-press-office/2013/06/25/remarks-president-climate-change>.

Website with complete remarks of President Obama on climate change at Georgetown University.

_____. 2015. **Statement by the President on the Keystone XL Pipeline. Office of the Press Secretary. November 6, 2015.**

Statement declaring the Keystone XL pipeline as not in the nation's best interest, due to lack of economic benefit. It would have no impact on gas prices and would not benefit energy security.

_____. 2015. **Internet website: <https://www.whitehouse.gov/the-press-office/2015/03/31/fact-sheet-us-reports-its-2025-emissions-target-unfccc>.**

Website with an overview of the United States commitment to cut net greenhouse gas emissions and the steps that have been taken to achieve that goal. The target is to cut 26 to 28 percent of emissions by 2025.

_____. 2016. **Internet website: <https://www.whitehouse.gov/the-press-office/2016/06/29/north-american-climate-clean-energy-and-environment-partnership-action>.**

Announcement of a partnership between the United States, Canada, and Mexico to protect and work toward a more environmentally friendly nation.

The White House Office of the Press Secretary. 2014. US-China Joint Announcement on Climate Change. Internet website: <https://www.whitehouse.gov/the-press-office/2014/11/11/us-china-joint-announcement-climate-change>.

Press release about the November 12, 2014, meetings in Beijing, which provides a framework for collaborating to reduce greenhouse gas emissions.

Whiteside, T., and G. Fauth. Heavy Traffic Still Ahead. Prepared for Western Organization of Resource Councils. Billings, Montana.

Report detailing major energy companies and transportation companies proposals in the Powder River Basin. Examines existing Canadian export coal terminals and provides an update to Heavy Traffic Ahead 2012, by describing the current plans for coal production and rail movements from current and proposed Powder River Basin mines to proposed export coal terminals.

Whitney, E. 1999. Beware of Orange Clouds. High Country News. Internet website: <http://www.hcn.org/issues/154/4970>.

Article on blasting in the Powder River Basin in open pit coal mines and the clouds of toxic nitrogen oxide gas created.

Wickham, J. D., et al. 2007. "The effect of Appalachian mountaintop mining on interior forest." Landscape Ecology 22:179-187. Internet website: <http://www.srs.fs.usda.gov/pubs/26001>.

This report uses spatial convolution to identify the effects of mountaintop mining on interior forests.

Wiener, J., et al. 1990. "Partitioning and bioavailability of mercury in an experimentally acidified Wisconsin lake." *Environmental Toxicology and Chemistry* 9:909-918.

Abstract of article that studied the portioning of mercury in a clear water seepage lake in Wisconsin, comparing it to a reference basin. Details the importance of biogeochemical cycling and uptake by fish.

WildEarth Guardians, et al. 2010. Petition for Rulemaking Under the Clean Air Act to List Coal Mines as a Source Category and to Regulate Methane and Other Harmful Air Emissions from Coal Mining Facilities Under Section 111. Denver, Colorado.

This is a petition to the EPA to discharge its duty to confront and control the adverse air quality impacts of coal mines in the United States.

Wilhelm, S. 2014. "Coal trains kill cold trains: Fruit delivery service shuts down as rail congestion heats up." *Puget Sound Business Journal*.

The article discusses congestion on rail lines from coal and oil trains that has forced shutdown of an express rail service transporting fruit in refrigerated cars and is curtailing delivery of produce to the Midwest and East Coast.

Williams-Derry, C. 2016. Unfair Market Value II. Coal Exports and the Value of Federal Coal. Sightline Institute. June 2016.

Report addressing the heavy reliance the coal industry has on federal coal leases that were purchased at low prices and expanding on the opportunity for improvement during the upcoming three-year moratorium on all new federal coal leases. The article concludes that the three-year break in coal leasing will give the government the opportunity to ensure that federal coal leasing policy represents the public interest.

_____. No date. The Rise and Fall of the Asian Coal Bubble. Sightline Institute.

Report from the Sightline Institute with information and analysis on a potential market bubble in the Asian coal market.

Wilson, R., et al. 2015. Analysis of the Tongue River Railroad Draft Environmental Impact Statement. Prepared for Sierra Club and EarthJustice. September 23, 2015.

Report from Synapse Energy Economics, Inc., prepared for Sierra Club and EarthJustice analyzing the Tongue River Railroad Draft Environmental Impact Statement. Addresses the proposed 42-mile rail line on the Powder River to transport coal. Analysis found that the DEIS lacked transparency and verifiable data that become problematic in the public decision-making process. The analysis also found issue with the Surface Transportation Board's conclusions on greenhouse gases and climate impacts of the Tongue River Railroad.

