Executive Summary

In an effort to more strategically build Texas' foster care capacity, the Department of Family and Protective Services (DFPS) will produce an annual foster care needs assessment. This assessment includes an analysis of two years of historical foster care placement activity to understand how the system has performed in the past, along with a forecast of foster care placement demand for fiscal year 2017-2018. The analysis helped to identify patterns and develop the methods for how need can be calculated. DFPS can use the forecast to more specifically estimate local area capacity need using the methods established by the analysis and what was learned about supply in each area.

The general logic used to calculate "capacity need" in this report is the number of placements that were made in a county or region during a set time period (supply) minus the number of placements needed for children from the county or region during the same time period (demand). A substantive negative calculation denotes missing capacity, a positive oversupply. The calculation is built on the logic that a county or region would use all placement supply to serve children from the county or region. This is the logic DFPS used to produce the occupancy analysis in spring 2016. The occupancy analysis provided preliminary data that was immediately shared with regional stakeholders.

DFPS made three key analytic modifications to improve upon the original logic for this needs assessment, in addition to securing the forecasted data:

1. The occupancy analysis used data counting all children in foster care placement at a point in time. The current analysis and forecast is based on the total number of placements opened for children during a fiscal year. This approach enables DFPS to communicate the total placement need for the children flowing through the system in a fiscal year. Conversely, the point in time approach counts children who did not experience a need for a new placement and underrepresents demand due to removals and placement changes.
2. The original calculation of capacity need, while valuable, does not account for the reality of placements in neighboring counties that may in fact be close to home, but are across county and/or regional lines. The current analysis addresses this in two ways. First, data is provided on the percentage of placements in county or contiguous counties to assess how areas keep children close to home by sharing resources. Second, DFPS produced an adjusted calculation of capacity need that allows for resource sharing across county or regional lines, if a placement is made in a county contiguous to the child's legal county.
3. There is a need to better understand the specific kind of capacity that is available in a county or region according to historical placements, and whether the supply matches local needs. Data was therefore analyzed by placement type, age, and assigned level of care. By understanding the specific types of supply that are missing, an area can work to either adapt the existing capacity or build new capacity to meet the need.

The report consists of data maps and tables that can be used together to investigate capacity needs in a county or region. The following points offer an initial analysis. More study and input is needed from local

stakeholders within CPS, the provider community, and from advocates to continue to understand capacity needs.

1. Regions 2 (Abilene), Region 4 (Tyler), Region 9 (Midland/Odessa), and Region 11A (Corpus Christi) are clear areas of the state for whom foster care capacity is needed at all ages and authorized service levels, and for whom sharing with neighboring catchments has not been a solution.
2. Region 1 (Amarillo/Lubbock), Region 5 (Nacogdoches), Region 10 (El Paso), and Region 11B (Brownsville) have an appearance of foster care capacity at the catchment level, but are missing capacity for specific ages and authorized service levels which are unique to each area. To place more children close to home, existing capacity needs to be developed to better match placement demand or new supply needs to be created.
3. Capacity deficits in the larger urban centers of 6A (Houston), 7B (Austin) and 8A (San Antonio) are supported by corresponding surpluses in the surrounding county catchments of 6B, 7A, and 8B. While resource sharing works to some extent, a greater development of foster care capacity in the urban centers would allow more children to be placed closer to home and for counties on the farther outskirts of the supplying catchments (6B, 7A, 8B) to participate in more resource sharing. The creation of new resource hubs may also be considered.
4. 3A (Denton), 3B (Fort Worth) and 3C (Dallas) participate in a similar resource sharing relationship, with 3C as the greater supplier of capacity for the area. The Foster Care Redesign Single Source Continuum Contractor is responsible for developing foster care network resources in 3B.
5. Regions 6 (Houston), 7(Austin), and 8 (San Antonio) supply the majority of residential treatment services for the state.

As with many states, DFPS is experiencing difficulty securing and maintaining placement resources for children. This data presents the opportunity to more strategically plan where to develop new capacity to keep children closer to home in placements that meet their needs.

Introduction

DFPS is engaged in multiple initiatives to improve foster care quality and capacity in Texas. Among these is an annual foster care needs assessment to better understand and communicate foster care placement need statewide. This needs assessment includes an analysis of historical placement activity. The analysis used data from fiscal years 2015-16 to identify placement patterns and show where capacity is most needed in order to target recruitment to those areas. The assessment also includes a forecast for fiscal year 2017 and 2018 projecting specific foster care placement need by age and placement type based on changing demand. The forecast is based on 5 years of historical placement data from fiscal year 2012 to 2016. DFPS can use the analysis and forecast data to both purchase and reshape foster care capacity to meet children’s needs.

