## **Dairy Farm Labor Issues**

Philip Martin: <u>plmartin@ucdavis.edu</u> January 29, 2017

1. There has been a slowdown in the arrival of newcomers from rural Mexico, contributing to the aging and settlement of the US hired farm work force, which is comprised mostly of unauthorized Mexicans. Most farm workers live in families that often include US-born children, own or rent homes within 25 miles of the farm where they work, and often commute to work in car or van pools.

Farm work traditionally has been a 10-year job rather than a career. With fewer newcomers, and because the average education level is eighth grade, crop workers are getting older at the rate of almost one year each year; they currently are an average 38, versus a median 42 for all US workers. Crop workers have an average 16 years experience.

Farm employers are responding to fewer unauthorized newcomers with 4-S strategies, viz, satisfy current workers to retain them, stretch them with training, mechanical aids, and management changes that raise productivity, substitute machines for workers or switch to less labor-intensive crops, and supplement the current farm workforce with H-2A guest workers, who are most of the new youthful entrants to the farm work force.

2. Five of the 15 NAICS agricultural codes account for over 90 percent of farm worker wages: fruits and nuts, vegetables and melons, horticultural specialties that include flowers, nursery commodities and mushrooms, dairies, and support activities for crop production (mostly FLCs).

The Big 4 dairy states, CA, WI, NY, and ID, account for almost half of the 9.2 million US dairy cows. Some 7,100 US dairies employed an average 103,000 workers at an average wage of \$615 a week in 2015, according to UI data that cover 86 percent of agricultural employment. California accounted for 17 percent of UI-covered dairy employment, Wisconsin 14 percent, New York 7.5 percent, and Idaho 6.6 percent.

Between 2006 and 2016, the number of UI-covered US dairy establishments rose by nine percent to 7,056, employment rose 31 percent to 103,300, and wages paid rose 71 percent to \$3.3 billion.

There were differences among the Big 4 states. In CA, establishments fell by 25 percent, employment was stable, and UI-covered wages rose by 34 percent. In WI, establishments rose by 58 percent, employment rose by 81 percent, and UI-covered wages rose by 145 percent, suggesting an increase in larger dairies subject to UI. In NY, establishments rose 25 percent, employment rose 42 percent, and total wages were up 88 percent, while in ID there was no change in establishments, but employment rose by 23 percent and total wages by 60 percent.

These data mean that some CA dairies covered by UI went out of business over the past decade, the number of UI-covered dairies rose rapidly in WI and slower in NY, and existing UI-covered dairies got larger and hired more workers in ID. Average weekly wages were \$617 in US dairies in 2015, and ranged from a high of \$675 in CA to a low of \$582 in WI; the increase in nominal weekly wages over the past decade was 30 to 35 percent.

In New Mexico, the number of UI-covered dairy establishments fell 13 percent while dairy employment fell only two percent, suggesting fewer and larger dairies. Compared to the Big 4 dairy states, New Mexico has the lowest average weekly dairy wages, \$570 in 2015, and the slowest growth in dairy wages over the past decade.

For all private sector workers, establishments rose nine percent, employment rose nine percent, wages rose 31 percent, and average weekly wages rose 25 percent, that is, UI-covered dairy employment, total wages, and average weekly wages rose more in dairy, 30 percent, than for all US private sector workers, 25 percent. The average dairy wage of \$617 a week was 61 percent of the average \$1,017 of all private-sector workers.

3. If the immigration status quo persists, most US farm workers of tomorrow are growing up today outside the US. How many foreign workers will be needed in US agriculture, and how will US farm employers gain access to them?

Current workers can be satisfied and retained by improving supervision and training, raising wages and improving benefits, or offering bonuses. Stretching workers means raising their productivity, often with mechanical aids or training. The "low-hanging fruit" on stretching mechanisms may already be in place after five years of fewer newcomers and rising minimum wages.

Substituting machines for workers can be complex, especially if a systems approach that involves major changes in production practices is required of all farmers simultaneously, as when all farmers must switch from delivering milk in cans to storing milk in bulk tanks for pick up. At such critical junctures, smaller producers must decide whether to "get big or get out" of a particular commodity because of the additional investment required. Adopting robotic milking systems is an example of such a critical juncture that could arise from rising labor costs.

Supplementing the dairy workforce with legal guest workers could largely preserve the status quo, albeit with potential differences in worker country of origin, as with the Indians in Italian dairies and Filipinos in NZ dairies. The current H-2A program normally restricts guest worker employment to seasonal farm jobs lasting less than 10 months, with the exception of sheepherding, which permits three-year H-2A visas. Allowing dairies that

offer year-round jobs to employ H-2A workers could shift the focus of recruitment away from Mexico.

## **Questions**

- 1. Unlike much of crop ag, where the demand for hired labor has been rising in berries and other commodities even as the supply of new workers shrank, the number of milk cows in the US has been relatively stable at 9.2 million. Does the increase in dairy employment reflect fewer and larger dairies that rely more on hired workers, as in WI and NM?
- 2. What is an average ratio of cows to workers (reports suggest a 50 to 79 cows per worker, so that a 1,000 cow dairy would have 15 to 20 employees)? What are the risks to producers who expand their herds and rely more on hired workers at a time of low milk prices? Can these dairies attract seasonal farm workers with year-round work and housing on the farm? If labor costs for dairies rise, can higher labor costs be offset with improved productivity or other changes to production practices?
- 3. Some 165,700 farm jobs were certified to be filled with H-2A workers in FY16, almost three times more than the 59,100 certified in FY06. Jobs filled by H-2A workers must be seasonal, generally lasting for less than 10 months, with an exception for sheepherders who can stay three years. If the H-2A program were changed to allow dairies to employ guest workers for three years, would farm employers ask supervisors and current workers to refer friends and relatives at home who are good workers to fill vacant jobs, or would they encourage current unauthorized to go home and return as H-2A workers? Would current workers want to take the risk of being denied re-entry?
- 4. If immigration enforcement were increased, there would likely be more audits of the I-9 forms completed by newly hired workers and their employers, and perhaps a requirement to use the E-Verify system to check the legal status of new hires, but employers may not have to use E-Verify to check current employees. How would E-Verify affect dairy employers, that is, how much turnover and new hiring is there?
- 5. How different is dairy from other ag? The number of H-2A guest workers in sheepherding is small, under 5,000, even the largest sheep employers rarely have more than 10 guest workers, and there is relatively little coming and going of workers. Crop farms, by contrast, may have several thousand H-2A workers, with new arrivals weekly until a peak period of employment. What are likely patterns of guest worker employment on mega- and smaller dairies?