Wong, L. D., D. de Jager, and P. van Breevoot. 2016. The incompatibility of high-efficient coal technology with 2 [degrees] C scenarios. Ecofys. April 2016.

Report examining the move toward a low-carbon economy that would be necessary to limit global warming to stay below 2 degrees Celsius. The report shows that high efficiency, low emissions coal-fired electricity generation is incompatible with the 2 degree goal, while detailing the implications of the 2 degree scenario on coal-fired electricity, comparing IEA World Energy Outlook 2015 to IPCC 2 degree scenarios, and looking at planned coal capacity in relation to the those scenarios. The report details how coal is not compatible with the 2 degree goal, but it does not examine alternatives.

Wood Mackenzie. 2016. Executive Summary: Impact of a Federal Coal Lease Program Reset.

Summary only. Highlights key issues surrounding federal coal leases and draws out implications.

WORC. 2014. Heavy Traffic Ahead, February; Heavy Traffic Still Ahead, July.

Heavy Traffic Still Ahead updates WORC's July 2012 report, Heavy Traffic Ahead, and reevaluates the anticipated increase in coal train traffic in light of the current proposals for new or expanded port facilities in the Pacific Northwest. In addition, the update discusses the combined effects of oil trains traveling from North Dakota over the same routes. The report also identifies impacts on communities along the transport route, consequences for existing rail users, including grain shippers and passenger service, and how coal export could affect rail corridors already near capacity. Both reports are available at <http://heavytrafficahead.org/>.

WORC and Powder River Basin Resource Council. 2015. Letter to BLM on the Buffalo PRMP/EIS.

This letter discusses comments on the proposed Buffalo Field Office Resource Management Plan and EIS. The organizations' comments concern lack of an alternative to encourage reclamation and to disclose impacts of coal and oil and gas exploration, drilling, and export.

WORC, NWF, and NRDC, Undermined Promise II, 2015. Internet website: www.underminedpromise.org.

The report updates the analysis of the status of coal surface mine reclamation in five western states 30 years after passage of the federal Surface Mining Control and Reclamation Act (SMCRA). It includes an overview of the impacts of coal mining and reclamation practices on wildlife and the plants that they depend on and a case study of issues around sage-grouse habitat restoration on mined lands. Coal mining has trended downward since 2008, and there is a growing push for export. Enforcement of SMCRA is crucial to maintain environmental protections.

World Bank Group. No Date. Coal Mining and Production. Internet website: https://www.ifc.org/wps/wcm/connect/79a98080488552b5ac5cfe6a6515bb18/coal_PPAH.pdf?MOD=AJPERES.

This is a report on the coal mining industry, including description and practices, waste characteristics, pollution prevention and control, target pollution loads, emission guidelines, and monitoring and reporting.

World Health Organization. 2007. Exposure to Mercury: A Major Public Health Concern. World Health Organization, Geneva, Switzerland.

This report discusses the sources of mercury pollution and associated health impacts.

_____. 2011. Tackling the Global Clean Air Challenge. World Health Organization, Geneva, Switzerland.

This report details new findings on the health effects of persistently elevated levels of particle pollution.

_____. 2016. Arsenic. World Health Organization, Geneva, Switzerland.

This report discusses the sources of arsenic exposure and associated health effects.

World Resources Institute. 2003. The Greenhouse Gas Protocol for Project Accounting. World Business Council for Sustainable Development.

The protocol provides specific principles and methods for quantifying and reporting greenhouse gas reductions, i.e., the decreases in greenhouse gas emissions, or increases in removals or storage from climate change mitigation projects (greenhouse gas projects).

WWC Engineering. 2010. Wright Area Coal Lease Applications Final Environmental Impact Statement. WWC Engineering, Sheridan, Wyoming.

FEIS assessing the environmental consequences of decisions to hold competitive, sealed-bid sales and issue leases for six federal coal maintenance tracts in Campbell County, Wyoming (the Powder River Basin) as a result of coal lease applications submitted by Ark Land Company, Jacobs Ranch Coal Company, and BTU Western Resources, Inc. As applied for, the Wright area coal lease-by-application tracts include approximately 18,021.73 acres containing approximately 2.570 billion tons of federal coal.

Wyden, R. No date. Fact Sheet: Federal Coal Royalties and Their Impact on Western States.

Fact sheet on royalty revenue collected by the BLM. Contains categories of Wyoming, Montana, Colorado, and Utah, as well as reference tables from Office of Natural Resources Revenue

_____. Various dates. Wyden correspondence, 2013-2014.

Folder containing nine documents with correspondence with Natural Resources Committee, incoming Chairman Ron Wyden.

Wyden, R., and L. Murkowski. 2013. Letter to Ken Salazar, Department of the Interior regarding coal royalties.