Methodology

Point-in-Time Caseload v. Flow Approach

The underlying data used for the assessment is the number of placements secured for children in foster homes and other foster care settings detailed in the next section. Every new placement a child needed during these years is captured along with the child’s age and authorized service level at the time the placement was opened. For example, if an 8-year old child was placed in an emergency shelter and then moved to a foster home, both placements are counted along with the child’s service level. The record would show the need for one basic emergency shelter placement for an 8 year-old and one moderate level foster home placement for an 8 year-old.

This approach defines placement need by the volume of children flowing through the system in a fiscal year rather than the more commonly used definition of need as an average count of children in foster care at a “point in time.” In the “point in time” approach children in foster care who do not experience the need for a new placement during a fiscal year are counted, and children experiencing placement changes are underrepresented. The “flow” approach has the advantage of enabling DFPS to communicate to providers the volume of new placement requests (demand for placements due to removals and placement changes) they can expect for children from their area in a fiscal year, along with anticipated ages and service level need. The following comparison further describes the difference.

Children served at point in time	All placements made over set time period
<ul style="list-style-type: none"> • Children who have been in care during the year but are not in care on the evaluated day are not counted. • Children experiencing multiple placements during the year have only their current placement counted. • Age and level of care is calculated on the point in time day which could be any day in the cycle of the placement. 	<ul style="list-style-type: none"> • All initial foster care placements of children newly entering care during the period are counted. • All new placements of children experiencing a change or disruption during the period are counted. • Placements made before the period are not counted. (But would be captured in a prior period.)

Children served at point in time	All placements made over set time period
	<ul style="list-style-type: none"> • Placements that are stable for the whole period are not counted. • Age and service level are measured at the time of each placement opening.

Input from stakeholders will support the continuance of this approach. Future assessments may break down placement demand into the proportion of children that are newly entering care and those experiencing disruptions. Making this distinction will help more effectively target placement capacity needs for the disruption population and adjust the overall assessment of capacity need if disruption rates are lowered.

Exclusions from Total Placement Flow Counts

The historical analysis focused on two placement goals: providing quality foster homes for children needing out of home care and providing residential treatment for children with more intensive service needs. The goal of the analysis is to understand historical patterns of placement supply for these two placement types to support long term planning for capacity building. The historic analysis uses the counts of foster home, General Residential Organization (GRO) basic child care facility and GRO residential treatment center (RTC) facility placements. Foster homes include basic and therapeutic foster homes and foster group homesⁱ. Though not part of the analysis, the forecasted data includes shelter placement counts and can be used to better distribute or grow emergency shelter supply or to shift some of this need to growth in foster home placements.

At any point in time children can be in a variety of other temporary placement settings, such as intensive psychiatric treatment programs and juvenile detention centers. A very small number of children are in placements offered through other state agencies, such as the Department of State Health Services, and the Department of Aging and Disability Services. There are also a small number of children with very high needs that require a child specific contract, often with a provider who is outside of the current contracted foster care system. None of these placement types were included in the historical analysis of total capacity need. Placement in verified kinship homes were also excluded as capacity that was available only for a specific child.

Region 3B is excluded from the analysis and forecast. Foster Care Redesign was implemented in Region 3B in fiscal year 2015. The Foster Care Redesign Single Source Continuum Contractor (SSCC) is responsible for developing the network of residential child care capacity to meet local placement need. Foster Care Redesign does not use the service level system and this data is no longer recorded in IMPACT. Foster Care Redesign also uses a more precise definition of children placed within 50 miles to measure placement of children close to home.

Defining Capacity Need

Capacity need is presented for county and regional catchment areas, as currently defined by Foster Care Redesign.ⁱⁱ Each of the tables and maps presented in the report uses as the basic calculation for “capacity

need” the number of placements that were made in the county or catchment during the two year period (supply) minus the number of placements needed for children from the legal county or catchment during the two year period (demand). In the current system, children may be placed in foster care in any of the 11 DFPS regions. As such, demand is the combined foster care needs for children from a county or regional catchment regardless of where they are placed. Supply is the foster care placements that are being provided to children from any region in the region or county being examined.

A negative number for “capacity need” on maps or in tables denotes that there is missing capacity to support local demand. A positive number denotes more placement supply than needed for children from that area. Note that there is not an excess of supply at the state level. All supply is being used. In addition, some fluctuation is expected. The significance of the need or oversupply must be considered against the size of the demand. For example, a county showing a capacity need of -71 in a table, means that over the last two years if every provider in the county that took a new placement had only taken children from that county, 71 placements would still have to be made outside the county. In other words, to meet the full county demand, capacity would need to be built to support a minimum of 71 more placements being made over a 2 year period. The significance of this need is different for an area whose total demand is 200 children versus 1000 children.

