How to Read Crosstables: In the example chart (left), rows represent the three possible response options to the question “All in all, do you think things are headed in the right direction, or are things pretty much on the wrong track?” The three response options are: “right direction,” “wrong track,” and “don’t know.” The amounts in each response category sum to the amount in the “total” row at the top of the table.

The first column, or banner, is the “Total” column. It reflects the overall results.

The next two columns reflect the results of a subgroup, “Gender.” The gender subgroup is composed of Males and Females, each with their own column. Both gender groups are assigned a letter (Male=B, Female=C).

These two columns show how males’ attitudes compare to females’ attitudes. As shown in the chart, 69% of the full sample thinks things are headed in the right direction. Looking at the gender subgroup, 71% of women think things are headed in the right direction, compared to 66% of men.

Statistically Significant Differences: If a pair of cells has a difference which is statistically significant, the larger of the two cells is flagged with the letter of the opposite column. The test shows the difference in females’ attitudes about things being headed in the right direction is statistically

significantly different than those of males’, which is signified by a “B” (the letter given to Males) next to females’ results for “right direction.”

The footnote indicates the level of significance (sig=.05). This level of significance means that 5% of the time, the difference between how the two groups feel about the direction is due to random chance, while 95% of the time the difference is meaningful.

Statement of Limitations: Any sampling of opinions or attitudes is subject to a margin of error, which represents the difference between a sample of a given population and the total population. The margin of error is a statistic expressing the amount of random sampling error in a survey’s results and differs by sample size, as reflected in the table below.

Margin of Error Based on Sample Size

N=1200	N=1000	N=800	N=600	N=500	N=400	N=300	N=200	N=150	N=100	N=50
+/- 2.8%	+/- 3.1%	+/- 3.5%	+/- 4.0%	+/- 4.4%	+/- 4.9%	+/- 5.7%	+/- 6.9%	+/- 8.0%	+/- 9.8%	+/- 13.8%

Q2. In which area of Portland do you live?

Q65. Which of the following comes closest to your own views on homelessness, even if neither is exactly right?

- The number of those experiencing homelessness in Portland is directly related to the cost of housing. Policies that focus on making housing more affordable for people with low incomes or people struggling with addiction or mental health problems are the best way to reduce homelessness in the state.
- Homelessness in Portland is best viewed as a separate issue from affordable housing. Policies that focus on making housing more affordable will not be as effective as those aimed at alleviating the real root causes of homelessness, such as drug addiction and mental health issues.

Q66. Which of the following comes closest to your own views on homelessness, even if neither is exactly right?

- a. Homelessness is a solvable problem in Portland. There are things we can change about our city to end it completely.
- b. Homelessness is an intractable problem in Portland. Even if we make changes to our city, there will still be some people who are homeless.