The letter writer requests Department of the Interior to provide accounting of violations of law related to royalty payments and steps to be taken to ensure a fair return to the public on coal sold internationally.

Wyoming Department of Environmental Quality. 2016. Permit termination for Medicine Bow Fuel and Power Coal to Liquid Project. July 1, 2016.

Letter from Wyoming Department of Environmental Quality terminating a permit after failure to follow and abide by Industrial Sitting Council order.

_____. 2015. Letter to Alpha Coal West regarding self-bonding.

The letter states that Alpha Coal West does not qualify for self-bonding and needs to substitute corporate sureties or other credit or securities in order to continue business.

Wyoming Mining Association. 2016, The 2015-2016 Concise Guide to Wyoming Coal. 2:4-5

Informational report from the Wyoming Mining Association on Coal detailing coal production, the technology, revenue, and environmental impacts that coal has on Wyoming.

_____. 2016. Internet website: <http://www.wyomingmining.org/economics>.

Website that contains information on the economics of minerals in Wyoming. Main focuses are on severance tax benefits, coals economic impact, and coal mining jobs.

Yager, L. 2009. United States Government Accountability Office, Washington, DC. July 8, 2009.

Letter to the Committee on Finance Chairman Max Baucus regarding how greenhouse gas emissions pricing could affect the international competitiveness of US industries and trade measures being considered as part of proposed US climate change.

Yale University. 2016. Internet website: http://e360.yale.edu/slideshow/loss_of_arctic_sea_ice_already_influencing_weather/74/4/.

Website from Yale reporting on the loss of arctic sea ice and its influence on weather. Provides five weather map diagrams with descriptions of this trend. Fulfills the roll of visual aid for the topic of weather and ice melt from climate change.

Young, P., et al. 2012. "Isocyanic acid in a global chemistry transport model: Tropospheric distribution, budget, and identification of regions with potential health impact." *Journal of Geophysical Research: Atmospheres* 117.

Abstract of article that conducts a study using a global transport model to estimate the distribution of isocyanic acid. This toxic acid can be the result of both anthropogenic and biomass burning sources. With a fixed heterogeneous loss rate the value of tropospheric concentrations were reduced to zero. The article suggests more observational data to evaluate the model.

Yuen, A. 2016. Coal: A Duel Between Policy and Markets. Citi Group Global Markets, Inc., Citi Research.

Report published by Citi Research with a look into the future of the coal industry for investment purposes. Contains data and analysis on future projections for demand on coal.

Zamor, R. M., and G. D. Grossman. 2007. "Turbidity affects foraging success of drift-feeding rosyside dace." *American Fisheries Society* 136:167-176. University of Georgia, Athens.

This article examines the effects of suspended sediment on reactive distance and prey capture success at spring, autumn, and summer temperatures for rosyside dace.

Zimmerman, G., C. Moser, J. Goad, M. Lee-Ashley. 2015. *Ensuring Taxpayers Receive a Fair Share for American's Public Resources*. Center for American Progress. Washington, DC.

This report looks at the return that taxpayers receive from public resources and examines three guiding principles for fair share reforms on public lands.

Zubets-Anderson, A. 2016. *Coal in the 21st Century: Bankruptcy and Financing Rating Agency's Perspective*. Moody's Investor Service.

Ratings report put out by Moody's investor services on the state of coal in the twenty-first century. Headlined by unprecedented market shifts leaving many companies in industry having to declare bankruptcy.

Zukoski, E. 2010. *Comments of Colorado Wild et al. on Federal Coal Lease Modifications COC-1362 and COC-67232*. EarthJustice.

Scoping letter comments submitted to Supervisor Richmond by EarthJustice on behalf of Colorado Wild, Wild Earth Guardians, High Country Citizens' Alliance, Wilderness Workshop, Sierra Club, The Wilderness Society, and Defenders of Wildlife.

_____. *BLM Must Reject Mountain Coal Company's Sep. 2014 Request for Royalty Relief on Federal Coal Leases C-1362 and COC-67232*. EarthJustice.

Letter on behalf of High County Conservation Advocates, Sierra Club, and Wild Earth Guardians urging the Bureau of Land Management to reject Mountain Coal Company's request for royalty relief on federal coal Leases. Letter explains reasons why the organizations are against the request.

_____. *2016. Recent Arch Coal Actions Further Undermine Mountain Coal Company's September 2014 Request for Royalty Relief on Federal Coal Leases C-1362 and COC-67232*. EarthJustice.

Additional information regarding previous letter, "BLM Must Reject Mountain Coal Company's Sep. 2014 Request for Royalty Relief on Federal Coal Leases C-1362 and COC-67232." This information relates to the \$8 million dollars in bonus that Mountain Coal Company had given.