This calculation of capacity need is based on the assumption that local providers would use 100% of homes for children from their county or regional catchment. At the practical level, however, there are several reasons to believe that local providers will still need to accommodate placements for children outside their county or catchment. Due to the timing of events, a local provider may not have an opening at the moment there is a need. The closest available provider for a child may in fact be just across a county or catchment area border. The child may have a unique placement need such as proximity to a grandparent or for specialized medical or therapeutic care provided by a unique provider.

An adjusted definition of capacity need was created to allow for some cross county or catchment sharing of supply. The assumption for the adjusted measure is that a local area would share supply with children placed in their county or region from a contiguous county. The adjusted capacity need calculation equals the adjusted supply (children placed from outside of county/region and contiguous county) minus the adjusted demand (placements of local children made farther out). The data in this report present both representations of capacity need referenced as “capacity need” and “adjusted capacity need.”

Categorizing Need

While the analysis shows the reality and benefit of resource sharing, the ability to access all of the state’s resources to meet placement demand has led some areas to develop capacity in response to statewide needs rather than to local needs. An important question, then, is whether supply that exists in a catchment area matches local demand. To identify the specific types of foster care placements available and missing at a local level, the data is broken down into the following categories: placement type, age, and authorized service level.

Placement Type

There are three placement type categories:

1. “Foster Homes” is the combined total of foster homes, foster group homes and GRO basic child care facility placements (FH). These placements were combined recognizing that they provide capacity for the same types of children, that is, children of all ages who have basic needs or therapeutic needs that do not rise to the level of needing residential treatment.
2. Residential Treatment Facilities (RTC).
3. Emergency Shelters. (Included in the forecast in Part 2)

Age

Age is grouped into three categories:

1. Children age 5 or under at the time of placement (Preschoolers)
2. Children over 5 and under 14 at the time of placement (School Age)
3. Youth age 14 or older at the time of placement (Teens)

Authorized Service Level

DFPS authorizes four service levels (ASL) for payment: Basic, Moderate, Specialized, and Intense. DFPS also tracks the final billed service level, which can differ. Detailed descriptions of service levels can be found in this [resource guide](#). To simplify, the authorized service levels for a child at placement were grouped into two levels for part of this report:

1. Basic
2. Therapeutic (moderate, specialized and intense combined).

Placements in the data with no ASL for a child were excluded from maps and tables. Region 3B operates outside the service level system under the Foster Care Redesign model. The data is therefore not presented for 3B. In addition, supply data in Regions 3A and 3C is impacted by children placed from 3B. Capacity need for 3A and 3C is described by age.

Geographic Proximity

DFPS considered several ways of measuring geographic proximity as an indicator of how close a child is placed to their home community. Data is provided for the following three different indicators:

1. The placement is in the child’s legal county.
2. The placement is outside the legal county but in a county contiguous to the legal county. Contiguous counties were identified as those counties that border (immediately touch) or circumference (surround but may not touch due to being slightly offset) a county. An example of offset counties considered to be contiguous to one another is Lamb and Swisher Counties in Region 1.
3. The placement is in the legal catchment area. This would include the legal county as well as all the counties in the catchment area but not contiguous counties outside the catchment area.

Using Maps and Tables

Due to the nuanced nature of defining missing capacity, this report offers a number of maps and tables that can be used together to get a picture of capacity need in a county or regional catchment.

The maps and tables were developed to answer the following questions:

- How is foster care demand distributed across the state?
- Which areas of the state have supply (or oversupply) to meet placement demand and which areas are lacking?
- What kinds of placements (placement types, ages, and service levels) are missing in each area?
- How do counties work together to share foster care resources?
- Where should DFPS target resources to develop foster care supply?

Data used for the maps is based on total placements during fiscal years 2015-16. Tables containing the supporting data for maps are noted. Counties shaded gray denote no children needed placement and no children were placed in the county. 3B counties (Erath, Hood, Johnson, Palo Pinto, Parker, Somervell, and Tarrant), are also shaded gray due to exclusion from the report. Other shaded colors are as noted in the key.

- Map 1 shows FH demand, including the proportion of need that is for therapeutic levels of care. (Table 3).
- Map 2 shows the percentage of FH placements of children from a county in the county or in a contiguous county (Table 4). Data on children placed in county or contiguous county is another way to help ameliorate the problem of calculating capacity need based on geography which does not account for sharing of resources across regional lines. This approach aligns with the Foster Care Redesign goal of placing children within 50 miles rather than within stringent county or regional boundaries.
- Map 3 shows county level FH capacity need (Table 3). Blue indicates counties with oversupply and red indicates counties with undersupply.
- Map 4 shows county level FH adjusted capacity need, which recognizes placements across county lines but in contiguous counties as potentially appropriate sharing of resources to maintain children close to home. (Table 3)
- Map 5 shows county level capacity need for RTCs (Table 3). The map shows the need for residential treatment capacity across the state and the areas of the state supporting supply. Blue indicates counties with oversupply and red indicates counties with undersupply.

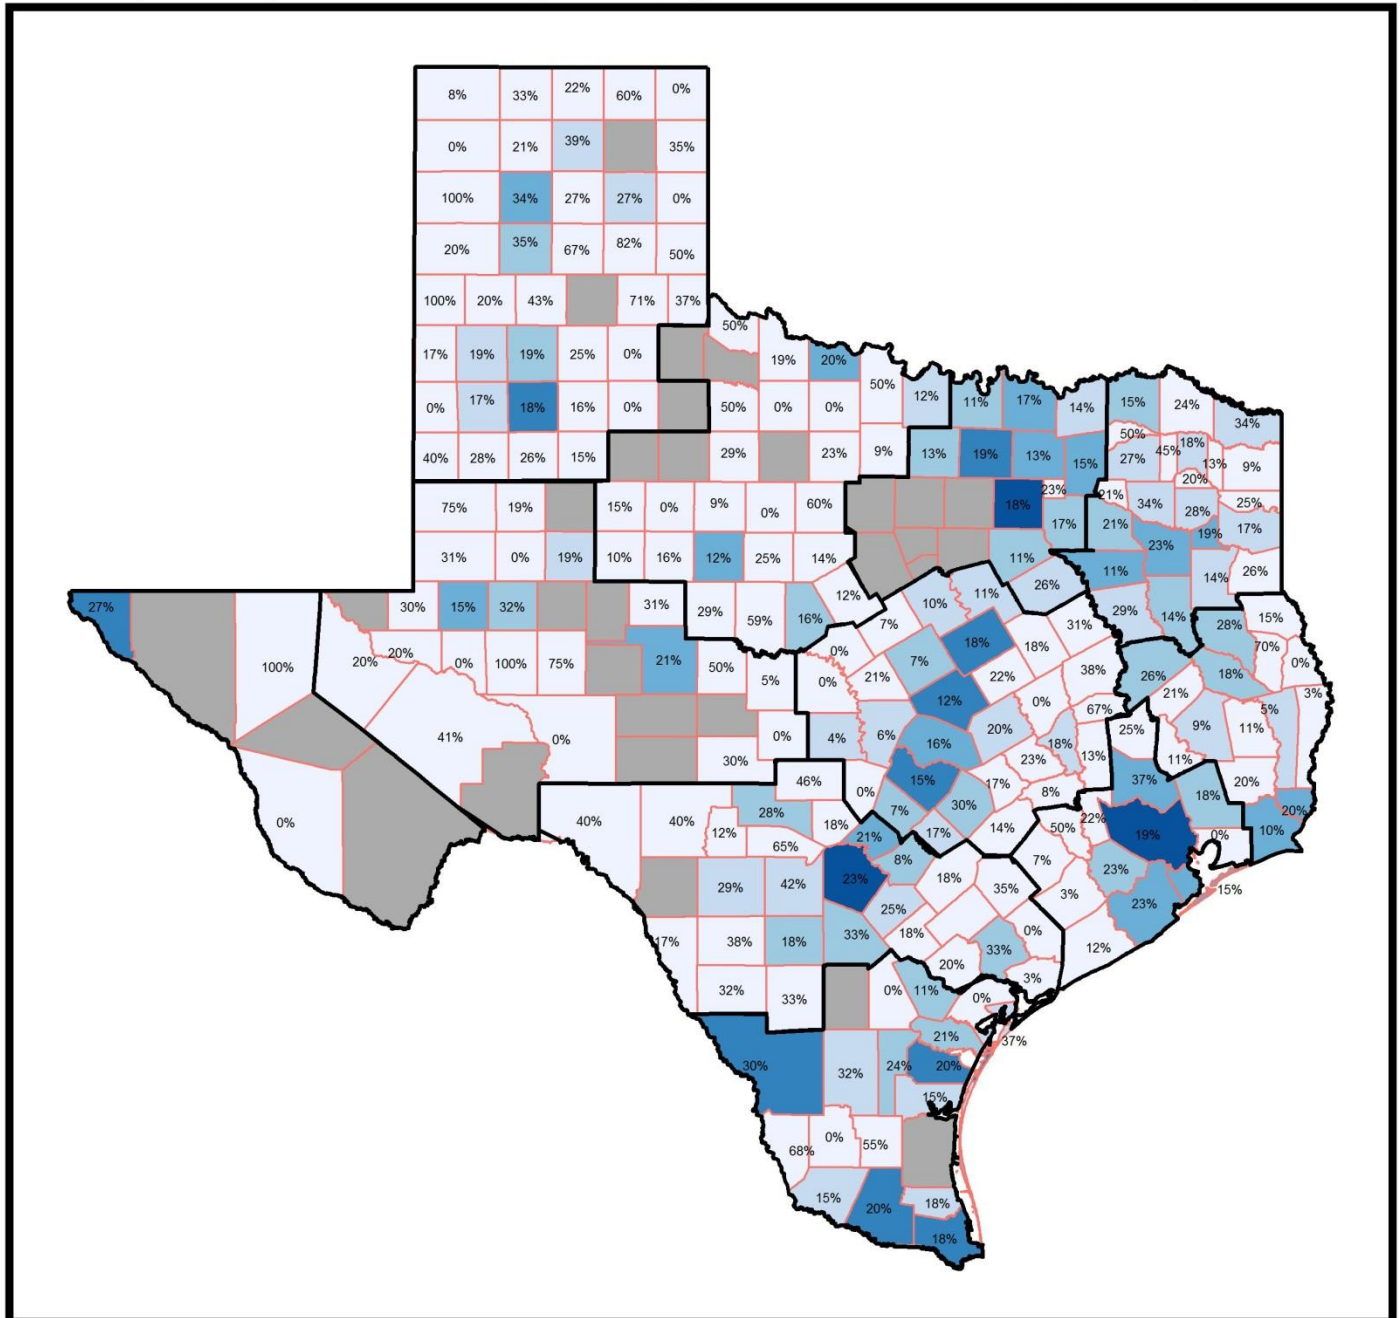

In addition to the two county level data tables, two additional tables provide catchment level supporting data:

- Table 1. FH and RTC Capacity Need, FY 15-16, by Catchment
- Table 2. Age and ASL for Capacity Need (FH and RTC combined), FY 15-16, by Catchment
- Table 3. FH and RTC Capacity Need, FY15-16, by County
- Table 4. FH Geographic Proximity, FY15-16, by County

Catchment Data Tables

As a part of Foster Care Redesign, DFPS solicited input from over 3,000 stakeholders in an effort to improve the quality of care and availability of capacity across the state. The information gathered from stakeholders informed the division of the state into 17 distinct geographic catchment areas.

Catchment	County Name
1	Armstrong, Bailey, Briscoe, Carson, Castro, Childress, Cochran, Collingsworth, Crosby, Dallam, Deaf Smith, Dickens, Donley, Floyd, Garza, Gray, Hale, Hall, Hansford, Hartley, Hemphill, Hockley, Hutchinson, King, Lamb, Lipscomb, Lubbock, Lynn, Moore, Motley, Ochiltree, Oldham, Parmer, Potter, Randall, Robert, Sherman, Swisher, Terry, Wheeler, Yoakum
2	Archer, Baylor, Brown, Callahan, Clay, Coleman, Comanche, Cottle, Eastland, Fisher, Foard, Hardeman, Haskell, Jack, Jones, Kent, Knox, Mitchell, Montague, Nolan, Runnels, Scurry, Shackelford, Stephens, Stonewall, Taylor, Throckmorton, Wichita, Wilbarger, Young
3A	Collin, Cooke, Denton, Fannin, Grayson, Hunt, Wise
3B	Erath, Hood, Johnson, Palo Pinto, Parker, Somervell, Tarrant
3C	Rockwall, Dallas, Ellis, Kaufman, Navarro
4	Anderson, Bowie, Camp, Cass, Cherokee, Delta, Franklin, Gregg, Harrison, Henderson, Hopkins, Lamar, Marion, Morris, Panola, Rains, Red, River, Rusk, Smith, Titus, Upshur, Van Zandt, Wood
5	Angelina, Hardin, Houston, Jasper, Jefferson, Nacogdoches, Newton, Orange, Polk, Sabine, San Augustine, San Jacinto, Shelby, Trinity, Tyler
6A	Harris
6B	Austin, Brazoria, Chambers, Colorado, Fort Bend, Galveston, Liberty, Matagorda, Montgomery, Walker, Waller, Wharton
7A	Bell, Bosque, Brazos, Coryell, Falls, Freestone, Grimes, Hamilton, Hill, Lampasas, Leon, Limestone, Llano, Madison, McLennan, Milam, Mills, Robertson, San Saba, Williamson
7B	Bastrop, Blanco, Burleson, Burnet, Caldwell, Fayette, Hays, Lee, Travis, Washington
8.1	Bexar
8B	Atascosa, Bandera, Calhoun, Comal, De Witt, Dimmit, Edwards Frio, Gillespie, Goliad, Gonzales, Guadalupe, Jackson, Karnes, Kendall, Kerr, Kinney, La Salle, Lavaca, Maverick, Medina, Real, Uvalde, Val Verde, Victoria, Wilson, Zavala
9	Andrews, Borden, Coke, Concho, Crane, Crockett, Dawson, Ector, Gaines, Glasscock, Howard, Irion, Kimble, Loving, Martin, Mason, McCulloch, Menard, Midland, Pecos, Reagan, Reeves, Schleicher, Sterling, Sutton, Terrell, Tom Green, Upton, Ward, Winkler
10	Brewster, Culberson, El Paso, Hudspeth, Jeff Davis, Presidio
11A	Aransas, Bee, Brooks, Duval, Jim Wells, Kenedy, Kleberg, Live Oak, McMullen, Nueces, Refugio, San Patricio, Webb
11B	Cameron, Hidalgo, Jim Hogg, Starr, Willacy, Zapata

*RTC Supply Counts of 1 are likely errors, with placements such as state schools, juvenile justice settings misidentified as RTCs

Table 4. Geographic Proximity of Foster Home and Basic Childcare Facility Placements (FH), FY15-16, by County

This table shows the supporting data for Map 2. Placements in County or Contiguous County, along with two other measures of geographic proximity: placements in county and placements in catchment.

Historical Placement Analysis Findings

The following points offer an initial analysis. More study and input is needed from local stakeholders within CPS, the provider community, and from advocates to continue to understand foster care capacity needs.

1. There are clear areas of the state lacking both foster home and residential treatment capacity.

Regions with overall need are: 2 (Abilene), 4 (Tyler), 9 (Midland/Odessa), and 11A (Corpus Christi). For these regions, the adjusted calculation of capacity need to recognize children placed in contiguous counties does little to improve the picture of missing capacity (Table 1). Further, the regions are missing supply at all age groups categories and authorized service levels, i.e. they have no significant oversupply at any of the subgroup levels (Table 2).

At the county level, there are pockets of supply with sharing occurring in each region, however the supply is not enough to buoy the entire region and avoid placing children further out of area.

- In Region 2, Brown, Callahan, Comanche, and Young counties have the most overcapacity while Taylor, Wichita and Nolan are more severely under capacity (Map 3). Map 4 shows that some sharing of the oversupply helps immediate surrounding counties. However the oversupply is not enough to carry the area. For example, when adjusted for sharing, capacity need for Taylor is lower but Callahan as a result of sharing, now shows a need.
- In Region 4, Smith and Harrison have oversupply while their surrounding counties have an undersupply. When adjusted for sharing, the region 4 county oversupply disappears (Map 4). The 6 neediest counties in the region all hover around or below 50% in county or contiguous county (Map 2).
- In Region 9, Midland has an oversupply while Ector right next door has an undersupply, perhaps in part due to its greater demand. (Map 4). Both counties have fewer than 50% of placements in county or contiguous county as shown on Map 2. Midland either does not have enough supply, or enough of the right kinds of supply to support its own need and that of its neighbor.
- Region 11A has no counties with oversupply.

RTC capacity is limited in these areas as well. The same counties demonstrating more foster home supply demonstrate RTC supply, but more is needed to provide treatment for children in the catchments close to home.

2. Several catchment areas show mixed supply and specific population needs.

While some regions have a clear undersupply in all areas, some have specific areas of missing capacity. This is the case of Region 1 (Amarillo/Lubbock), Region 5 (Nacogdoches), Region 10 (El Paso), and Region 11B (Brownsville). An overall appearance of FH capacity at the regional catchment level (Table 1) belies that oversupply in some age and ASL categories makes up for undersupply in other age and ASL groups (Table 2). This is significant because it means that existing FH capacity in the regions, if reserved for children from the catchment, would not match placement demand. In addition, in these regions, the adjusted capacity need does not differ significantly from the capacity need suggesting the regions are

not improving FH capacity through sharing. At the broadest level, all three are missing RTC capacity (Table 1). The need for specific age/ ASL groupings is as follows:

- Region 1 is missing capacity for teens at all authorized service levels indicating a need for both foster home and RTC capacity. Existing capacity leans toward the lower service levels with more need for therapeutic placements overall.
- Region 5 is missing supply at polar ends with a need for basic homes for preschool children and specialized and intense homes for teenagers. Supply is made up in the middle.
- Region 10 shows the highest need for placements for teens. Specialized placements for school aged children are also a need. Existing supply is geared toward preschool and lower level service school age children.
- Region 11B (Brownsville) has a significant oversupply of foster homes, but is included here due to its specific need for specialized and intense level placements for teens and inability to share with neighboring areas to improve capacity. Accessing more of its own supply or that of its immediate neighbors is not a solution for 11B to meet the needs of teens and children with more intense service needs.

3. There is a unique sharing relationship between large urban centers and surrounding neighboring counties which requires the use of an adjusted capacity measure.

Regions 6, 7, and 8 on the whole show an ability to meet local demand with supply. However, when capacity need is broken down by regional catchments as in this report, the story changes to show FH capacity deficits in the urban centers of 6A (Houston), 7B (Austin), and 8A (San Antonio) and surpluses in the bordering counties that make up 6B, 7A, and 8B (Table 1). For example, in Region 7, catchment 7A shows a FH surplus (+524) and catchment 7B a deficit (-425) that closely mirror one another. Map 2 shows a high percentage of children in their legal county or a contiguous county leading to the positive outcome of large numbers of children being placed close to home albeit across catchment lines.

The high level of supply sharing in these areas required a more accurate indicator of capacity need. The adjusted “supply minus demand” calculation of capacity need eliminates placements in contiguous county from the calculation for capacity need. Missing capacity is for children who had to be placed outside of their catchment or a county next to their legal county that may be out of catchment, but is potentially within 50 miles. This calculation dramatically shrinks the missing FH capacity for 6A and 8A turning it to oversupply and 7B shows a less significant FH need (Table 1).

This adjusted capacity need calculation suggests the following capacity needs in Regions 6, 7, and 8:

- Region 6A and 6B show surplus capacity in all age and ASL grouping (Table 2). This does not change when looking at the adjusted capacity indicator at the county level. The issue seems to be strictly a resource sharing issue with Colorado, Wharton, Matagorda and Chambers not sharing in the resource distribution (Map 4, Table 4). This is especially curious for Wharton and Matagorda as

neighboring Fort Bend and Brazoria counties have large oversupply even when adjusted for sharing with Houston.

- Regions 7A and 7B when need is adjusted for sharing show an evening out of FH capacity with 7A showing less of a surplus and 7B showing much less need. One subgroup, however, that shows a need in both 7A and 7B is teens at the Intense level of care (Table 2). While both Catchments appear to have RTC capacity, capacity for this age and need level is missing. There also seem to be some uneven geographical distribution of supply (Map 4, Table 4). McLennan County shows particular capacity need.
- Map 3 shows that in 8B, the surplus is concentrated in the counties north of San Antonio. Map 4 shows that most of the surplus is going to San Antonio as shared supply. The counties to the south and west of San Antonio, however, still have a significant capacity shortage as well as Victoria to the east. Table 2 shows that 8B by allowing 8A access to homes now shows a change from a surplus to a shortage in basic homes for preschoolers and for moderate levels at all ages.

This data shows some benefits to resource sharing. Urban centers are able to rely on neighboring counties more able to grow foster home supply. However, this sharing results in less ability for those same neighboring counties to share surplus across the catchment. A greater development of homes within the urban centers could allow the surrounding counties to share resources with the more rural counties further out. Another approach may be strategic development of resource hubs in the outer areas.

4. Region 3A, 3B, and 3C also reflect resource sharing.

Deciding how to most effectively promote and monitor capacity for catchments with high levels of resource sharing is a critical task given the State's commitment to improving services for children in the context of Foster Care Redesign. The Foster Care Redesign model seeks to build supply as close to home as possible, within 50 miles. This requires a balance of resource sharing and reservation.

Region 3B (Fort Worth) began serving children under a Foster Care Redesign model in fiscal year 2015. The Foster Care Redesign SSCC produces its own data on children placed in close proximity and has shown improvement in developing capacity to place children closer to home. 3A (Denton) and 3C (Dallas) were limited in their access to 3B placement capacity once Foster Care Redesign began. The percentage of placements made in 3B for children from 3A and 3C dropped to less than 1% in FY16. While 3A and 3C necessarily began to rely on one another and surrounding county areas more, 3A and 3C, too, have begun placing more children in catchment (Map 2).

3A, 3B and 3C participate in a similar resource sharing relationship as Regions 6,7, and 8, with 3C as the greater supplier of capacity for the area (Table 1). Foster Care Redesign does not use assigned service levels and therefore supply data for 3A and 3B is best assessed by age due to the number of placements from 3B with no service level. (Table 3.) Region 3A needs capacity for all ages. Sharing with 3C does not ameliorate the need. Region 3C remains over capacity for preschool and school age children even when sharing is taken into account, but is missing supply for older youth, likely at high service levels. The Foster Care Redesign Single Source Continuum Contractor is responsible for identifying need and

developing foster care network resources in 3B. Region 3 as a whole is notably low in residential treatment resources with only Hunt in 3A showing a small amount of additional supply available to the region (Map 5).

5. Residential treatment capacity is concentrated in limited areas of the state.

Map 5, supported by Table 1, shows that all areas of the state are low in RTC capacity except for regions 6, 7 and 8. Counties in these three regions supply the majority of residential treatment services for the state. In Region 6, Harris alone supplied 1,361 RTC placements, Fort Bend 383, and Austin 265. In Region 8, Bexar supplied 606 RTC placements and Comal 232. The top need for RTC is found in Region 3 Tarrant (-274), Dallas (-190), Johnson (-95), and Collin(-60). El Paso in Region 10 also has a need (-112). Nueces (-90) in Region 11A and Hidalgo (-87) in Region 11B also demonstrate need. Region 7 shows a deficit of capacity in the Bell (-92), Williamson (-60), and Travis (-32) corridor, but with capacity in the outer parts of the catchment in Falls, Hays and Caldwell counties that support demand.

Fiscal Year 2017 Foster Care Placement Forecast

DFPS is charged with conducting a formal statewide needs assessment to determine an adequate placement array, including by number, geographic distribution, and placement type. DFPS worked with HHSC to produce a forecast of total annual placements needed in every catchment at each placement type (Foster Home, Basic Childcare Facility, Residential Treatment Center, and Emergency Shelter). The forecast was produced based on five years of monthly historical placement data from fiscal years 2012 to 2016.

Forecasted data is presented in the following tables:

- Table 5. combines the forecasted foster home and GRO basic child care facility placements for fiscal years 2017-18 and compares to fiscal year 2015-2016 supply to calculate capacity need and adjusted capacity need as in the needs analysis (See pages 7-8). The same calculation is made for RTC forecasted supply and demand.
- Table 6. shows the forecasted data including breakdown by age as defined in the analysis (preschool, school age, teen) and assigned service level (Basic, Moderate, Specialized, Intense).
- Table 7. Presents forecast for shelter demand.

Some totals may appear greater than the sum of counts shown due to rounding.

DFPS will use the forecast capacity need to more strategically purchase capacity. In some cases, DFPS may want to purchase supply to change rather than respond to forecast need. For example, an area may want to build more foster homes for younger children as an immediate placement rather than build emergency shelter supply. DFPS has developed an Excel format tool to incorporate such adjustments. The tool relies on decisions that must be made at the local level based on an understanding of resources and barriers to pursuing capacity goals.

Providers must translate demand and capacity need into beds based on data about their own capacity. For example, Child Placing Agencies know the frequency with which specific homes accept children and whether there is existing supply that may be developed to meet local demand or if new beds are needed.

Conclusion

DFPS supports widespread dissemination and use of the data in this report to support strategic capacity building efforts. Within DFPS, the data can be used to drive procurement efforts to focus on specific areas of the state and specific types of placements needed. In communities, the data can be used by residential child care providers such as child placing agencies to drive foster home development in response to capacity need. Both internal and external stakeholders can use annually produced (or more frequently produced) placement data to assess progress in developing supply to meet capacity needs and the impact on proximity. In this way, the annual report will continue to be useful as DFPS moves from purchasing capacity to supporting widespread implementation and oversight of Foster Care Redesign.

DFPS welcomes input from internal and external stakeholders on the value of the data and how it can be improved upon in the future. For example, future analysis may distinguish placements for children newly removed and placed into foster care from placements that are the result of placement changes and disruptions. Some placement change is anticipated to support children's therapeutic needs or permanency goals. Other disruptions may be due to the need for more high quality, stable therapeutic placements. System stability would result in some reduction in the number of placements needed over time. Future technologies may also support more geographic overlay of placement supply.

ⁱ DFPS modified placement in Foster Group Homes in December 2015 in response to court order. In the future, DFPS will continue to shift more placements from congregate care (including basic child care facilities) to foster home settings.

ⁱⁱ Foster Care Redesign breaks some of the larger DFPS regions of 3,6,7,8, and 11 down into catchments. The current catchment boundaries were defined as part of the initial Foster Care Redesign planning and are subject to change. The significance of the catchments was to recognize the natural service hubs within a catchment. Data used in this report may be used to further refine boundaries. Tables are organized by catchment, and by catchment and county.
